43. R. *moschata*. Musk, or Cluster, Rose. Mill. Dict. ed. 8. n. 13. Willd. n. 23. Ait. n. 26. Desfont. Atlant. v. 1. 400. Lawr. Rof. t. 64. t. 53. Jacq. Hort. Schoenbr. v. 3. 16. t. 280. Ger. Em. 1265. f. 1 and 2. (R. moschata minor, flore simplici; Bauh. Hist. v. 2. 45; and flore pleno; ibid. 47.)—Fruit ovate, villous when young, as well as the flower-stalks. Stem and leaf-stalks prickly. Leaflets oblong, pointed, smooth. Panicles many-flowered, downy as well as the calyx.—Desfontaines found this elegant and fragrant Rose growing every where in the hedges of Barbary. It is cultivated by the inhabitants of Tunis, who obtain from its petals, by distillation, a very fragrant essential oil; the same, if we mistake not, which in the East Indies is called *Ottar*. The *shrub* is common in our gardens, and has been so from Gerarde's time, flowering from July to October. The semidouble kind most usually occurs. The *stems* are long and lax, smooth, beset with scattered, short, hooked *prickles*. *Leaves* of a light, slightly glaucous green, especially beneath, smooth, except some downiness on their *footstalks*, and their ribs beneath. *Stipulas* small, narrow, fringed with glands, and divaricated at the points. *Flowers* rather small, white, exceedingly numerous, in large terminal *panicles*, whose *stalks* are slender, downy, destitute of prickles or glands, as is likewise the slender, downy, partly pinnate, *calyx*. *Petals* with slender claws. *Fruit* small, smooth, orange-coloured.—R. moschata major, Bauh. Hist.

v. 2.

v. 2. 45. Lob. Ic. v. 2. 208, quoted by Miller incautioufly for this, may be *R. damafcena.*

44. R. *rubrifolia.* Red-leaved Rofe. Villars Dauph. v. 3. 549. Willd. n. 24. Bellardi Append. ad Fl. Pedem. 23. t. 4. (Rofier multiflore; Reynier Mem. de la Suiffe, v. 1. 222.—Fruit roundifh-ovate, fmooth as well as the flower-ftalks. Prickles of the ftem and leaf-ftalks hooked. Leaflets ovate, fmooth, coloured, fimply ferrated. Flowers corymbofe, with fheathing dilated bracteas and ftipulas.—Native of the mountains of Switzerland, Dauphiny, and Savoy; a ftranger to our gardens. The whole plant, *branches, leaves, ftalks,* and tube of the *calyx,* are more or lefs tinged with a vinous red. The *ftem* is erect and robuft, ten to fifteen feet high, armed with fcattered, diftant, recurved *prickles. Leaflets* feven or nine, large, broadly ovate, with ftrong fharp ferratures, fmooth on both fides, with numerous, parallel, red veins. *Stipulas* red, fmooth; the upper ones, near the flowers, much dilated, and replaced immediately by fimilar, but fmaller, *bracteas. Flowers* from three to five, of a fine pink, forming a fhort fmooth *corymb.* Segments of the *calyx* almoft entirely fimple, very long and flender, downy within, flightly glandular at the edges, each terminating in a long, lanceolate, leafy point. *Fruit* oval, fmall, fmooth. Villars fays the cultivated plant retains the peculiar red tints of its *bark* and *foliage;* only the fize of the *flowers* is fomewhat diminifhed.

45. R. *lagenaria.* Bottle-fruited Rofe. Villars Dauph. v. 3. 553. Willd. n. 25.—Fruit obovate, beaked, fmooth, pendulous. Stem without prickles. Leaf-ftalks rather prickly. Flower-ftalks downy, fomewhat cymofe. Leaflets elliptical, doubly ferrated, fmooth as well as the calyx.—Native of France, in the diftrict of Embrun, among the woods of Bofcodon. Villars fays he never met with this fpecies elfewhere. He defcribes it as akin to the following, but differing in its large leafy *calyx,* and the greatly elongated fpindle-fhaped *fruit,* having a neck like that of a bottle. The *ftem* is from three to five feet high, without thorns. *Leaflets* thin, obtufe. *Flower-ftalks* three together, flightly downy, recurved. We have feen no fpecimen.

46. R. *alpina.* Alpine Rofe. Linn. Sp. Pl. 703. Willd. n. 26. Ait. n. 27. Villars Dauph. v. 3. 552. Sm. Tour on the Cont. v. 3. 137. 140. Jacq. Auftr. t. 279. Lawr. Rof. t. 30. (R. n. 1107; Hall. Hift. v. 2. 41.)—Fruit ovate, fmooth. Stem without prickles. Leaf-ftalks and flower-ftalks briftly. Leaflets elliptic-oblong, doubly ferrated, fmooth.—Very common in the alpine thickets of Switzerland, Savoy, Dauphiny, Auftria, &c. flowering from June to Auguft. It has long been cultivated in botanic gardens, but is not one of our popular fpecies, being, though an elegant plant, and remarkable for the want of prickles, lefs ftriking than *R. pendulina,* which is alfo known by the name of "the Rofe without a thorn." The prefent has fmooth, fpreading, fometimes procumbent, *ftems* and *branches,* of a fhining deep red, obferved by Jacquin to be occafionally hairy or briftly, but never thorny. *Leaflets* feven or nine, elliptic-oblong, ufually more than an inch in length, thin, fmooth, doubly and fharply ferrated; paler beneath, with fome hairs, now and then, on the midrib. *Flowers* generally folitary, of a rich and elegant rofe-colour, on drooping, red *ftalks,* clothed with glandular briftles. *Calyx* downy, with long, fimple, flender, rather leafy-pointed fegments; its tube generally fmooth, though we have from M. Du Cros, a fpecimen with briftles on that part, as well as on the fegments of the calyx. *Fruit* pendulous, oval, fomewhat beaked, of a fine fcarlet.—Mifs Lawrance's t. 75 cannot poffibly have any relationfhip to this fpecies; fee *lucida,* n. 14.

47. R. *pyrenaica.* Pyrenæan Rofe. Gouan. Illuftr. 31. t. 19. Willd. n. 27.

β. R. pimpinellifolia; Villars Dauph. v. 3. 553. (R. glandulofa; Bellardi Append. ad Fl. Pedem. 24.)

Fruit ovate, hifpid as well as the flower-ftalks, and fomewhat prickly leaf-ftalks. Stem without prickles. Leaflets elliptical, doubly ferrated, fmooth.—Native of vallies among the Pyrenæan mountains, as well as of Switzerland and Dauphiny. We are fully perfuaded that the *R. pimpinellifolia* of Villars is, as he himfelf fuggefts, but a variety of Gouan's *pyrenaica,* nor can we trace out fufficient marks to defcribe it even as a variety. The glandular edging of the *ftipulas,* on which our worthy friend Bellardi has founded its character and name, is no lefs evident and conftant in *pyrenaica,* and even in *alpina* itfelf; of which laft indeed we are ftrongly inclined to confider the fuppofed fpecies, both of Gouan and Villars, as mere varieties, differing from the ufual kind in their briftly *calyx* and *fruit.* The fegments of the *calyx* are fimple, with more or lefs leafy points in all, nor does Gouan mention any thing that affords a permanent mark of difcrimination between *pyrenaiea* and *alpina.*

48. R. *pendulina.* Smooth Pendulous Rofe. Rofe without a thorn. Linn. Sp. Pl. 705. Willd. n. 28. Ait. n. 28. Purfh n. 12. Ehrh. Arb. 105. Lawr. Rof. t. 9. (R. fanguiforbæ majoris folio, fructu longo pendulo; Dill. Elth. 325. t. 245. f. 317.)—Fruit ovate, elongated, fmooth, pendulous. Stem and branches fmooth, without prickles. Flower-ftalks and leaf-ftalks hifpid. Leaflets elliptical, doubly ferrated, fmooth, rather numerous. Segments of the calyx fimple, naked and entire. Dillenius fays this fpecies was raifed, in the Eltham garden, from New England feeds; but Mr. Purfh never met with it wild in any part of North America; and Ehrhart gives his fpecimen as a Swifs plant. We believe however that it is a North American, not an European fhrub. In our gardens it bloffoms towards the end of May, ripening fruit in Auguft. The *ftem* is five or fix feet high, bufhy, fmooth, dark red, nor is there a prickle to be found on any part of the plant. *Leaves* bearing a confiderable refemblance to thofe of the Greater Burnet, *Sanguiforba,* and compofed of from nine to thirteen large, elliptical, fmooth *leaflets,* paler beneath, with double glandular ferratures. *Flowers* folitary, crimfon, on glandular, rather than briftly, *ftalks.* Tube of the *calyx* oblong, very fmooth; its fegments quite fimple, entire, narrow, downy at the edges, but deftitute of dorfal prickles or glands. *Fruit* pendulous, fcarlet, fmooth and fhining, remarkably elongated, beaked and curved, fufficiently difcriminating the fpecies, which neverthelefs is nearly related to *R. alpina,* but in every part more robuft.

49. R. *montana.* Round-leaved Mountain Rofe. Villars Dauph. v. 3. 547. Willd. n. 29.—Fruit oval, briftly as well as the flower-ftalks. Leaf-ftalks prickly and glandular. Stem with hooked folitary prickles, below each leaf. Leaflets roundifh, abrupt, doubly ferrated, fmooth.—Native of hills in Dauphiny and Switzerland. A very diftinct fpecies, of which we have fpecimens from Mr. Schleicher. The *ftem* is only two or three feet high, but ftrong, with many fpreading, reddifh, fmooth *branches. Prickles* pale brown, moderately hooked or deflexed, awl-fhaped, with a long linear bafe. They ftand folitary, a little below each branch or leaf. *Stipulas* broad, fringed with glands. *Leaf-ftalks* purplifh, flightly prickly and glandular. *Leaflets* feven, fomewhat glaucous, much refembling thofe of the Leffer Burnet, *Poterium;* their termination generally abrupt, and their ferratures coarfe, fcarcely glandular; the midrib now and then hairy beneath. *Flower-ftalks* terminal, fhort, very briftly and glandular, either folitary,

litary, or two or three together, enveloped in the uppermoſt *ſtipulas*. *Petals* ſmall, generally white, ſometimes red. Segments of the *calyx*, briſtly and glandular at the back, partly pinnate. *Fruit* red, armed with many ſtrong briſtles. This ſpecies has but a remote affinity to either *canina* or *arvenſis*, with which Villars contraſts it, except that the *ſtyles* are ſaid to be elongated, after flowering, as in the latter.

50. R. *multiflora*. Bramble-flowered Chineſe Roſe. Thunb. Jap. 214. Willd. n. 30. Ait. n. 29. Curt. Mag. t. 1059. ("R. flava; Donn. Cant. ed. 4. 121.")—Fruit ovate, villous, unarmed. Flower-ſtalks villous, racemoſe. Stem and leaf-ſtalks prickly. Leaflets ovate, ſimply ſerrated; downy beneath.—Native of Japan and China. Introduced into this country by Thomas Evans, eſq. of Stepney, about the year 1804. It is hardy, flowering in June and July, and a great acquiſition to the gardens, being a *ſhrub* of luxuriant growth, eaſily trained to a conſiderable height. The *leaves* are of a greyiſh aſpect; ſmooth above; paler and downy beneath; their ſerratures ſimple. *Flowers* in cluſters, ſimple or compound, reſembling thoſe of the double-flowering Bramble, and not much larger. Thunberg deſcribes them white; with us they are pink, with very numerous, ſmall, imbricated *petals*, a few remains of *ſtamens*, and ſome elongated, dilated, greeniſh *ſtyles*. The *flowers*, on the firſt introduction of the plant, were reported to be yellow, but we have not heard of any ſuch variety having made its appearance.

51. R. *caucaſica*. Caucaſian Roſe. "Marſch. Taurico-Caucaſ. v. 1. 400." Ait. n. 33.—"Fruit ovate, ſmooth as well as the flower-ſtalks. Leaf-ſtalks prickly. Stem not hairy; its prickles hooked. Leaflets doubly ſerrated, downy. Flowers umbellate."—Native of mount Caucaſus, from whence it is ſaid, in Hort. Kew., to have been brought to England about the year 1798. It is a hardy ſhrub, flowering in June and July. We have ſeen neither ſpecimen nor figure. If the plant ſtill exiſts in our collections, it ought to be delineated and given to the public.

52. R. *parvifolia*. Small-leaved, or Burgundy, Roſe. Ehrh. Beitr. v. 6. 97. Willd. n. 33.—"Fruit ovate, nearly ſmooth. Flower-ſtalks glandular. Leaf-ſtalks and ſtem with minute ſtraight prickles. Leaflets ovate, rugged; ſomewhat villous beneath; their ſerratures glandular." Said to be a native of Europe. A dwarf *ſhrub*. *Leaflets* five, ſmall, ovate, acute. *Flowers* ſmall. *Willdenow*. We know not what is intended under the above deſcription, unleſs it be the Burgundy Roſe, Miſs Lawrance's t. 44, which we have, after the example of Hort. Kew. conſidered as a variety of *centifolia* or *gallica*, ſee n. 28. The characters anſwer, as far as any thing can be made out by the figure. We ſhould have ſuſpected the Roſe de Meaux, Miſs Lawrance's t. 31, might have been Ehrhart's and Willdenow's plant; but the latter has duly referred that, as we have done, to *provincialis* in its proper place, and having ſeen both in a living ſtate, muſt be preſumed to have diſtinguiſhed them. There ſeems a great probability that the *parvifolia* in queſtion is ſome garden variety of the *gallica*, to which its characters approach ſufficiently near to authorize this opinion. We leave it for the final determination of thoſe who may meet with authentic ſpecimens.

53. R. *ſemperflorens*. Dark Chineſe Roſe. Curt. Mag. t. 284. Willd. n. 34. Ait. n. 34. Sm. Exot. Bot. v. 2. 63. t. 91. Lawr. Roſ. t. 28. Jacq. Hort. Schoenbr. v. 3. 17. t. 281. (R. diverſifolia; Venten. Jard. de Cels, t. 35.)—Fruit ovate, roughiſh. Stem, leaf-ſtalks, and flower-ſtalks, hiſpid or prickly. Prickles hooked. Leaflets three or five, ovate, ſmooth; paler beneath, with a hairy rib. Calyx reflexed, entire.—Native of China, from whence it was introduced by the late Mr. Slater, about the year 1789. The ſhrub is perfectly uninjured by any of our froſts, and where the air is pure, grows luxuriantly in the open ground, flowering moſt part of the year. Yet it ſometimes dies off unaccountably, and is not become ſo general an ornament of every cottage garden as the Pale Chineſe Roſe, hereafter mentioned, brought to England about the ſame period. The *ſemperflorens* is generally of humble growth, but in a rich loamy ſoil, on the outſide of a greenhouſe, may be trained to a conſiderable height. The *ſtem* is much and variouſly branched, armed with ſcattered, ſhort, hooked prickles. *Leaflets* three or five, ovate, acute, rigid, unequally ſerrated; of a dark ſhining green, and ſmooth, above; paler, and rather glaucous, beneath, with a denſely hairy rib. *Leaf-ſtalks* clothed with glandular briſtles, and ſome ſoft hairs, as well as with a few hooked prickles. *Stipulas* linear, acute, fringed with ſtalked glands. *Flower-ſtalks* terminal, uſually ſolitary, rough with glands or prickles, ſingle-flowered. Segments of the *calyx* reflexed, lanceolate, coloured, ſimple and entire, downy, more or leſs fringed or glandular at the edges. *Petals* deep crimſon, ſometimes very dark, tremulous from the ſlenderneſs of their claws; paler at the back. The figures in Ventenat, and our Exotic Botany, exhibit the *flowers* in a ſingle ſtate; the reſt have double *flowers*, as uſually ſeen in gardens. Jacquin repreſents a ſuppoſed bluſh-coloured variety, which is probably *indica*, n. 55. The *fruit* is moſtly roughiſh, at leaſt when young; but ſometimes quite ſmooth. We have not met with it ripe. The *ſhrub* is readily increaſed by cuttings.

54. R. *chinenſis*. Slender Chineſe Roſe. Jacq. Obſ. faſc. 3. 7. t. 55.—"Fruit ovate, ſmooth as well as the flower-ſtalks. Leaf-ſtalks and ſtem prickly. Leaflets uſually three, ovato-lanceolate, finely ſerrated, ſmooth."—Native of China. Deſcribed by Jacquin from ſome ſpecimens belonging to Gronovius. He ſpeaks of the *leaves* as perfectly ſmooth and ſhining, and the ſegments of the *calyx* fringed with down. The *leaves* were moſtly ternate, ſome of them only having a ſmall additional leaflet at one ſide. This is very likely to be, as Willdenow ſuſpected, the ſame ſpecies with our *ſemperflorens*. If it ſhould ſo prove, we hope the latter name, though of poſterior date, will not be ſacrificed to one ſo vague and indiſcriminate as *chinenſis*; eſpecially as *ſemperflorens* is now eſtabliſhed in ſyſtematic works of authority, and Jacquin himſelf, who, in his Hort. Schoenbr. conſidered theſe plants as the ſame, has liberally preferred it.

55. R. *indica*. Bluſh Chineſe Roſe. Linn. Sp. Pl. 705. Willd. n. 36. Ait. n. 35. (R. ſemperflorens β; Lawr. Roſ. t. 26. R. longifolia; Willd. n. 37.)—Fruit ovate, ſmooth. Flower-ſtalks briſtly and glandular. Leaf-ſtalks glandular and prickly. Leaflets ovate, pointed, ſmooth; paler beneath. Prickles of the ſtem ſcattered, ſlightly hooked. Flowers ſomewhat corymboſe. Calyx partly pinnate and leafy.—Native of China and the Eaſt Indies. Introduced by ſir J. Banks, about the year 1789, into the gardens of England, where it proves quite hardy, flowering profuſely, almoſt throughout the year; and is undoubtedly one of the moſt deſirable acquiſitions, of the ornamental kind, that our collections have for a long time received. The *ſhrub* is of rapid and lofty growth, much ſtronger than *R. ſemperflorens*. *Stem* more or leſs armed with ſcattered, very ſtrong, reddiſh, ſharp, hooked or recurved *prickles*, which we have never found entirely wanting. *Leaves* of a full, bright, ſhining green on the upper ſide; paler, opaque, and a little glaucous, beneath; their *leaflets* for the more part five, ovate, taper-pointed, ſharply and pretty

pretty equally, but not ſtrongly, ſerrated. *Leaf-ſtalks* bordered with glandular briſtles, and furniſhed with a few hooked prickles. *Stipulas* linear, narrow, reticulated, fringed with red glandular briſtles; their points acute, divaricated at right angles. *Flower-ſtalks* terminal, very numerous and corymboſe in ſtrong-growing plants; in ordinary ones fewer; in ſome ſolitary and ſingle-flowered at the ends of weak lateral branches. They are always clothed with minute glandular briſtles, even in the original ſpecimen of Linnæus, which he deſcribed as ſmooth. Neither are the *leaves* of that ſpecimen downy beneath. He ſeems to have taken that character from another, which he confounded therewith, but which we judge to be *moſchata*, whoſe very young *leaves* bear a few hairs on their ribs and veins. *Flowers* moderately large, in a double ſtate conſiſting of numerous, lax, diſorderly *petals*, varying with every tint of pink or carnation, and having a ſweet, though light, odour, as in *ſemperflorens*, but not exactly the ſame. The perfume of both is very inferior to moſt of our garden Roſes, and even to the wild *R. canina*. The *calyx* of *R. indica* is variable in luxuriance, but always in ſome degree leafy, pinnate, or jagged. *Fruit* large, pale ſcarlet. On a careful compariſon of Willdenow's *longifolia*, (ſent by the Rev. Dr. Rottler, and by the late Dr. Koenig, from the Eaſt Indies,) with our garden plant, and the Linnæan ſpecimen, we can have no doubt of their perfect identity; though the prickles of the *ſtem* ſeem wanting on the upper part, at leaſt, of the luxuriant Indian ſpecimens. Every one, who has attended to the cultivated *R. indica*, will be aware that this circumſtance is of no importance, in the conſideration of ſuch materials as we have before us.

56. R. *bracteata*. Macartney Roſe, or Sir George Staunton's Roſe. Willd. n. 38. Ait. n. 36. Venten. Jard. de Cels, t. 28. Curt. Mag. t. 1377. (R. lucida; Lawr. Roſ. t. 84.)—Fruit obovate. Bracteas pectinated, concealing the flower-ſtalk, which is villous like the young branches. Prickles in pairs under the prickly leaf-ſtalks. Leaflets obovate, obtuſe, crenate, ſmooth and ſhining. Stipulas deeply jagged. Calyx ſilky, taper-pointed.—Native of China, from whence it was brought by lord Macartney and ſir G. Leonard Staunton, in 1795. It proves tolerably hardy in England, flowering from Auguſt to the end of autumn; but is often ſo much injured by expoſure to our ſevere froſts, as ſeldom to recover ſufficiently to bloſſom well in the enſuing ſummer. The *ſtem* is four or five feet high, downy, armed with a pair of deflexed reddiſh prickles under each *leaf-ſtalk*, and with innumerable minute ſtraight ones over the whole ſurface. *Leaf-ſtalks* hairy, glandular, and prickly. *Leaflets* about ſeven or nine, rigid, ſhining, of a fine green; their ribs minutely prickly. *Stipulas* but little attached to the leaf-ſtalk, deeply cut, or pectinated, at one ſide. *Flowers* terminal, ſolitary, large, cream-coloured, agreeably ſcented, on ſhort hairy *ſtalks*, which are concealed by ſeveral large, ſheathing, deeply pectinate, or pinnatifid, *bracteas*. *Calyx* coriaceous, taper-pointed, very ſilky externally. Ventenat mentions a ſmall central point, in the ſinus of each *petal*, which we do not find conſtant. The *ſtipulas*, and eſpecially the *bracteas*, are ſo peculiar, that this ſpecies can be confounded with no other.

57. R. *alba*. White Garden Roſe. Linn. Sp. Pl. 705. Willd. n. 39. Ait. n. 37. Lawr. Roſ. t. 37. t. 25. t. 23. t. 32. Ger. Em. 1260, with the ſame cut which Lobel uſes for *R. damaſcena*.—Fruit ovate, ſmooth. Flower-ſtalks and calyx briſtly. Leaf-ſtalks downy, armed like the ſtem with hooked prickles. Leaflets roundiſh-ovate, ſharply ſerrated, downy beneath. Calyx partly pinnate. —Native of Europe; in the hedges and thickets of Heſſe and Saxony, according to Roth. Common in our gardens from the days of Gerarde, flowering in June and July. The buſh is five or ſix feet high. *Leaves* dark green, of five or ſeven large, broad *leaflets*, ſharply and copiouſly ſerrated, veiny; paler, and more or leſs downy, beneath. *Stipulas* paler, broad, dilated upwards, with glandular ſerratures, and obliquely ſpreading points. *Flowers* large, ſomewhat corymboſe, pleaſantly but weakly ſcented, uſually pure white, but often tinged with a moſt delicate bluſh, as in Miſs Lawrance's t. 23 and t. 32. Segments of the *calyx* partly bordered with long leafy appendages, glandular at the edges. *Bracteas* like the *ſtipulas*, but more ovate. *Fruit* tawny, rarely perfected in gardens. We can give no good reaſon for placing the preſent ſpecies here, at a diſtance from *gallica*, n. 28, to which it is moſt naturally allied. No difficulty or confuſion indeed can ariſe reſpecting a plant ſo well known, and ſo clearly defined. The White Roſe was formerly an article of the Materia Medica, its diſtilled water, which poſſeſſes a ſlight aſtringency, being ſuppoſed good for inflammations and weakneſſes of the eyes. A more fragrant water, equally colourleſs and efficacious, is diſtilled from the Provins roſe, n. 26; which, we believe, is uſually kept in the ſhops. In ſome of this, after long keeping, we have ſeen a floating oilineſs, as deliciouſly and powerfully fragrant as the oriental ottar of roſes.

Our catalogue of ſpecies thus amounts to 18 more than Willdenow's, notwithſtanding ſome retrenchments. The drawings of the Chineſe afford reaſon to ſuppoſe we are not yet acquainted with all their ſpecies, and we have already hinted that ſome Iriſh ones are ſtill waiting for more complete elucidation than they have hitherto received. The diſtribution of the ſpecies in general requires reviſion; nor have botaniſts ſufficiently adverted to ſome characters, that appear to us more important than ſeveral they have depended upon. The number, and preciſe ſituation, of the ſubſtipulary prickles, the form of the ſtipulas, and the ſtructure of the calyx, appear to us more conſtant, than the abſence or preſence of glands, or of pubeſcence, in certain parts. The nature of the ſerratures of the leaves, whether ſimple or double, glandular or not, is likewiſe occaſionally worthy of notice.

Rosa, in *Gardening*, contains plants of the deciduous flowering, ſhrub, and evergreen kind, of which the ſpecies cultivated are: the ſingle yellow roſe (R. lutea); the double yellow roſe (R. ſulphurea); the Hudſon's-bay roſe (R. blanda); the cinnamon roſe (R. cinnamomea); the white dog roſe (R. arvenſis); the ſmall burnet-leaved roſe (R. pimpinellifolia); the Scotch roſe (R. ſpinoſiſſima); the ſmall-flowered American roſe (R. parviflora); the ſhining-leaved American roſe (R. lucida); the Carolina roſe (R. carolina); the apple roſe (R. villoſa); the Provence roſe (R. provincialis); the hundred-leaved roſe (R. centifolia); the red roſe (R. gallica); the damaſk roſe (R. damaſcena); the evergreen roſe (R. ſempervirens); the dwarf Auſtrian roſe (R. pumila); the Frankfort roſe (R. turbinata); the ſweet-briar roſe (R. rubiginoſa); the moſs Provence roſe (R. muſcoſa); the muſk roſe (R. moſchata); the Alpine roſe (R. alpina); the deep red China roſe (R. ſemperflorens); and the white roſe (R. alba).

Of the firſt there is a variety termed the Auſtrian roſe, which has the ſtalks, branches, and leaves, like thoſe of the ſingle yellow roſe, but the leaves are rounder. The flowers are alſo larger; the petals have deep indentures at their points; are of a pale yellow on the outſide, and of a reddiſh copper colour, orange ſcarlet, or barré colour within; are ſingle, have no ſcent, or a diſagreeable one, and ſoon fall away.

away. It has ſometimes flowers entirely yellow on one branch, and copper-coloured on another.

In the fourth ſpecies there is a double variety, in which the ſhoots are redder; the flowers ſmall, ſhort, thick, and double, of a pale red colour at the end of the leaves (petals), ſomewhat redder and brighter towards the middle. It is the ſmalleſt and earlieſt of the double garden roſes, flowering in May.

In the ſeventh ſort there are ſeveral varieties, as the ſtriped-flowered, or with variegated flowers, red ſtriped with white. The red Scotch roſe, which ſeldom riſes more than a foot high; the ſtalks are covered with a brown bark, and are cloſely armed with ſmall ſpines; the leaves are very ſmall; the flowers are alſo ſmall, ſeſſile, and of a livid red colour; the fruit is round, of a deep purple colour, inclining to black when ripe. And according to Withering, there is alſo a variety with prickly peduncles, and cream-coloured flowers, changing to white. Lawrance likewiſe mentions a double Scotch roſe.

In the eighth kind there is a variety with a double flower.

Of the twelfth ſpecies there are ſeveral varieties, as the red Provence roſe; the ſtem and branches are not ſo great as thoſe of the other, but greener, the bark not being ſo red; the flowers are not ſo large, thick and double, but of a little deeper damaſk or bluſh colour, turning to red, but not coming near the full colour of the beſt red roſe; nor is the ſcent ſo ſweet as that of the damaſk Provence, but coming near that of the ordinary red roſe. It is not ſo plentiful in bearing as the damaſk Provence. The bluſh Provence roſe, in which the ſtalks riſe from three to four feet high, and are unarmed; the leaves are hairy on their under ſide; the peduncles have ſome ſmall ſpines; the ſegments of the calyx are ſemi-pinnate; the corolla has five or ſix rows of petals, which are large, and ſpread open; they are of a pale bluſh colour, and have a muſky ſcent. The white Provence roſe, which differs only in the colour of the flowers. The great and ſmall dwarf Provence roſes, called roſe de Meaux, differ from each other in little except ſize; the ſmaller of the two is generally known by the nurſery-men and gardeners by the name of Pompone roſe. It throws out numerous ſtems, which rarely exceed a foot, or a foot and half, in height; uſually ſtraight, rigid, and very prickly; the flowers very ſmall, and diſtinguiſhed by the brilliant colour of the central petals, appearing in June. All the ſorts flower from July to Auguſt.

In the thirteenth ſpecies the varieties are very numerous; as the Dutch hundred-leaved roſe; the bluſh hundred-leaved roſe; the Singleton's hundred-leaved roſe.

The ſingle and double velvet roſe, which, according to Parkinſon, has the old ſtem covered with dark-coloured bark, but the young ſhoots of a ſad green, with few or no thorns; the leaves are of a ſadder green than in moſt roſes, and very often ſeven on a ſtalk; the flower is ſingle; or double, with two rows of petals, the outer larger, of a deep red, like crimſon velvet; or more double, with ſixteen petals or more in a flower, moſt of them equal: they have all leſs ſcent than the ordinary red roſe. The Burgundy roſe, which is an elegant little plant, not more than a foot or eighteen inches in height. The ſultan roſe, the Stepney roſe, the gurnet roſe, the biſhop roſe, and the Liſbon roſe.

In the fourteenth ſort there are ſeveral varieties; as the red official roſe, the Mundi roſe, which has the flowers very elegantly ſtriped or variegated with red and white: in other circumſtances it ſo perfectly reſembles the red roſe, that there can be no doubt of its being a variety of that: indeed it frequently happens that a red roſe or two appears on the ſame plant with the variegated flowers. The Childing roſe, the marbled roſe, and the double virgin roſe, which have great affinity with each other, according to Miller.

Of the fifteenth ſort there are alſo ſeveral varieties, as the red damaſk roſe, the bluſh damaſk roſe, which differ only in the ſhade and colour. The York and Lancaſter roſe, which agrees with the damaſk in ſtalk, leaf, &c. differing only in the flower being variegated with white ſtripes. Mr. Hart's roſe has the white ſtripes more diſtinct; the flowers in theſe being leſs double than in ſeveral others, are frequently ſucceeded by fruit, and have ripe ſeeds, from which other varieties may be obtained. According to Parkinſon, ſometimes one half of the petal is of a pale whitiſh colour, and the other half of a paler damaſk than common; or one petal is white or ſtriped with white, and the other half bluſh or ſtriped with bluſh; ſometimes alſo ſtriped or ſpotted over, and at other times little or no ſtripes or marks, and the longer it remains blown open in the ſun, the paler and the fewer ſtripes, marks, or ſpots will be ſeen in it. The ſmell is of a ſweet damaſk roſe ſcent. The red monthly roſe, the white monthly roſe, which are ſo called from their continuing to blow in ſucceſſion during the greater part of the ſummer; not that they blow in every month, as the name implies. They are, in every reſpect, like the damaſk roſe, unleſs it be that they are more full of prickles than that. The bluſh Belgic roſe, which riſes about three feet high, with prickly ſtalks; the leaves are compoſed of five or ſeven leaflets, which are oval, hairy on their under ſide, and ſlightly ſerrate; the peduncles and calyxes are large and ſemi-pinnate; the flowers very double, of a pale fleſh colour, with little ſcent, generally in great quantities. The red Belgic roſe, which differs only in having the colour of the flower a deep red. The great royal roſe, and the imperial bluſh damaſk roſe.

In the nineteenth ſort the cultivated plant grows larger and more erect; the leaves are bigger and much ſweeter than in the wild one, the ruſty colour of them diſappears, and the whole puts on a more vigorous appearance; the ſweet ſcent is ſuppoſed to proceed from the gland. There are varieties with double flowers; as the common double ſweet-briar, the moſſy double ſweet-briar, the evergreen double ſweet-briar, the red double ſweet-briar, the royal ſweet-briar, and the yellow ſweet-briar.

Of the twenty-firſt kind there is a variety with double flowers. And the editor of Miller's dictionary conſiders the evergreen muſk roſe of Miller to be the ſame with this.

Of the twenty-fourth ſort, according to Parkinſon, there are two varieties of the white garden roſe; one attaining ſometimes the height of eight or ten feet, with a ſtock of a great bigneſs, the other ſeldom higher than a damaſk roſe. Both have ſomewhat ſmaller and whiter-green leaves than in many other roſes, five moſt uſually on a ſtalk, and paler underneath; as alſo a whiter-green bark, armed with ſhort prickles. The flowers in the one are whitiſh, with an eye of bluſh, eſpecially towards the bottom, very double, and for the moſt part not opening ſo fully as the red or damaſk roſe. In the other more white, leſs double, and opening more. Some have only two or three rows of petals; and all have little or no ſmell.

Method of Culture.—In all the ſorts the increaſe may be effected by ſuckers, layers, or by budding upon ſtocks of other ſorts of roſes; but this laſt method is only practiſed for ſome peculiar ſorts, which do not grow well upon their own ſtocks, and ſend forth ſuckers ſparingly. Where more ſorts than one are to be had upon the ſame plant, ſuch ſorts only ſhould be budded upon the ſame ſtock as are nearly equal in their manner of growth, otherwiſe the ſtrong one will draw all the nouriſhment from the weaker.

The ſuckers ſhould be taken off in October, and planted out either in nurſery-rows, or in the places where they are to remain; as where they are permitted to ſtand upon the roots of the old plants more than one year, they grow woody, and do not form ſo good roots as if planted out the firſt year. The beſt method to obtain good-rooted plants is to lay down the young branches in autumn, which will take good root by the autumn following; eſpecially when watered in dry weather; when they may be taken off from the old plants, and be planted out where they are to remain. The ſeeds are ſometimes ſown in the autumn, to produce new varieties, in beds of light mellow earth, or in drills, eſpecially for the common ſweet-briar kinds, and for raiſing hedges of them.

But although new varieties and ſome particular permanent ſorts, ſuch as continue the ſame by ſeeds, may occaſionally be raiſed in this way; all the double kinds and peculiar varieties, are by no means, in general, to be produced in this manner, as they cannot be continued, with certainty, the ſame by ſeeds, but conſtantly require, in this intention, to be raiſed from layers or ſuckers.

The moſt proper ſeaſon for planting all the ſorts is the autumn or winter, when the weather is mild and open, when they will, for the moſt part, flower in full perfection during the ſucceeding ſummer, but, ſhould there be a neceſſity, they may be replanted out even ſo late as the beginning of the ſpring months without much danger. And it is often an uſeful practice to ſet out a few plants in this late manner for the ſake of a late long continued blow in the autumnal ſeaſon. In general, however, the ſooner the work of planting them out is performed, the ſtronger and more fully will the plants afford their flowers.

In planting them out in the common or ſhrubbery borders, it ſhould moſtly be done in a ſingle manner; and they may be trained with ſingle ſtems to the height of one, two, or more feet, and then managed ſo as to branch out into buſhy heads; and it is commonly adviſeable to have them in this form; though ſome, for the ſake of a more buſhy growth, ſuffer them to branch away immediately from the bottom, as they will flower well in any mode of training.

Some, for curioſity, may alſo be run up with ſingle ſtems to the height of from five or ſix to ten feet, and be kept in erect poſitions by means of proper ſupports, being made to form branchy heads at theſe heights, ſome running up more or leſs for the ſake of greater variety. The large growing ſorts may likewiſe, in ſome caſes, be planted out againſt walls, pales, &c. and be trained laterally as well as in an upright manner to ſome conſiderable extent.

Some plants of the early ſorts, as the monthly, &c. may alſo be ſet out in warm ſituations for more early blowing, and be treated in the ſame way.

But in the gardens about the metropolis, where large quantities of flowers of this kind are wanted for ſale, the plants are generally ſet out in cloſe rows, being put into the ground, in a ſort of trench planting manner, at the diſtance of about a foot from each other, and afterwards kept down to the height of from not more than one to three feet, according to the ſorts and circumſtances by cutting them over, or clipping them, every autumn or winter, at the top and on the ſides, by which lateral branches are ſent off in greater abundance for future flowering.

All good gardens ſhould moſtly be poſſeſſed of the different ſorts of theſe flowers, as they are eaſily procured, and multiply in an expeditious manner.

Some of the beſt ſorts of theſe plants may further alſo occaſionally be put in pots for the purpoſe of being ſet out conveniently in different parts for the ſake of ornament.

And where there are the conveniencies of hot-houſes and forcing-frames, it may, in many caſes, be deſirable and proper to place ſome of the prime ſorts in pots for the purpoſe of being forced in ſuch places for an early blow by means of artificial heat. In this way they may be made to flower either in the winter or early ſpring months. In which intention ſome potted plants of the monthly, common, or moſs Provence, or other choice ſorts of roſes, muſt, in the winter, be ſet in the above ſort of frame, wrought by dung, bark, or fire heat, or in a hot-houſe, which is by much the beſt, and be, by ſuch means properly applied, forced into blow in the beginning of the new year and in ſucceſſion for the two following months, and until the plants in the natural open ground begin to flower, different ſucceſſional ſupplies of plants being ſo placed at the diſtance of every two or three weeks.

For this uſe a quantity of plants ſhould, in general, be annually potted, which, if they have had a ſummer's growth in the pots, plunged in the ground, before they are employed in this way, it will be the better, as they will be more firmly rooted, and conſequently blow in greater perfection and beauty. See Forcing, and Forcing-*Frame*.

It is not unuſual for the gardeners in the vicinity of the metropolis to form conveniencies of the above kinds in order to force flower-plants of this nature, as there is almoſt conſtantly a great demand and ready ſale for them, at an early ſeaſon, while they are in flower in the pots, as well as when the flowers are gathered in noſegays and other ways. They often pay extremely well in this manner of cultivating them.

Almoſt all the open ground ſorts delight in a rich moiſt ſoil and an open ſituation, in which they produce a greater quantity of flowers, and thoſe much fairer, than when they are upon a dry ſoil, or in a ſhady ſituation. The pruning which they afterwards require, is only to cut out their dead wood, and take off all their ſuckers, which ſhould be done every autumn; and if there are any very luxuriant branches, which draw the nouriſhment from the other parts of the plant, they ſhould be taken out, or ſhortened, to cauſe them to produce more branches, if there be occaſion for them to ſupply a vacancy; but it is beſt to avoid crowding them with branches, which is as injurious to theſe plants as to fruit-trees; for if the branches have not equal benefit from the ſun and air, they will not produce their flowers ſo ſtrong, or in ſo great plenty, as when they are more open, and better expoſed to the ſun, ſo as to have a more free circulation of air. As the moſs Provence roſe ſeldom ſends out ſuckers, and does not ſtrike very freely by layers, it is often increaſed by budding it upon ſtocks of the other ſorts; but the plants are beſt when raiſed from layers.

In general the beſt ſort for flowering early and late is the monthly, next to which in flowering in the open air is the cinnamon, which is immediately followed by the damaſk roſe, then the bluſh, York, and Lancaſter; after which, the Provence, Dutch hundred-leaved, white, and moſt other ſorts; and the lateſt ſorts are the Virginian and muſk roſes, which, if planted in a ſhady ſituation, ſeldom flower until September, and if the autumn proves mild, continue often till the middle of October. And the plants of the two ſorts of muſk roſes ſhould be placed againſt a wall, pale, or other building, that their branches may be ſupported, otherwiſe they are ſo ſlender and weak as to trail

upon

upon the ground. Thefe plants fhould not be pruned until fpring, becaufe their branches are fomewhat tender; fo that when they are cut in winter, they often die after the knife; thefe produce their flowers at the extremity of the fame year's fhoots in large bunches, fo that their branches muft not be fhortened in the fummer, left the flowers fhould be cut off. The fhrubs will grow to be ten or twelve feet high, and muft not be checked in their growth, if intended to flower well. They are all highly ornamental plants, moftly for the fhrubbery borders and clumps, being planted according to their habits of growth.

Rosa, Salvator, in *Biography*, fo well known among the cognofcenti as the author of fpirited and extravagant pictures of banditti, &c., was born at Naples in 1614, and received his firft knowledge of defign from his kinfman, F. Francazano; but by the death of his father, being reduced to extreme poverty, he was conftrained to provide himfelf a maintenance by fketching defigns upon paper, and felling them at any price he could obtain.

In that wretched fituation he laboured for fome time, till one of his defigns, an hiftorical fubject of Hagar and Ifhmael, accidentally happened to fall into the hands of Lanfranc. Pleafed with the ability it difplayed, he eagerly enquired for the artift; and as foon as he became acquainted with him, took him under his protection, and provided for him generoufly. This unexpected and happy change in his circumftances, enabled Salvator to purfue his ftudies with more effect; and he foon acquired confiderable eminence, and his works were eagerly fought after.

The ftyle which he formed is peculiarly his own, and his beft productions are beautiful imitations of nature; but in general his works are artificial combinations, and wrought with extravagance; the fpirit and fire with which they are executed, too frequently giving them a confequence and a name they do not deferve. This, indeed, may perhaps be faid, that half the pictures which go under his name, are fpurious or heavy imitations, and he pays the tax which all mannerifts, like him, muft fubmit to.

He certainly poffeffed a comprehenfive genius; and was an excellent fatirical poet, as well as an ingenious painter. In landfcape painting he was entirely original, delighting in fcenes of defolation and terror; thefe he peopled with banditti repofing, or lurking for their prey, or dividing their fpoils; lonely fhepherds, or forlorn travellers. Sometimes he attempted to create an intereft by filling the fcene he drew with fome facred or hiftoric fubject, but in this he feldom fucceeded; his figures being ill proportioned, falfely attired, and void of expreffion. In colour he fometimes attained excellence. The dull, low, or lurid tone, which fo juftly becomes the character of lonelinefs, of forefts almoft impenetrable, or dreadful to fee, and conveying ideas of danger in their afpect, he frequently prefented moft perfectly; and wrought the various parts with the greateft freedom of touch, and the utmoft readinefs of invention. His pictures are not unfrequent in our collections in this country; and genuine ones of the firft quality are fold at extravagant prices. He died at the age of 59, in the year 1673.

Among mufical MSS. purchafed at Rome in 1770, was the mufic-book of Salvator Rofa, the painter, in which are contained, not only airs and cantatas fet by Cariffimi, Cefti, Luigi, Cavalli, Legrenzi, Capellini, Pafqualini, and Bandini, of which the words of feveral are by Salvator Rofa; but eight entire cantatas written, fet, and tranfcribed by this celebrated painter himfelf. The book was purchafed of his great grand-daughter, who inhabited the houfe in which her anceftor lived and died. The hand-writing was afcertained by collation with his letters and fatires, of which the originals are ftill preferved by his defcendants. The hiftorians of Italian poetry, though they often mention Salvator as a fatirift, feem never to have heard of his lyrical productions; and as this book is not only curious for the mufic it contains, but the poetry, we fhall be fomewhat minute in our account of its contents.

The firft compofition in this MS. was luckily a fcene in Cefti's opera of Orontea, which it would have been difficult to have found elfewhere; for of the many hundred operas that were compofed for the different theatres of Italy, during the laft century, except two or three that have been printed, an entire copy, in fcore, it would be difficult to find, if not impoffible.

II. Is a cantata by Capellini, a compofer of no great eminence; yet there is in it a very pleafing air in triple time of $\frac{3}{2}$, in which the crotchets are expreffed by minims hooked or tied like quavers.

III. Is an elegant fimple air, by Legrenzi, fung to two different ftanzas. See Legrenzi.

IV. Is a beautiful Siciliana by Cavalli, the compofer of Erifmena. See Cavalli.

V. Is a cantata written by Salvator Rofa, and fet by Cefti. Recitative had not, as yet, banifhed formal clofes, or regular modulation, which encroached too much upon air, and deftroyed its narrative and declamatory plainnefs and fimplicity.

Salvator was either the moft miferable or the moft difcontented of men. Moft of his cantatas are filled with the bittereft complaints, either againft his miftrefs, or mankind in general. In this he fays, that he has had more misfortunes than there are ftars in the firmament, and that he has lived fix luftres (thirty years) without the enjoyment of one happy day.

VI. Is a cantata fet by Luigi, almoft wholly in recitative, which, but for the formality of the clofes, would be admirable. See Luigi.

VII. Another cantata by the fame compofer, of which the words are very beautiful.

VIII. A cantata fet by Cariffimi, in which the melody is impaffioned, and the recitative admirable. See Cariffimi.

IX. Is a pleafing and natural air by Marc Antonio Pafqualini, which is repeated to different ftanzas. The compofer of this air was admitted into the Papal chapel in 1630; and from the year 1643 to 1670, he was a favourite ftage-finger, with a foprano voice. Many of his compofitions are preferved in the collections of the time, in which more grace and facility appear than force and learning.

X. A cantata, of which the words are by Salvator Rofa, and the mufic by Cefti. There are great ftrength and imagination in this poetry.

In the church of Santa Maria degli Angeli de' PP. Certofini, at Rome, where Salvator Rofa was buried, there is an infcription on his tomb, at which Crefcimbeni, a Florentine, is angry; as it gives him *il primato fopra tutti i Rimatori Tofcani.* This, like almoft all monumental praife, is certainly hyperbolical; but Salvator's poetry feems to have great merit for its boldnefs and originality; it is indeed fomewhat rough, even in his lyrics; and his fatires are often coarfe; but he appears to us always more pithy than his contemporaries, whom Marini's affectation had perhaps enervated and corrupted.

Salvator's cantata, of which we are now fpeaking, is the incantation of a female, diftracted with love, difappointment, and revenge. This lyric poem feems to have furnifhed ideas to the author of Purcell's Mad Befs.—" By the

the croaking of the toad," &c. And in Salvator all the charms and spells of the witches in Macbeth are invoked.

XI. Is a gloomy, grumbling history of this painter and poet-musician's life, in which the comic exaggeration is not unpleasant; but it is rather a satire on the times in which he lived, than a lyric composition. However, it is set by Bandini; but being chiefly narrative, the music is almost wholly recitative; scarcely any measured melody being introduced, except to the first line, which serves as a refrein, or burden.

XII. Is an excellent cantata on the torments of *jealousy*, set by Luigi, in which there is more air and less recitative than usual at this period.

XIII. Is a single air by Alessandro Scarlatti, which must have been produced early in that great composer's life; as Salvator, in whose hand-writing it is entered in his book, died in 1675 (Orlandi Abcdario Pittorico); some writers say in 1673. See SCARLATTI.

XIV. and XV. Are two single airs by Legrenzi, of which the melody is pleasing; they were perhaps sung in operas. The music of all the rest of the cantatas and songs in this book, amounting to eight, is of Salvator's own composition, and is not only admirable for a dilettante, but in point of melody superior to that of most of the masters of his time.

The two first are cantatas, but so ill written as to be difficult to read. The third begins with a pleasing air; and the fourth with such a spirited movement as the seventeenth century seldom produced. Two other airs in the same cantata are well accented, and pleasing. In the recitative of the fifth cantata, some of the first true closes occur that we have met with in narrative melody. There are several airs in this and the rest of Salvator's cantatas on pleasing subjects, and treated in a manner above mediocrity. The last of his airs is chiefly remarkable for its moving base: and if we only suppose this cantata to have been composed just before the author's death, it will be of a higher date than the publication, or perhaps the existence of any of Corelli's works, who is supposed to have been the inventor of this kind of pendulum base; which, however, frequently occurs in the cantatas of Cesti.

Whoever is curious to see specimens of Salvator Rosa's musical compositions, may find in the fourth volume of Burney's Gen. Hist. Mus. fragments, not only of his own productions, but of his contemporary composers of eminence, whose works he thought worth entering in his music-book. Signorelli, tom. v. p. 338.

ROSA DA TIVOLI. See ROOS.

ROSA, in *Geography*, a small island near the E. coast of Sardinia. N. lat. 39° 5′. E. long. 9° 3′.—Also, a town of Germany, in the county of Henneberg; five miles S. of Saltzungen.—Also, a town of Spain, in the province of Seville; eight miles S. of San Lucar.

ROSA. See ST. *Rosa*.

ROSA, *Cape*, a cape on the coast of Algiers. N. lat. 37° 2′. E. long. 8° 5′.

ROSA, *Mount*, an eminence of the Alps, reckoned the second mountain of that famous ridge, lying about midway between Great St. Bernard and the lake of Locarno. M. Saussure visited this mountain, which has been reckoned only 60 feet inferior in height to Mont Blanc, this being estimated about 14,700 feet above the level of the sea. But in sir George Shuckburgh's table of heights taken by the barometer, &c. (Phil. Trans. vol. lxvii. p. 592.) Mont Blanc is elevated 14,432 feet above the lake of Geneva, and 15,662 feet above the Mediterranean; and mount Rosa, as measured geometrically by Father Beccaria, is 15,084 feet above the same sea.

ROSA *Crucis*, in *Church History*. See ROSYCRUCIANS.

ROSA *Fatuina*, in *Botany*, a name given by some authors to the piony.

ROSA *Junonis*, a name given by some authors to the lily.

ROSACEÆ, the 92d natural order in Jussieu's system, the 10th of his 14th class. See FICOIDEÆ, for the distinctions of that class. The characters of this large and important order, named from the Rose, and rose-like flowers, which compose it, are the following.

Calyx either superior, and tubular; or inferior, pitcher or wheel-shaped; its limb mostly divided, and generally permanent. *Petals* definite, usually five, inserted into the upper part of the calyx and alternate with its divisions; sometimes wanting. *Stamens* indefinite, rarely definite, inserted into the same part below the petals; anthers often roundish. *Germen* in some cases simple, inferior, the styles and stigmas mostly numerous; in others superior, simple, with one style, or manifold with many styles; the styles in every instance lateral, or proceeding from the side of each germen. Structure of the *fruit* various; in some an inferior apple, of many cells, or a sort of cup or urn, apparently inferior, bearing many seeds, over which it closes; in others the seeds, or seed-vessels, each of one cell, and mostly single-seeded, indefinite or definite, are superior, standing on a common receptacle; in others, again, there is either a solitary superior capsule of one cell; or a superior nut, with one or two seeds, which is either naked, or invested with a drupaceous coat. The scar of each *seed* is lateral, just below the summit, connected by a thread, or umbilical cord, with the lower part of the seed-vessel. *Corculum* straight, without an *albumen*. *Stem* herbaceous, shrubby, or arboreous. *Leaves* either simple or compound, alternate, accompanied by *stipulas*.

Section 1. POMACEÆ. *Germen simple, inferior, with many styles. Apple umbilicated, or bordered, with the limb of the calyx, of many cells.* Trees or shrubs.—This section contains the Linnæan genera of *Pyrus*, (from which Jussieu distinguishes *Malus* and *Cydonia*,) *Mespilus*, *Cratægus*, and *Sorbus*.

Sect. 2. ROSÆ properly so called. *Germens several, indefinite, invested with the urn-like calyx contracted at the top, so that they seem inferior; each accompanied by one style. Seeds as many.* Shrubs.—*Rosa* here stands alone.

Sect. 3. SANGUISORBÆ. *Germens several, definite, rarely solitary, invested with cup-like calyx contracted at the top, so that they seem inferior; each with one style. Seeds as many.* Mostly herbaceous, many of them without petals, many with a definite number of stamens, some with stamens and pistils in separate flowers.

Poterium, *Sanguisorba*, *Ancistrum*, *Acæna*, *Agrimonia*, *Neurada*, *Cliffortia*, *Aphanes*, *Alchimilla*, and *Sibbaldia*.

Sect. 4. POTENTILLÆ. *Germens several, indefinite, truly superior, standing on a common receptacle, each with one style. Seeds as many, naked, rarely pulpy.*—Herbs, rarely shrubs.

Tormentilla, *Potentilla*, *Fragaria*, *Comarum*, *Geum*, *Dryas*, *Rubus*; to which is to be added our *Duchesnea*, (see FRAGARIA, at the conclusion) now described in Tr. of Linn. Soc. v. 10. 372.

Sect. 5. SPIRÆÆ. *Germens several, definite, superior, each with one style. Capsules as many, with one or more seeds.*—Shrubs, rarely herbs.

Spiræa, *Suriana*, and *Tetracera*.

Sect. 6. PROCKIÆ. *Germen single, superior, with one style.*

ſtyle. Fruit of one cell, with one or more ſeeds.—Trees or ſhrubs, ſometimes deſtitute of petals.

Tigarea of Aublet; *Delima*, *Prockia*, and *Hirtella* of Linnæus.

Sect. 7. Amygdaleæ. *Germen ſingle, ſuperior, with one ſtyle. Nut either naked, or more uſually inveſted with a pulpy coat, and containing one or two ſeeds.*

Hedycrea of Schreber, which is Aublet's *Licania; Grangeria* of Commerſon; *Chryſobalanus* of Linnæus; *Ceraſus*, *Prunus* and *Armeniaca* of Tournefort, all three included in the Linnæan *Prunus; Amygdalus* of Tournefort and Linnæus, including *Perſica* of the former; *Moquilea*, *Couepia*, and *Acioa* of Aublet, (the latter Schreber's *Acia*); and *Parinari* of Aublet, which is Schreber's *Petrocarya.*

Sect. 8. *Genera akin to the Roſaceæ.*

Plinia of Plumier and Linnæus, the uncertainty of whoſe hiſtory we have fully explained; ſee Plinia.

Calycanthus, allied by its fruit to *Roſa*, but the leaves are oppoſite and ſimple, and the flower in a manner apetalous.

Ludia of Commerſon; *Blackwellia* of the ſame author; *Homalium* of Jacquin and Linnæus; and *Napimoga* of Aublet. The three laſt appear to conſtitute one genus; ſee Homalium.

ROSACEOUS Corolla, is one which conſiſts of ſeveral petals ranged in a circle; ſo that, according to Tournefort's acceptation of the word, it includes, not only the natural order of Rosaceæ, (ſee that article,) and other flowers agreeing therewith in having moſtly five petals, as *Ranunculus;* but even ſuch as have only two, like *Circæa.* The author is obliged to exclude the Cruciform and Umbelliferous plants from this order by a particular and arbitrary exception; for according to his primary idea, it would admit every polypetalous regular flower, as well as ſome that are irregular, as *Caſſia*, &c. See Corolla.

ROSACLORUM, or, according to ſome authors, *Roſichiero*, a fine red uſed to enamel on gold with. It is prepared in this manner: take ten pounds of cryſtal-glaſs, put it into a pot, and when it is well melted, add to it, at twice, a pound of the beſt red-lead; ſtir the maſs well together, and afterwards caſt it into water. Repeat this proceſs three times, then when the matter is again in fuſion, mix with it five ounces of calcined braſs, and the ſame quantity of the deepeſt cinnabar; ſtir the whole well together, and let it ſettle three hours; then add of glaſs of tin three ounces, mix the whole, and it will be of a fine roſe-colour. Merret's Notes on Neri, p. 350.

ROSADE, a kind of liquor, prepared of pounded almonds and milk, mixed with clarified ſugar.

ROSALBA, Carriera, in *Biography*, was of Chiozza, and carried crayon painting to a high degree of perfection. Orlandi celebrates her miniatures. Her crayon painting arrives, not ſeldom, at the ſtrength of painting in oil. Her portraits ſpread all over Europe, are as elegant and graceful in conception and attitude, as freſh, neat, and alluring in colour. Her Madonnas, and other ſacred ſubjects, riſe from grace to dignity, and even majeſty. Equal and inceſſant application deprived her of ſight during the laſt ten years of her life. She died in 1757, at the age of 82.

Roſalba is celebrated by Walther for her muſical talents and exquiſite taſte in ſinging.

ROSALE, in *Geography*, a town of Perſia, in the province of Fars, or Farſiſtan; 15 miles W. of Kazeron.

ROSALGATE, Cape. See Rasalgata.

ROSALIA, a name uſed by authors for the meaſles, or a diſeaſe very like the meaſles, conſiſting of a number of aſperities and protuberances of the ſkin, which ſoon die away.

Rosalia, in *Muſic.* See Repetitions.

ROSALIND, a maſk, written by Lockman, ſet by Smith for Hickford's rooms, and performed there in ſtill life, oratorio wiſe, in 1740. This little drama would not be mentioned here, as the poetry is upon a level with Mr. Lockman's other productions; and of the muſic we know nothing, as it was never publiſhed. But as, "to raiſe the pamphlet price a ſhilling," the poetry is preceded by "inquiries into the origin of operas."

ROSAMARINA, in *Geography*, a town of Sicily, in the valley of Demona, at the mouth of a river of the ſame name, which runs into the ſea, 10 miles N.E. of Miſtretta.

ROSAMOND, in *Biography*, daughter of lord Clifford, was a young lady of great beauty, fine accompliſhments, and endowed with the moſt engaging wit and ſweetneſs of temper. She had been educated, according to the cuſtom of the times, in the nunnery of Godſtow, and the popular hiſtory of her is as follows. Henry II. of England ſaw her, was ſmitten with her beauty, and triumphed over her honour. To avoid the jealouſy of his queen, Eleanor, he kept her in a labyrinth at Woodſtock, and by his connection with her had two children, who were afterwards William Longſword, earl of Saliſbury, and Geoffrey, biſhop of Lincoln. On Henry's abſence in France, the queen found means to diſcover her, and, jealous of her great beauty, cauſed her to be poiſoned. This ſtory is not well ſupported by hiſtorical documents. Several writers mention no more of her, than that the queen cauſed her to be ſo haraſſed, that ſhe did not long ſurvive after ſhe was diſcovered. Other writers aſſert, that ſhe died a natural death, and the ſtory of her being poiſoned is ſuppoſed to have ariſen from the figure of a cup being placed on her tomb. She was buried in the church of Godſtow, oppoſite to the high altar, where her body remained till it was ordered to be removed with every mark of diſgrace by Hugh, biſhop of Lincoln, in 1191. By many, however, ſhe has been regarded as a ſaint, but her hiſtory is in every reſpect very uncertain. See Groſe's Antiq. of Eng. and Wales.

Rosamond, an Engliſh opera, written by Addiſon on the Italian model. After the great ſucceſs of Arſinoe and Camilla in 1705 and 1706, in which the dialogue was wholly ſpoken in recitative, and the performers all Engliſh ſingers; in 1707, notwithſtanding the deficiencies of thoſe dramas in poetry, muſic, and performance (for as yet no foreign compoſer or captivating ſinger was arrived) this kind of exhibition became ſo formidable to our own actors, that a ſubſcription was opened the beginning of this year, "for the encouragement of the comedians acting in the Haymarket, and to enable them to keep the diverſion of plays under a ſeparate intereſt from operas." Daily Courant, January 14th, Cibber gives a circumſtantial account of this humiliating tranſaction, and ſpeaks of its ſucceſs with conſiderable triumph. See Clayton.

The verſes of Roſamond are highly poliſhed, and more lyrical perhaps than in any poem of the ſame kind in our language. And yet this drama is not wholly free from opera abſurdities, on which Addiſon was afterwards ſo ſeverely pleaſant. For inſtance, the king's approach to the ſecret bower of bliſs, where his fair Roſamond was treaſured up from the reſentment of his jealous queen, is always announced and publiſhed by a loud concert of military inſtruments: Act i. ſc. 1.

"Hark,

"Hark, hark! what found invades my ear?
The conqueror's approach I hear.
He comes, victorious Henry comes!
Hautbois, trumpets, fifes, and drums,
In dreadful concert join'd,
Send from afar the found of war,
And fill with horror ev'ry wind."

It was the fashion in almoft all the ferious operas that were written in Italy, before the time of Apoftolo Zeno and Metaftafio, to mix comic and buffoon characters with the tragic, even in *dramme facri*, notwithftanding the feverity of fome Italian critics upon our Shakfpeare for the fame practice.

And Mr. Addifon has fully complied with this cuftom, in the characters of fir Trufty and Grideline, which are of the loweft fpecies of comic.

If it can be proved that gunpowder was invented, and in military ufe in the time of Henry II. Mr. Addifon was guilty of an anachronifm in making him afk,

"Why did I not in battle fall
Crufh'd by the *thunder* of the Gaul?"

The lofs of Rofamond in the fecond act of this drama is not compenfated by a fingle interefting event in the third, which drags and languifhes for want of her fo much, that neither the flat and forced humour of fir Trufty and Grideline, nor the elegant compliments made to the duke of Marlborough and Blenheim, ever kept the audience awake in the performance.

In 1733, Rofamond was fet by Mr. (afterwards Dr.) Arne, his firft attempt at dramatic mufic, in the performance of which his fifter, Mifs Arne, afterwards the juftly celebrated actrefs Mrs. Cibber, performed the part of Rofamond. The airs in this *coup d'effai* of Arne, were extremely pleafing, and far fuperior to thofe of any Englifh compofer of that period. Many of them were afterwards fung at Vauxhall by Mrs. Arne and Low with great applaufe. "Was ever Nymph like Rofamond," was long in univerfal favour all over the kingdom.

ROSAN, in *Geography*, a town of the duchy of Warfaw, on the Narew; 110 miles E. of Thorn.

ROSANA, a river of Germany, which runs into the Inn, near Landeck, in the county of Tyrol.

ROSANI, Cape, a cape on the coaft of Romania, in the Grecian Archipelago. N. lat. 40° 35′. E. long. 24° 14′.

ROSANNA, a town of Lithuania, in the palatinate of Novogrodek; 36 miles W. of Novogrodek.

ROSARBA, in *Botany*, the name of an imaginary plant, which has given great trouble to the commentators on the works of the ancients.

The Arabian writers, Avicenna, Serapion, and others, have mentioned two kinds of carob or ceration; the one efculent, and endowed with the virtue of a gentle purgative, the other an aftringent.

This laft they have diftinguifhed from the other by the name of the nabathæan pod or aljembut. They fay in their defcriptions, that the aljembut is like the rofarba; fo run the old tranflations, but the true meaning of the original is *rofa vineæ*. This was a name given to the common wild acacia-tree, and the tree which produced the nabathæan pod, might be very well likened to this; it being, in reality, only a fpecies of the acacia, and the fuccus acaciæ, or infpiffated acacia juice of the fhops, being, according to Ifidore, made oftentimes from the unripe fruit of this very fpecies.

ROSARIA, among the Romans, a kind of perfumes, fo called either from their being chiefly made of rofes, or becaufe they had a moft exquifite odour.

ROSARIO, in *Geography*, a fmall ifland in the Spanifh main, near the coaft of Carthagena. N. lat. 10° 5′. W. long. 75° 56′.—Alfo, a town of New Navarre; 30 miles S.W. of Cafa Grande.—Alfo, a town of South America, in the province of Tucuman; 78 miles N. of St. Miguel de Tucuman.—Alfo, a town of Brazil, in the government of Minas Geraes; 220 miles N. of Villa Rica.—Alfo, a town of North America, in the county of California; 30 miles S.W. of Loreto.—Alfo, a town of the ifland of Cuba; 45 miles S. of Havannah.

Rosario, *El*, a town of Mexico, in the province of Chiapa; 140 miles S.E. of Chiapa dos Efpagnols.

Rosario, or *Neuftra Senhora del Rofario*, a canal of a ftrait in the gulf of Georgia, which feparates the ifland of Florida from America; about 30 miles in length. At the S.E. extremity the canal is fix miles broad; but towards the N.W. its breadth is gradually diminifhed to two miles, in its narroweft part.

ROSARUM Acetum. See Acetum.

ROSARUOLO, in *Geography*, a town of Iftria; 8 miles E. of Capo d'Iftria.

ROSARY, in the *Romifh Church*, a chaplet confifting of five or fifteen decads of beads, to direct the recitation of fo many Ave Maria's, in honour of the Virgin.

Rosary alfo denotes a particular mafs or form of devotion addreffed to the Virgin, to which the chaplet of that name is accommodated. It confifts of fifteen repetitions of the Lord's prayer, and an hundred and fifty falutations of the bleffed Virgin; whilft the *crown*, as it is called, according to the different opinions of the learned concerning the age of the Virgin, confifts of fix or feven repetitions of the Lord's prayer, and fix or feven times ten falutations or Ave Maria's.

Some attribute the inftitution of the rofary to St. Dominic; but F. d'Achery fhews it was in ufe the year 1100; fo that St. Dominic could only make it more celebrated. Others attribute it to Paulus Libycus, and others to St. Benedict; others to the Chartreux; others to Venerable Bede; and, finally, others to Peter the Hermit. Thofe who afcribe it to St. Dominic, differ as to the particular time of its inftitution; fome referring it to the year 1208, when he preached againft the Albigenfes; others will have him to have fet it on foot in the courfe of his miffions in Spain, before he paffed into France.

Rosary, *Order of the*, or of *our Lady of the Rofary*, is an order of knights, fuppofed by Schoonebeck, and the Jefuit Bonanni, to have been inftituted by St. Dominic, but by miftake; for that faint never inftituted any order under this name, and thefe authors apparently make a military order of an army of croifes, who, under the command of the count de Montfort, fought againft the Albigenfes.

The abbot Juftiniani, and M. Hermant, will have this order to have been eftablifhed by an archbifhop of Toledo, named Frederic, after St. Dominic's death; and to have borne for a badge a black and white crofs, in the middle of which was reprefented our Lady, holding her little fon in one hand, and in the other a rofary. F. Mendo adds, that they were obliged to rehearfe the rofary on certain days. After all, F. Helyot doubts whether or no fuch an order in reality ever exifted. Edmondfon refers the inftitution of this order to the year 1212; and he fays, the badge of the order was a crofs patonce per crofs countercharged argent and fable, furmounted on the centre with a medal or, enamelled

melled with the image of the Virgin, ſupporting the infant in one hand, and holding a roſary in the other, all proper. The order of the "Celeſtial Collar of the Holy Roſary" is a religious order for ladies, inſtituted at the requeſt of father Francis Arnoul, a Dominican, by queen Anne of Auſtria, widow of the French king Lewis XIII., and mother of Lewis XIV., for fifty young ladies of the firſt families in France. The collar of the order was compoſed of a blue ribbon, enriched with white, red, and maiden's bluſh roſes, interlaced with the capital letters A. V. in cypher affixed to it; and pendent at the breaſt by a ſilk cordon, a croſs of eight points pomettée, and in each angle a fleur-de-lis: on the centre the image of the Virgin Mary, and on the reverſe the image of St. Dominic, enamelled.

ROSARY is a word frequently met with in the ancient hiſtories of Ireland, and uſed to expreſs a peculiar ſort of baſe money coined abroad, in the form of the penny, current in that kingdom; but of ſo much baſer an alloy, that it was not worth quite half the real value of the penny. This and many other ſuch coins were decried, and it was made death to import any of them, by Edward I., in 1300.

ROSARY, *Perſian*, a beautiful compendium of oriental ethics, written by a Perſian poet, whoſe name was Eddin Sadi; who, about the middle of the 13th century, when the Turks invaded Perſia, withdrew from his own country, and ſettled at Bagdad, for the purpoſe of proſecuting his ſtudies. After experiencing much viciſſitude of fortune, he returned home, and compiled the book juſt mentioned, which he completed in the year 1257. This book, we are informed, has been univerſally read in the Eaſt; and has been tranſlated into Latin, and into ſeveral modern languages. As our readers in general may not have acceſs to the original work, which is divided into eight chapters, nor to extracts from it, we ſhall here ſubjoin, both for their information and amuſement, the following citations.

1. Paradiſe will be the reward of thoſe kings who reſtrain their reſentment, and know how to forgive. A king, who inſtitutes unjuſt laws, undermines the foundation of his kingdom. Let him, who neglects to raiſe the fallen, fear, leſt when he himſelf falls, no one will ſtretch out his hand to lift him up. Adminiſter juſtice to your people, for a day of judgment is at hand. The diſhoneſt ſteward's hand will ſhake, when he comes to render an account of his truſt. Be juſt, and fear not. Oppreſs not thy ſubjects, leſt the ſighing of the oppreſſed ſhould aſcend to heaven. If you wiſh to be great, be liberal; for, unleſs you ſow the ſeed, there can be no increaſe. Aſſiſt and relieve the wretched, for misfortunes may happen to yourſelf. Wound no man unneceſſarily; there are thorns enough in the path of human life. If a king take an apple from the garden of a ſubject, his ſervants will ſoon cut down the tree. The flock is not made for the ſhepherd, but the ſhepherd for the flock.

2. Excel in good works, and wear what you pleaſe: innocence and piety do not conſiſt in wearing an old or coarſe garment. Learn virtue from the vicious; and what offends you in their conduct, avoid in your own. If you have received an injury, bear it patiently: by pardoning the offences of others, you will waſh away your own. Him, who has been every day conferring upon you new favours, pardon, if, in the ſpace of a long life, he ſhould have once done you an injury. Reſpect the memory of the good, that your good name may live for ever.

3. In your adverſity, do not viſit your friend with a ſad countenance; for you will embitter his cup: relate even your misfortunes with a ſmile; for wretchedneſs will never reach the heart of a cheerful man. He who lives upon the fruits of his own labour, eſcapes the contempt of haughty benefactors. Always encounter petulance with gentleneſs, and perverſeneſs with kindneſs: a gentle hand will lead the elephant itſelf by a hair. When once you have offended a man, do not preſume that a hundred benefits will ſecure you from revenge: an arrow may be drawn out of a wound, but an injury is never forgotten. Worſe than the venom of a ſerpent is the tongue of an enemy, who pretends to be your friend.

4. It is better to be ſilent upon points we underſtand, than to be put to ſhame by being queſtioned upon things of which we are ignorant. A wiſe man will not contend with a fool. It is a certain mark of folly, as well as rudeneſs, to ſpeak whilſt another is ſpeaking. If you are wiſe, you will ſpeak leſs than you know.

5. Although you can repeat every word of the Koran, if you ſuffer yourſelf to be enſlaved by love, you have not yet learned your alphabet. The immature grape is ſour; wait a few days, and it will become ſweet. If you reſiſt temptation, do not aſſure yourſelf that you ſhall eſcape ſlander. The reputation, which has been fifty years in building, may be thrown down by one blaſt of calumny. Liſten not to the tale of friendſhip, from the man who has been capable of forgetting his friend in adverſity.

6. Perſeverance accompliſhes more than precipitation; the patient mule, which travels ſlowly night and day, will in the end go further than an Arabian courſer. If you are old, leave ſports and jeſts to the young: the ſtream, which has paſſed away, will not return into its channel.

7. Inſtruction is only profitable to thoſe who are capable of receiving it: bring an aſs to Mecca, and it will ſtill return an aſs. If you would be your father's heir, learn his wiſdom: his wealth you may expend in ten days. He who is tinctured with good principles while he is young, when he is grown old will not be deſtitute of virtue. If a man be deſtitute of knowledge, prudence, and virtue, his doorkeeper may ſay, Nobody is at home. Give advice where you ought; if it be not regarded, the fault is not yours.

8. Two kinds of men labour in vain: they who get riches, and do not enjoy them; and they who learn wiſdom, and do not apply it to the conduct of life. A wiſe man, who is not at the ſame time virtuous, is a blind man carrying a lamp: he gives light to others, whilſt he himſelf remains in darkneſs. If you wiſh to ſleep ſoundly, provide for to-morrow. Truſt no man, even your beſt friend, with a ſecret; you will never find a more faithful guardian of the truſt than yourſelf. Let your misfortunes teach you compaſſion: he knows the condition of the wretched, who has himſelf been wretched. Exceſſive vehemence creates enmity; exceſſive gentleneſs, contempt: be neither ſo ſevere, as to be hated; nor ſo mild, as to be inſulted. He who throws away advice upon a conceited man, himſelf wants an adviſer. In a ſingle hour you may diſcover, whether a man has good ſenſe; but it will require many years to diſcover whether he has good temper. Three things are unattainable; riches without trouble, ſcience without controverſy, and government without puniſhment. Clemency to the wicked is an injury to the good. If learning were baniſhed from the earth, there would, notwithſtanding, be no one who would think himſelf ignorant. Brucker's Hiſt. of Philoſ. by Enfield, vol. ii.

ROSAS, in *Geography*, a ſea-port town of Spain, in Catalonia, on the north ſide of a gulf of the Mediterranean, to which it gives name, with a good harbour, defended by a fort. It was anciently called "Rhoda," and "Rhode;" 22 miles N.E. of Gerona. N. lat. 42° 17′. E. long. 3° 0′.

ROSATA Aloe. See Aloe.

ROSATE, in *Geography*, a town of Italy, in the department of the Olona; 9 miles S.W. of Milan.

ROSATUM Acetum. See Acetum.

Rosatum *Vinum*. See Vinum.

ROSAZZO, in *Geography*, a town of Italy, in Friuli; 6 miles S. of Friuli.

ROSBACH, a town of Germany, in the county of Sayn; 8 miles E. of Hachenburg. See Rossbach.

ROSBEGH Point, a cape on the weſt coaſt of Ireland. N. lat. 52° 6′. W. long. 9° 52′.

ROSBOTH, a word uſed by ſome authors to expreſs a ſoft excreſcence from any part.

ROSCHINTZE, in *Geography*, a town of Pruſſia, in Natangen; 12 miles S. of Lick.

ROSCHITZ, a town of Auſtria; 2 miles S.W. of Schrattentaal.—Alſo, a town of Moravia, in the circle of Brunn; 8 miles W. of Brunn.

ROSCIUS, Quintus, in *Biography*, a Roman actor of great celebrity, was a native of Gaul. He was contemporary at Rome with the celebrated actor Eſopus. So great were his talents for the ſtage, and ſuch was the degree of perfection to which he carried his art, that, according to Cicero, a complete maſter in any other art was popularly called the Roscius of it. Roſcius was not leſs eſteemed for his morals and good conduct, than admired for his profeſſional talents. The greateſt men in the ſtate were his intimate friends, and the loſs of him was univerſally lamented. "Which of us," ſays Cicero, alluding to Roſcius in his oration for the poet Archias, "was ſo rude and unfeeling as not to be affected by the recent death of Roſcius, who, though he died at an advanced age, appeared, on account of his excellence in his art, worthy of immortal life." His death took place in the year 61 B.C. He compoſed a parallel between theatrical and oratorical action, which is loſt.

There are ſeveral paſſages in Cicero concerning Roſcius, which, if the ancient actors, Romans as well as Greeks, did not declaim in muſical notes, would be wholly unintelligible. He tells us (de Orat.), that Roſcius had always ſaid, when age ſhould diminiſh his force, he would not abandon the ſtage, but would proportion his performance to his powers, and make muſic conform to the weakneſs of his voice; which really happened: for the ſame author informs us (de Leg.), that in his old age he ſung in a lower pitch of voice, and made the tibicines play ſlower.

As there were combats, or conteſts, eſtabliſhed by the ancients for the voice, as well as for other parts of the *Gymnaſtice*, thoſe who taught the management of the voice were called φωνασκοι, *phonaſci;* and under their inſtructions were put all thoſe who were deſtined to be orators, ſingers, and comedians. Roſcius had an academy for declamation, at which he taught ſeveral perſons, preparatory to their ſpeaking in public, or going on the ſtage. He had a law-ſuit with one of them, in which Cicero pleaded his cauſe.

Theſe are proofs ſufficient of the dramatic declamation of the ancients being uttered in muſical tones, agreeing with thoſe of the muſical inſtruments by which they were accompanied. See Declamation and Recitative.

ROSCOEA, in *Botany*, being a new and very diſtinct genus of the natural order of *Scitamineæ*, was dedicated, by the writer of the preſent article, to his diſtinguiſhed friend William Roſcoe, eſq. F.L.S., whoſe papers in the Linnæan Society's Tranſactions, and eſpecially his New Arrangement of the order in queſtion, printed in their eighth volume, richly entitle him to this botanical honour. Of his particular obſervations and diſcoveries reſpecting this order, by which he has reduced to clear ſcientific principles, what had hitherto been an indigeſted chaos, we ſhall ſpeak under the article Scitamineæ, in its proper place.—Sm. Exot. Bot. v. 2. 97.—Claſs and order, *Monandria Monogynia*. Nat. Ord. *Scitamineæ*, Linn. *Cannæ*, Juſſ.

Gen. Ch. *Cal.* Perianth ſuperior, of one leaf, tubular, cylindrical, its limb ſheathing, erect, undivided, membranous at the edge. *Cor.* of one petal, irregular; tube ſcarcely longer than the calyx, erect, ſtraight, triangular upwards: outer limb ringent, two-lipped; its upper lip broadeſt, erect, obovate, acute, concave; lower about as long, in two deep, linear-lanceolate, acute, reflexed lobes: inner limb ringent, two-lipped; the upper lip erect, ſhorter than the outer limb, of two cohering, half-ovate lobes, tapering at the baſe, and embracing the organs of fructification; lower much longer and broader, ſpreading, cloven. *Stam.* Filament one, inſerted into the top of the tube, ſhort, linear, channelled, erect; anther much longer than the filament, linear, channelled, greatly incurved, bearing pollen in the upper part only, its baſe extended in the form of two lanceolate, horizontal, aſcending, acute, membranous, lobes. *Piſt.* Germen inferior, oval, very ſmall; ſtyle thread-ſhaped, lodged in the groove of the filament, and of the anther, to whoſe curvature it conforms; ſtigma obtuſe, concave, downy, juſt projecting beyond the anther. *Peric.* Capſule? we preſume it to be analogous to that of other *Scitamineæ*.

Eſſ. Ch. Anther two-lobed, incurved, terminal, embracing the ſtyle, with a cloven appendage at its baſe. Outer limb of the corolla irregular; upper lip vaulted; lower deeply divided: inner limb in three parts, two-lipped.

1. R. *purpurea*. Purple Roſcoea. Sm. Exot. Bot. v. 2. 97. t. 108. (Hatucon Swa of the Nawars of Nepaul.)—This plant was found at Narainhetty, in the mountains of Upper Nepaul, by Dr. Francis Buchanan, flowering in April 1802. It is the only ſpecies, hitherto diſcovered, of this very well-defined genus, which ſhould be arranged near Hedychium and Kæmpferia, (ſee thoſe articles,) to both of which genera it has ſome points of affinity; but *Roſcoea* is diſtinguiſhed from every other known plant of the *Scitamineæ*, by the irregularity of its two-lipped outer limb, and the peculiar appendages to the baſe of the anther.

The *root* is perennial, of ſeveral, cluſtered, ſpreading, oblong, tapering knobs, producing branched fibres. No aromatic or pungent flavour is perceptible in our ſpecimens. *Stem* ſolitary, erect, a foot or more in height, ſimple, leafy, compreſſed. *Leaves* ſpreading in two ranks, alternate, oblong, pointed, folded, wavy, entire, ſmooth, with many oblique parallel veins; pale at the under ſide; ſomewhat rounded and heart-ſhaped at the baſe, running down into broad, ſheathing, compreſſed, furrowed, purpliſh *footſtalks*, which embrace and conceal the ſtem. *Stipula* crowning the inſide of the footſtalk, very ſhort, entire. *Flowers* ſeveral, opening in ſucceſſion, terminal, cluſtered, ſeſſile, erect, large, and handſome, of a violet-purple, with whitiſh organs of impregnation; the tube of the calyx of each concealed by the ſheaths of the upper leaves.

ROSCOFF, or Roscou, in *Geography*, a ſea-port town of France, in the department of Finiſterre; 4 miles N. of St. Pol de Leon. As a ſea-port it is much frequented by thoſe who carry on a contraband trade with England, eſpecially in wine and brandy. The inhabitants uſed formerly to import linſeed, and export linen manufactured in the country annually to the amount of 500,000 livres. Since the

the revolution this trade has been interrupted, but with the return of peace may be eafily revived. The harbour, however, without timely precaution, is in danger of being choaked up with fand. In the neighbourhood of the town, and throughout the department of Finifterre, the fields are manured with fea-weed. Wood is very fcarce, and their fruit-trees occafionally ferve for fuel. In the ifland of Bas they burn cow-dung and fea-weed. Rofcoff contains 1000 inhabitants; neverthelefs, the depopulation from its lofs of trade, the arid fandy ground on which it is built, and the defolated ruins of former eftablifhments, give the place a melancholy appearance of defolation. In this place there is not a fingle fountain, nor any inftitution for the inftruction of youth, nor any regulation for preferving the health of the inhabitants. This is faid to be the place where the chevalier St. George landed, after his unfuccefsful attempt in 1745.

ROSCOLÆ, a name given by fome medical writers to the meafles.

ROSCOMMON, *Earl of*, in *Biography*. See Dillon.

Roscommon, in *Geography*, a county of Ireland, in the province of Connaught, is bounded on the eaft by the river Shannon, which feparates it from the King's county, Weft-Meath, Longford, and Leitrim; and on the weft by Galway, Mayo, and Sligo. Towards the north and fouth it is contracted into narrow necks of land, between the eaft and weft confines. According to Dr. Beaufort, its length from north to fouth is 47 miles (60 Englifh), and its breadth about the middle of the county 29 (37 Englifh) miles. The latter varies confiderably, being in fome parts lefs than 10 miles. The area meafures 346,650 acres, or 541 fquare miles, equal to 556,847 acres, or 869 fquare miles, Englifh meafure. This county contains 56 parifhes, 22 of which have churches. Of thefe the greater part are under the fee of Elphin. When Dr. Beaufort wrote, the population was eftimated at 86,000; what it is at prefent cannot be afcertained. Rofcommon is a flat open country, in fome places fprinkled with rocks, in many interrupted by extenfive bogs, and but little diverfified with hills. The only mountains within the county are in a narrow part between Lough Arrow and Lough Allen; and thefe are become valuable, on account of the coal and iron which they are found to contain. The lofty Curlew mountains, which join Lough Arrow, feparate this county from Sligo. The Shannon beautifully delineates the eaftern confines, branching in a courfe of 50 miles into feveral fine lakes, of which Lough Ree, Lough Baffin, and Lough Allen, are the largeft. The Suck divides it from Galway for a great length of way, till it lofes its name and waters in the Shannon. A number of fmall ftreams from the interior interfect the county, fertilizing and enlivening the fields. The largeft of the lakes is Lough Key, in the north of the county, which is rendered delightful by wooded iflands and furrounding groves. The foil is fertile; lime-ftone and marle are abundant, and the climate not fevere. The county has long been famed for its paftures; but as population increafes, wants and cares are augmented, and pafturage gives way to tillage, as a more abundant fource of fupply. Hence we find, that although pafturage is calculated to cramp population, yet, by the introduction of manufactures, it may be fo increafed, that paftures muft be broken up and tilled. This natural courfe of events has operated very powerfully in Rofcommon. The manufacture of linen and woollen ftuffs has been diffufed; bounties have alfo been offered for farinaceous produce; and under thefe neceffities and incitements, pafturage has confiderably decreafed. It has been contended, that converting fuch rich paftures to tillage muft prove a great lofs to the country; but although the land cannot, for a confiderable time, fo fully repay the labours of the hufbandman, as when in the zenith of their paftoral utility, yet in the end there cannot furely be a doubt of their more amply remunerating the country. In the paftoral economy of this diftrict we find fheep the largeft proportion of the farm-ftock: bullocks and cows form a leffer fhare. Mr. Wakefield commends the quality of both. The farms are generally divided by ftone-walls. Agriculture is in its infancy, but the abundance of lime-ftone has contributed, in a great degree, to promote the extenfion of tillage. This is conducted on the fame plan as in other parts of Connaught, and is thus defcribed by Dr. M'Parlan. "The mode of culture is with a long narrow fpade, commonly called a loy. This machine they prefer to ploughs, and affign many reafons for doing fo. The hills are very fteep, (fpeaking of Leitrim,) befet with ftones; and notwithftanding the foil being generally gravelly, fo tough and retentive of wet, as to render ploughing objectionable. They alfo complain of a fcarcity of horfes: but, above all, they affign, as a peculiar inducement, the abundance of crop produced by the loy culture compared to that of the plough. In fome of the more level parts, ploughing is in practice; and in fome others they unite both, firft ploughing, then mincing and dreffing with the loy. The foil being in general of the ftiff argillaceous kind, wherever it is fo, the potatoes are planted by dibbling with the *fleveen*. In a few places they plant, by fpreading the cuts on the dung or green turf, and then digging up the furrows; and in ftill fewer, where the foil is light and friable, they plant potatoes by drilling with a one-horfe plough, particularly in ftubble and old potatoe ground." Mr. Wakefield calls this a faithful picture of the cultivation of this diftrict. Rofcommon is the fhire-town, but Boyle is more thriving. None of the towns are large. The county is reprefented in parliament by two members only. Beaufort. Wakefield. Robertfon.

Roscommon, a poft-town of Ireland, and the fhire-town of the county of the fame name, where the affizes are held. It is fituated about three miles from the Shannon, where it expands into Lough Ree. It is a fmall place, agreeably fituated, but has little trade. The ruins of a Dominican friary exhibit fome remains of elegant architecture, efpecially a tomb of Felim O'Connor, king of Connaught, adorned with a number of emblematical devices. Rofcommon is 69 miles W.N.W. from Dublin.

ROSCOTTY, a town of Thibet; 18 miles W. of Sirinagur.

ROSCREA, a poft-town of the county of Tipperary, Ireland, on the border of the King's county. It is a neat and thriving town. The church is very ancient, and has a curious frontifpiece at the weft end. Near it ftands one of the largeft round towers in Ireland, all built with fquare ftone, which is unufual in thefe edifices. Rofcrea was once a bifhopric, but was united with Killaloe in the twelfth century. The large old caftle was built by the Ormond family. It is 59 miles S.W. from Dublin.

ROSE, in *Botany* and *Gardening*. See Rosa.

It is a tradition among the ancients, that the god of love made a prefent to Harpocrates, the god of filence, of a beautiful rofe, the firft that had been known, to engage him not to difcover any of the private practices of his mother Venus. And hence it became a cuftom to have a rofe placed in their rooms of mirth and entertainment, that under the affurance thereof they might be induced to lay afide all conftraint, and fpeak what they pleafed. Thus did the rofe become a fymbol of filence; fo that to be *fub rofa, under the rofe,* *rose*, denotes as much as to be out of danger of having any converſation divulged.

Rose *Bay*. See Nerium.

Rose, *Campion*. See Agrostemma.

Rose, *China*, the name by which ſome call the ketmia of botaniſts. See Hibiscus.

Rose, *Chriſtmas*. See Helleborus.

Rose, *Corn*. See Papaver.

Rose, *Mountain-bay*, or *Dwarf-bay*, a name by which the chamærhodendros of botaniſts is ſometimes called. See Kalmia, and Rhododendrum.

Rose, *Guelder*, a name ſometimes given to the opulus, or water-elder. See Viburnum.

Rose, *Virginian Guelder*. See Spiræa.

Rose, *Martinico*. See Hibiscus.

Rose *of Jericho*, a name by which ſome call the heſperis. See Anastatica.

Rose *Mallow*. See Aliza.

Rose, *South Sea*, a name ſometimes given to the *Nerium* of botaniſts; which ſee.

Rose, *Rock*. See Cistus.

Rose-*Root*. See Rhodiola.

Rose, in the *Materia Medica*. The flowers of the *Roſa canina*, dog-roſe, or hep, are ſaid by ſome botaniſts to be inodorous, and yet their fragrance is often very perceptible. The fruit called heps, or hips, has a pleaſant acidulous taſte, depending on the uncombined citric acid and ſugar which it contains. This pulpy fruit is cooling, but poſſeſſes no ſpecific medicinal virtue. It is uſed in the preparation of a conſerve or confection. For this purpoſe the London pharmacopeia directs a pound of the pulp and 20 ounces of refined ſugar, in powder, to be rubbed together until they be well incorporated; and in the Edinburgh Diſpenſatory, it is ordered, that the freſh fruit of the dog-roſe, carefully freed from the ſeeds and incloſed ſpiculæ, be beaten into a pulp, and, while beating, that three times its weight of double refined ſugar be gradually added. (See Conserve). Formerly, ſays Woodville, it was eſteemed uſeful in many diſorders, as dropſies, calculous complaints, dyſenteries, hæmorrhages, &c. A moſs-like excreſcence, called "Badeguar," "Roſe-ſponge," and by the French "Galle chevelue," is frequently found upon the branches of this tree, and is the habitation of the inſect called "cynips roſæ." This excreſcence was formerly in great repute as a remedy for various diſeaſes.

The *Roſa centifolia*, or hundred-leaved roſe, of which there are many varieties, is improperly confounded in the Dublin pharmacopeia with the damaſk roſe, *Roſa damaſcena*, which is altogether a different ſpecies. The petals of this ſpecies are directed for medicinal uſe. They are of a pale red colour, and of a very fragrant odour, which is to many people very agreeable, and therefore this as well as moſt of the other roſes, are made up into noſegays: and theſe, in ſome circumſtances, have produced alarming ſymptoms, ſuch as ſneezing, inflammation of the eyes, faintings, hyſterical affections, abortion, &c.: and perſons confined in a cloſe room, with a large quantity of roſes, have been in danger of immediate extinction of life. The petals impart their odorous matter to watery liquors, both by infuſion and diſtillation. Six pounds of freſh roots impregnate, by diſtillation, a gallon or more of water ſtrongly with their fine flavour. On diſtilling large quantities, there ſeparates from the watery fluid a ſmall portion of a fragrant butyraceous oil, which liquefies by heat, and appears yellow, but concretes in the cold into a white maſs: 100 pounds of the flowers, according to the experiments of Tachenius and Hoffman, afforded ſcarcely half an ounce of oil. The ſmell of this oil exactly reſembles that of the roſes, and is therefore much uſed as a perfume.

The oil of roſes poſſeſſes very little pungency, and has been highly recommended for its cordial and analeptic qualities. The flower alſo contains a bitteriſh ſubſtance, which is extracted by water along with the odorous principle, and remains entire in the decoction after the latter has been ſeparated by diſtillation or evaporation. This fixed ſapid matter of the petals manifeſts a purgative quality, and it is on this account that the flowers are received in the materia medica. The pharmacopeias direct a ſyrup to be prepared of this roſe, which is ordered as an adjunct to oil and other purgatives in the diſeaſes of infants; but they are chiefly employed for the diſtillation of roſe-water. The London pharmacopeia directs ſeven ounces of the petals of the hundred-leaved roſe dried to be macerated in four pints of boiling water for 12 hours, and to ſtrain it; and then to evaporate the ſtrained liquor in a water-bath down to $2\frac{1}{2}$ pounds, and to add ſix pounds of refined ſugar, ſo as to make a ſyrup. This ſyrup is prepared, according to the Edin. Pharm. by macerating one pound of the freſh petals of the *roſa centifolia*, or, as it is erroneouſly denominated, damaſk roſe, in four pounds of boiling water for 12 hours, and adding three pounds of refined ſugar to the ſtrained liquor, and boiling ſo as to form a ſyrup. This ſyrup, in doſes of a ſpoonful, or from f ℨij to f ℨxij or more, is found to be pleaſant and uſeful as a laxative for children, or to obviate coſtiveneſs in adults.

The Rose-*Water*, *Aqua roſæ*, (Lond. and Dub. Ph.), *Aqua roſæ centifoliæ* (Edin.) is prepared by taking 8lbs. (Lond.), 6lbs. (Edin. and Dub.), of the petals, and pouring over them as much water as will prevent empyreuma during the diſtillation; and then diſtilling a gallon (Lond. and Dub.), or 10 pounds (Edin.) This water has the agreeable odour of the roſe in great perfection, when properly prepared; but it is very apt to ſpoil, unleſs it be rectified by a ſecond diſtillation. As it is free from acrimony, and, except in point of odour, does not differ from diſtilled water, it is generally employed in collyria, with acetate and ſuperacetate of lead, and acetate and ſulphate of zinc. The oil and water, obtained by diſtillation, and uſed chiefly in perfumes and flavouring materials, are recommended by Hoffman as excellent cordials for raiſing the ſtrength and ſpirits, and allaying pain. They appear to be of a mild nature, and not liable to heat or irritate the conſtitution. Roſe-water is, however, in great eſteem throughout the Eaſt, particularly in China and Perſia, where the trade of it is very conſiderable. The roſe-leaves, remaining at the bottom of the ſtill, are kept under the name of roſe cakes for a perfume.

The flowers of the *Roſa gallica*, or red officinal roſe, give out their virtue both to water and rectified ſpirit, and tinge the former of a fine red colour, but the latter of a very pale one. The extract obtained by inſpiſſating the watery infuſion is moderately auſtere, bitteriſh, and ſubſaline. The ſpirituous extract is conſiderably ſtronger both in aſtringency and bitterneſs. Water at 212° extracts both its odour and taſte; and the infuſion ſtrikes a black with ſulphate of iron; and alſo forms a precipitate of a dark colour with ſulphate of zinc. The red roſe is aſtringent and tonic. It forms an uſeful and elegant vehicle for the exhibition of mineral acids, nitrate of potaſs, and other neutral ſalts, in hæmorrhages and ſome other diſeaſes. It has been ſaid, that the flowers of this ſpecies poſſeſs neither the fragrance nor the laxative power of thoſe of the *centifolia*; but Poterius, cited by Lewis, relates, that he found a drachm of powdered red roſes occaſion three or four ſtools, and this not in a few inſtances, inftances, but conftantly in feveral. Its fragrance is improved by drying; and both the aftringency and the colour of the petals are beft preferved by hafty exficcation. Its flowers are chiefly valued for their aftringent qualities, which are moft confiderable before the petals expand, and, therefore, in this ftate they are chofen for medicinal ufe, and ordered by the pharmacopeias in different preparations, as thofe of a conferve, a honey, an infufion, and a fyrup. Thefe preparations, efpecially the firft and fecond, have been highly efteemed in phthifical cafes, particularly by the Arabian phyficians; who mention fome in which they were effectual remedies. The cafe of Kruger, related in the German Ephemerides, has been thought a more evident proof of the efficacy of the conferve of rofes in phthifis pulmonalis; but as the ufe of the conferve was commonly joined with that of milk and farinacea, together with proper exercife in the open air, it has been doubted if thefe recoveries could be wholly imputed to the rofes, though their mild aftringent and corroborant virtues certainly contributed much. In fome of the cafes above alluded to, 20 or 30 pounds of the conferve were taken in the courfe of a month.

The *Confectio rofæ gallicæ*, confection of the red rofes of the Lond. Pharm. is prepared by beating a pound of the unblown petals of the red rofe, freed from the claws, in a ftone mortar, and adding three pounds of refined fugar, and then beating again until the whole be thoroughly incorporated. The Edin. Pharm. directs the unblown petals of the red rofe to be beaten to a pulp, and during the beating to add three times their weight of refined fugar. The *Conferva rofæ*, or conferve of rofes of the Dubl. Pharm. is prepared by beating the unblown petals of the red rofe, freed from their claws, and adding gradually three times their weight of refined fugar. The confection of the red rofe poffeffes a fmall degree of aftringency, and is fometimes given diffolved in new milk as a tonic in early convalefcence from acute difeafes; but its chief ufe is to form a pleafant vehicle for more active medicines.

Mel Rofæ, or rofe honey. See HONEY.

Infufion of Rofes. See INFUSION.

Syrup of red rofes, Syrupus rofæ gallicæ, is prepared, according to the Edin. Pharm. by macerating feven ounces of the dried petals of the red rofe in five pounds of boiling water for 12 hours, then boiling a little and ftraining; and adding fix pounds of refined fugar to the ftrained liquor, and again boiling a little fo as to form a fyrup. This fyrup is a weak aftringent; and as fuch is added to aftringent and ftomachic infufions and gargles: it is ufeful in hæmoptyfis and fome other hæmorrhagic complaints as a gargle, and its efficacy chiefly depends on the acid; but it is principaly valued on account of its flavour and colour. Lewis Mat. Med. Woodville Med. Bot. Thomfon Lond. Difp.

ROSES, *Effence of.* There is fcarcely a more valuable perfume in the world, than the effence of damafk rofes, and fcarcely any thing is obtained from its fubject with more difficulty, and in lefs quantity. All effences or effential oils are, while in the plant, contained in certain veficles lodged in different parts, and of different ftructure; thefe veficles are in the rofe particularly fmall and tender, and are placed very fuperficially; the confequence of this is, that there is originally but a very little of this effence in the flower, and this is the very fubject that will be diffipated and loft when the flowers are gathered and thrown in a heap together, as they are fucculent, and very quickly heat in lying together. To avoid all diffipation and wafte of this choice effence, the rofes fhould be thrown into the ftill as foon as gathered, and diftilled with very little water, and that in a balneum Mariæ; then the fire is to be continued fo long as the flowers float feparate about in the water; but as foon as ever they form themfelves into a cake, and ftick to the bottom, the diftillation fhould be finifhed, as they then yield no more effence. With all thefe precautions, however, it is with great difficulty we can procure any effence of rofes. What we obtain by this diftillation being chiefly a very odoriferous and fragrant water. In the warmer countries the fame caution affords a larger quantity of oil, which may be feparated and preferved under the name of the effence. In Italy, they make fome quantity of it, but there it is very dear; a vaft quantity of the flowers yielding only a very little effence, and that being thick and troublefome in the procuring, as it every where fticks to the veffels.

It is to be obferved, that the feafon of the year as to wet or dry, makes a very great difference in the effential oils of all plants; they are always much finer in dry and hot feafons, than in cold and moift; we find our rofe-water in England much finer, and more fragrant, though diftilled in the fame proportion, in hot and dry fummers, than in cold and rainy ones; and Mr. Geoffroy gives an account that he fucceeded, one very hot and dry year, in the making effence of rofes in France in the following manner.

As the rofes were brought to him frefh gathered, he turned them immediately into the ftill; and drawing over the water into a glafs matrafs, when it had ftood by fome time, and was perfectly cold, he difcovered fome of the effence fixed to the fides of the matrafs, and the furface of the water covered with a thin reticular pellicle. All the contents of the matrafs were put to filter through a paper, fupported by a fine linen cloth; and the filtrated water was added to new rofes for many fucceeding diftillations, the produce of which was all filtered through the fame paper. After a long courfe of diftillations, with frefh flowers every time, but ftill with the fame veffels and the fame water, there was found in the paper of the filtre a quantity of thick effence; this being carefully wafhed out of the paper, with a fmall quantity of the moft fragrant of the water, and afterwards feparated pure from its furface, was very white and extremely fragrant, and as thick as fine butter. This is not the only effential oil which naturally concretes into this firm ftate; oil of anifeed, though fluid when diftilled, always concretes in the fame manner on the firft approach of cold; and another oil of this kind is that of the laurel, which is ufed in fome places, though very improperly, to give the fcent and tafte of bitter almonds, or apricot kernels, to foods of different kinds.

Monfieur Homberg has taught us how to gain a larger quantity of the effential oil of rofes than in the ufual diftillation, by the previous addition of mineral acids, as the fpirit of falt, vitriol, &c. thereto; which increafe the fermentation, and joining with the oil, render it more liquid, and eafier to be raifed by heat. He advifes a perfumer (who before fcarcely obtained an ounce of oil from a hundred weight of rofes) to fteep his flowers, for fifteen days, in water made fharp with the fpirit of vitriol; by which means the perfumer, upon diftillation, found his quantity of oil increafed almoft a third.

The perfumers keep the ftructure of the veffel they employ in this diftillation a great fecret. M. Homberg tells us, it is a large convenient ftill, that opens in a tube at the top to receive the water, which muft often be poured upon the rofes, to bring over the oil with it; this it does but very flowly, and fo requires that its quantity be large; the ftill alfo opens below, that the flowers, when they will yield no more oil, may be eafily taken out; but the principal contrivance

contrivance is the figure of the veſſel which receives the oil; this is made like an ordinary matraſs, from the lower part of the belly of which comes a tube, as from an old-faſhioned cruet, and riſing to the bottom of the neck of the receiver, it bends outward; ſo that though the veſſel uſually contains but two or three French pints, it conveniently receives and lets paſs many hundred pints of the roſe-water, without any neceſſity of being changed; for a change would loſe the ſmall quantity of the oil obtained. The water diſtilled runs through a pipe into a ſecond receiver; the oil, being lighter than the water, floats upon its ſurface, and adheres to the neck of the veſſel, as high as the aperture of the little pipe, while the water runs from the bottom of the firſt receiver into the ſecond. See Mém. de l'Acad. des Sciences, 1700.

M. Homberg obſerves, that this ſtill may be uſeful to draw off any kind of precious eſſential oils.

The proceſs for making attar, or eſſential oil of roſes, ſo much eſteemed as a perfume, is related in the "Aſiatic Reſearches," (vol. i. p. 332.) by lieutenant-colonel Polier, and is as follows. "Forty pounds of freſh roſes, with their calyces, but the ſtems cut cloſe, are put in a ſtill with 60 pounds of water. The maſs is then well mixed together with the hands, and a gentle fire is made under the ſtill. When the water begins to grow hot, and fumes to riſe, the cap of the ſtill is put on, and the pipe fixed; the chinks are then well luted with paſte, and cold water put on the refrigeratory at the top. The receiver is alſo adapted at the end of the pipe; and the fire is continued under the ſtill, neither too violent nor too weak. When the impregnated water begins to come over, and the ſtill is very hot, the fire is leſſened by gentle degrees, and the diſtillation continued till thirty pounds of water are come over, which is generally done in about four or five hours. This roſe-water is to be poured again on a freſh quantity (forty pounds) of roſes; and from fifteen to twenty pounds of water are to be drawn by diſtillation, following the ſame proceſs as before. The roſe-water thus made and cohobated, will be found, if the roſes were good and freſh, and the diſtillation carefully performed, highly ſcented with the roſes. It is then poured into pans either of earthen-ware or of tinned metal, and left expoſed to the freſh air for the night. The *attar*, or *eſſence*, will be found in the morning congealed, and ſwimming on the top of the water. This is to be carefully ſeparated, and collected, either with a thin ſhell or a ſkimmer, and poured into a vial. When a certain quantity has thus been obtained, the water and feces muſt be ſeparated from the clear eſſence, which, with reſpect to the firſt, will not be difficult to do, as the eſſence congeals with a ſlight cold, and the water may then be made to run off. If, after that, the eſſence is kept fluid by heat, the feces will ſubſide, and may be ſeparated; but if the operation has been neatly performed, theſe will be little or none. The feces are as highly perfumed as the eſſence, and muſt be kept after as much of the eſſence has been ſkimmed from the roſe-water as could be. The remaining water ſhould be uſed for freſh diſtillations, inſtead of common water; at leaſt as far as it will go.

"The above is the whole proceſs of making genuine attar of roſes. But, as the roſes of this country give but a very ſmall quantity of eſſence, and it is in high eſteem, various ways have been thought of to augment the quantity, though at the expence of the quality. In this country it is uſual to add to the roſes, when put in the ſtill, a quantity of ſandal-wood raſpings, ſome more, ſome leſs, from one to five tolahs, or half ounces. The ſandal contains a deal of eſſential oil, which comes over freely in the common diſtillation, and mixing with the roſe-water and eſſence, becomes ſtrongly impregnated with their perfume. The impoſition, however, cannot be concealed; the eſſential oil of ſandal will not congeal in common cold; and its ſmell cannot be kept under, but will be apparent and predominate, in ſpite of every art. In Caſhemire they ſeldom uſe ſandal to adulterate the attar; but I have been informed, to increaſe the quantity, they diſtil with the roſes a ſweet-ſcented graſs, which does not communicate any unpleaſant ſcent, and gives the attar a high clear green colour. This eſſence alſo does not congeal in a ſlight cold, as that of roſes."

The quantity of eſſential oil to be obtained from the roſes is very precarious, as it depends not only on the ſkill of the diſtiller, but alſo on the quality of the roſes, and the favourableneſs of the ſeaſon. In order to obtain 4 maſhas (about $1\frac{1}{2}$ drachm) from 80 pounds, which, deducting the calyces, amounts to ſomething leſs than 3 drachms *per* 100 pounds of roſe-leaves, the ſeaſon muſt be very favourable, and the operation carefully performed. The colour of the attar of roſes is no criterion of its goodneſs, quality, or country. In the year 1787, Col. Polier had attar of a fine emerald green, of a bright yellow, and of a reddiſh hue, from the ſame ground, and obtained by the ſame proceſs, only of roſes collected at different days. The calyces, he obſerves, do not in any degree diminiſh the quality of the attar, nor impart any green colour to it; though perhaps they may augment the quantity; but the trouble neceſſary for ſtripping them muſt, and ought, to prevent its being ever put in practice.

Roses, *Oil of.* See Rose, and the preceding article.

Rose-*Fly*, in *Natural Hiſtory*, the name given by authors to a peculiar ſpecies of fly, found very frequent on roſe-buſhes, and produced out of a baſtard caterpillar, which feeds on the leaves of that tree. See Cynips.

The male of this fly has a long body, the female a ſhort and thick one; ſhe depoſits her eggs in ſmall holes, which ſhe makes in the bark of the young branches, and for this purpoſe is furniſhed with a very remarkable inſtrument, placed at the hinder part of the body, which is a kind of ſaw.

This is a four-winged fly, and is ſo common on roſe-buſhes, that it is ſcarcely poſſible to miſs it in any of the ſummer months; and the parts of the branches where it has depoſited its eggs are ſo vitiated by it, that they alſo are eaſily known. They are uſually ſwelled to a greater bigneſs than either the part above or below them, and are uſually ſomewhat bent; they are often black on the under ſide, and among this blackneſs the holes made for the eggs, and often the eggs in them, may be ſeen. The head and breaſt of this fly are black; its wings alſo are edged with black, its body is yellow, and its legs yellow, with a few black ſpots.

If theſe flies be obſerved in a ſummer morning, as they are crawling on the branches of a roſe-tree, they will ſoon be found at work for the depoſiting of their eggs. Theſe creatures give us a very good opportunity of obſerving the manner in which they perform this, as they are of a very ſluggiſh diſpoſition, and will ſtand ſtill even to be taken between the fingers; ſo that when one of them is in a proper ſituation, it may be examined by bringing the eye near it, and by uſing the common magnifying glaſſes, without quitting its place or its work; and if there be leaves of the tree, or ſmall branches of it in the way, they may be removed without diſturbing the creature. Reaumur's Hiſt. Inſ. vol. ix. p. 145.

There is, beſides this ſpecies, another fly of the ſame genus, produced from a baſtard caterpillar of the roſe-tree, and of the ſame ſhape and ſtructure of parts with this, but different

different in colour. The head and breaſt of this fly are of a deep violet colour, the body is yellow, and the legs and wings are of a ſomewhat paler violet tinge. This creature alſo depoſits its eggs in holes made in the branches of the roſe-tree, by means of a double ſaw, placed at the hinder part of the body; but, as the former ſpecies lays them in a ſingle ſtraight line, this diſpoſes them in a very beautiful and very regular manner in two rows.

Rose-*Galls*, a name given by authors to certain unnatural productions of the *roſa ſylveſtris*, or dog-roſe, occaſioned by the bites of inſects. There are two kinds of theſe, the one very common, the other more rare.

The ſcarcer kind is uſually found on the young ſhoots, and on the heps, or fruit, and is of a woody ſubſtance; the other is hairy and ſpongy, and is found on the old branches. The woody kind uſually appears in the months of June and July, and is always found in cluſters. Theſe are compoſed of ten, twelve, or more galls of different ſizes and figures, ſome round, others oblong, ſome of the ſize of an olive, and others not larger than a pea. They are of the common ſubſtance of the white wood, or blea, of trees, and when ſituated on the fruit, they prevent its ripening, and make a very ſingular figure. They are of a reddiſh colour, and are uſually ſmooth and gloſſy, but ſometimes they are beſet with ſhort and fine prickles.

The hairy roſe-gall is too common, and too ſingular a figure to have eſcaped the obſervation of perſons in all ages; it has been introduced into medicine in many parts of the world, and is at this time preſcribed in Germany, when reduced to powder, in diarrhœas, dyſenteries, and other diſorders of the bowels, and to promote urine and break the ſtone.

Theſe roſe-galls, though they appear at firſt ſight compoſed of tufts of hair, are, however, in reality, made up of ſeveral ſmall galls, growing from a bud on the branch, and forming a cluſter on the part. They are of an oblong figure, and reſemble the ſhape of a plum-ſtone. Each of them is the habitation of a ſingle worm, each having one cell in the centre.

All theſe galls of the roſe-tree afford the ſame ſpecies of worms and flies. The proper inhabitants, however, are hardly to be diſtinguiſhed by the moſt curious obſerver from the great variety of ſpecies which are found in them, all produced of the eggs of other flies, whoſe worms are of the carnivorous kind, and are lodged in the gall, not to feed on the juices of the tree, but on the fleſh of the proper inhabitant. When the parent-fly, who gives origin to the galls, has depoſited her eggs, and the tumour, in conſequence, begins to be formed, an enemy of this kind pierces the covering, and ſends in her offſpring to feed on the inhabitant. Theſe are flies of the ichneumon kind, and ſeveral ſpecies of them are of great beauty. All the flies deſcribed by authors as iſſuing out of this gall ſeem to have been of this kind; the proper inhabitant, being a ſmall black fly of no great beauty, is diſregarded, while the others have been particularly deſcribed.

Mentzelius has given an elegant account of a ſpecies whoſe back is of a fine blue, and its belly purple; and others have figured and deſcribed greeniſh and gold-coloured ones; but theſe are all ichneumons, all bred of devouring enemies which have fed on the proper inhabitants of the galls, and lived and transformed themſelves in their cells.

Rose-*Wood*, *lignum rhodium*, or *aſpalathum*. See Aspalath.

Rose *Pink*. See Pink.

Rose, *Golden*, is a roſe which the pope bleſſes at maſs, on the firſt Sunday in Lent, while they ſing Lætare Jeruſalem; and which, after maſs, he carries in proceſſion; and then ſends as a preſent to ſome ſovereign prince.

Rose, *the factions of the red and white*, are famous in our Engliſh hiſtories. They had their riſe in 1454, under Henry VI. between the houſes of York and Lancaſter, and ended in Henry VII. who united the two branches. The houſe of Lancaſter had for its badge a *red* roſe; that of York a *white* one.

Rose, in *Architecture* and *Sculpture*, an ornament cut in reſemblance of a roſe.

It is chiefly uſed in friezes, corniches, and vaults of churches, and particularly in the middle of each face of the Corinthian abacus. And in the ſpaces between the modillions, under the plafonds of corniches.

Roses, in *Heraldry*, is a difference denoting the ſeventh ſon of a family.

Rose-*Nails*. See Nail.

Rose-*Diamond*. See Diamond.

Rose-*Noble*, an ancient Engliſh gold coin, firſt ſtruck in the reign of Edward III. when the ſeries of gold coinage commences, and then called the *penny of gold*; ſince called *roſe-noble*, becauſe ſtamped with a roſe. It was current at 6*s*. 8*d*., and conſequently formed half a "mark," ſo called as being a grand limited ſum in account (Marc, *limes*, Goth.), 8 oz. in weight, and ⅔ds of the money pound. This, as one half of the commercial pound of 16 ounces, is ſometimes called "ſelibra." The *noble* (which ſee) was ſo called from the nobility of the metal, being of the fineſt gold then, or now, uſed in the world for coinage; and it was attended by its half and quarter; the proportion of ſilver to gold being then 1 to 11. This coin was ſometimes called the "roſe-noble," from both ſides being impaled in an undulating circle, reſembling the outline of an expanded roſe, together with its half and quarter; and theſe continued the only gold coins till the angels of Edward IV. 1465, ſtamped with the angel Michael and the dragon, and the angelets, equal to half the angel, or 3*s*. 4*d*. were ſubſtituted in their place. Antiquaries likewiſe aſſert, that gold being ſcarce in Henry Vth's time, that prince diminiſhed the noble, retaining its former value; but that Henry VI. reſtored it to its ſize, and cauſed it to paſs for 10*s*. under the new name of ryal. Accordingly, the noble of Henry V. weighs only 108 grains now, while thoſe preceding his reign weigh 120. This ſpeaks gold to have increaſed in value about 10 *per cent*. The old noble of Edward III. and Richard II. at 120 grains, paſſed but for 6*s*. 8*d*.; but in the fifth year of Edward IV. 1465, the angel was of equal value, though but 80 grains in weight; which ſhews gold to have increaſed in value then no leſs than 30 *per cent*. Certain it is that the ryal of 10*s*. and the angel of 6*s*. 8*d*. with their diviſions of half and quarter, were the ſole gold coins till, in 1485, Henry VII. publiſhed the double ryal, or ſovereign, of 20*s*. accompanied by the double ſovereign, of 40*s*. See Money.

Rose *Engine*, *Roſe lathe*, or *Figure lathe*, in the *Mechanic Arts*, is a machine uſed for turning any articles in wood, ivory, or metal, in the ſame manner as a common lathe, but it has additional parts, by which the ſurface of the ſubject which has been turned, can afterwards be engraved with a great variety of patterns of curved lines, which, in general, are denominated from the French *roſette*, from a ſlight general reſemblance which they have to a full-blown roſe, and hence the machine is called a roſe engine.

This machine, as we have ſaid, contains all the parts of the *lathe*, (ſee that article,) and in the ſame manner as in turning, the work is cauſed to revolve, whilſt the cutting tool is kept ſtationary; but the difference between the roſe

lathe

lathe and the common lathe is, that in the former the centre of the circle, in which the work revolves, is not a ſtationary point, but a ſlight motion is given to the centre whilſt the work is revolving upon it, the tool being all the while ſtationary; the ſurface of the figure which it forms will be, of courſe, out of round, *i. e.* it will deviate from the circular figure as much, and as often, as the motion is given to the centre.

The art of turning curioſities in wood or ivory, is one of thoſe which is beſt adapted, of any of the mechanic arts, as an amuſement for perſons who either have leiſure to apply to ſuch ſubjects, or who require relaxation from mental ſtudies: it has long been a favourite purſuit of many gentlemen, and the machines they employ are very ingeniouſly conſtructed. The curious in this art reckon two points of perfection in their works, one where the extreme delicacy, or elegance, of the object renders it admirable, and the other is conſidered from the difficulties of the execution; the former may be judged by all perſons poſſeſſed of good taſte, but to judge of the latter requires ſome knowledge of the art, or, at leaſt, ſo far as to know that the lathe will form only ſuch articles as are perfectly circular, all the parts having a common axis; therefore the ſpecimens of turning are to be more or leſs eſteemed, in proportion as they are more oppoſed to the circular figure. This art was more cultivated a hundred years ago than at preſent, and more curious ſpecimens were then produced, ſuch as hollow balls of ivory, containing many excentric figures, formed within each other, all being cut from the ſame ſolid piece, and every one beautifully ornamented upon the ſurface, although only ſmall holes were left through them to gain acceſs to the interior ones: this was carried ſo far as to form twelve balls of ivory one within the other. A great collection of curioſities of this kind will be found in a French work entitled "Récueil d'Ouvrages Curieux dans le Cabinet de M. Grollier de Servir," 4to. Lyons, 1719. This contains drawings of ſome very curious articles; but although the art is not ſo generally practiſed at the preſent day as formerly, the machines which are now invented are vaſtly ſuperior, and, with the ſame attention, would doubtleſs admit of the curioſities being equally extended. Meſſrs. Holtzapffel and Deyerlien, of Cockſpur-ſtreet, London, have made many improvements in the conſtruction of roſe engines, which they execute, as well as all other tools, for ornamental turning, in the moſt finiſhed ſtyle. We have obtained drawings of one of theſe, ſee *Plate* III. *Engines*, in which *fig.* 6. is an elevation in front of the machine. A A B B is the wooden frame; D, the large foot-wheel, to give motion to the mandrel, or ſpindle, T T, by the band and pulley F. The work is fixed in a chuck I, at the extremity of the mandrel; and the tool is held by the ſlide-reſt K, which, though it has the means of moving the tool a ſmall quantity, to adjuſt it to the radius of the roſe, or figure intended to be cut, ſtill it will firmly retain the poſition in which it is placed. The upper part, A, of the frame of the machine is made of mahogany, but has within it a caſt-iron frame, conſiſting of two bars, or bearers, which being placed parallel, and at a ſmall diſtance aſunder, leave a groove or opening between them, in the ſame manner as the cheeks of any other lathe, for the reception of the tenon, at the lower end of the back puppet (ſhewn by the dotted lines) L, which is uſed to ſupport the end of a long piece of work; though this is ſeldom uſed, becauſe the work can only be turned circular, when the back centre ſupports it. All work which is to be figure-turned muſt be held in a chuck, ſcrewed on to the end of the mandrel T; becauſe it is only the mandrel which is moveable, to give thoſe deviations from the circular figure, which are neceſſary to form the figured work. For this purpoſe, the two ſtandards, G and H, which ſupport the mandrel, are not firmly fixed to the bed, A, of the machine, as in other turning-lathes; but they deſcend between the cheeks or caſt-iron bed, almoſt as low as the bottom of the mahogany bed A, and have there an axis P (dotted), which is parallel to the mandrel, and ſupported on pivots at its ends; theſe pivots being received in pieces of caſt-iron, deſcending from the cheeks, and ſtrengthened by the iron bar, Q, extended between them. The two ſtandards, G, H, are formed of one piece, and have a ſtrong bracing of iron between them, in addition to the axis P; but this cannot be ſeen in the figure, becauſe it is concealed between the cheeks of the bed O. The oſcillating motion is given to the mandrel by means of metal roſettes M: theſe are wheels, fixed upon the mandrel, each having its periphery indented and curved with a waving line, as ſhewn at M, *fig.* 7. The roſettes are acted upon by a ſmall roller, placed at the end of a piece *n*, which is ſupported by a triangular bar *m*, fixed parallel to the mandrel, upon the upper ends of curved arms, as ſhewn in both figures. Now it is evident that when the mandrel revolves, the eminences and depreſſions of the roſette, applying themſelves to the roller of the piece *n*, which is ſtationary, will cauſe a vibrating or oſcillating motion of the mandrel, and the frame, G H, which contains it. A ſtrong ſpring is placed within the cavity of the bed A, and applied to the frame of the mandrel; ſo that it inclines the latter always towards the central or vertical poſition, that is, the poſition, when the line of the mandrel is produced, would paſs exactly through the point of the ſcrew of the back puppet L; therefore, when the protuberant or waved parts of the roſette cauſes the mandrel to depart from this ſituation, the ſpring will be bent, and ready to force it back, the inſtant the curvature of the roſette will permit. The ſpring is ſlightly curved, and placed in the ſpace between the inſides of the iron cheeks of the bed and the frame of the mandrel, ſo that the middle of the curved part acts thereupon, and the two ends bear againſt the inſide of the frame, to give the re-action. Seventeen different roſettes are placed upon the mandrel, as ſhewn in a cluſter at M, each being of a different pattern. Several are of the kind ſhewn in *fig.* 7, that is, ſcolloped out with waves or concave depreſſions, but differing in the number of waves from 12, as in the figure, to 144, which will, therefore, be very minute. The ſocket for the piece *n* can be fixed, by its clamp ſcrew, upon any part of the triangular bar *m*, to bring it oppoſite any one of the roſettes which is required to be uſed. Other roſettes, inſtead of having waves or concave depreſſions, as ſhewn in *fig.* 7, have convex protuberances. In either caſe, when the pattern is very fine, the roller upon the end of the bearing-piece, *n*, cannot be admitted, becauſe its curvature would not be ſufficiently rapid to ſuffer it to fall into the depreſſions. In theſe caſes, therefore, the end of the piece *n* is uſed for the contact, being rounded, and well hardened and poliſhed, to diminiſh as much as poſſible the friction of the roſette revolving, whilſt in contact with it.

The ſlide-reſt, which ſupports the tool, is next to be deſcribed: the manner in which it applies to a piece of work, when fixed in a chuck at the end of the mandrel, is ſhewn in *fig.* 6, whilſt *figs.* 11 and 12 are on a larger ſcale to deſcribe it minutely. The reſt can be faſtened at any part of the bed, by the lower part of the foot, which is ſupported on the bed, A, of the lathe, and is divided with a dove-tailed groove in the under ſide, to receive the head of a ſcrew-bolt, going down through the lathe-bed, and fixing it at any place by a thumb-nut, as ſhewn at *k*, *fig.* 6; the groove in the foot is for the purpoſe of allowing the reſt to be moved to and from the centre

centre of the lathe, to adjuſt it to the diameter of the work which is turning. The foot has a ſtrong cylindrical pin fixed upright in the end of it, and this is fitted into a correſponding ſocket S, formed out of a ſolid piece, with the lower ſlider K of the reſt; a clamp-ſcrew in the ſide fixes the ſocket faſt upon the pin, and there is a wheel *s*, cut with notches, at the bottom of the ſocket, with a catch *t*, fixed upon the foot R, to engage its teeth and hold it faſt; by which means the ſliders, K, can be fixed, and held faſt at any required angle with the mandrel, for purpoſes we ſhall hereafter mention.

The upper part of the ſlide-reſt conſiſts of two horizontal ſliders, K and *g*, placed in directions perpendicular to each other; to one of theſe the tool is firmly attached, and by means of ſcrews with handles, the ſliders and the tool can be moved in any direction, to follow the tool to the work; K, in both figures, is a frame of metal, formed from the ſame piece as the ſocket S; its upper ſurface is made flat, and upon this a ſlider, or flat plate, *e e*, is fitted, to move with freedom and preciſion. A ſcrew is mounted in the opening of the frame, and is tapped into a piece of metal, projecting from the lower ſide of the ſlider, ſo that the ſcrew, when turned round by a handle *d*, fitted on its ſquare end, advances, or draws back the ſlider, which is guided in a right line by two pieces of braſs, ſcrewed to the under ſide of it, to form a dove-tailed groove, to which the edges of the frame K are fitted very accurately: upon this ſlider a frame, or two rulers, are ſcrewed, having a ſecond ſteel ſlider *g*, fitted in the dove-tailed groove formed between them, and provided with a ſcrew *i*, as the former, to move it. This upper ſlider carries a piece of metal, with a ſquare hole through it, in the direction of its length, to receive the tool *k*, and a ſcrew at top to faſten it in. The ſlide-reſt being mounted in the manner of *fig.* 6, upon the bed of the lathe, the upper ſlider, *g*, is parallel with the mandrel, and the lower one perpendicular thereto. For turning flat or face work, the tool is put as there ſhewn. Now, by turning the ſcrew, *i*, of the upper ſlider, the tool advances to a contact with the work, which is mounted in a chuck, as in the figure; then by the other ſcrew, *d*, it is moved acroſs the face of the work, turning it as it proceeds to a perfectly flat ſurface. For turning a cylinder, mounted between centers, the ſlide-reſt is to be turned one quarter round upon the pin in the ſocket S, ſo that the upper ſlider will be perpendicular to the mandrel, and the lower one parallel thereto; in this caſe, the upper ſlider muſt be moved, to adjuſt the tool to the diameter of the intended work, and the lower ſlider is moved by its handle *d*, to carry the tool along the length of the cylinder, and cut it as it goes. The whole reſt can be fixed at any part of the bed, and can be moved inſtantly if required. The ſlide-reſt will alſo turn cones by the following contrivance: the plate, or dove-tailed groove ſupporting the upper ſlider, *g*, may be turned round upon the plate *e e*, and faſtened at any inclination by a ſcrew paſſing through a circular groove in the plate. By this means, the upper ſlider is inclined, in any required angle, to the mandrel, and will then turn a cone, either hollow or ſolid. The ſlide-reſt preſents the tool ſo firmly to the work, that it will not retreat in the leaſt when any protuberance comes by, but cuts it away, if the ſtrain is not ſo great as to break the tool: but of this there is no danger if it be properly managed, becauſe the ſcrews advance the tool ſo ſlowly, that there is no need to puſh it forwards ſuddenly, as it is often unavoidable in turning by hand. The ſliders are often divided into inches and ſubdiviſions, by which the work can be made exactly to any dimenſions without trouble, or two things may be fitted exactly together. The upper ſlider, *g*, has a graduated arc to ſhew the angle of inclination which it makes with the lower one, when ſet for turning cones, ſo that a hollow cone being bored out in a chuck, a ſolid plug may at once be turned to fit it, without trial, the reſt making it certainly of the true angle.

The lathe is put in motion either by the hand, or by the foot of the turner. The latter, when the work is to be turned or reduced to the circular figure, as in any common lathe; and the former, when the work, after being turned, is to be ornamented, an operation which, from its delicacy, requires a very regular motion.

When the machine is turned by the foot, it is done by the preſſure upon the treadle E, which acts upon the crank C, on the axis of the foot-wheel, or fly-wheel, D. The motion is communicated from the treadle by a crank-hook, or connecting rod, *a*, faſtened to the crank of the wheel, by a collar embracing and turning round at the upper end. When the foot puſhes down the treadle, it gives the wheel a rotative motion; and when the crank has been drawn to the loweſt point, the momentum which the wheel has thus acquired, draws up the treadle, and thus, by the alternate preſſure of the foot, and the momentum of the wheel, the motion is regularly continued. The wheel is made of caſt iron, and fixed on the extreme end of the axis; it has two rims of different ſizes, and the ſurface of each is made conical, and cut with three annular grooves, which are receſſed, with an angle at the bottom, ſo as not to have a flat bottom. This form is advantageous, on account of the band having more power to turn the wheel F. Theſe different grooves are made, in order to give different degrees of velocity to the lathe, or to increaſe the power. The axle of the wheel is made of wrought-iron, except the pivots or centers, and it is bent in the middle to form the crank C: the pivots at the ends are made of hard ſteel, welded to the iron parts of the axle. The band which connects the fly and mandrel is made of catgut, of ſuch thickneſs as the nature of the work may require, and is either ſpliced at the joining of the two ends, or they are faſtened together by a ſteel hook and eye. The band may be either tightened, by ſhifting it to other grooves in the great wheel, or in the pulley F, of the mandrel; or otherwiſe by a ſliding-piece in the leg B, which is regulated by a ſcrew *x*.

The motion for the hand is given by a ſmall handle O, *fig.* 6; this is fixed upon the end of a ſpindle, which at the other end carries a ſmall wheel N, communicating by a band with the great wheel D. The ſpindle is ſupported in a frame, which is attached to the lathe-frame, by a centre or joint, on which it can be raiſed up, and fixed by a toothed ſector, to tighten the band when it is required.

The pulley F has three or four grooves, of different ſizes, to receive the band, and by this means the mandrel may be turned with different degrees of velocity, and made to accommodate itſelf to the length of the band. The wheel N is made in the ſame manner.

When a piece of work is to be made in the roſe engine, it is firſt turned true to the ſize and figure, and then poliſhed, before it is ornamented: therefore the machine is firſt ſet to turn circular. For this purpoſe, the piece *n*, *fig.* 7, is withdrawn, ſo as to be beyond the reach of the roſette, and a head at 2, *fig.* 6, being turned, it ſhoots a double bolt, which locks the frame G H faſt in its perpendicular poſition; that is, when the point of the back centre-ſcrew L will be exactly in the line of the mandrel, the frame being thus rendered immoveable, the machine will turn the ſame as any common lathe. If the work is of conſiderable length, it muſt be ſupported at the end by the back centre L, at leaſt whilſt it is turned circular, previous to being ornamented.

The back puppet, L, is made of caſt-iron, and is fitted upon the caſt-iron bearers, on which it can be fixed at the required diſtance from the mandrel by a vertical ſcrew underneath, and a nut, which comes in contact with a horizontal plate or waſher below the ſaid bearers. Its centre-ſcrew has a ſharp conical point to ſupport the work, and there is a clamp-ſcrew at top to faſten the centre-ſcrew, to prevent it from running baek.

The methods of fixing the work to the end of the mandrel whilſt it is turned are very numerous, and vary in almoſt every inſtance: in general, it is held in a piece of wood, I, called a chuck, which is ſcrewed upon the noſe of the mandrel T, and being bored, or turned out in the manner of a cup, the piece of wood or ivory which is to be turned is driven into it by a mallet till it is firmly fixed: the wood is, of courſe, cut nearly to a circular figure, before it is fixed in the chuck; it is then wrought with a ſharp triangular pointed tool, *h*, which being fixed in the reſt, and advanced to the work by the ſcrew *i*, cuts ſmall contiguous grooves on the ſurface, till it has broken the grain of the wood, and removed all exuberances. The tool being gradually advanced by its ſcrews *d* and *i*, as is required, the work is reduced at length nearly to its intended ſize and figure, but will be wholly covered with ſmall grooves: to remove theſe, and render the work even, another tool is next uſed; this is formed like a narrow chiſſel, but made very thick, and with an obtuſe edge, which is only bevelled on the under ſide: its edge will remove the eminences between the grooves left by the firſt tool. The work is then ſmoothed, by applying to it the edge of a piece of the blade of a broken knife bevelled away; this is held in the hand, and the work is followed up with it, that its ſharp edge may ſcrape away any roughneſs left by the tools. To poliſh the wood, a piece of ſeal-ſkin, Dutch reed, or glaſs paper, is held by the hand upon the work as it runs round, and it cuts away a fine powder, making the work ſmooth enough to receive a poliſh. This is raiſed by firſt applying a piece of bees-wax, till the work is ſlightly covered with it, then afterwards burniſhing or poliſhing it, by holding a flat piece of hard wood upon it. The finiſh can be given by the friction of a coarſe woollen rag, lightly ſmeared with olive oil.

Ivory is turned nearly in the ſame manner, but is poliſhed with chalk and water, and afterwards by the friction of a woollen cloth; or, if it is firſt touched with an oily rag, and rubbed off with a dry woollen cloth, it will have a very fine ſurface.

This is only the ſame proceſs as is uſed for ordinary turning; but when the work is finiſhed in this manner, the ornamenting is began by releaſing the bolt, 2, of the mandrel-frame G H, and chuſing the roſette beſt adapted to the pattern which is required. The piece, *n*, is ſet upon the triangular bar, to be in contact with its wave, and will thus give the oſcillating motion, as before deſcribed; ſo that when the tool is applied to the work, it will produce a waved or indented ſurface, or outline, correſponding with the figure of the roſette, inſtead of the circular figure produced by the common lathe.

If the ornamenting is to be performed upon a flat ſurface, ſuch, for inſtance, as the lid or top of a box, it is chucked, as ſhewn in *fig.* 6, and the point of the tool being applied to it, will cut a waved line. To do this more conveniently, the ſlider, *g*, is advanced to the work, by preſſing it with the hand inſtead of the ſcrew *i*; for, by lifting up a ſmall ſpring catch, of which the tail is ſeen plainly at 3, *fig.* 6, the ſlider is releaſed from the nut of the ſcrew *i*, which has no other attachment to the ſlider than by a tooth on this catch entering into a notch in the nut, and it is preſſed into the notch by a ſcrew *l*. Now, by releaſing the ſcrew *l*, lifting up the catch 3, and drawing back the ſlider, the tooth of the catch falls behind the nut of the ſcrew, inſtead of being in the notch; it will, therefore, form a ſtop, to check the advance of the tool, though it allows it to be drawn back to clear the work, and alſo to be puſhed up towards it by the hand, to cut the line, the ſtop regulating the depth of the line, as the hand can advance the ſlider no farther when it meets the nut.

In this manner, a waved line is engraved round the edge of it, ſuch as is ſhewn in *fig.* 9, the breadth of the line being determined by the depth to which the point of the tool is regulated to penetrate, by turning the ſcrew *i*. The outer line being thus finiſhed, the tool is now withdrawn to clear the work, and the ſcrew, *d*, of the great ſlider being turned a ſmall quantity, the point of the tool is brought nearer to the centre of the work; here, by puſhing up the tool, another line is deſcribed; then a third within the ſecond, and ſo on, at equal diſtances, until they reach the centre: this makes a very pretty ornament, as in *fig.* 9. It ſhould be obſerved, that as each line has the ſame number of waves, or indentations, they will neceſſarily grow very fine as they approach towards the centre; but at the ſame time as the deviation from the circular figure is equal in the ſmalleſt as well as the largeſt rings, it follows, that the curves of the waves of each ring, or line, will vary in a very gradual and pleaſing manner, being ſlightly curved at the circumference, and more rapidly towards the centre. This pattern admits of great variety, by employing different roſettes, fine or coarſe, concave or convex; but it will always have the waves included in ſtraight lines directed to the centre. A very pretty variation is made by turning the roſette round upon the mandrel a very ſmall quantity every time before a freſh line is deſcribed. For this purpoſe, the roſettes are not fixed faſt upon the mandrel, but are fitted thereupon, ſo as to admit of turning round, being moved by a ſmall ſcrew at the end towards H. As an example of the uſe of this movement, *fig.* 10. is given, which conſiſts of a roſe of twenty-four waves. In this, after drawing the exterior line, in the ſame manner as the former, when the ſlider is ſet for the ſecond, the roſette is turned round upon the mandrel a quantity equal to one-fourth of a wave, or one-ninty-ſixth part of the whole circle: the circle is now deſcribed, and its waves will not fall exactly within thoſe of the former, but a little advanced therefrom. The next time a circle is to be drawn, the roſette is again ſhifted, and ſo on. As this is a quantity equal to one-fourth of the ſpace between the waves, it is plain that at every fourth line the waves will fall in lines drawn towards the centre. Still this will not affect the appearance, which will be totally different from the former, (*fig.* 9.) and very ſuperior to it. The concentric lines, in either of theſe patterns, are made exactly at equal diſtances, by means of the diviſions before-mentioned, upon the ſlider K, or otherwiſe by diviſions made upon a head, which is fitted upon the end of the ſcrew *d*; and the roſettes are ſet exactly to the quantity they are intended to be turned round, by means of diviſions made upon the edge of a circular plate, which is fixed faſt upon the mandrel, towards the end H, and a line or mark upon the laſt roſette applies to it. The ſcrew which effects the movement is ſupported in bearings upon this plate, and acts in the teeth of a wheel, fixed within the hollow of the laſt roſette. By this means, when the ſcrew is turned round by a key, it cauſes all the roſettes to turn round together any quantity which the diviſions on the circle indicate. On this principle, great varieties of patterns may be made, and they may be greatly diverſified by ſhifting the roſettes alter-

 nately

nately in contrary directions: thus, after eight, twelve, or any other number of rings have been drawn, by gradually shifting them each time, as before defcribed. By reverfing the fhifting movement to the oppofite direction, a total change will be produced; and continuing in this manner for eight or twelve more circles, the rofettes are again to be advanced in the firft-mentioned direction, and continued for eight or twelve. This method produces a curious effect, and admits of much variety in the patterns.

After having drawn a waved line, the rofette may be advanced half a divifion, and then another line drawn, without altering the flide-reft. By this means, the two waved lines will interfect each other, and make a number of loops like a chain of beads. A number of concentric lines of this fort, drawn upon a circle, is very handfome.

We have now fhewn the principal diftinctions of the patterns which can be defcribed upon a flat furface; but it is evident, that from the number of the rofettes, a very numerous fuit of curious combinations can be made. An elliptical and an excentric chuck are adapted to this machine, to fcrew on at T: a new field is thus opened, which is fo extenfive as to exercife conftantly the tafte and fancy of the operator, in producing new combinations, and renders the machine a fource of the moft interefting amufement. The elliptical and excentric chucks, when applied to a common lathe, will form a great many interefting patterns, but are vaftly more extenfive with the rofe engine. Their conftruction will be defcribed under TURNING. It is fufficient here to fay, that by the elliptical chuck, the waved lines may be drawn in ellipfes, inftead of circles; and by the excentric, feveral fmall waved circles, or ellipfes, can be arranged round the circumference of a larger circle, and their interfections produce a very pretty effect.

Another fpecies of rofe-turning is performed upon the furface of a cylinder, globe, or cone; whereas that which we have defcribed is only upon the flat furface of a circular piece, or end of the cylinder. To ornament the furface of the cylinder, the flide-reft is turned round one-fourth of a circle, as before defcribed, for forming the cylinder; fo that the long flider becomes parallel to the mandrel. In this way the whole furface of the cylinder may be waved; but great care muft be taken to advance the tool very gradually, becaufe it will not cut fo readily as when turning circular work. By dividing the length of the cylinder into fmall equal portions, and by fhifting the rofettes every time one of thefe is finifhed, the waves may be made to follow each other in a fpiral direction round the cylinder; or, by a proper rofette ufed in this manner, very elegant patterns of bafket-work may be formed.

There is another movement of the rofe lathe, which we have not yet defcribed: this is called the pumping. It is principally ufed for defcribing waved lines upon the furface of a cylinder; that is, the furface is left cylindrical, but the lines are waved in the direction of the length of the cylinder, or alternately towards its ends. This is effected by making the mandrel move end-ways in its bearings: for which purpofe, the necks upon which it turns are made exactly cylindrical, and fitted very correctly to fteel collars, which are fixed into the ftandards, G, H. It has, therefore, liberty to flide end-ways in its collars, when the pumping motion is required. This is given by rofettes waved upon the edge or fide, and acting againft the fide of a piece of fteel, fuch as *n*, *fig*. 7. A fpring, *p*, *fig*. 6, is fixed at the end of the frame, and acts againft the fhoulder of the mandrel, to force it end-ways, and keep the rofette always in contact with the piece of fteel. The rofettes, M, are cut in a waved manner upon their fides, as well as upon their circumferences; and thus a variety of pumping rofettes are obtained. By this means, curious waving lines may be drawn round a cylinder; or, if the motions firft defcribed are ufed in combination with the pumping, the furface of the cylinder may be waved, at the fame time that waved lines are drawn upon it. In this cafe, the two rofettes employed muft have the fame number of waves. When the pumping motion is ufed upon face or flat work, fuch as is fhewn in *fig*. 6, it produces very agreeable effects, by rendering the waves of the line, which the tool cuts, alternately deeper and fhallower, fo as to give fine and ftrong ftrokes alternately, in the manner of fine writing; or, if the tool is not fet fo deep, they will only be cut on one fide of the wave, and diminifhing gradually, will not be feen on the other, and thus produce a number of new patterns; as the waved lines will confift of detached ftrokes, cut fine at each end, and deep in the middle.

Many patterns may be cut very expeditioufly in the rofe engine by means of fcrew tools: thefe tools are formed like a broad chiffel, but the edge is cut with notches, fo as to prefent a number of points inftead of one continued edge. Thefe points are very exactly equidiftant, being intended to cut fcrews; and therefore the teeth are of the proper figure to form the threads thereof. By a tool of this kind fix or eight lines may be cut at one operation, inftead of the trouble of altering the flide-reft, and cutting each feparately; and there will be a greater certainty of cutting them all to the fame depth, and exactly equidiftant. The mode of cutting fcrews by this tool is called cutting flying, and is thus performed in the rofe, or in any common lathe, without a flide-reft. The intended fcrew being turned cylindrical, the points of the tool are applied to its furface, fo that they will cut, and the tool is regularly advanced up towards the mandrel as it turns round: its teeth will, therefore, inftead of defcribing circles, trace the fpirals of a fcrew on the work; and if the advancement is timed fo exactly that in one revolution the tool is advanced the exact quantity of a fpace between two adjacent teeth, then the fecond tooth will, at the end of a revolution, fall into the fpiral cut by the firft tooth, and one complete fpiral being thus obtained, it guides the whole tool, by means of the fecond tooth, regularly along, the firft tooth continuing to cut the fpiral forwards till a third tooth lays hold, then a fourth, and fo on, till the required length of a fcrew is cut. The trace of a fcrew being thus made, the tool is preffed deeper, till the threads are fully formed, the turner taking care, every time, that the end-tooth of the tool gets to the end of the fcrew, to difengage it, and draw it back, for as it could not advance any further than the fhoulder, it would fpoil all the threads by cutting them to circular rings.

This method requires great habit and dexterity to give the motion fo exactly that it will caufe the teeth to fall properly into the fpirals cut by their predeceffors, and that without any fudden advance at the place, for the fcrew would then be what is called drunken, that is, its threads would be more inclined at one part of its revolution than at another, and fuch a fcrew can never be fitted exactly with its fellow. The habit of cutting fcrews accurately with the fcrew-tool, can only be acquired by practice and experience, the only precaution which is taken being to get the lathe-wheel into a regular motion, and at fuch a rate as has been found, by experience, will be proper for the fize of the thread intended to be cut. The rofe engine before us has a very complete apparatus for cutting fcrews, which deferves a particular defcription. A tube is fitted on the end of the mandrel at *o*, its circumference being cut with a fpiral, or fcrew-thread of the degree of finenefs required: this is called the regulator fcrew.

H is a ſlider, fitted to the ſtandard H, and moved by a ſcrew: *r* is a wheel fixed to this ſlider, and having ſeveral half-circle cavities cut in it, which embrace the ſcrew, as ſhewn in *fig.* 10: each cavity or ſocket has a thread in it, correſponding with the regulator ſcrew. The mandrel being made, as before-mentioned, with cylindrical collars at each end, is at liberty to ſlide endways by the movement of the regulator, when the ſcrew H draws up the ſocket *r*; therefore, every thing being prepared for cutting the thread, the ſcrew H is turned; this raiſes up the ſlider, and ſocket *r*, to touch the regulator; the tool is then applied by the ſlide-reſt, and the lathe being put in motion, the mandrel will move along endways, and alſo the work with it, ſo that the tool will cut a ſcrew, although it is held faſt by the reſt. In this caſe the ſcrew may be cut by a ſingle pointed tool, but it will be better to uſe a ſcrew tool which is of exactly the ſame thread as the regulator. The turner ſhould be provided with a variety of ſets of ſcrew tools, and as many regulators, *o*, correſponding to them, which are made like a tube, and fitted on the mandrel, being held by a nut. The ſocket *r*, which is made like a wheel, *fig.* 10, can be turned round on its centre, and has ſix different half-circle notches cut in it, each adapted to a particular regulator; therefore, by turning this wheel, *r*, any of the notches can be applied to the regulator *o*, when the ſlider is raiſed up by the ſcrew H. This ſcrew regulator may be ſometimes uſed to advantage when ornamenting the circumference of a cylinder of wood or ivory, as contiguous circles, or waved lines, may then be cut in a ſpiral direction, without moving the ſlide-reſt to cut each one ſeparately.

Another part of the roſe engine is for the purpoſe of turning ſwaſh work; this is circular work, but the mouldings or other lines traced round the cylinder are inclined to the axis. An inſtance is ſeen in the baluſtrades of old-faſhioned ſtair-caſes, where the mouldings are made to ſuit the inclination of the ſtairs. To turn this kind of work, a ſteel circle, or hoop, V, is fitted on the end roſette of the mandrel, ſo that it can be inclined from the perpendicular thereto at pleaſure: by this means it forms a guide for the pumping motion, which will ſo regulate it as to turn any work of this kind, *viz.* with the mouldings, or other ornaments, arranged in lines round the cylinder, but theſe lines will incline to the axis of the cylinder inſtead of being perpendicular to it.

Rose, in *Geography*, a town of Naples, in Calabria Citra; nine miles N.N.E. of Coſenza.—Alſo, a town of Virginia; 20 miles S.W. of Charlotteville.

Rose *Iſlands, Great* and *Little*, two ſmall iſlands among the Bahamas; 12 miles N. of Providence.

Rose *Iſland*, an iſland in the North Pacific ocean, near the W. coaſt of America. N. lat. 59° 35′. W. long. 146° 30′.

ROSEA, a name given by ſome authors to the eryſipelas, or St. Anthony's fire.

ROSEAU, in *Geography*, now "Charlotte-town," the capital of the iſland of Dominica, ſituated in St. George's pariſh; about ſeven leagues from Prince Rupert's bay; on a point of land on the S.W. ſide of the iſland, which forms two bays, *viz.* Woodbridge's bay N., and Charlotteville bay S. Roſeau is about half a mile in length from Charlotteville to Roſeau, and moſtly two furlongs in length, but of an irregular ſhape. It contains more than 500 houſes, beſides cottages occupied by negroes. N. lat. 15° 25′. W. long. 61° 27′.

ROSECK, a town of the duchy of Carniola; eight miles E. of Gottſchee.

ROSEHEARTY, a fiſhing town and ſea-port of Scotland, in Aberdeenſhire, with a tolerable harbour; for the improvement of which lord Gardenſtone bequeathed by will a conſiderable ſum of money; four miles W. of Fraſerburgh. N. lat. 57° 38′. W. long. 2°.

ROSEINGRAVE, Thomas, in *Biography*, an enthuſiaſtic, ingenious, and worthy muſician, of conſiderable eminence in his youth for his performance on the harpſichord and organ, both as a ſightſman and voluntary player. His intellects, in the latter part of his life, being ſomewhat deranged, rendered his character ſo ſingular, that he merits ſome notice for his eccentricities, as well as profeſſional abilities.

He was the ſon of Daniel Roſeingrave, who having been brought up in the king's chapel at the ſame time with Purcell, was firſt promoted to the place of organiſt of Saliſbury cathedral, and afterwards of St. Patrick's, Dublin. Daniel had two ſons, both muſicians: one of them, Ralph, ſucceeded his father at St. Patrick's; the other, Thomas, being regarded as a young man of uncommon diſpoſitions for the ſtudy of his art, was honoured by the chapter of St. Patrick's with a penſion, to enable him to travel for improvement; and about the year 1710 he ſet off for Italy. Being arrived at Venice in his way to Rome, as he himſelf ſays, he was invited, as a ſtranger and a virtuoſo, to an academia at the houſe of a nobleman, where, among others, he was requeſted to ſit down to the harpſichord, and favour the company with a toccata, as a ſpecimen *della ſua virtù*. And, ſays he, "finding myſelf rather better in courage and finger than uſual, I exerted myſelf, my dear friend, and fancied, by the applauſe I received, that my performance had made ſome impreſſion on the company." After a cantata had been ſung by a ſcholar of Fr. Gaſparini, who was there to accompany her, a grave young man dreſſed in black, and in a black wig, who had ſtood in one corner of the room, very quiet and attentive while Roſeingrave played, being aſked to ſit down to the harpſichord, when he began to play, Roſy ſaid, he thought ten hundred d—ls had been at the inſtrument; he never had heard ſuch paſſages of execution and effect before. The performance ſo far ſurpaſſed his own, and every degree of perfection to which he thought it poſſible he ſhould ever arrive, that, if he had been in ſight of any inſtrument with which to have done the deed, he ſhould have cut off his own fingers. Upon inquiring the name of this extraordinary performer, he was told that it was Domenico Scarlatti, ſon of the celebrated cavalier Aleſſandro Scarlatti. Roſeingrave declared, he did not touch an inſtrument himſelf for a month. After this rencontre, however, he became very intimate with the young Scarlatti, followed him to Rome and Naples, and hardly ever quitted him while he remained in Italy, which was not till after the peace of Utrecht, as appears by an anthem which he compoſed at Venice in 1713, and which Dr. Tudway has inſerted in the fifth volume of his Manuſcript Collection of Engliſh Muſic, p. 149: "Ariſe, ſhine, for thy light is come," Iſaiah, chap. lx. There is much fire and ſpirit in the introductory ſymphony of a very modern caſt. Roſeingrave is here erroneouſly called a ſtudent of Chriſt-church, Oxford, inſtead of Dublin, whence he had his exhibition.

On his return from Italy in 1720, he ſettled in London, and brought on the ſtage and conducted the performance of the opera of "Narciſo," or "Narciſſus," ſet by his friend Domenico Scarlatti; being the third opera that was performed in our lyric theatre, after the eſtabliſhment of the Royal Academy of Muſic. He compoſed ſeveral additional ſongs for this opera, in which the ſingers were ſignor Benedetto Baldaſſarri, Mr. Gordon, ſignora Duraſtanti, Mrs. Anaſtaſia Robinſon, Mrs. Turner Robinſon, daughter of Dr. Turner, and wife of Mr. Robinſon, organiſt of

Weſt minſter-Abbey. Roſeingrave's additional ſongs were compoſed in the ſtyle of his friend Mimo Scarlatti, in whoſe muſic of Narciſſus, though there were many new and pleaſing paſſages and effects, yet thoſe acquainted with the original and happy freaks of this compoſer in his harpſichord pieces, would be ſurpriſed at the ſobriety and almoſt dulneſs of his ſongs. His genius was not yet expanded, and he was was not ſo much uſed to write for the voice as his father, who was the greateſt vocal compoſer of his time, as the ſon afterwards became the moſt original and wonderful performer on the harpſichord, as well as compoſer for that inſtrument. But it ſeems impoſſible for any individual to be equally great in any two things of difficult attainment.

Roſeingrave was likewiſe the editor of the firſt edition of Scarlatti's Harpſichord Leſſons, in 2 vols. long 4to.

His election to the place of organiſt of St. George's, Hanover-ſquare, was attended with very honourable circumſtances. The pariſhioners, conſiſting chiefly of perſons of rank and fortune, being very deſirous of having a good organiſt, and unwilling to truſt to their own judgment, or be teazed by the ſolicitations of candidates of mean abilities, requeſted Mr. Handel, Dr. Pepuſch, Dr. Greene, and Mr. Galliard, to hear the competitors play, and determine their degree of merit.

The candidates were allowed half an hour each to manifeſt their abilities on the organ, in whatever way they pleaſed, and then were ſeverally required to play *extempore* on ſubjects given by the judges. Mr. Handel did not attend in perſon, but ſent his ſubject. Among the numerous candidates for this place there were ſeveral who acquitted themſelves very well, during the half-hour of free-agency, by playing with great neatneſs pieces they had probably ſtudied for the occaſion; but when ſubjects of fugue were preſented to them for extemporaneous treatment, they neither knew how nor when to bring in the anſwer, or even to find harmony for the themes with either hand when they were brought in. Roſeingrave, on the contrary, whoſe ſtyle, though too crude and learned for the generality of hearers, when left to himſelf, treated the ſubjects given with ſuch ſcienee and dexterity, inverting the order of notes, augmenting and diminiſhing their value, introducing counter-ſubjects, and turning the themes to ſo many ingenious purpoſes, that the judges were unanimous in declaring him the victorious candidate. The late Dr. Arne and Mr. Mich. Chriſt. Feſting, who were both preſent at this contention, informed us of theſe particulars, which happened in the year 1726, and ſpoke with wonder of Roſeingrave as an extempore fughiſt; but confirmed the general cenſure of his crude harmony and extravagant modulation, which indeed his printed compoſitions imply.

Roſeingrave having, a few years after this election, fixed his affections on a lady of no dove-like conſtancy, was rejected by her at the time he thought himſelf moſt ſecure of being united to her for ever. This diſappointment was ſo ſeverely felt by the unfortunate lover, as to occaſion a temporary and whimſical inſanity. He uſed to ſay, that the lady's cruelty had ſo literally and completely broke his heart, that he heard the ſtrings of it *crack* at the time he received his ſentence; and on that account ever after called the diſorder of his intellects his *crepation*, from the Italian verb *crepare, to crack*. After this misfortune, poor Roſeingrave was never able to bear any kind of noiſe, without great emotion. If, during his performance on the organ at church, any one near him coughed, ſneezed, or blew his noſe with violence, he would inſtantly quit the inſtrument, and run out of church, ſeemingly in the greateſt pain and terror, crying out that it was *old ſcratch* who tormented him, and played on his *crepation*.

About the year 1737, on account of his occaſional inſanity, he was ſuperſeded at St. George's church by the late Mr. Keeble, an excellent organiſt, intelligent teacher, and a worthy man, who, during the life of Roſeingrave, divided with him the ſalary. We prevailed on him once to touch an organ at Byfield's, the organ-builder; but his nerves were then ſo unſtrung, that he could execute but few of the learned ideas which his mental diſorder had left him. His ſweetneſs of temper and willingneſs to inſtruct young perſons, who were eager in the purſuit of knowledge, tempted us frequently to viſit him at Mrs. Bray's, Hampſtead, where he reſided. His converſation was very entertaining and inſtructive, particularly on muſical ſubjects. Indeed, his paſſion for the art never quitted him to the time of his death, which happened in Ireland about the year 1750. The inſtrument on which he had exerciſed himſelf, in the moſt enthuſiaſtic part of his life, bore very uncommon marks of diligence and perſeverance; for he had worn the ivory covering of many of the keys quite through to the wood. In his younger days, when he enjoyed the *mens ſana in corpore ſano*, he was regarded as having a power of ſeizing the parts and ſpirit of a ſcore, and executing the moſt difficult muſic at ſight beyond any muſician in Europe. Indeed, it was ſaid that he could read a muſic-book, if turned topſy-turvy; but this ſeems exaggeration of praiſe. which few can believe, who know the difficulty, without ocular and auricular demonſtration. The harmony in the voluntaries, which Roſeingrave publiſhed, is rendered intolerably harſh and ungrateful by a licentious and extravagant modulation, and a more frequent uſe of the ſharp third and flat ſixth than any compoſer with whoſe works we are at all acquainted, not excepting Dr. Blow; and his double fugues are ſo confuſed by the too cloſe ſucceſſion of unmarked ſubjects, that it is impoſſible, at the end of the performance, to remember what they are. His cantatas, which he publiſhed by ſubſcription, being compoſed on the model of the elder Scarlatti, are the moſt pleaſing of his works; but they were ſtill-born, and never lived to ſpeak in public.

ROSELLE, in *Geography*, a town of Etruria; two miles N. of Groſſeto.

ROSEMARKIE, a royal borough town in a pariſh of the ſame name, in the county of Roſs, Scotland, is ſituated on the northern ſhore of the Moray-frith, nearly oppoſite to fort George. It was conſtituted a royal burgh by Alexander II. king of Scotland; but in the reign of king James II. it was united with the town of Chanonry, (ſo called from its having been the chanonry of Roſs, and the reſidence of the biſhop,) and re-incorporated by charter under the name of Fortroſs, ſince ſoftened to Fortroſe. For ſome further particulars reſpecting this town, ſee FORTROSE. Carliſle's Topographical Dictionary of Scotland, 4to. 1813.

ROSEMARY, in *Botany*. See ROSMARINUS.

ROSEMARY, *Poet's*. See OSYRIS.

ROSEMARY, *Wild, Marſh Ciſtus*. See LEDUM.

ROSEMARY, in the *Materia Medica*. Roſemary has a fragrant aromatic ſmell, and a bitteriſh pungent taſte. The leaves and tops of this plant are the ſtrongeſt with regard to their ſenſible qualities; the flowers are not to be ſeparated from their calyces or cups, as the active matter principally, if not wholly, reſides in the latter.

Roſemary gives out its virtues completely to rectified ſpirit, but only partially to water. The leaves and tops, diſtilled with water, yield a thin, light, pale-coloured eſſential oil

oil of great fragrancy, though not quite ſo agreeable as the roſemary itſelf; from one hundred pounds of the herb in flower were obtained eight ounces of oil; the decoction, thus diveſted of the aromatic part of the plant, yields, on being inſpiſſated, an unpleaſant bitteriſh extract. Rectified ſpirit likewiſe, diſtilled from roſemary leaves, becomes conſiderably impregnated with their fragrance, leaving, however, in the extract the greateſt ſhare both of their flavour and pungency. The active matter of the flowers is ſomewhat more volatile than that of the leaves, the greateſt part of it ariſing with ſpirit. Tournefort obſerves, that thoſe ſorts of roſemary, which produce neither flowers nor ſeeds, and which have very hard ſhrubby ſtalks, and long narrow leaves, ſmell ſtrongly like camphor, and yield on diſtilling a large quantity, for the purpoſe of obtaining their oil, a portion alſo of real camphor.

Roſemary is reckoned one of the moſt powerful of thoſe plants which ſtimulate and corroborate the nervous ſyſtem; it has, therefore, been recommended in various affections, ſuppoſed to proceed from debilities, or defective excitement of the brain and nerves; as in certain head-aches, deafneſſes, giddineſſes, palſies, &c. and in ſome hyſterical and dyſpeptic ſymptoms. Dr. Cullen ſuppoſes the ſtimulant power of roſemary inſufficient to reach the ſanguiferous ſyſtem; it has however the character of being an emmenagogue, and the only diſeaſe, in which Bergius ſtates it to be uſeful, is the chloroſis. In diſorders of this kind it has been given in the form of infuſion; but it is now ſcarcely ever preſcribed, unleſs as an odorous additament to ſternutatory powders. The doſe in ſubſtance may be from grs. x to ℈ij, and from ʒj to ʒiſs in infuſion. The officinal preparations are the "oleum roſmarini," and "ſpiritus roſmarini." It is alſo a principal ingredient in what is known by the name of HUNGARY *Water;* which ſee.

ROSEMARY, *Oil of*, Oleum roſmarini, Lond.; Oleum ſummitatum florentium roriſmarini officinalis, Edinb.; Oleum herbæ floreſcentis roris marini, Dub., is prepared by diſtilling twenty-four pounds of the plant, which yield one ounce of a fluid colourleſs oil, the odour of which is leſs agreeable than that of the plant. It depoſits cryſtals of camphor when long kept. Its ſpecific gravity is .934. (See OIL.) This oil is ſtimulant; and frequently enters into the compoſition of liniments. The doſe, as an internal remedy, may be from ♏ij to ♏vi; but it is ſcarcely ever ordered.

ROSEMARY, *Spirit of*, Spiritus roſmarini (Lond.) is obtained by macerating two pounds of freſh roſemary tops in a gallon of proof ſpirit, with water ſufficient for preventing empyreuma, for twenty-four hours, and then diſtilling a gallon in a gentle heat. Spiritus roriſmarini officinalis (Edinb.) is prepared by taking two pounds of freſh roſemary tops and eight pounds of alcohol (ſpec. grav. .335), and drawing off ſeven pounds by diſtillation in a water bath. Spiritus roriſmarini (Dub.) is obtained by diſtilling with a moderate fire five pints from a pound and a half of freſh roſemary tops and a gallon of proof ſpirit. Oil of roſemary is ſufficiently volatile to riſe in diſtillation with rectified ſpirit, which the Edinb. college has, therefore, directed to be uſed. It is a fragrant perfume; and is chiefly uſed in the compound ſoap liniment or the compound ſpirit of lavender. Lewis Mat. Med. Woodv. Med. Bot. Thomſon's Diſp.

ROSEMBERG, in *Geography*, a town of Pomerelia; 10 miles S. of Dantzic.

ROSENAU, a town of Pruſſia, in Oberland; 16 miles E. of Marienwerder.—Alſo, a town of Moravia, in the circle of Prerau; eight miles E. of Meſeritſch.—Alſo, a town of Hungary, near which are mines of gold, copper, quickſilver, and cinnabar; 24 miles W. of Caſchau.

ROSENBERG, a town of Pruſſia, in the province of Oberland; 17 miles E. of Marienwerder. N. lat. 53° 39′. E. long. 19° 10′.—Alſo, a town of Hungary, on the Waag, trading chiefly in ſalt; 18 miles N. of Libeten.—Alſo, a town of Bohemia, in the circle of Bechin; 37 miles S. of Bechin. N. lat. 48° 40′. E. long. 14° 18′.

ROSENBERG, or *Oleſno*, a town of Sileſia, in the principality of Oppeln; 26 miles N.E. of Oppeln. N. lat. 50° 52′. E. long. 18° 28′.

ROSENBURG, a town of the duchy of Magdeburg; 24 miles S. of Magdeburg.—Alſo, a ſmall Dutch iſland, at the mouth of the Meuſe; three miles E. of Briel.

ROSENDAL, a town of Brabant; 15 miles W. of Breda.

ROSENDORF, a town of Bohemia, in the circle of Leitmeritz; ſix miles W. of Kamnitz.

ROSENEATH, a town of Scotland, in Dumbartonſhire; nine miles W.N.W. of Dumbarton.

ROSENESS, a cape on the S. coaſt of the iſland of Pomona. N. lat. 58° 45′. W. long. 2° 42′.

ROSENFELD, a town of Wurtemberg; eight miles S.E. of Sulz. N. lat. 48° 14′. E. long. 8° 43′.

ROSENGAT, a town of Germany, oppoſite to Worms.

ROSENHEIM, a town of Bavaria, at the conflux of the Inn and the Manguald; 38 miles W. of Salzburg.

ROSENHOF, a town of the duchy of Holſtein; five miles N. of Ciſmar.

ROSENIA, in *Botany*, ſo called by Thunberg, in honour of two brothers of the name of Roſen, both eminent as phyſicians and botaniſts, one of whom is well known as the determined and jealous rival of the early fame of Linnæus, though afterwards his friend. (See LINNÆUS.) This gentleman, who died in 1773, aged 67, was profeſſor of Medicine at Upſal: the other at Lund. They were natives of Sweden, and knights of the Polar Star.—Thunb. Prodr. præf. n. 59. Nov. Gen. diſſ. 12. 161. Willd. Sp. Pl. v. 3. 2134.—Claſs and order, *Syngeneſia Polygamia Superflua*. Nat. Ord. *Compoſitæ Diſcoideæ*, Linn. *Corymbiferæ*, Juſſ.

Gen. Ch. *Common calyx* of many leaves, imbricated; ſcales ovate, obtuſe, undivided, ſmooth, tranſparent, with a brown, opaque, longitudinal line. *Cor.* compound, radiated; *florets* of the diſk perfect, tubular, five-cleft; thoſe of the radius female, ligulate, convolute, arched. *Stam.* (in the perfect florets) Filaments five, very ſhort; anthers united into a cylindrical tube. *Piſt.* (both in the diſk and radius) Germen ſmall, ſtyle thread-ſhaped; ſtigma cloven. *Peric.* none, except the unchanged calyx. *Seed* (in both kinds of florets) angular, ſmooth; down, of two kinds of capillary ſcales; the two innermoſt of the radius generally ſetaceous and longeſt; the outermoſt capillary, united at the baſe into ſeveral parcels. *Recept.* compoſed of lanceolate, membranaceous ſcales.

Eſſ. Ch. Receptacle chaffy. Seed-down of two kinds, chaffy. Corolla radiated. Calyx ſcarioſe.

1. R. *glanduloſa*. Thunb. and Willd.—Native of the interior of the Cape of Good Hope. For all that is known of this ſolitary ſpecies of *Roſenia*, we are indebted to the following deſcription of Thunberg. "*Stem* ſhrubby, round, ſmooth, wavy, erect, much branched, generally more than two feet high. *Branches* and *branchlets* alternate, three or four together, in a cluſter, ſpreading, ſtriated: the branchlets lateral, very ſhort, leafy. *Leaves* ſomewhat cluſtered, approximating, ſeſſile, ovate, obtuſe, undivided, ſlightly concave,

cave, chiefly glandular at the margin, downy, thickifh, imbricated, half as long as the nail. *Flowers* capitate, terminal."

ROSENOU, in *Geography*, a town of Pomerania; eight miles S.S.E. of Cofslin.

ROSENTHAL, a town of the principality of Heffe; eight miles N.N.W. of Marburg.—Alfo, a town of Weftphalia, in the bifhopric of Hildefheim; three miles S.W. of Peina.—Alfo, a town of Pruffia, in the palatinate of Culm; eight miles N.E. of Bretchen.—Alfo, a town of Bohemia, in the circle of Bechin; three miles N. of Rofenberg.

ROSEOLA, in *Medicine*, a term appropriated, in the nomenclature of cutaneous difeafes devifed by the late Dr. Willan, to a rofe-coloured rafh or efflorefcence upon the fkin, which is varioufly figured, without any elevation of the furface, and not communicable by contagion.

This rafh is of little importance in a practical view, becaufe it is moftly a mere concomitant of different febrile complaints, and requires no deviation from the treatment adapted to their relief; but as it is fometimes miftaken both for fcarlet fever and meafles, which are contagious and often dangerous difeafes, fo it ought to be known, and its varieties difcriminated. The appellation of rofeola is to be found in the works of fome of the early modern writers; but it was applied fomewhat indifcriminately to every red rafh, to fcarlet fever, meafles, &c. Fuller, in his Exanthematologia, p. 128, fpeaks of a fort of rofe-rafh, as a flufhing all over the body, like fine crimfon, which, he fays, is void of danger, and "rather a ludicrous fpectacle, than an ill fymptom."

Seven varieties of rofeola were diftinguifhed by Dr. Willan under the following appellations.

1. The rofeola *æftiva*, fo called from its ufual occurrence in fummer, is fometimes preceded for a few days by flight feverifh fymptoms, fuch as pains in the head and limbs, laffitude, and liftlefsnefs. The rafh appears firft on the face and neck, and, in the courfe of a day or two, is diftributed over the reft of the body, producing a confiderable degree of itching and tingling. The mode of diftribution is into feparate fmall patches of various figure, but of larger and more irregular forms than in the meafles, with numerous interftices of the natural fkin. It is at firft red, but foon affumes the deep rofeate hue peculiar to it. The fauces are tinged with the fame colour, and a flight roughnefs of the tonfils is felt in fwallowing. The rafh continues vivid through the fecond day; after which it declines in brightnefs, flight fpecks only of a dark red hue remaining on the fourth day, which, together with the conftitutional affection, wholly difappear on the fifth.

Not unfrequently, however, the rafh is partial, extending only over portions of the face, neck, and upper part of the breaft and fhoulders, in patches, very flightly elevated, and itching confiderably. In this form the complaint continues a week or longer, the rafh appearing and difappearing feveral times; fometimes without any apparent caufe, and fometimes from fudden mental emotions, or from taking wine, fpices, or warm liquors. The retroceffion of the rafh is ufually accompanied with diforder of the ftomach, head-ache, and faintnefs, which are immediately relieved on its re-appearance.

This fpecies of rofeola ufually occurs in the fummer feafon, and particularly in females of an irritable conftitution. The patients commonly afcribe it to fudden alternations of heat and cold, and efpecially to having drank cold liquors, when perfpiring after exercife. Sometimes it occurs in connection with bilious diarrhœa, cholera, dyfentery, or other bowel complaints of the hot feafon; and fometimes it appears after much fatigue.

Very little medical treatment is required for this eruption, which is generally alleviated by moderate diet, from which every thing heating is excluded; and by the ufe of acidulated drinks, with occafional laxative medicines. The complaint is never dangerous, except from the fudden repulfion of the eruption, in confequence of expofure to very chill air, or of the application of cold water; in which cafe violent diforder has taken place in the head, ftomach, or bowels of the patient, as happens under fimilar circumftances in other eruptive difeafes, fuch as meafles, the red gum, &c.

2. The rofeola *autumnalis* is not uncommon in children of five, or from that to ten years of age, in the autumn. It occurs in diftinct patches, of an oval or circular fhape, which occafion no elevation of the cuticle, and gradually increafe to about the fize of a fhilling. Their hue is of a dark damafk red; fo that at a diftance the fkin appears as if ftained with the juice of black cherries or mulberries. They are ufually diffufed over the arms, feldom on the face and body; and they continue about a week, being fometimes, but not always, fucceeded by defquamation. This eruption is not accompanied by much itching or tingling, nor is there any fymptom of general diforder, except a whitenefs of the tongue. It is generally removed in a fhort time by the exhibition of the diluted fulphuric acid internally.

3. The rofeola *annulata* appears on almoft every part of the furface of the body in rofe-coloured rings, which have central areas of the ufual colour of the fkin; and it likewife flightly affects the throat. The rings are at firft from a line to two lines in diameter; but they gradually dilate, leaving a larger central fpace, fometimes to the diameter of half an inch; and excite, efpecially in the night, a troublefome fenfation of heat, and of itching or prickling. The duration of the eruption is very uncertain; in fome cafes it commences with fhivering fucceeded by heat, and is attended with head-ache, flufhing of the face, ficknefs at the ftomach, and pains in the limbs; it then continues four or five days, and difappears as the febrile fymptoms decline. In other cafes, which are without fever, the complaint is of long duration; the efflorefcence ufually fades in the morning, and returns in the evening or night, the rings becoming vivid, and fometimes a little elevated. If the rings fhould difappear, or be very faint in colour for feveral fucceffive days, the patient becomes affected with pain in the ftomach, ficknefs, vomiting of bile, great languor, giddinefs and aching in the limbs. Thefe fymptoms are alleviated or removed by the ufe of the warm bath, after which the efflorefcence generally returns. Sea-bathing and the mineral acids afford much relief to the more chronic forms of this fpecies of rofeola.

The annular rofeola appears to be fometimes connected with an irregular ftate of the catamenia in women, and with gouty and rheumatic complaints in both fexes. It fometimes fucceeds to a fit of the gout, and we have feen it appear as the precurfor of a fit, which immediately followed its difappearance.

4. The rofeola *infantilis* affects children during the period of teething, in fevers, and in diforders of the bowels, and the rafh is ufually fo clofe and full as to leave very fmall interftices of the natural hue of the fkin. It is very irregular, however, in its appearance and progrefs, fometimes continuing only for a night; fometimes appearing and difappearing for feveral fucceffive days, being attended with fymptoms of violent irritation; and fometimes arifing in fingle,

fingle, but numerous and coalefcing, patches, of about the fize of a fixpence, which continue for feveral days, and terminate in fcurf. This rafh, where it is pretty generally diffufed, is often miftaken, as Dr. Underwood has remarked, for meafles and fcarlet fever. Whence it is neceffary, that its character fhould be well known to medical practitioners; although it requires no fpecific treatment, but ufually difappears under the employment of remedies calculated to relieve the bowel complaints, painful dentition, and other febrile affections, with which it is fo frequently connected.

5. The rofeola *variolofa* occurs previous to the eruption of the fmall-pox, when produced by an inoculation, in the proportion of about *one* cafe in *fifteen*, according to obfervations made at the Small-Pox Hofpital. It ufually appears on the fecond day of the eruptive fever, which is generally the ninth or tenth after inoculation, and is deemed by inoculators a certain prognoftic of a fmall and favourable eruption of the fmall-pox. It does alfo occafionally occur in the natural fmall-pox, on the third or fourth day, and with a moderate and favourable eruption of puftules; but it is much more rare than in the inoculated difeafe.

This rafh is firft obfervable on the arms, breaft, and face: on the following day it extends over the trunk of the body and the extremities. Its diftribution is various; fometimes in contiguous femicircles; fometimes in longitudinal irregular patches, with fmall diftinct dots intermixed; and in a few cafes, all thefe appearances being combined, it forms an almoft continuous rednefs over the body, and is in feveral parts flightly elevated above the furface, as in the meafles. It is not eafily repelled by cold air, or cold drinks, as the early inoculators apprehended; and is aggravated by the confinement and fudorific medicines which they recommended.

Thefe rofeolous efflorefcences, antecedent to the eruption of fmall-pox, were occafionally obferved by the firft writers on the difeafe; and both by them and fubfequent authors were deemed to be meafles, which were faid to be converted into fmall-pox.

6. Rofeola *vaccina*. An efflorefcence which is fomewhat diffufe, like the variolous rafh, but appears generally in congeries of dots and fmall patches, a little elevated, takes place in fome children on the ninth and tenth day of *vaccination*, at the place of inoculation, and at the fame time with the areola that is formed round the veficle; and from thence it fpreads irregularly over the whole furface of the body. But this does not occur nearly fo often as after variolous inoculation. It does not continue vivid above forty-eight hours; and is ufually attended with a very quick pulfe, a white tongue, and great reftlefsnefs. Some vaccinators attach little importance to it; others think it a favourable circumftance, as denoting that the fkin and conftitution have been fully affected by the cow-pock.

7. Rofeola *miliaris*. This rafh often accompanies an eruption of miliary veficles, with fever, where much heat and fweating have been excited. (See Miliary *Fever.*) It occurs occafionally, however, in the continued fevers of this country, where neither a miliary eruption nor profufe fweating had preceded it, and does not appear to be an unfavourable fymptom. See Willan on Cutaneous Difeafes, p. 433, et feq., and Bateman's Pract. Synopfis of Cutan. Dif. p. 96. 3d edit. See alfo Underwood, on the Dif. of Children, vol. i. p. 87.

ROSES, *Iflands of Two,* in *Geography*, two fmall iflands in the Indian fea, near the coaft of Africa. S. lat. 17°.

Roses. See Rosas.

ROSETO, a river of Naples, which runs into the gulf of Tarento, N. lat. 40° 2′. E. long. 16° 40′.

ROSETTA, Rossetta, or *Rafchid*, a town of Egypt, of confiderable fize and population, founded in the eighth century, as fome have faid; though Elmacin informs us, that it was built during the reign of Elmetouakkel, caliph of Bagdad, towards the year 870 of our era, and under the pontificate of Cofma, patriarch of the Jacobites at Alexandria. Others date its foundation at a much later period; and Belon, who travelled in Egypt in 1530, fays that this town was much fmaller than Faoüé, but at prefent it is much larger. It has borne the Arabic name Rafchid ever fince the time of Edriffi the geographer, in 1153, and of this the Europeans have made Rofetta or Roffetta. Some have erroneoufly afferted, that it was built on the fpot where Canopus was fituated; whereas the Canopic branch of the Nile is the lagoon of Maadié, and the ruins of Canopus are at Aboukir. Rofetta affords no trace of antiquity; neverthelefs it is certain, fays Sonnini, that it cannot be far from the place where ftood Metelis or Metilis, of which Strabo and Ptolemy make mention, and which was on the weftern bank, and near the mouth of the Bolbitic branch of the Nile. The heaps of fand, which this river is continually accumulating, no longer permit veffels to reach as far as Faoué. Although Rofetta was built at the mouth of the river, it is already two leagues from it. According to Abulfeda it was very inconfiderable in the 13th century; nor was it much increafed for 200 years after this time. But when the Ottomans added Egypt to their conquefts, they neglected the fupport of the canals. Thus, the canal of Faoué ceafing to be navigable, Rofetta became the emporium of the merchandize of Alexandria and Cairo. Commerce foon made it flourifh, and it is at this day one of the handfomeft towns in Egypt. It extends along the weftern bank of the Nile, and is above a league in length, by a quarter of a mile in breadth. Although it has no remarkable place, nor any one ftreet quite regular, yet all the houfes, being built with terraces, and well difpofed, have, by Savary's defcription of it, an air of cleanlinefs and elegance, which is very agreeable; to which Sonnini adds, that here are feen long ftreets formed by two rows of fhops, in which are found all forts of goods; the neceffaries of life being very plentiful, and procured at a low price. Within the houfes are fpacious apartments, well ventilated by a great number of windows, which are always open. The blinds and tranfparent linen, which they ftretch over them, keep out the rays of the fun, afford a moderate light, and mitigate the exceffive heats. The only public buildings worthy of notice are the mofques, with their lofty minarets, of light architecture, and conftructed with much boldnefs. They thus produce a very picturefque effect in a town where all the roofs are flat, and throw great variety into the picture. The houfes in general have a view of the Nile, and of the Delta, which form a moft magnificent fpectacle. The river is always covered with veffels, mounting and defcending with oars, or under fail. The tumult of the harbour, the joy of the mariners, their noify mufic, exhibit a moving and animated fcene. The Delta, that immenfe garden, where the earth is never weary of production, furnifhes the whole year a fucceffion of harvefts, of vegetables, of flowers, and of fruits; various fpecies of cucumbers and delicious melons, the fig, the orange, the banana, the pomegranate, of the moft exquifite flavour. To the north of the town are gardens, where lemon and orange trees, date trees, and fycamore trees, are planted at random; by their foliage affording an arch impenetrable to the rays of of the ſun, and by their flowers rendering the ſhade of theſe groves delightful. The houſes of Roſetta, ſays Sonnini, are much better built, in general, than thoſe of Cairo: its ſituation upon the banks of the river; the view of the Delta, which preſents, as Savary deſcribes it, the delightful proſpect of the moſt beautiful culture, the perfumed groves in its neighbourhood, and its pure and wholeſome air, have moſt deſervedly procured for it the name of the "garden of Egypt." Commerce conſtitutes the principal wealth of the inhabitants of Roſetta. The importation of foreign merchandize to Cairo, and of the productions of Egypt into the port of Alexandria, employs a great number of mariners. (See Boghass and Scherm.) The bar of the Nile is totally ſhut during two months of the year, and the commerce of Alexandria is interrupted. But if all the ſhips in Egypt were to periſh, the Ottoman government, ſays Savary, would not remove one inch of ground of the canal of Faoué to render it navigable. It ſuffers every thing to go to ruin, and repairs nothing.

In the town of Roſetta a profound ſilence reigns, uninterrupted by the noiſe of any carriage. The inhabitants move with gravity through the ſtreets, clad in long robes which hang down to their heels. Their heads are covered with heavy turbans, or bound round with a ſchale or ſhawl, which is a long piece of ſtuff made of ſilk or wool. The girdle is made uſe of by both ſexes. The citizen is armed with a knife, the ſoldier with a ſabre, and a pair of piſtols. The women of the lower claſs, whoſe dreſs conſiſts of a large blue ſhift, and a long pair of drawers, have their faces covered with a piece of linen, with holes oppoſite to the eyes. The rich wear a large white veil, with a cloak of black ſilk, that wraps up their whole body. But though they are thus maſked, they are not ſcrupulous in making ſigns, nor in ogling.

The moſt ordinary paſtime here is ſmoking and drinking coffee. From morning to night the inhabitants have their pipes in their mouths; at home, in each other's houſes, in the ſtreets, on horſeback, they keep their pipe lighted, and the tobacco-bag is hung at their waiſt. If the inhabitants of Roſetta be leſs barbarous, ſays Sonnini, than thoſe of the other parts of Egypt, they are not leſs ignorant, leſs ſuperſtitious, nor leſs intolerant. We find among them, although with ſhades more ſoftened down, the ſame roughneſs of character, the ſame implacable averſion towards the nations of Europe, and diſpoſition to inſult both Chriſtians and Jews, the ſame revengeful diſpoſition, in a word, the ſame treachery; and they are addicted to the ſame ſhameful vices, ſome of which we cannot name.

The country round Roſetta is an immenſe ſurface, without a mountain or hill, interſected by innumerable canals, covered with harveſt and a variety of trees, which winter never ſtrips of their leaves. The ſoil is a black mould, the fertility of which is inexhauſtible. The chief article of cultivation is rice, called in the vicinity of Roſetta "ſultani," which is ſown from the month of March to that of May, tranſplanted on the banks of the Nile, and on the borders of the canals at the end of July, and cut in November. (See Egypt.) Rice forms a principal article of exportation, which they dry by ſpreading upon the terraces of the houſes and in the public ſquares; and to this operation is attributed the multitude of gnats, with which the town and the inſide of the houſes are filled at the time when it is performed.

Roſetta, beſides being the great emporium of the trade that is carried on between Cairo and Alexandria, has ſome branches of commerce peculiar to itſelf; ſuch as ſpun cotton, dyed red, which is drawn from the adjacent diſtricts; dreſſed flax, linen cloths, ſilk dyes for the eaſtern dreſſes, &c. The flax of the country, which is long, ſoft, and ſilky, would make beautiful linen, if they knew how to employ it; but the ſpinſters are very inexpert, and the thread they make is clumſy, hard, and uneven. The linens they bleach ſerve for the table; the reſt, dyed blue, is employed for the clothing of the people. In Roſetta there are ſtore-houſes of natron, and manufactories where it is uſed. (See Natron.) Moſt of the merchants of this town are Turks or Syrians, and ſome from Barbary. The Copts are numerous, together with ſome Arabs. The command of the town is veſted in an officer of the Mamlouks, who bears the title of Aga. About a league from the ſea, northward of Roſetta, are two caſtles, one on the weſtern bank of the Nile, and the other on the oppoſite bank of the river, conſtructed to defend the entrance of the river. The former, which is aſcribed to St. Lewis in the time of the cruſades, is almoſt entirely demoliſhed; and the few cannon which remain in it are unfit for ſervice. Theſe two forts, though inconſiderable, and in a ruinous ſtate, would be ſufficient to ſtop veſſels from entering the river, if the Turks knew how to make uſe of cannon; but here they have no occaſion for it; as nature has guarded the mouth of the Nile, by raiſing a dangerous bar, called the *Boghaſs* or *Bogaz*, which is the terror of mariners. About half a league to the ſouth of Roſetta is a tower, called the tower of Canopus, from the erroneous ſuppoſition that Roſetta is on the ſcite of the ancient Canopus. This tower has been built, in modern times, upon a hillock of ſand, which at this place forms the W. bank of the Nile. It is ſquare, and partly demoliſhed. In the lower part the inhabitants of this diſtrict ſhew the opening of a ſubterraneous paſſage, which, as they ſay, led to Alexandria. Near the top of the ſame is preſented a general view of the country, having no bounds except thoſe which nature has preſcribed; and near its foot, cloſe to the edge of the Nile, ſtands a moſque, conſecrated to a holy Muſſulman, called "Abou-Mandour," which ſignifies father of the light. This ſaint, if he be the father of the light, is alſo the terror of the ſands, as, but for him, they would long ago have overwhelmed Roſetta, and added it to their dreary domain. Oppoſite to this moſque, upon the E. bank of the Nile, are two or three houſes, called Maadée, becauſe they ſtand at the place facing the uſual paſſage to the Delta. On the weſt bank, at a ſhort diſtance above Abou-Mandour, is Dgeddiè, a conſiderable village, in the environs of which a great number of vine-plants grow in the ſand; from hence Roſetta and Alexandria are ſupplied with grapes.

At the foot of the tower above-mentioned, a large ſemicircular baſon announces a port, which has been choaked up by the ſand. In digging at the bottom of this hillock, twenty beautiful marble pillars were diſcovered by a Turkiſh merchant, who was ſtripped of his fortune by the Beys, from an imagination that he had carried off a treaſure from this place. M. d'Anville ſuſpects that the ancient Bolbitina muſt have been at a very ſmall diſtance from the ſpot on which Roſetta now ſtands. The ruins now mentioned ſeem to confirm his conjecture; as they are at the extremity of a town, and can only belong to the Bolbitina ſpoken of by Steph. Byz. and which gives its name to one of the branches of the Nile. This place is very pictureſque; the tower, falling into ruins, is ſurrounded by tombs, and to the weſtward is a deſart plain, whoſe burning extent the eye cannot look over without horror; but on the E. the contraſt is very ſtriking, preſenting a majeſtic river, and the Delta, uniting moſt profuſely the graces of the ſpring, the beauty of the ſummer, and the rich luxuriance of the autumn.

Sir R. Wilſon has given us a picture of Roſetta, very different from that which we have above exhibited. He ſays, it is built of a dingy red brick, and that a great part of the town is in ruins, many of the houſes having been pulled down by the French for fuel. The ſtreets are not more than two yards wide, and full of wretches, which the pride of civilization revolts at acknowledging to be human. The number of blind perſons is prodigious; nearly every fifth inhabitant having either loſt, or having ſome humour in, his eye. The eryſipelas, the dropſy, the leproſy, the elephantiaſis, and luſi naturæ, conſtantly offend the ſight. Filth, moſquitos of the moſt dreadful ſort, vermin of every kind, women ſo ugly, that, fortunately for Europeans, their faces are concealed by a black cloth veil, in which are cut two eye-holes; ſtench intolerable; houſes almoſt uninhabitable:—theſe form the charms of Roſetta, and Savary's garden of Eden. The quay, however, is allowed to be a handſome object, and might be made noble. The baths are repreſented as horridly diſguſting. Dr. Wittman, cited alſo by Crutwell, obſerves, that though it contains but few ſtriking public edifices, Roſetta muſt be conſidered as a handſome place by thoſe who have been accuſtomed to mud walls and ſandy deſarts; the moſques and their minarets, as well as their houſes, built with bricks, plaſtered over and white-waſhed. The population he eſtimates at 8 or 10,000, but from the number of empty houſes, it appeared capable of containing at leaſt treble that number. In 1807, the Britiſh were defeated here, with conſiderable loſs, by the Turks; 90 miles N.W. of Cairo. N. lat. 31° 24'. E. long. 30° 40'. Savary. Sonnini. Niebuhr.

ROSETTE, in *Military Language*, an ornamental branch of ribbands, or cut leather, which is worn both by officers and ſoldiers in the Britiſh ſervice, on the upper part of their cues.

ROSETTES, two ſmall bunches of ribbands that are attached to the loops by which the gorget of an officer is ſuſpended upon his cheſt. The colour of the ribband muſt correſpond with the facing of the uniform. The French uſe the ſame term.

ROSETTI, DONATO, in *Biography*, an ingenious Italian, who flouriſhed in the 17th century, but of whoſe perſonal hiſtory little is known. He was a native of Leghorn, where he was probably educated, and was ſo ſucceſsful in the cultivation of the ſciences, that at a very early age he was conſidered as completely qualified to teach mathematics and the elements of philoſophy in different univerſities. While he was profeſſor of logic at Piſa, he publiſhed a treatiſe relating to the ſyſtem of the earth, which was well received. The title of this work was "Antignome fiſico Mathematiche con il nuovo Orbe e Syſtema terreſtre." This was followed by "A Collection of phyſico-mathematical Inſtructions;" "A Treatiſe on the Compoſition of Dutch Glaſſes, and Glaſs Drops;" "A Collection of phyſico-mathematical Demonſtrations" of propoſitions which he had undertaken to prove. In his "Antignome," he maintained that the number of ſenſes was eleven; this increaſe he made out by conſidering the different modes in which we touch bodies as ſo many different ſenſes, and endeavouring to ſhew that the perceptions ariſing from them cannot properly be aſcribed to the ſenſe of feeling in general. He was the author of another treatiſe, entitled "Poliſta fedele," intended to explain the inclination of bodies to unite at their poles, and various phenomena reſpecting their hardneſs, their elaſticity, their extenſion, and the cauſes which convert ſolids into fluids. It is not known when this philoſopher died: he was living at Piſa in the year 1678.

ROSETTI, ANTONIO, chapel-maſter to the duke of Mecklenburg Schwerin, born, according to Gerber, at Milan, in 1744; but we have better authority to ſay that he was a native of Bohemia, and a diſciple of the great Haydn at Vienna, where, in 1755, he was a violiniſt in the imperial chapel, and afterwards in the ſervice of count Althan, 1780. Since that time he has been a voluminous publiſher at Hamburgh and Leipſic, of pieces for the piano-forte, with and without a violin accompaniment, of ſymphonies for a full orcheſtra, on the plan of his maſter Haydn, flute concertos, &c. Some of his ſymphonies, when performed at the concerts in England, while Haydn was in this country, we thought written with force, and abounding with fire and new paſſages.

ROSEWAY PORT, in *Geography*, a populous ſea-port town on the S.E. coaſt of Nova Scotia, N.E. by E. of cape Negro and Harbour.

ROSEWAY *Iſland*, an iſland that lies at the mouth of Port Wager, on the S.E. coaſt of Nova Scotia.

ROSEWELL, THOMAS, in *Biography*, a Preſbyterian divine, was born in Somerſetſhire about the year 1630, and was educated at Oxford. After leaving the univerſity, he was preſented to the living of Strode, in his native county, from which he was ejected in the year 1662, by the Bartholomew act. In 1674 he officiated with a Non-conformiſt congregation at Rotherhithe; and in the year 1684 he was arreſted on a charge of high treaſon: on this charge he was tried in the court of king's bench, November 8th, before the infamous Jefferies. The indictment was on words ſaid to have been delivered from the pulpit, and the witneſſes were three women of abandoned characters, of whom the chief was afterwards ſet in the pillory for perjury. The trial laſted ſeven hours, and Mr. Roſewell behaved with all the decency and reſpect that could have been expected, and made a defence that was applauded by all who heard him. The women, ſays biſhop Burnet, could not prove, by any circumſtance, that they were even preſent at the meeting, and the words to which they ſwore were ſo groſs, that it was not to be imagined that any man in his wits would have made uſe of them in a mixed aſſembly; yet Jefferies urged the matter with his uſual vehemence. He laid it down as an axiom, concerning which there could be no controverſy, that all preaching at conventicles, as he was pleaſed to call diſſenting places of worſhip, was treaſonable, and that this ought to diſpoſe the jury to believe any evidence upon that head. The jury accordingly found the priſoner guilty. As ſoon, however, as the trial was over, ſir John Talbot, who was preſent at it, went to the king, and urged it on his majeſty, that if ſuch evidence was admitted, as had appeared againſt Mr. Roſewell, no one of his ſubjects would be ſafe. Upon this, when Jeffries ſoon after came into the royal preſence, with an air of exultation and triumph, to congratulate his majeſty on the conviction of a traitor, the king afforded him a cool reception, which mortified him exceedingly, but at the ſame time it gave a complete turn to the bent of his mind; ſo that when the court met to hear Mr. Roſewell's counſel, who moved for an arreſt of judgment, this judge, who was as mean as he was corrupt and cruel, aſſumed a tone of moderation, and ſtrongly recommended to the king's counſel caution and deliberation where the life of a man was depending. The priſoner was, in the end, pardoned. He died in 1691. Neal's Hiſt. vol. iv.

ROSHAN, or ROSHAWN, in *Geography*, a country of Aſia, ſituated between Meckley and Arracan, between 92°

92° and 95° E. long., and 21° and 23° N. lat.; about 120 miles in length, and 80 in breadth. See ARRACAN.

ROSHEIM, a town of France, in the department of the Lower Rhine, and chief place of a canton, in the district of Barr; 15 miles S.W. of Strasburgh. The place contains 3355, and the canton 12,017 inhabitants, on a territory of 227½ kiliometres, in 15 communes.

ROSHOVER, a township of Pennsylvania, in Westminster county, containing 1786 inhabitants.

ROSICRUCIANS. See ROSYCRUCIANS.

ROSIENNE, in *Geography*, a town of Samogitia, in which the diet and court of judicature are held; 76 miles S. of Mittaw. N. lat. 55° 30′. E. long. 41° 57′.

ROSIERE, LA, a small island near the S.W. coast of the island of Jersey; 1 mile E.S.E. of Noirmont Point.

ROSIERE, a town of France, in the department of the Somme, and chief place of a canton, in the district of Montdidier. The place contains 2760, and the canton 13,812 inhabitants, on a territory of 120 kiliometres, in 21 communes.

ROSIERES *aux Salines*, a town of France, in the department of the Meurte, on the Meurte, formerly celebrated for its salt-works; 6 miles W. of Luneville.

ROSIERS, a town of France, in the department of the Mayne and Loire, on the Loire; 7 miles N.W. of Saumur.

ROSIERS, *Cape*, the S. limit of the mouth of the river St. Lawrence; being the easternmost point of the district of Gaspee, in Lower Canada. N. lat. 48° 56′. W. long. 63° 40′.

ROSIGNANA, a town of Etruria; 13 miles S.E. of Pisa.

ROSIL, in *Rural Economy*, a term applied to such land as is neither light nor heavy, being a medium between sand and clay; it is sometimes written *rosills*.

ROSILLY BAY, in *Geography*, a bay on the S. coast of Wales. N. lat. 51° 32′. W. long. 4° 16′.

ROSIN, JOHN, in *Biography*, an antiquary, was born at Eisnach in 1551, and died of the plague in 1626. He was author of "Antiquitatum Romanarum," a work of high reputation, of which the best edition is that of Utrecht, in 1701.

ROSIN, *Resina*, in *Pharmacy*. See RESIN.

ROSIN is particularly used for a resinous matter prepared from the juice of the pine-tree; in ordinary use for the making of ointments, plasters, and for other purposes.

For the method of procuring it, see PINE, and TURPENTINE.

ROSITO, in *Geography*, a town of Naples, in Calabria Citra; 16 miles N.E. of Cassano.

ROSITO, *Cape*, a cape on the east coast of Calabria. N. lat. 40° 5′. E. long. 16° 40′.

ROSKOPF, a mountain of Austrian Swabia; 1 mile S.E. of Schonau.

ROSLAND, in our *Old Writers*, heathy land, or ground full of ling: also watery and moorish land.

ROSLAVL, in *Geography*, a town of Russia, in the government of Smolensk. N. lat. 54°. E. long. 32° 50′.

ROSLAW, a river of Saxony, which runs into the Elbe, opposite to Dessau.

ROSLDORF, a town of Austria; 6 miles S.W. of Ehrnsprunn.

ROSLYN, ROSLIN, *Roselyn*, or *Roskelyn*, a village in the parish of Laswade, and county of Midlothian, Scotland, is about six miles S.S.W. from Edinburgh. This place is much celebrated on account of its castle and chapel, and for the romantic character of the scenery in its immediate vicinity. An excursion to Roslyn is one of the favourite summer recreations of the inhabitants of the northern metropolis; and no traveller of taste leaves that part of the kingdom, without contemplating its beauties. The castle is seated on a bold and lofty rock, overhanging the river North-Esk, which dashes over a rugged channel at the base, in a semicircular sweep; and the precipitous banks are covered with a profusion of wood. Only a very small portion of the ancient building is now standing; but a modern mansion has been erected on part of the old walls. It is uncertain when this castle was built; but that event most probably occurred about the commencement of the 12th century, when William de Sancto-Clere (son to Waldernus de St. Clere, who came to England with William the Conqueror) obtained a grant of the barony of Roslyn from the Scottish king, Malcolm Canmore. No mention of it is made in history, however, till the reign of James II. of Scotland, when sir William Hamilton is stated to have been confined here, for joining the rebellious standard of earl Douglas. In 1554 it was set fire to, and in great part demolished, by the forces of king Henry VIII. The St. Clere family, or, as the name is now spelt, St. Clair, was anciently of great note in Scotland. Their possessions were very extensive, and their titles numerous, being earls of Caithness and Orkney, lords of Nithsdale, and barons of Pentland, Cousland, Cardain, Saint-Clair, Herbertshire, Hertfoord, Grahamshaw, Kirkton, Cavers, Newborough, and Roxburgh. Their affluence and power exceeded that of most contemporary nobles, either in England or Scotland; and they lived in a style of magnificence and splendour, which even the Scottish monarchs were scarcely able to rival. James II. conferred upon them the honour of being hereditary patrons and grand masters of masonry in Scotland; privileges which they continued to enjoy for several generations.

The chapel of Roslyn occupies the summit of a hill above the castle. It was founded in the year 1446, by William Saint Clair, earl of Caithness and Orkney, for a provost, six prebendaries, and two singing boys; and was endowed by him with considerable landed possessions. He did not, however, live to complete his undertaking, notwithstanding he spared neither trouble nor expence to effect this purpose before his death, which happened in 1479. From a manuscript memoir of the house of Douglas, deposited in the library of the Faculty of Advocates at Edinburgh, we learn many curious particulars relative to the building of this chapel. It is there said, that the founder "caused artificers to be brought from other regions and forraigne kingdomes, and causd dayly to be abundance of all kinde of workemen present;" and it is subsequently added, "and to the end the worke might be more rare, he causd the draughts to be drawn upon Eastland boords, and made the carpenters to carve them according to the draughts, and then gave them for patterns to the masons, that they might thereby cut the like in stone." The present building is generally supposed to have been intended only for the choir of a large collegiate church, which, according to tradition and probability, it was the design of the founder to have erected. Though in a mutilated state, its architecture is unique, and combines, according to Mr. Gandy, "the Egyptian, Grecian, Roman, and Saracenic styles;" and exhibits the arch "in all its possible forms and principles." This structure measures in the interior 68 feet in length, and 35 in breadth. The exterior is supported by 21 buttresses, surmounted by pinnacles, each differing from the others in its ornaments. Two of these buttresses have double pinnacles, the outer shafts of which are smaller than the inner, with which they are connected by flying abutments. Similar members alſo unite the larger pinnacles with the upper part of the chapel. The eaſtern end diſplays five buttreſſes, with four pointed windows intervening, all of uniform ſize and ſtyle, though varying ſomewhat in the tracery work with which they are ornamented. Each window is divided by a ſtone mullion, faced, both internally and externally, with double columns; and the tranſom of the arch is decorated with half figures of perſons in the attitude of ſupplication, and with different kinds of foliage. On the north and ſouth ſides of the chapel, in the lower compartment, are five windows of a ſimilar kind; alſo a pointed arched door-way, receſſed under a larger ſemicircular arch, above which is an irregular triangular window, highly ornamented. Another tier of windows, on each ſide, gives light to the upper part of the building; but theſe are now much mutilated, having loſt their mullions, tracery, &c. Between every two windows are two canopied niches, and a bracket, which appear to have been deſigned for ſtatues. This portion of the building is ſupported by two oppoſite ranges of five arches each, ſeparating the body of the chapel from the ſide aiſles; beyond which, at the eaſt end, there are two columns, and two more in the centre between them, all of them ſupporting ſtone beams, exhibiting a great variety of ſculptural ornaments. One of the centre pillars is wreathed, and is popularly called the apprentice's pillar, from a tradition reſpecting its execution by an apprentice of the maſter maſon of the ſtructure; who, it is ſaid, finding himſelf unable to underſtand the model furniſhed to him, went abroad for inſtructions, during which time the work was accompliſhed by the apprentice. It is ſingular that a ſimilar ſtory is told of ſome of the beſt ſculptures in Melroſe abbey; and we believe, alſo, of a much later production of art, the ſtatue of king Charles II. in the Parliament-ſquare at Edinburgh. Two heads in the chapel are ſaid to repreſent the maſter and the apprentice. The former is ſhewn as frowning, and the latter with a ſcar or indention on the forehead, to denote that he was murdered by his maſter, through envy of his ſuperior genius. At the eaſt end of the chapel are four altars, dedicated to different ſaints. "Of arches," ſays Mr. Britton, in his Architectural Antiquities, "there are more than thirteen varieties to be found in this building. A flat or ſegment beneath the roof of the aiſles, and over the door to the ſub-chapel; ſemicircular in the vault of the roof, and over the entrance doors; groined, acutely pointed over the weſtern aiſle; flat pointed between the centre and ſide aiſles; ſharp pointed in the lower windows; ogee to the piſcinas; flattened, and lateſt of the pointed ſtyle, inſide of the door-way, ſouth ſide; half ſegment in the flying buttreſſes; counter arch in the triangular windows; flat arch and ſegment joined in a door in the vault; ſeveral arches of various forms in the windows, niches, and canopies, alſo in the battlements." The vault above-mentioned is the burying-place of the family of the Sinclairs. The ſoil of it is ſo dry, that bodies have been found entire 80 years after their interment. They were formerly buried in armour, and without a coffin. "The late Roſlin," ſays father Hay, in his MS. memoirs, "was the firſt that was buried in a coffine, contrary to the ſentiments of James VII., who was then in Scotland;" and he adds, "that the great expence my mother was at in burying her huſband, occaſioned the ſumptuary acts that were made in the next parliament." There was formerly a ſuperſtitious ſtory relative to this chapel current among the common people in the neighbourhood. They believed that, previous to the death of any member of the Saint Clair family, the chapel was to be ſeen in flames, without ſuſtaining any injury. This ſuperſtition is alluded to by Mr. Scott, in his "Lay of the Minſtrel," in the following beautiful lines:

> "Seem'd all on fire that chapel proud,
> Where Roſlin's chiefs uncoffin'd lie,
> Each baron, for his ſable ſhroud,
> Sheath'd in his iron panoply.
> Seem'd all on fire, within, around,
> Deep ſacriſty, and altar's pale;
> Shone every pillar foliage bound,
> And glimmer'd all the dead men's mail.
> Blaz'd battlement and pinnet high,
> Blaz'd every roſe-carv'd buttreſs fair,
> So ſtill the blaze, when fate is nigh,
> The lordly line of high St. Clair."

The village of Roſlyn was anciently a place of conſiderable importance. King James II. conſtituted it a burgh of barony in the year 1456, and granted to the inhabitants a weekly market and a fair; but theſe privileges are now abandoned. The fields immediately contiguous are celebrated in hiſtory as the ſcene of three ſanguinary engagements betwixt the Engliſh and Scotch; all fought on the ſame day, the 24th of February, 1303. The particulars are thus narrated by the Scottiſh hiſtorians. During a truce, Ralph Confroy, treaſurer to Edward I., invaded Scotland at the head of thirty thouſand men. With a view to plunder, he divided his forces into three bodies; and having reached the vicinity of Roſlyn, encamped them in three diſtant ſtations. On being appriſed of this invaſion, ſir John Cumming and ſir Simon Frazer marched with 10,000 men to watch the motions of the enemy; and finding the firſt diviſion unprepared, attacked and routed it with great ſlaughter. The ſecond diviſion coming up immediately after the battle, ſhared the ſame fate; as did likewiſe the third diviſion, which appeared in a ſimilar manner at the cloſe of the ſecond action. This engagement excited much intereſt both at home and abroad; and is ranked among the nobleſt efforts of Scottiſh bravery. About half a mile lower down the Eſk, is ſituated the houſe of Hawthornden, remarkable not only for its having belonged to Drummond, the celebrated poet and hiſtorian, but alſo for the caves under it. There are various conjectures as to the original intention of theſe ſubterraneous cavities. Stukeley has given credit to a fabulous tradition, that they were ſtrong holds of the Pictiſh kings; and accordingly one cave is called the king's gallery, another the king's bed-chamber, and a third the guard-room. Setting aſide this groundleſs tradition, the moſt probable opinion is, that they were reſorted to as places of refuge during the deſtructive wars between the Engliſh and Scotch. Detached from the principal caves is a ſmaller one, called the Cypreſs grove, where Drummond is ſaid to have compoſed many of his poems. It was in theſe caverns that the famous ſir Alexander Ramſay, one of the anceſtors of the Dalhouſie family, who performed ſuch exploits of valour in the conteſt for the crown between Bruce and Baliol, uſed to conceal himſelf. Here he was reſorted to by the young warriors of his day, who conſidered it as a neceſſary part of military education to have been of his band. From thence he ſallied forth, as occaſion preſented itſelf, and attacked the Engliſh, then in poſſeſſion of Edinburgh. The Statiſtical Account of Scotland, by ſir John Sinclair. Architectural Antiquities of Great Britain, vol. iii. 4to. by John Britton, F.S.A. A Companion and uſeful Guide to the Beauties of Scotland and the Hebrides, &c. by the Hon. Mrs. Murray Auſt, of Kenſington, 2 vols. 8vo. Lond. 1810.

ROSMARILHAL, a town of Portugal, in the province of Beira, on the borders of Spain; 8 miles W. of Alcantara, in Spain. N. lat. 39°33′. W. long. 6°50′.

ROSMARINUS, in *Botany*, fo called from *ros*, *dew*, and *marinus*, alluding to its fituation on the fea-fhore. Thofe who have obferved it mantling the rocks of the Mediterranean in winter, with its grey flowers glittering with dew, cannot but be ftruck with the elegant propriety of the name.—Linn. Gen. 16. Schreb. 22. Willd. Sp. Pl. v. 1. 126. Mart. Mill. Dict. v. 4. Sm. Prodr. Fl. Græc. Sibth. v. 1. 12. Ait. Hort. Kew. v. 1. 52. Tournef. t. 92. Juff. 111. Lamarck Illuftr. t. 19.—Clafs and order, *Diandria Monogynia*. Nat. Ord. *Verticillatæ*, Linn. *Labiatæ*, Juff.

Gen. Ch. *Cal.* Perianth inferior, of one leaf, tubular, compreffed at the upper part, with an erect mouth; upper lip undivided; lower cloven. *Cor.* unequal; tube longer than the calyx; limb gaping; upper lip divided into two parts, erect, fhorter, acute, with reflexed margins; lower reflexed, trifid; the middle fegment very large, concave, narrow at the bafe; the lateral ones narrow, acute. *Stam.* Filaments two, awl-fhaped, fimple, with a tooth at one fide, inclined towards the upper lip, and exceeding it in length; anthers fimple. *Pift.* Germen fuperior, four-cleft; ftyle refembling the ftamens; ftigma fimple, acute. *Peric.* none, except the permanent calyx, which contains four ovate *feeds* in its bottom.

Obf. This genus approaches very near to *Salvia*, from which however it differs in having the ftamens fimply furnifhed with a lateral tooth.

Eff. Ch. Corolla unequal, its upper lip cloven. Filaments longer than the corolla, curved, fimple with a tooth. Calyx campanulate, trifid. Seeds four, naked.

1. R. *officinalis*. Common Rofemary. Linn. Sp. Pl. 33. Sm. Fl. Græc. Sibth. t. 14. Woodv. Med. Bot. t. 87.—Leaves feffile.—Native of the fouth of Europe, the Levant, and occafionally in the Grecian iflands; common in gardens, flowering from January to May.—An erect, evergreen *fhrub*, four feet high, very much branched; *branches* obfcurely quadrangular, downy, leafy on all fides. *Leaves* oppofite, fpreading in a recurved manner, linear-oblong, obtufe, revolute, entire; fmooth, dark green, and fhining above; downy and veined beneath. *Flowering branches* axillary, oppofite, fhort, very leafy. *Flowers* axillary, terminal, on very fhort ftalks, erect, of a bright blue colour, variegated with purple and white, having, like the leaves, a ftrong aromatic fragrance, refembling camphor. This is the Λιβανωτις of Diofcorides and other ancient authors. Rofemary, when wild, has broader leaves, larger flowers, and a ftronger fcent than when cultivated in our gardens; indeed Miller, following the old writers, regarded this as a fufficient ground to make them diftinct fpecies; the former being fubject to a variety whofe leaves are ftriped with yellow, and hence called *Gold-ftriped Rofemary*; the latter varying with a white ftripe, and thence named *Silver-ftriped Rofemary*. The filver variety is very tender. From an old opinion of Rofemary-juice having the property of ftrengthening the memory, this plant has been poetically made an emblem of remembrance or fidelity; and this was probably the origin of its being worn or ufed at funerals and weddings.

2. R. *chilenfis*. Chili Rofemary. Willd. n. 2. Ait. Hort. Kew. v. 1. 52.—Leaves on ftalks.—Native of Chili, and flowering in July. This *fhrub* is only known from Molina's Natural Hiftory of Chili, who defcribes it as having ftalked *leaves*. Future obfervation muft determine whether or not it be really a *Rofmarinus*.

Rosmarinus, in *Gardening*, contains plants of the hardy, fhrubby, evergreen kind, of which the fpecies cultivated is the officinal rofemary (R. officinalis).

There are varieties of this with narrow leaves; with broad leaves; with filver-ftriped leaves, and with gold-ftriped leaves.

Method of Culture.—In all the forts it may be effected by planting flips or cuttings in the early fpring months, as from March to May, as well as by layers; in performing the firft methods of which a quantity of young fhoots fhould be cut, or ftripped off, from about five or fix to eight or ten inches long, ftripping off the lower leaves, and then planting them in a border of light earth, in rows a foot afunder, giving a good watering, and repeating it frequently till they are rooted, which they effect in a fhort time; in the fame year they fhoot at top, and become tolerable little plants by autumn; when about the beginning or middle of September, or in the fpring following, they may be tranfplanted where they are defigned to remain for growth.

The layers fhould be laid down in any of the convenient lower young branches, into the earth, in the fpring, fummer, or autumn, and they will be well rooted by autumn following, when they may be taken off, and planted out where they are to remain for plants.

Almoft all the varieties are moderately hardy ever-green plants, though the common green forts are the moft fo; the ftriped kinds being liable to fuffer by hard frofts, if much expofed, or planted in wet ground; of courfe they, as well as all the forts, fhould have a warm fituation and dry foil: fome of the variegated kinds fhould alfo be potted, in order to have the fhelter of a green-houfe in winter. They are moft durable in dry poor foils. In regard to the ufes of thefe plants, the common green forts are generally made ufe of for different medicinal purpofes, the leaves as well as the flowers being employed, and both thefe and the ftriped kinds are planted out as fhrubs for the fake of affording a more full variety. They all afford variety of courfe in the borders, clumps, and other parts of gardens and fhrubberies.

Rosmarinus, in the *Materia Medica*. See Rosemary.

ROSMARUS, in *Zoology*, the name of an animal called alfo by fome the fea-horfe, and more ufually known by the name of *morfe*.

ROSMITHAL, in *Geography*, a town of Bohemia, in the circle of Prachatitz; 11 miles N. of Blatna.

ROSNAY, a town of France, in the department of the Indre; 8 miles N.E. of Le Blanc.

ROSNY, a town of France, in the department of the Seine and Oife; 3 miles W. of Mantes.—Alfo, a town of France; 5 miles E. of Paris.

ROSOLIS, or Ros-solis, popularly *Rofa-folis*, *fundew*, an agreeable fpirituous liquor, formerly much in repute, chiefly taken after meals, by way of a drachm, to aid digeftion; being compofed of burnt brandy, fugar, cinnamon, and milk-water, and fometimes perfumed with a little mufk.

It had its name, becaufe anciently prepared wholly of the diftilled water of the plant Ros *folis*, which fee; but that plant was at length neglected in the compofition.

The beft was that of Turin. The French have now a particular kind, not called *ros folis*, but *du roy*; becaufe ufed with good effect by Louis XIV. It is compofed of Spanifh wine, in which are infufed anife, fennel, aneth, coriander, &c. for three weeks.

ROSOMACHA, or Rosomak, in *Zoology*, a name given by the Ruffians to the glutton. They are, fays Olaus, taken by the hunters chiefly on account of their fkins, members alfo unite the larger pinnacles with the upper part of the chapel. The eaftern end difplays five buttreffes, with four pointed windows intervening, all of uniform fize and ftyle, though varying fomewhat in the tracery work with which they are ornamented. Each window is divided by a ftone mullion, faced, both internally and externally, with double columns; and the tranfom of the arch is decorated with half figures of perfons in the attitude of fupplication, and with different kinds of foliage. On the north and fouth fides of the chapel, in the lower compartment, are five windows of a fimilar kind; alfo a pointed arched door-way, receffed under a larger femicircular arch, above which is an irregular triangular window, highly ornamented. Another tier of windows, on each fide, gives light to the upper part of the building; but thefe are now much mutilated, having loft their mullions, tracery, &c. Between every two windows are two canopied niches, and a bracket, which appear to have been defigned for ftatues. This portion of the building is fupported by two oppofite ranges of five arches each, feparating the body of the chapel from the fide aifles; beyond which, at the eaft end, there are two columns, and two more in the centre between them, all of them fupporting ftone beams, exhibiting a great variety of fculptural ornaments. One of the centre pillars is wreathed, and is popularly called the apprentice's pillar, from a tradition refpecting its execution by an apprentice of the mafter mafon of the ftructure; who, it is faid, finding himfelf unable to underftand the model furnifhed to him, went abroad for inftructions, during which time the work was accomplifhed by the apprentice. It is fingular that a fimilar ftory is told of fome of the beft fculptures in Melrofe abbey; and we believe, alfo, of a much later production of art, the ftatue of king Charles II. in the Parliament-fquare at Edinburgh. Two heads in the chapel are faid to reprefent the mafter and the apprentice. The former is fhewn as frowning, and the latter with a fcar or indention on the forehead, to denote that he was murdered by his mafter, through envy of his fuperior genius. At the eaft end of the chapel are four altars, dedicated to different faints. "Of arches," fays Mr. Britton, in his Architectural Antiquities, "there are more than thirteen varieties to be found in this building. A flat or fegment beneath the roof of the aifles, and over the door to the fub-chapel; femicircular in the vault of the roof, and over the entrance doors; groined, acutely pointed over the weftern aifle; flat pointed between the centre and fide aifles; fharp pointed in the lower windows; ogee to the pifcinas; flattened, and lateft of the pointed ftyle, infide of the door-way, fouth fide; half fegment in the flying buttreffes; counter arch in the triangular windows; flat arch and fegment joined in a door in the vault; feveral arches of various forms in the windows, niches, and canopies, alfo in the battlements." The vault above-mentioned is the burying-place of the family of the Sinclairs. The foil of it is fo dry, that bodies have been found entire 80 years after their interment. They were formerly buried in armour, and without a coffin. "The late Roflin," fays father Hay, in his MS. memoirs, "was the firft that was buried in a coffine, contrary to the fentiments of James VII., who was then in Scotland;" and he adds, "that the great expence my mother was at in burying her hufband, occafioned the fumptuary acts that were made in the next parliament." There was formerly a fuperftitious ftory relative to this chapel current among the common people in the neighbourhood. They believed that, previous to the death of any member of the Saint Clair family, the chapel was to be feen in flames, without fuftaining any injury. This fuperftition is alluded to by Mr. Scott, in his "Lay of the Minftrel," in the following beautiful lines:

> "Seem'd all on fire that chapel proud,
> Where Roflin's chiefs uncoffin'd lie,
> Each baron, for his fable fhroud,
> Sheath'd in his iron panoply.
> Seem'd all on fire, within, around,
> Deep facrifty, and altar's pale;
> Shone every pillar foliage bound,
> And glimmer'd all the dead men's mail.
> Blaz'd battlement and pinnet high,
> Blaz'd every rofe-carv'd buttrefs fair,
> So ftill the blaze, when fate is nigh,
> The lordly line of high St. Clair."

The village of Roflyn was anciently a place of confiderable importance. King James II. conftituted it a burgh of barony in the year 1456, and granted to the inhabitants a weekly market and a fair; but thefe privileges are now abandoned. The fields immediately contiguous are celebrated in hiftory as the fcene of three fanguinary engagements betwixt the Englifh and Scotch; all fought on the fame day, the 24th of February, 1303. The particulars are thus narrated by the Scottifh hiftorians. During a truce, Ralph Confroy, treafurer to Edward I., invaded Scotland at the head of thirty thoufand men. With a view to plunder, he divided his forces into three bodies; and having reached the vicinity of Roflyn, encamped them in three diftant ftations. On being apprifed of this invafion, fir John Cumming and fir Simon Frazer marched with 10,000 men to watch the motions of the enemy; and finding the firft divifion unprepared, attacked and routed it with great flaughter. The fecond divifion coming up immediately after the battle, fhared the fame fate; as did likewife the third divifion, which appeared in a fimilar manner at the clofe of the fecond action. This engagement excited much intereft both at home and abroad; and is ranked among the nobleft efforts of Scottifh bravery. About half a mile lower down the Efk, is fituated the houfe of Hawthornden, remarkable not only for its having belonged to Drummond, the celebrated poet and hiftorian, but alfo for the caves under it. There are various conjectures as to the original intention of thefe fubterraneous cavities. Stukeley has given credit to a fabulous tradition, that they were ftrong holds of the Pictifh kings; and accordingly one cave is called the king's gallery, another the king's bed-chamber, and a third the guard-room. Setting afide this groundlefs tradition, the moft probable opinion is, that they were reforted to as places of refuge during the deftructive wars between the Englifh and Scotch. Detached from the principal caves is a fmaller one, called the Cyprefs grove, where Drummond is faid to have compofed many of his poems. It was in thefe caverns that the famous fir Alexander Ramfay, one of the anceftors of the Dalhoufie family, who performed fuch exploits of valour in the conteft for the crown between Bruce and Baliol, ufed to conceal himfelf. Here he was reforted to by the young warriors of his day, who confidered it as a neceffary part of military education to have been of his band. From thence he fallied forth, as occafion prefented itfelf, and attacked the Englifh, then in poffeffion of Edinburgh. The Statiftical Account of Scotland, by fir John Sinclair. Architectural Antiquities of Great Britain, vol. iii. 4to. by John Britton, F.S.A. A Companion and ufeful Guide to the Beauties of Scotland and the Hebrides, &c. by the Hon. Mrs. Murray Auft, of Kenfington, 2 vols. 8vo. Lond. 1810.

ROSMARILHAL, a town of Portugal, in the province of Beira, on the borders of Spain; 8 miles W. of Alcantara, in Spain. N. lat. 39° 33′. W. long. 6° 50′.

ROSMARINUS, in *Botany*, ſo called from *ros*, *dew*, and *marinus*, alluding to its ſituation on the ſea-ſhore. Thoſe who have obſerved it mantling the rocks of the Mediterranean in winter, with its grey flowers glittering with dew, cannot but be ſtruck with the elegant propriety of the name.—Linn. Gen. 16. Gen. Ch. *Cal.* Perianth inferior, of one leaf, tubular, compreſſed at the upper part, with an erect mouth; upper lip undivided; lower cloven. *Cor.* unequal; tube longer than the calyx; limb gaping; upper lip divided into two parts, erect, ſhorter, acute, with reflexed margins; lower reflexed, trifid; the middle ſegment very large, concave, narrow at the baſe; the lateral ones narrow, acute. *Stam.* Filaments two, awl-ſhaped, ſimple, with a tooth at one ſide, inclined towards the upper lip, and exceeding it in length; anthers ſimple. *Piſt.* Germen ſuperior, four-cleft; ſtyle reſembling the ſtamens; ſtigma ſimple, acute. *Peric.* none, except the permanent calyx, which contains four ovate *ſeeds* in its bottom.

Obſ. This genus approaches very near to *Salvia*, from which however it differs in having the ſtamens ſimply furniſhed with a lateral tooth.

Eſſ. Ch. Corolla unequal, its upper lip cloven. Filaments longer than the corolla, curved, ſimple with a tooth. Calyx campanulate, trifid. Seeds four, naked.

1. R. *officinalis*. Common Roſemary. Linn. Sp. Pl. 33. Sm. Fl. Græc. Sibth. t. 14. Woodv. Med. Bot. t. 87.—Leaves ſeſſile.—Native of the ſouth of Europe, the Levant, and occaſionally in the Grecian iſlands; common in gardens, flowering from January to May.—An erect, evergreen *ſhrub*, four feet high, very much branched; *branches* obſcurely quadrangular, downy, leafy on all ſides. *Leaves* oppoſite, ſpreading in a recurved manner, linear-oblong, obtuſe, revolute, entire; ſmooth, dark green, and ſhining above; downy and veined beneath. *Flowering branches* axillary, oppoſite, ſhort, very leafy. *Flowers* axillary, terminal, on very ſhort ſtalks, erect, of a bright blue colour, variegated with purple and white, having, like the leaves, a ſtrong aromatic fragrance, reſembling camphor. This is the Λιβανωτὶς of Dioſcorides and other ancient authors. Roſemary, when wild, has broader leaves, larger flowers, and a ſtronger ſcent than when cultivated in our gardens; indeed Miller, following the old writers, regarded this as a ſufficient ground to make them diſtinct ſpecies; the former being ſubject to a variety whoſe leaves are ſtriped with yellow, and hence called *Gold-ſtriped Roſemary*; the latter varying with a white ſtripe, and thence named *Silver-ſtriped Roſemary*. The ſilver variety is very tender. From an old opinion of Roſemary-juice having the property of ſtrengthening the memory, this plant has been poetically made an emblem of remembrance or fidelity; and this was probably the origin of its being worn or uſed at funerals and weddings.

2. R. *chilenſis*. Chili Roſemary. Willd. n. 2. Ait. Hort. Kew. v. 1. 52.—Leaves on ſtalks.—Native of Chili, and flowering in July. This *ſhrub* is only known from Molina's Natural Hiſtory of Chili, who deſcribes it as having ſtalked *leaves*. Future obſervation muſt determine whether or not it be really a *Roſmarinus*.

Rosmarinus, in *Gardening*, contains plants of the hardy, ſhrubby, evergreen kind, of which the ſpecies cultivated is the officinal roſemary (R. officinalis).

There are varieties of this with narrow leaves; with broad leaves; with ſilver-ſtriped leaves, and with gold-ſtriped leaves.

Method of Culture.—In all the ſorts it may be effected by planting ſlips or cuttings in the early ſpring months, as from March to May, as well as by layers; in performing the firſt methods of which a quantity of young ſhoots ſhould be cut, or ſtripped off, from about five or ſix to eight or ten inches long, ſtripping off the lower leaves, and then planting them in a border of light earth, in rows a foot aſunder, giving a good watering, and repeating it frequently till they are rooted, which they effect in a ſhort time; in the ſame year they ſhoot at top, and become tolerable little plants by autumn; when about the beginning or middle of September, or in the ſpring following, they may be tranſplanted where they are deſigned to remain for growth.

The layers ſhould be laid down in any of the convenient lower young branches, into the earth, in the ſpring, ſummer, or autumn, and they will be well rooted by autumn following, when they may be taken off, and planted out where they are to remain for plants.

Almoſt all the varieties are moderately hardy ever-green plants, though the common green ſorts are the moſt ſo; the ſtriped kinds being liable to ſuffer by hard froſts, if much expoſed, or planted in wet ground; of courſe they, as well as all the ſorts, ſhould have a warm ſituation and dry ſoil: ſome of the variegated kinds ſhould alſo be potted, in order to have the ſhelter of a green-houſe in winter. They are moſt durable in dry poor ſoils. In regard to the uſes of theſe plants, the common green ſorts are generally made uſe of for different medicinal purpoſes, the leaves as well as the flowers being employed, and both theſe and the ſtriped kinds are planted out as ſhrubs for the ſake of affording a more full variety. They all afford variety of courſe in the borders, clumps, and other parts of gardens and ſhrubberies.

Rosmarinus, in the *Materia Medica*. See Rosemary.

ROSMARUS, in *Zoology*, the name of an animal called alſo by ſome the ſea-horſe, and more uſually known by the name of *morſe*.

ROSMITHAL, in *Geography*, a town of Bohemia, in the circle of Prachatitz; 11 miles N. of Blatna.

ROSNAY, a town of France, in the department of the Indre; 8 miles N.E. of Le Blanc.

ROSNY, a town of France, in the department of the Seine and Oiſe; 3 miles W. of Mantes.—Alſo, a town of France; 5 miles E. of Paris.

ROSOLIS, or Ros-solis, popularly *Roſa-ſolis*, *ſundew*, an agreeable ſpirituous liquor, formerly much in repute, chiefly taken after meals, by way of a drachm, to aid digeſtion; being compoſed of burnt brandy, ſugar, cinnamon, and milk-water, and ſometimes perfumed with a little muſk.

It had its name, becauſe anciently prepared wholly of the diſtilled water of the plant Ros *ſolis*, which ſee; but that plant was at length neglected in the compoſition.

The beſt was that of Turin. The French have now a particular kind, not called *ros ſolis*, but *du roy*; becauſe uſed with good effect by Louis XIV. It is compoſed of Spaniſh wine, in which are infuſed aniſe, fennel, aneth, coriander, &c. for three weeks.

ROSOMACHA, or Rosomak, in *Zoology*, a name given by the Ruſſians to the glutton. They are, ſays Olaus, taken by the hunters chiefly on account of their ſkins, fkins, which are much efteemed by people of fortune for robes, as being variegated with very bright colours, refembling flowers. See URSUS *Gulo*.

ROSOSZE, in *Geography*, a town of Auftrian Lithuania; 30 miles S.W. of Brzefk.

ROSOY. See ROZOY.

ROSPORDEN, a town of France, in the department of the Finifterre, and chief place of a canton, in the diftrict of Quimper. The place contains 560, and the canton 4413 inhabitants, on a territory of 127½ kiliometres, in four communes.

ROSPUS, a name ufed by fome authors for the ftrange fifh called the *rana pifcatrix*, or frog-fifh. See SEA-*devil*.

ROSS, ALEXANDER, in *Biography*, was born at Aberdeen, and became mafter of the grammar-fchool at Southampton, and chaplain to king Charles I. His works are numerous, of which the beft known is "A View of all Religions:" and a curious performance, called "Virgilius Evangelizans," taken wholly from the Æneid. He died in 1654, aged 61.

ROSS, JOHN, a learned prelate, was born in Herefordfhire, and educated at St. John's college, Cambridge, where he took his degree of D.D. in the year 1756. He had fome years previoufly to this publifhed a pamphlet in defence of Dr. Middleton againft the criticifms of Dr. Markland, and in 1749 an edition of Cicero's "Epiftolæ ad Familiares," in two vols. 8vo. He was prefented to the vicarage of Frome, in Somerfetfhire, and in 1778 he was advanced to the bifhopric of Exeter. He died in 1792.

ROSS, JOHN LOCKHART, the fifth fon of fir James Lockhart, was born in November 1721, and having manifefted an inclination for the fea-fervice, he was, at the age of 14, placed under captain Ofborn, who then commanded his majefty's fhip the Portland of 50 guns, which failed in September 1735, for Conftantinople. He ferved in feveral different fhips, and under different commanders, till 1743, when he was advanced to the rank of lieutenant. It was not till 1755 that he was appointed to a command, which was in the Savage floop of war, of 12 guns and 70 men. In a very fhort time he took a St. Domingo merchant-man, valued at 30,000*l.* In the following year he was appointed to the command of the Tartar floop of 24 guns, and 200 men. War was now declared againft the French, and on the 20th of September he chafed and engaged two French frigates of 28 guns, and drove them into Morlaix. Without particularizing the inftances of his fuccefs, we may obferve that, between the 20th of September 1756 and the 19th of October 1758, he took nine privateers, containing 220 guns, and about 2500 men, with the lofs of only five men killed and two wounded in the different engagements. At length the name of captain Lockhart was almoft fufficient to terrify the enemy to ftrike. The following fact, which ftands upon the moft indubitable authority, fhews in what manner he was regarded on the feas. A privateer belonging to Briftol, called the King George, and commanded by a Mr. Read, having fallen in with an enemy's fhip of far fuperior force, during the night, and finding that the exigencies of her fituation demanded the moft prompt and vigorous exertions to preferve herfelf from capture, the commander ran with great fpirit along-fide, and hailing the enemy, commanded her to ftrike to the Tartar, captain Lockhart, and was inftantly obeyed without the fmalleft hefitation. Captain Lockhart's conduct in protecting the trade of the country was fo meritorious, that the magiftrates of Plymouth, immediately after his return to port, voted him the freedom of their corporation to be prefented him in a gold box. A prefent equally honourable was made him the enfuing year, by the merchants and underwriters of London, which confifted of a filver cup and falver, curioufly chafed, and emboffed with his arms, and the reprefentation of the Tartar, and the feveral privateers which had been captured by him.

In 1759 he was promoted to the Chatham of 50 guns, and had two fmaller veffels put under his command. In a fhort cruife he took the Arethufa, a French frigate of 32 guns. In the following year he was promoted to the Bedford, a third rate, but did not long retain the command. In the fame year, by the death of a brother, he changed his name to Rofs, and was elected a reprefentative in parliament. It was not till 1777 that he was called again to ferve his country in the fea-fervice. In that year he was employed under the orders of admiral Keppel, in the famous battle on the 27th of July. (See KEPPEL.) In 1779 he was raifed to the rank of rear-admiral of the blue, and appointed fourth in command of the Channel fleet, having hoifted his flag on board the Royal George of 100 guns. About this period he fucceeded his brother to the dignity of a baronet. He next accompanied fir George Rodney on his fortunate expedition, undertaken for the relief of Gibraltar. After his return he went but little to fea; but in 1787 he was advanced to the rank of vice-admiral of the blue; and here clofed the profeffional career of fir John Lockhart Rofs, who, confidering his great zeal and activity in the profecution of the duties of his profeffion, and the vaft benefits which the commercial interefts of his country reaped from his exertions, muft be allowed to rank very high in his profeffion. His coolnefs and intrepidity in the hour of battle were never furpaffed; and, in the courfe of a very long fervice, to fight and to conquer were alike habitual to him. He died in June 1790, after a lingering and painful illnefs; and his remains were interred in the Rofs aifle, forming the eaft end of the church of Fearn, which had been the burying-place of all the refpectable families of the name of Rofs for many ages. Stockdale's edition of Campbell's Lives of the Admirals, vol. vi. Charnock's Biographia Navalis, vol. vi.

ROSS, in *Geography*, a borough and market-town in the lower divifion of the hundred of Greytree, county of Hereford, England, is feated on a commanding eminence, overhanging the river Wye, at the diftance of 15 miles S.E. by E. from the city of Hereford, and 121 W. by N. from London. This town was made a free borough by king Henry III., and feems to have been a place of more importance formerly than at prefent. In the time of Camden it was famous for its cyder, and for the manufacture of iron wares. Its celebrity for cyder yet continues, but the laft-mentioned branch of trade has much declined. According to the parliamentary returns for 1811, Rofs contained 558 houfes, and a population of 2261 perfons. The market-day is Thurfday, weekly; and the fairs are on Holy Thurfday, Corpus Chrifti, 20th July, Thurfday after 10th October, and 11th December. The petty feffions for the hundred of Greytree are held here. The government of this borough is vefted in a ferjeant and four conftables, but their powers are extremely limited. Here are two charity fchools, and an alms-houfe; the latter of which owed its eftablifhment to John Kyrle, whom Pope has characterized and invefted with deathlefs and truly merited fame, by the name of "the Man of Rofs." This truly benevolent character was born at White Houfe, in the parifh of Dymock, Herefordfhire, in 1637; ferved the office of fheriff for the county in 1683, and died in 1724. Though poffeffed only of an annual income of 500*l.*, he not only lived in happinefs and refpectability himfelf, but diffufed around him innumerable

merable benefits to the poor and the unfortunate. Among other advantages conferred by him on Rofs, he raifed the church fpire above 100 feet in height, and inclofed a piece of ground with a wall, and funk a refervoir in the centre of it, for the ufe of the inhabitants. He likewife conftructed a fine broad caufeway at the weftern extremity of the town. The houfe in which Mr. Kyrle refided was afterwards the King's Arms, fituated near the entrance of the town from Gloucefter, but is no longer an inn.

The ftreets of Rofs are moftly fituated on the top and flope of a hill, and are extremely narrow. The market-houfe, though erected fo late as the reign of Charles II., is in a very decayed ftate. It is conftructed of ftone, and difplays the heterogeneous mode of building prevalent in the reign of his predeceffor, James I. The church is a handfome ftructure, having a tower, furmounted by a lofty fpire at its weftern end. In the window over the altar here, among other fragments of painted glafs, is one reprefenting a bifhop, with the infcription, "Thomas Herefordenfis," written beneath in black letter. This bifhop had probably been a benefactor to the church. The views from the furrounding cemetery, and from the contiguous profpect ground, are much celebrated. Immediately below, the river Wye forms a fine femicircle, at one of the extremities of which are the ruins of Wilton caftle; and beyond it an extenfive vale, terminated by diftant mountains. Near the church-yard is a fpot called Bifhop's-Court, from the circumftance of its having been anciently the fcite of a palace, belonging to the bifhops of Hereford.

The ruins of Wilton caftle above-mentioned ftand on the weftern bank of the Wye. This manfion was for feveral centuries the refidence of the Greys, of the fouth, who derived from it their original baronial title, in the reign of Edward I. foon after they acquired poffeffion of it. Its prefent ruinous condition is to be attributed to the royalift governors of Hereford, by whofe orders the whole interior was confumed by fire. The feats and objects of antiquarian intereft in this vicinity are numerous. On the fummit of Eaton-hill, about two miles to the north of Rofs, is a large encampment, probably of Roman origin. The intrenchments are in a very perfect ftate, and are of great depth. A farm-houfe here difplays veftiges of an ancient manfion, and the furrounding grounds are ftill defignated the Park of Eaton; but the hiftory of the place is entirely loft. At a hamlet called Hole-in-the-Wall, about a mile further to the north, are fome foundations of walls, which bear the appearance of great antiquity. What occafioned the appellation by which their fcite is diftinguifhed, is an excavation formed in the rocky bank of a neighbouring garden, which, when complete, led by a flight of fteps downwards into a cavity, whofe roof was fupported by a fingle column. Afcending the hill towards Old Gore is a hollow fpace extending about 100 paces, in which a number of celts were difcovered a few years ago. Thefe inftruments were nearly of the fame fize, and had evidently been caft, as the marks of the mould were vifible. On the oppofite fide of the river from Hole-in-the-Wall, ftands Kingfton-houfe, long the property of the Hofkyns' family; one of whom, ferjeant Hofkyns, is faid to have entertained here James I. with a morrice-dance, performed by ten perfons whofe united ages exceeded one thoufand years. Above this manfion is Fawley-Court, anciently the feat of fir John Kyrle, progenitor to the "Man of Rofs," and now the property of a gentleman named Money, a defcendant from the family by the female line. Goodrich caftle is fituated about four miles to the fouth of Rofs, on a finely wooded promontory, round which the river Wye forms a femi-circular fweep. This fortrefs was for many years the baronial refidence of the Talbots, earls of Shrewfbury. By whom it was originally founded is unknown, though the near affinity of its name to that of duke Godric, who occurs as a witnefs to two charters granted by king Canute, renders it not an improbable conjecture that he was the perfon. Nothing of its authentic hiftory is recorded till the reign of king John, where we find it mentioned as the property of William Strigul, earl marfhal, who died here in 1246. Subfequently it was conveyed by a female heir to William de Valentia, earl of Pembroke, from whofe family it paffed to the Talbots, afterwards earls of Shrewfbury. Elizabeth, daughter of Gilbert, the feventh earl, carried it by marriage to Henry de Grey, earl of Kent, whofe defcendants held it till the death of Henry, duke of Kent, when it was fold to admiral Griffin, anceftor to the prefent proprietor. Few events of hiftorical note are related refpecting this caftle. In the civil wars between king Charles I. and his parliament, it was at firft garrifoned for the latter, but was captured foon after by the royalifts, who, in their turn, were compelled to furrender it to the republicans, after a fiege of fix weeks, A.D. 1646. On the 25th of Auguft, in the fame year, the parliament ordered it to be notified to the countefs of Kent, that it was neceffary the caftle fhould be demolifhed. Accordingly it was difmantled in March following; and has fince been gradually falling to decay, but enough of it yet remains to point out its former extent and grandeur. The form of this ftructure is that of a parallelogram 176 feet long, by 152 broad. Each of the four angles is ftrengthened by a round tower, and in the fouth-weft part of the area is a fquare keep, which appears to be of anterior date to the reft of the building. "This keep tower," fays King, in his Munimenta Antiqua, vol. iii. "has every mark in its ftyle of architecture of being coeval with the Saxon age." It confifts of three ftories, the loweft of which was ufed as a prifon. The principal entrance was by a flight of fteps, which is detached from the main building, and conducts to a platform before the door-way into the fecond and principal ftory, which has no interior connection with the dungeon beneath, as happens in moft Norman caftles. The entrance to the prifon-apartments was under a very remarkable fort of pointed arch, formed of "quite flat fides, which feem, from the appearance of the wall around, and from its peculiar ftyle, to have been inferted many ages after the keep was erected, and in the time of Edward III.;—a fufpicion that appears to be moft ftrongly confirmed by the circumftance, that about the twenty-fecond year of the reign of that king, Richard Talbot, its then lord, obtained the royal licence for having in his caftle a prifon for malefactors; having alfo the cognizance of pleas of the crown, &c. within his lordfhip of Irchenfield and Wormilow." The windows in the two upper ftories are faid, by the fame author, to be genuine Saxon; and that in the middle of the higher ftory feems to have continued unaltered from the period of its conftruction. The columns on each fide ftand within the arch, the femicircular part of which is ornamented with zigzag: this window terminates the middle projecting buttrefs that affifts in fupporting the tower; and under it is a zigzag moulding, or band, which is carried round the whole building. The window in the middle ftory is nearly fimilar to that defcribed; but a ftone frame for glafs is inferted in it, apparently of the age of Henry VI., and probably the work of the celebrated earl Talbot, who, according to tradition, had his private chamber in this keep. The other portions of the caftle are of much later erection than the keep. The entrance was very ftrongly fortified. Immediately in front, and

and within the ſpace incloſed by the ſurrounding foſſe, was a very deep pit, hewn out of the ſolid rock, and having a drawbridge thrown acroſs it, which, when drawn up, exactly fitted the ſpace between the towers on each ſide of the gateway, which was further defended by two maſſive gates and portculliſes, and by loop-holes, and machicolations in the vaulting, through which boiling lead and water were poured down on the heads of aſſailants. This paſſage opened into the great inner court, on one ſide of which ſtands the chapel, now in ruin; and near it is a ſmall octagonal watch-tower, which riſes higher than any other building within the caſtle. Adjoining the entrance to the keep is the garriſon tower, which is thirty-ſix feet ſquare at the baſe; "but the three outward angles diminiſh as they aſcend and form triangular buttreſſes, ſo that the upper part of the tower is circular." From the keep a wall formerly extended to the weſt, or Great tower, which is circular in its outward form, but octangular within. Between this and the north, or Ladies' tower, were ranged the ſtate apartments. The hall was a magnificent room, 65 feet long and 28 broad, and appears, from the pointed ſtyle of its windows, to have been erected in the reign of Edward I. or II. It communicated, towards the north, with a kind of anti-chamber, whence a paſſage led into the great ſtate-room; the northern end of which exhibits two moſt beautiful pointed arches, of a later date than the reſt of the apartments. The Ladies' tower occupies a high and ſteep precipice to the north of this building, and is hence the moſt defenſible part of the caſtle. Its name clearly indicates its appropriation as the reſidence of the female part of the garriſon. See a plan and views of Goodrich caſtle, in Bonner's Perſpective Itinerary; with hiſtorical and deſcriptive accounts.

Three miles eaſtward from Roſs is Roſe, or Bury-hill, where ſome antiquaries have placed the Ariconium of Antoninus, which Camden had fixed erroneouſly at Kencheſter. The ſcite of this ſtation is ſtrongly marked by the colour of the ſoil, which is extremely black within its area, while all around it is inclined to red. About ſixty years ago, the ground here was covered with rubbiſh, and overgrown with briars, &c. but the then proprietor ſoon afterwards incloſed and levelled it. In the courſe of that operation, many Roman antiquities were diſcovered by the workmen; ſuch as fibulæ, lares, lachrymatories, rings, coins, fragments of pillars, and of teſſellated pavements, innumerable pieces of red pottery, and ſome foundations of buildings. A field near this ſtation retains the name of Kill-Dane-Field, but the particulars of the event to which it alludes is unknown. About a mile to the ſouth-weſt is the ſcite of Eccleſwall caſtle, now occupied by a modern manſion; and ſtill more to the ſouth, and ſomewhat nearer to Roſs, are the remains of Penyard caſtle, which appears to have been conſtructed for the defence of the narrow paſs through the woods from the county of Glouceſter, into thoſe of Monmouth and the principality. This fortreſs was demoliſhed during the civil wars. It had formerly a park and chace attached; and the latter appellation is ſtill given to an eminence which riſes to the weſtward of the caſtle. Beauties of England and Wales, vol. vi. by E. W. Brayley, and John Britton, 8vo. 1805. King's Munimenta Antiqua, vol. iii. fol.

Ross, a biſhopric in Ireland, united with Cork by queen Elizabeth in 1586. It contains 124,000 acres, all in the county of Cork, in 33 pariſhes.

Ross, a poſt-town of Ireland, in the county of Cork, diſtinguiſhed by the name of "Roſs Carbery." It is ſituated on a bay or harbour, to which it gives its name, but which is choaked up with ſand. The town is ſituated on a rocky eminence projecting to the ſouth, and nearly ſurrounded by a ſtrand. In the centre of the town is a pretty large ſquare, with four narrow ſtreets diverging from its angles. It is chiefly inhabited by weavers, and a good deal of linen yarn is ſold here. In former times a ſchool was founded here by St. Fachnan, which was much frequented. It is 155 miles S.W. from Dublin, and 32 from Cork.

Ross, *New*, a ſea-port and poſt-town of Ireland, in the county of Wexford. This, according to Mr. Wakefield, appears to be a ſpot well adapted for becoming a place of great commercial importance. It is ſituated at a conſiderable diſtance from the coaſt on the river Barrow, which has a ſufficient depth of water to allow veſſels of large ſize to unload at the quay. Not far remote is the junction of this river with the Nore, the latter of which conveys merchandize to Thomaſtown, within a few miles of Kilkenny, while the former affords a communication by canal to Dublin. The Barrow is alſo united to the Suire, which is navigable to Clonmell. Notwithſtanding theſe advantages, Mr. W. ſtates Roſs to be in a ſtate of inactivity, *without trade or capital.* Other writers ſpeak of it as a flouriſhing place, the buildings numerous and elegant, and the population rapidly increaſing. Roſs is a corporate town, and one of the ſtaple ports for the exportation of wool. To the former circumſtance Mr. Wakefield attributes its decline. It ſends a member to parliament, under the influence of the marquis of Ely. There is a charter ſchool for 60 boys. It is called New Roſs, to diſtinguiſh it from another, now a mere village, a few miles diſtant. New Roſs is 67¼ miles S.S.W. from Dublin.

Ross, a county of the ſtate of Ohio, divided into 11 townſhips, and containing 15,514 inhabitants.—Alſo, a town of Waſhington county, Pennſylvania, containing 1327 inhabitants.

Ross, a ſmall iſland near the W. coaſt of Scotland, and county of Argyle; 6 miles N.N.E. of Cambeltown.

Ross-*Iſland*, lies in the lake of Killarney, county of Kerry, Ireland, in which is a rich vein of grey copper ore, with copper pyrites, galena, and blende, the working of which has been prevented by an influx of the waters of the lake. A caſtle on this iſland has a military governor.

Ross's *Iſland*, a ſmall iſland in the Mergui Archipelago. N. lat. 10° 44'.

Ross *of Balmangar*, a cape of Scotland, on the S. coaſt of the county of Kircudbright, at the mouth of the Dee; 4 miles S. of Kircudbright.

ROSSA, a ſmall iſland near the W. coaſt of the iſland of Corſica; 10 miles N.E. of Calvi.—Alſo, a ſmall iſland in the Mediterranean, near the N. coaſt of Sardinia. N. lat. 41° 15'. E. long. 9° 25'.

ROSSAL Point, a cape of England, on the coaſt of Lancaſhire; 2 miles W. from the mouth of the river Wyre.

ROSSANO, a city of Naples, in Calabria Citra, the ſee of an archbiſhop, formerly the moſt celebrated rendezvous of Baſilian monks in Italy; 27 miles N.N.E. of Coſenza. N. lat. 39° 38'. E. long. 16° 44'.

ROSSARNO, a town of Naples, in Calabria Ultra, on the Metrano; 4 miles S.E. of Nicotera.

ROSSBACH, a town of Saxony, in Thuringia, near which Frederic II. king of Pruſſia, gained, in the year 1557, a glorious victory over the combined armies of France and Auſtria; 5 miles N.W. of Weiſſenfels.

Rossbach, *Ober*, a town of Upper Heſſe; 2 miles S.W. of Fridberg.

Rossbach, *Nider*, a town of Upper Heſſe, near Ober Roſsbach.

ROSSCHOCHA, a river of Ruſſia, which runs into the Indigirka, N. lat. 67° 50′. E. long. 140° 14′.

ROSSDEOGHAN, a ſmall iſland on the W. coaſt of Ireland, in Kenmare river; 10 miles N.E. of Lamb's Head.

ROSSDORF, a town of Bavaria; 12 miles N.E. of Bamberg.—Alſo, a town of Germany, in the county of Henneberg; 10 miles N.W. of Meinungen.

ROSSE, in *Ichthyology*, the name given by Bellonius to that kind of cyprinus of Artedi, which we call the roach.

ROSSEL, in *Geography*, a town of Pruſſia, in the province of Ermeland; 50 miles S.S.E. of Königſberg. N. lat. 53° 57′. E. long. 21° 11′.

ROSSELARE, a town of France, in the department of the Lys; 3 miles N. of Grammont.

ROSSENAW, a town of Auſtria; 2 miles N.W. of Zwetl.

ROSSENBURG, a town of the margraviate of Anſpach; 8 miles N. of Anſpach.

ROSSENDORF, a town of the margraviate of Anſpach; 2 miles N.W. of Cadolzburg.

ROSSI, Gian-Vittorio, in *Biography*, an Italian man of letters, was born of a good family at Rome, in 1577. He was educated under the Jeſuits of the Roman college, where he joined the ſtudies of the law and philoſophy to that of polite literature, but being diſappointed in his expectations with reſpect to the firſt of theſe purſuits, he limited his attention to the laſt. He became a member of the academy degli Umoriſti, of which he was one of the moſt zealous promoters, and gave ſuch proofs of ability in its exerciſes, that ſeveral advantageous offers of employment were made to him. He, at length, accepted the poſt of ſecretary to the cardinal Andrea Peretti, with whom he reſided twenty years. After the death of that prelate he retired to a ſolitary villa on mount Sant' Onofrio, where he lived in tranquillity to himſelf, and engaged in his ſtudies, till he died in 1647, at the age of 70. He was much eſteemed by the men of letters at Rome, as well as by many perſons of rank, among whom was the cardinal Chigi, afterwards pope Alexander VII. Roſſi, who is better known by his claſſical name, Erythreus, was author of ſeveral works. His firſt publication was a kind of ſatire on the corrupt manners of the Romans, entitled "Eudemiæ Lib. X." He alſo publiſhed two volumes of "Epiſtles," addreſſed to cardinal Chigi, under the name of Tyrrhenus, and two others to different perſons; alſo various dialogues on moral topics, orations, and other tracts, which are all in the Latin language. His chief work is entitled "Pinnotheca Imaginum illuſtrium Virorum," being eulogies or biographical accounts of many learned men his contemporaries. Gen Biog.

Rossi, Pasquale, called *Paſqualino of Vicenza*, by long practice after the beſt Venetian and Roman pictures, acquired, without a maſter, a conſiderable power of deſign and colour. Few of his public works remain; one of the beſt is a St. Gregorio in the dome of Matelica. In galleries we meet with his cabinet pictures, repreſenting converſations, gaming parties, concerts, and ſimilar capricci, highly elaborate, and of Flemiſh finiſh.

Rossi, Lemme, publiſhed in 1666, at Perugia, in quarto, a work entitled "Siſtema Muſico," or Speculative Muſic, explaining the moſt celebrated ſyſtem of the ancients in all the genera. This is one of the cleareſt and beſt digeſted treatiſes on harmonics that was produced in Italy during the 17th century.

Rossi, Michael Angelo, a dilettante or gentleman-performer on the violin, who, in the part of Apollo, in 1632, accompanied himſelf on that inſtrument in a muſical drama at Rome, entitled "Il Ritorno di Angelica nell' Indie," to the great delight of the audience. It appears that Stradella, who ſung in his own oratorio of St. John the Baptiſt at Rome, led the band, and accompanied his own voice on the violin.

Rossi. See Luigi.

Rossi, la Pasqua, a female ſinger in the conſervatorio of the Incurabili at Venice in 1770, who performed in a motet by Galuppi under his own direction, in a very ſuperior manner. Italian Tour.

Rossi, Francesco di Puglia, an excellent muſical compoſer of the old ſchool, who produced the following three operas, that were much admired in their day: "Sejano moderno della Tracia," 1636; "La pena degl' Occhi," 1688; and "La Corilda, o l'Amor trionfante della Verdetta."

ROSSIGLIONE, Alto, in *Geography*, a town of the Ligurian republic; 17 miles N.W. of Genoa.

Rossiglione, *Baſſo*, a town of the Ligurian republic; 15 miles N.W. of Genoa.

ROSSIGNOL, a conſiderable lake of Nova Scotia, between Liverpool and Annapolis, ſaid by the Indians to be the main ſource of the Liverpool and Petit rivers.—Alſo, a port on the S. coaſt of Nova Scotia, S.W. of Port de l'Heve.

Rossignol, in *Ornithology*. See Motacilla *Lucinia* and *Phœnicurus*.

ROSSINA, in *Geography*, a town of the duchy of Parma; 14 miles S.S.E. of Parma.

ROSSITA, a river of European Turkey, which runs into the Jantra, near Nicop, in Bulgaria.

ROSSITTEN, a town of Pruſſia, in the province of Samland, on the Kuritſch Nerung; 18 miles N. of Königſberg.

ROSSITZ, a town of Bohemia, in the circle of Chrudim; 8 miles N.N.W. of Chrudim.

ROSSLA, a town of Germany, in the principality of Weimar; 6 miles N.E. of Weimar.

ROSSLEBEN, or Rossel, a town of Saxony, in Thuringia; 3 miles N.N.E. of Wiehe.

ROSSLYN, *Earl of*, in *Biography*. See Wedderburne.

ROSSMORE, in *Geography*, an iſland in Kenmare river, county of Kerry, Ireland, about 6 miles W. of Kenmare town.

ROSSO, Cape, a cape on the E. coaſt of the iſland of Metelin. N. lat. 39° 18′.

ROSSOCKEN, a town of Pruſſia, in the province of Oberland; 25 miles S.W. of Ortelſburg.

ROSSOMAKA, in *Zoology*. See Ursus *Gulo*.

ROSS-SHIRE, a county or diſtrict of Scotland, including the ſmall diſperſed county of Cromarty, which united, form one ſheriffdom, though ſeparated lieutenancies, is ſituated between 57° 7′ 40″ and 58° 7′ 20″ north latitude. It is one of the largeſt ſhires in North Britain, and extends about eighty miles in length, and ſeventy-eight in breadth. The whole comprehends 3799 Britiſh ſquare miles, of which 562 are in the iſle of Lewis, and 344 in Cromarty. Roſsſhire ſtretches acroſs the whole of Scotland, from the northern to the weſtern ocean, and has annexed to it, beſides the iſles of Lewis, Barra, and Rona, the Suliſker-rock, and the Flannan and Shaint iſles, which will be found to be noticed under their reſpective names. It is bounded on the north by the county of Sutherland, on the eaſt by the Moray and Cromarty friths, on the ſouth by the county of Inverneſs, and on the weſt by the Atlantic ocean. According

According to the population returns of 1811, the united counties contain 13,280 houfes, and 60,853 inhabitants.

Hiftorical Events—Rofsfhire, in very remote times, conftituted part of the Pictifh kingdom. At a later period, when the Norwegians obtained poffeffion of the Orkneys, and fubdued the neighbouring counties of Caithnefs and Sutherland, it feems to have fhared the ufual fate of frontier provinces, and to have belonged alternately to the Norwegians and to the Scotch. According to the Icelandic writers, it made part of the dominions of the earls of Orkney; but in the "Defcriptio Albaniæ," both the counties of Rofs and Moray are mentioned as comprehended within Scotland; and other accounts ftate that part of Rofsfhire was poffeffed by the princes of the Hebrides, or lords of the Ifles. The truth probably is, that, favoured by their peninfular fituation, the inhabitants of Rofs paid little refpect to the authority of any of their powerful neighbours. Rofsfhire formed a comitatus, or earldom, as early as the 11th century; but of the hiftory of its firft earls fcarcely any authentic document exifts. What is remarkable, however, contrary to the cuftom in moft other feodal poffeffions, this earldom feems to have defcended to heirs female as well as to heirs male. Hugh, one of the earls of Rofs, was flain at the battle of Halidon-hill, in 1333. William, his fon, fucceeded, who appears to have had fome claim to the Weftern ifles, as in a variety of charters, yet extant, he is ftyled earl of Rofs, and lord of Skye. This nobleman flew Raynold of the Ifles in a fray at Perth; but in endeavouring to eftablifh a right to his poffeffions by force, he was completely thwarted. William left iffue an only daughter, who married Walter Leflie, and thereby gave him a title to the earldom. His fon and fucceffor, Alexander, efpoufed one of the daughters of the regent of Scotland, Robert, duke of Albany, and had by her a daughter, Euphemia, who, while a child, was induced to refign her rights to the regent's fon, who thereby became earl of Rofs and Buchan. He did not, however, long enjoy his honours and poffeffions in quiet, for on the death of Euphemia, as is generally believed by poifon, Donald, lord of the Ifles, afferted his title to the earldom of Rofs, and being received by the inhabitants, not only fucceeded in obtaining poffeffion of the diftrict, but extended his dominions as far fouthwards as the Grampian hills, and tranfmitted them to his pofterity. John, his fon and fucceffor, who lived in the middle of the 15th century, was one of the moft powerful chieftains of his age. He ufed the ftyle of an independent prince, made treaties with Edward IV. of England, &c.; and, indeed, the extent of his territories might well juftify fuch conduct, as his fway was acknowledged over at leaft a fourth part of the whole kingdom of Scotland.

General Afpect.—On the eaftern coaft of Rofsfhire, to a fhort diftance from the fea, the country is comparatively flat, and being chiefly inhabited by perfons fpeaking the Englifh language, has been long confidered to be part of the lowlands of Scotland. This tract is extremely fertile and well cultivated, and abounds with feats belonging to opulent and refpectable proprietors, by whofe exertions it has been greatly improved of late years. The climate is more favourable to agricultural purfuits than in moft of the northern diftricts of our ifland; fo likewife is the foil, which, in many parifhes, is a deep loam, capable of yielding very large crops of wheat. In fhort, fuch are the natural advantages of this narrow tract, that it is confidered little inferior to Fifefhire, either in point of foil or climate. Unfortunately, however, the portion of it fufceptible of arable culture, though nearly fixty miles in length, rarely exceeds a mile and a half in breadth, except in the parifhes of Nigg and Tarbet. The foils here are, of courfe, various. In the parifhes of Fodderty, Dingwall, Kiltearn, Nigg, and Eaftern Fern, a rich deep loam prevails. About Contin, and in the parifhes of Alnefs, Rofekeen, and Kilmuir, the foil is light, but fufficiently favourable for general crops. The other portions confift of a conftant fucceffion of lofty mountains. The central diftrict, however, may be juftly defcribed as a beautiful Highland country, the hills being covered with a profufion of grafs, and every where interfected by ftraths, or valleys, many of them extremely rich and fertile; but on approaching the weftern coaft the general afpect is uninviting. The traveller who climbs a mountain beholds around him a profpect exhibiting a defolate and dreary region, where nothing can be feen but vaft rocky mountains, with fummits broken, ferrated, and fpringing into various forms. Yet amidft thefe hills, fo dreary to the fight, and producing little but heath, fome valleys, at once beautiful and fertile, intervene, which might be cultivated with advantage, did not the climate to which they are fubjected deter the inhabitants. During March and April, the weather is commonly friendly to the operations of the hufbandman. In the autumnal months rain falls in fuch quantities, as to lay the ripening corn flat upon the fields, and to fwell every trifling ftream into a torrent, by which the lands are ftripped of their produce, and fand and ftones are fubftituted. The fair days in this diftrict, according to a regifter kept at Lochalfh, are eftimated at 143 in number annually; but in the months of Auguft, September, October, and November, not more than five days in thirty are free from rain. The foils in the valleys, both here and in the middle diftrict, are moftly alluvial, and partake, in general, of thofe of the nature of the furrounding mountains. At the head of the bay of Applecrofs the foil is fandy; and on its fouthern fide refts on lime-ftone. At Keefhorn it is of the fame defcription, and very fertile. The foil of Terridon is light and gravelly, with the exception of a few patches of mofs; which have lately been brought into a ftate of cultivation. At loch Carron, a great variety of foil may be obferved within a very limited fpace. On the flat fpots along the fhore the foil is light and ftony; on the higher and floping grounds, a fandy loam; and at the head of the loch it is of a loofe clayey confiftence.

Mineralogy.—The mineral products of thefe counties are but very little known, becaufe the fubterranean contents have hitherto been but little inveftigated. Coal is indicated in every part of the Black ifle, in Cromarty, and throughout all the eaftern parts of Rofsfhire. Lime-ftone is abundant on the weftern coaft, where it is leaft wanted, and is likewife partially found at Kirkan, and in the eaftern diftrict, particularly in the vicinity of Geanies and Cadboll. Copper has been wrought in primary lime-ftone near Keefhorn; but the mine is for the prefent abandoned. In the parifh of Kiltearn, fmall quantities of lead-ore have been difcovered; and a vein of the fame metal, very rich in filver, appears in the parifh of Alnefs. Here alfo is a ftratum of iron-ftone, which is plentiful in moft parts of the eaftern diftrict. At Poolew yet remain the ruins of a large fmelting-furnace, the exiftence of which fhews the manufacture of iron to have been once an important bufinefs in that part of the country. Marle has been found in large quantities in the fame diftrict, particularly at Culrain, near the fea; and on the weft coaft, in the parifh of Lochalfh, is an immenfe bank of fhell-fand, the right of property in which has been for many years a fubject of litigation between Mr. Innes of Lochalfh, and the clergyman of the parifh, Mr. Downie, the former contending that it belongs to him as proprietor of the eftate of Lochalfh, and the latter, that it lies

within

within sea-mark, and is therefore *inter regalia*. In the parish of Kincardine stands one of the loftiest mountains in Ross-shire, called Carnchuinaig, on which stones have been found perfectly similar to those known by the name of Cairngorums.

Knockirny, another hill on the borders of the same parish, produces excellent marble, both white and particoloured. The other loftiest mountains in Rossshire are, Tulloch-Ard, in the district of Kintail; Ben-Uaish, in the parish of Kiltearn; and Scuilm-a-bharra, in the parish of Kincardine. That of Tulloch-Ard claims particular attention on account of its importance in remote times. "Like the temple of Janus of ancient Rome, it indicated peace or war; for when war commenced, a barrel of burning tar, on the highest peak, was the signal; and in twenty-four hours all the tenants and vassals of Seaforth appeared at the castle of St. Donan, armed *pro aris et focis*. This mountain is the crest of Seaforth's arms."

Lochs and Rivers.—The eastern coast of the united counties of Ross and Cromarty is washed by three large arms of the sea, the Dornoch, Cromarty, and Murray friths.

On the western coast there are eight arms of the sea, stretching for many miles up the country. These are, loch Broom, Little loch Broom, loch Greinord, loch Ew, loch Torbidon, loch Carron, loch Daich, and the Gairloch; all of them the usual resort of vast shoals of herrings. Gairloch has likewise been celebrated, during several centuries, for the cod-fishing. One proprietor, only, sends on an average 40,000 fish of this kind to market annually. The principal fresh-water lakes are loch Maree, and loch Tannich, the former about fifteen miles long, and the latter seven; besides which there are above twenty less considerable lakes, and a great number of small ones. These abound with fine trout and pike, and in some are charrs. In loch Maree is found that species of trout called the gizzard trout. This loch is adorned with twenty-four small islands, planted with fir-trees, and other kinds of wood. The largest rivers on the western coast are the Ew, the Carron, and the Broom, which fall into the respective lochs of the same names. The first-mentioned of these is frequented by prodigious numbers of salmon, and is perhaps the best angling stream in Britain. Salmon are likewise plentiful in the Carron, and at Ullapool. On the eastern coast the chief rivers are the Conan, the (east) Carron, the Alness, and the Oikel. The Conan and Alness fall into the Cromarty frith, which also receives several minor streams. The Carron empties itself into the Dornoch frith, as does likewise the Oikel, which forms the boundary between the counties of Ross and Sutherland. The salmon fisheries on all these rivers are very productive. The river Beaulie, which flows into the Murray frith, is the boundary of the county for several miles on the Invernessshire side.

There is a variety of sulphureous and chalybeate springs in Rossshire. The spring at Strathpeffer, which is sulphureous, is most remarkable, on account of the very great resort of Highhlanders and strangers to drink its waters from a belief in their medicinal qualities for the cure of cutaneous disorders, and of barrenness in women.

State of Property.—The value of land in these counties, as in most parts of Great Britain, has vastly increased within the last twenty years. Numerous farms, which, at the commencement of that period, were rented at little more than 200*l.* *per annum*, have been leased since 1805, as high as 800*l.* or 1000*l.*; and their monied price, when they have been brought to market, has held a proportional elevation. Landlords, trusting to ignorant surveyors, when about to let their lands, generally put a value on them, which experience has woefully shewn to be far beyond their intrinsic worth. Hence distress arose among the farmers, even when food was at its highest pitch, and most of them were consequently compelled to throw up their leases, or to obtain a considerable reduction of rent.

Most of the estates in Ross and Cromarty shires are held directly under the crown, vice the earls and bishops of Ross. The few duties formerly paid to the earls and bishops are now levied for the government; and being payable chiefly in kind, convertible at the fair price of corn, they have become a very heavy burthen on the estates from which they are taken. Until lately almost every extensive proprietor committed the management of his estate to a factor, but the evils of this practice have at length begun to operate a cure. "There can be no doubt," observes sir George Mackenzie, in his "General View of the Agriculture" of these counties, "but that the crowded population of the Highlands, and their consequent slow improvement, must be attributed, in a great measure, to the extensive power given to factors." The late factor of the proprietor of Lochalsh, by his injudicious conduct, involved his employer in numerous litigations with the minister of the parish, and with his tenants, some of which have been depending for upwards of nine years. The principal landholders are the heirs of the late lord Seaforth, Mr. Innes of Lochalsh, sir Hugh Monro of Fowlis castle, sir Alexander Munro of Novar house, sir Hector Mackenzie of Conanside, sir Roderick Mackenzie of Rosehaugh, sir Charles Ross of Balnagown castle, and Alexander Ross, esq. of Cromarty house. This mansion is by far the most elegant, and the best laid out building of any in this part of the united kingdom, but the pleasure-grounds have been much neglected.

Agriculture.—The proprietors of the eastern district of these counties are very spirited in improving, and follow every species of good husbandry practised in the south. Farmers of the superior class begin to imitate their example; but the smaller tenants are far behind. The usual grains cultivated on the arable lands are bear, oats, potatoes, pease and beans, and, along the shore, wheat. Every rotation customary in the south has been tried; but the want of markets within the county has induced many to lay their farms down with grass. The grasses generally sown, both for hay and pasturage, are red and white clover, with a mixture of rye-grass and rib-grass. The ordinary rotation practised by the small tenants, and which they have uniformly pursued for centuries, is bear, or bigg, with manure, followed by two crops of oats, or sometimes pease, and always a quantity of potatoes; on which root their families are chiefly maintained during nine months of the year. The gentlemen, and more extensive farmers, use lime, marle, and shelly-sand, as manure. The smaller tenants make a compost at the rate of one load of dung to three of earth, which they deposit for some time in pits, and then spread in February on the stubble land. The manure is then ploughed down, and another ploughing is given towards the end of April, when they sow their bear, or bigg. The shelly-sand on the west coast is reckoned a very valuable manure; it lasts from twelve to fifteen years, and has the effect of converting a light brown insipid soil into rich black loam. The size of farms here is various. The native farmers occupy from seven to thirty-seven acres of arable land; and, in some instances, have small grazings contiguous to their arable fields; but, for the most part, the horses and cattle employed in the labour of the farms are sent, as soon as seed-time is over, to graze during summer on some hill pasture, for which five or six shillings *per* head are paid. The gentlemen, and better sort of farmers, possess from 300 to 800 acres,

acres, which are in general inclosed; but the rest of the country is almost entirely open field. Among the smaller tenants leases usually run from five to seven years, at the end of which an increase of rent is most frequently demanded. This limitation of leases greatly retards improvement; for the tenant can reap but little benefit from his labour in so short a space of time; and if he has done any thing more than his neighbours, his farm is coveted, and he must either give a greater increase of rent than it can properly bear, or remove. There are some estates, however, in the leasing of which a different practice has been adopted, to the mutual advantage of the landholder and the tenant.

The central and western districts of Rosshire may be considered as exclusively devoted to pasturage; the small quantities of arable lands in the vallies bearing but a very insignificant proportion to the extent of the country. Till within the last thirty years these districts were inhabited by a number of small farmers who maintained themselves and their families from the produce of the little spots they had to cultivate, and who, in favourable seasons, were enabled to pay the trifling rent imposed by the landlord, from the profit of the cattle they possessed. These extensive districts, particularly the central district, are now converted from cattle into sheep farms; and there is no question of their superior adaptation to the latter species of stock. For every pound of beef which a Highland cattle grazier can send to market, a shepherd can at least bring three pounds of mutton. The wool also furnishes the staple for a useful and important branch of manufacture. Hence the shepherd can afford a double rent with ease; and there can hardly exist a doubt that property in the Highlands will, in process of time, be tripled, or even quadrupled, by sheep farming. The result, however, upon the population of the country is becoming more and more evident. In proportion as capital is acquired, farms augment in magnitude, and a smaller number of people find employment and support within a given space.

Live-Stock.—The cattle reared in the low parts of these counties are chiefly intended for the dairy, and are a mixed breed. The oxen and old cows are commonly fattened for the butchers of Inverness and Fort George. The breeds of sheep kept are various. The pure Cheviots, a mixture of that breed with the Leicester, and a mixture of the latter with the old white-faced horned breed of the country, are frequently met with, and also the pure Leicester. Some gentlemen have introduced the South Down and the Merino, and have successfully attempted crosses of these with the Cheviot breed. The mountain breed is not larger than ponies, but by care and attention in breeding, the size and utility might be greatly augmented. The breed of hogs kept by gentlemen for their tables, is that of China; but the country people chiefly rear the large common sow. Turkies, ducks, pea fowls, Guinea fowls, and common fowls, are reared by most of the families residing in the country, but only to supply their own consumption. Pigeon-houses are very frequent; and bees are beginning to attract considerable attention.

Roads.—Through the cultivated parts of the county the roads have been long noted for their excellence, though there were no other means for making or repairing than the ordinary statute labour. About seven years ago, however, a bill for converting the statute labour into money was presented to parliament, and passed into a law. By this act, the post-road from the borders of the county of Ross, near Beauly, to its termination at the Frith of Dornoch, is to be made turnpike; and authority is given for the erection of toll-gates every six miles. The materials for making roads are every where found in great abundance; but the number of bridges required renders road-making very expensive. The roads forming by government, and the Highland counties conjointly, will cost, on an average, 250*l. per* mile; though their breadth be only fifteen feet. The roads in the mountainous districts, if roads they can be called, are very bad; but most of them are in progress of amelioration. The road from Contin to Lochcarron is considerably advanced.

Towns and Villages.—In the united counties of Ross and Cromarty there are three royal boroughs, all of them situated in the eastern district. These are Tain, on the southern side of the Frith of Dornoch; Dingwall, at the inland extremity of the Frith of Cromarty; and Fortrose, on the northern side of the Moray Frith. Of the villages, the most worthy of notice are Cromarty, Ullapool, Fairntosh, and Lochalsh: the last has lately been constituted a burgh of barony. Fairntosh is remarkable for the singular privilege it enjoyed for nearly a century, of exemption from excise, on condition of an annual payment of 400 marks Scots. This right was resumed by government in 1786, and the sum of 20,000*l.* was granted as a compensation to the proprietor. Before that period, Fairntosh whiskey was proverbial for its purity and excellence; and even yet, the appellation of real Fairntosh is used to denote the best samples of that favourite Highland beverage. Fairs, markets, and "trysts" for cattle, are held at various places throughout the country; some of them established by custom, and others by acts of parliament.

Manufactures and Commerce.—The only manufacture which has been established in these counties is that of biscuit and cotton-bagging at Cromarty, with branches at Invergordon and Port-Mahomack. This is carried on to a considerable extent. The bagging made at these places, and at Inverness, obtains a decided preference, under the name of Inverness bagging, where it is principally sold. Many years ago, a flax manufactory was attempted to be established, but without success. With respect to commerce, it may be observed, that the chief exports are black cattle, sheep, and wool, and a considerable quantity of wheat and oats.

Antiquities.—Rosshire contains a considerable number of remains of antiquity, which are not unworthy of notice. These consist chiefly of Druidical temples, and Pictish or Danish forts, called Duns, and of the castles of the ancient chieftains. In the parish of Kiltearn, in the eastern district, is a Druidical temple, consisting of a row of twelve large stones, so disposed as to form two conjoined ovals. The area of each oval is 13 feet long and 10 feet broad in the centre. At the western extremity of one of them is a stone, which rises eight feet above the surface of the ground; but the other stones do not exceed six feet in length. In the middle of the western oval is a flat stone, which was probably the altar; and at the distance of three paces from the eastern oval is a circular hollow, said to have been a well of considerable depth, but it is now filled up. These ovals occupy the summit of an eminence, round which are drawn three concentric circular ditches; and at the distance of half a mile to the westward is a cairn, 30 paces in diameter, containing in the centre a grave $3\frac{1}{2}$ feet long, 18 inches broad, and 14 deep, lined by four flat stones, and covered by another. Cairns are also numerous on the adjoining hill. In the parish of Nigg, on the the same coast, stands a large obelisk, on one side of which are cut the figures of different animals, and on the other a cross. The former is supposed to be a much older work than the latter; and the tradition is, that the stone was erected in memory of a shipwreck, by which three

three sons of one of the Danish monarchs are said to have lost their lives, and their bodies buried under the obelisk. The rock opposite, where the vessel struck, is from this circumstance still called the King's-Sons. Another obelisk, similar to the above, formerly stood in Nigg church-yard, but the base of it alone remains. Near Dunskeath, on the ledge of a rock over-hanging the Moray frith, are the remains of a castle, built in 1179, by William, surnamed the Lion, king of Scotland. In the parish of Kincardine is Craigchenican, where the gallant marquis of Montrose fought his last battle. He swam to Kyle, and lay some time concealed in Assint; but being discovered and apprehended he was sent prisoner to Inverness. The ground where the battle took place received its present name from the event of that memorable day. Near the church, in the same parish, is an alley, walled in, and terminating in a large semicircle, appropriated to the military exercise and discipline, distinguished by the name of Weapon-shawing; and in the cemetery is a stone sculptured with an imperial crown, and a man on horse-back, in the act of darting a lance. Tradition reports it to be the upper part of a stone coffin, in which the remains of a prince of Loellin, who died of his wounds in the neighbourhood, were deposited. In the same neighbourhood are also several Druidical circles, and likewise some of the round buildings which were formerly mentioned under the denomination of Picts-houses. Near Avoch, the foundations still remain of a large old castle, or fortalice. To this ruin tradition gives the name of Douglas castle. It is about 350 feet long and 160 feet broad, divided into numerous apartments, which appear to have been constructed of coarse red quarry-stone and lime; and was defended on one side by a deep fosse, and on another by bastions. Throughout every part of the eastern district are abundance of places where battles with the Danes and Norwegians, or between rival clans, are said to have been fought. Numbers of cairns point out the spots where the ashes of the dead have been deposited, though concerning most of them tradition is silent. In the parish of Eddertoun, however, on a plain to the west of the church, tradition says a great battle was fought against the Danes, one of whose princes, who fell in action, lies buried in the centre of a large circular barrow in the immediate vicinity. In the parish of Fearn are several Druidical temples; but the most interesting monuments of antiquity here are the abbey and castle of Lochlin. The abbey-church was long used for divine service, but is now in a state of ruin. The castle occupies the summit of a very lofty eminence, and is one of the most conspicuous objects in the country. It is built in the form of two squares, joined together at the corners. Another very ancient castle was situated at Cadboll, whence it derived its name. Few remains of it now exist, except the vaults under ground; but it deserves notice on account of a singular tradition concerning it, which is fully credited by the vulgar, *viz.* that though it was inhabited for many centuries, no person ever died in it; in short, that it possessed a magical charm against death, though not against disease, or the evils attendant on extreme old age. Hence many of the inhabitants, it is said, when they became weary of life, requested to be carried out of the castle, that they might obtain relief. The castle of Craighouse, in the parish of Kirk-Michael, stands close to the shore, inclosed on the land side by a ditch and high wall. All the apartments of that portion of the mansion now most entire are vaulted with stone. This castle was long the property of the family of Williamson, who emigrated to Germany; it afterwards became the occasional residence of the bishops of Ross. In this vicinity is a great number of ancient encampments, likewise various tumuli and cairns. In Killernan parish are two ancient structures, Killcoy and Redcastle, of considerable strength. The latter was anciently of some importance. It was annexed to the crown in 1455, and was constituted a borough of barony, and a free-port, with the right of holding weekly markets, and levying toll and anchorage dues. Rory Mackenzie, the proprietor of Redcastle in 1646, having joined the rebellious standard of the gallant marquis of Montrose, was taken prisoner near Balveny, in Morayshire, and suffered the death of a traitor. During his absence the castle was garrisoned by his sons and dependants, but was soon after stormed and taken by a party of royalists, who put the garrison to the sword and set fire to the buildings. In the mountainous peninsula of Kintail, on the west coast, stand the ruins of the castle of Donan, which was built by Alexander III. of Scotland, to resist the depredations of the Danes. Colin Fitzgerald, ancestor to the late earl of Seaforth, was made constable of the castle, for his bravery at the battle of Largs, fought in 1263. In 1715 it was taken from the king's forces by stratagem; but two years afterwards, having been attacked on the sea side, by a line of battle ship, it was demolished. In the front of a clergyman's house, in Kintail, stands Donan-Diarmed, or the fort of Diarmed. It is of a circular form, twenty feet in diameter, and of the same height. Diarmed's tomb is on the north-east side of the fort.

Such parts of Rosshire as are included in the Hebrides, the reader will find noticed under their respective names, and also under the words WESTERN ISLANDS. Beauties of Scotland, vol. v. Lond. 8vo. 1808. A General View of the Agriculture, &c. of the Counties of Ross and Cromarty, by sir George Stuart Mackenzie, bart. Lond. 8vo. 1810.

ROST, JOHN CHRISTOPHER, in *Biography*, a German poet, was born at Leipsic in the year 1717. He received a good education, and as he advanced in life he studied, with the utmost assiduity, jurisprudence, antiquities, and the belles lettres. His chief instructor was Ernesti, but he studied philosophy also under Hoffman, and attended the lectures of Gottsched, to whose praise he devoted the first fruits of his muse, though he afterwards wrote against him a satirical poem, which was published in 1743. This is said to be the best of his productions, and to abound with genuine and delicate wit. He attempted pastorals in the German language, which were printed at Berlin in 1742, but the morality of them is exceedingly lax, and vice is exhibited too frequently under the captivating form of innocence. A new edition of them appeared at Dresden in 1744, entitled "An Attempt at Pastoral Poetry, with other poetical Pieces," and a third was published in 1768. In 1746, Rost was appointed secretary and librarian to count Bruhl, and died in 1765, in the 48th year of his age. His miscellaneous poems were published after his death, in 1769. Gen. Biog.

ROST, in *Metallurgy*, a term used by the miners at Chremnitz to express the ore of gold after it has been washed and powdered, and melted first with lime-stone, and afterwards burnt with charcoal alone. See LECH.

ROSTAD, in *Geography*, a town of Norway; 70 miles N. of Drontheim.

ROSTAK, a town of Arabia, in the province of Oman, the seat of a sovereign prince, at some distance from the sea; 70 miles W. of Mascat.

ROSTAK, a town of Persia, in the province of Laristan; 90 miles S. of Mar.

ROSTAL, a town of Germany, in the principality of Anspach; 7 miles N.N.W. of Schwabach.

ROSTAN,

ROSTAN, a town of Syria, in the pachalic of Damafcus; 45 miles N.N.E. of Damafcus.

ROSTAYN, a town of Bohemia, in the circle of Boleflau; 4 miles N. of Aycha.

ROSTEN, in the *Materia Medica* of earlier ages, a name given to crab's eyes.

ROSTER, in *Military Language*, a plan, or table, by which the duty of officers, entire battalions, and fquadrons, is regulated.

ROSTGAARD, Frederick, in *Biography*, a learned Danifh writer, was born at Kraagerup, in Seland, in the year 1671. He was educated at Copenhagen, and in 1690 he undertook a tour through Europe; in the courfe of which he paid a vifit to the moft celebrated univerfities of Germany, Holland, England, France, and Italy. After his return in 1669, he was made private keeper of the records to his Danifh majefty, and in 1702 was ennobled and appointed a counfellor of juftice. In 1721 he became chief fecretary in the Danifh chancery, and after receiving a confiderable penfion, he was nominated in 1735 a counfellor of conference. He died in 1745, and bequeathed to the library of the univerfity of Copenhagen a great many manufcripts and feveral printed books, confifting moftly of hiftorical works, with a large fount of Arabic and Perfian types. He was author of a great number of works, among which the following may be enumerated: "Deliciæ Poetarum Danorum;" "A Danifh Tranflation of Corneille's Cid;" "Projet d'une nouvelle Methodé pour dreffer le Catalogue d'une Bibliothéque felon les Matières avec le Plan;" "Enchiridion ftudiofi, Arabicè cum Verfione Latina, edit. ab Hadrino Relando." He collected, with great care, and at a confiderable expence, in various parts of France and Italy, manufcripts of "Libanii Epiftolæ," from which the edition of J. C. Wolfius of Hamburgh was publifhed. It was through the exertions of Roftgaard that the "Fragmentum Theotifcum Ifidori Hifpalenfis" was difcovered and publifhed in the fecond volume of the Danifh Bibliotheque. He was the author of many Latin and Danifh poems, and was employed for feveral years on a Danifh Lexicon, as well as in collecting rare Arabic and Greek manufcripts, and heraldic documents relating to the Danifh nobility. Gen. Biog.

ROSTOCK, in *Geography*, a fea-port town of Germany, in the circle of Lower Saxony, and duchy of Mecklenburg, on a lake which communicates with the Baltic. It contains three churches and an univerfity, jointly founded by the dukes and the town in the year 1419, and privileged by a bull of pope Martin V. afterwards confirmed by the emperor Ferdinand I. But in 1437, the town fell under the ban both of the emperor and pope, and the profeffors removed to Griefswalde, whence they returned again in 1443. In 1487, on account of a mifunderftanding between the dukes and the town, the univerfity was removed to Lubeck, but again reftored in 1492. The place has thrice fuffered from the peftilence, and at the commencement of the reformation was deferted by its profeffors and ftudents till the year 1530, and in 1560 the emperor Ferdinand afforded it a new charter. In purfuance of a convention made, in 1563, between the dukes and the town, the former nominate and pay fifteen profeffors, and the town nine. It was alfo agreed that the dukes fhould annually contribute 3000 florins, and the town 500, towards the falaries of the profeffors. The magiftracy confifts of three burgher-mafters, one fyndic, twelve aldermen, one fecretary, and a prothonotary. It poffeffes the right of coining copper, filver, and gold, and therefore has a mint. Both the civil and criminal jurifdiction are vefted in the magiftracy, with right of appeal to the two fupreme courts of juftice, except in thofe cafes where no appeal is allowed. The town enjoys other confiderable privileges; neverthelefs it is hereditarily fubject to the dukes, in acknowledgment of which fubjection it annually pays 55 rixdollars, as an original tribute, and alfo 600 florins, for the grant of an excife. The trade of this town is very confiderable. In the year 1218 it was admitted into the Hanfeatic confederacy; 25 miles N.E. of Weifmar. N. lat. 54° 10′. E. long. 12° 12′.

ROSTOV, a town of Ruffia, in the government of Jaroflavl, fituated near a lake, to which it gives name: the fee of a bifhop; 36 miles S. of Jaroflavl. N. lat. 57°. E. long. 39° 54′.

ROSTRA, in *Antiquity*, a part of the Roman forum, wherein orations, pleadings, funeral harangues, &c. were delivered.

The roftrum was a kind of chapel, taken out of the forum, and furnifhed with a fuggeftum, or eminence, called more particularly the roftra, where the orators ftood to fpeak.

It was adorned, or, as Livy fays, built, with the beaks of fhips taken from the people of Antium, in a naval engagement; whence the name.

There were two kinds of roftra; *roftra vetera* and *roftra nova*. The latter was erected by Auguftus, and decorated with the prows of veffels which he took at the battle of Actium. The firft were thofe already defcribed.

ROSTRALIS Corona, *Roftral Crown*. See Crown.

Rostralis *Columna*, *Roftral Column*. See Column.

ROSTRATA, in *Zoology*. See Toucan.

ROSTRENEN in *Geography*, a town of France, and principal place of a diftrict, in the department of the North Coafts; 20 miles S. of Guingamp. N. lat. 48° 14′. W. long. 3° 15′.

ROSTREVOR, a poft-town of the county of Down, Ireland, fituate on the bay of Carlingford, and much frequented for fea-bathing. Mr. Wakefield calls it the Brighton of Ireland, and it has been much admired for its romantic fcenery. It is a wooded bank, on a fmall arm of the fea, and has behind it the Mourne mountains. It is $57\frac{1}{2}$ miles N. from Dublin, and $7\frac{1}{2}$ from Newry.

ROSTRIFORMIS Processus, in *Anatomy*, the fame as coracoides.

ROSTRUM literally denotes the beak or bill of a bird. This is a hard horny fubftance, confifting of an upper and under part, extending from the head, and anfwering to the mandibles in quadrupeds. Its edges are generally plain and fharp, like the edge of a knife, or cultrated; fometimes ferrated, or jagged, or pectinated, or denticulated; but always deftitute of real teeth immerfed in fockets. See *Anatomy of* Birds.

Hence the word is alfo figuratively applied to the beak, or fore-part, of the head of a fhip.

The roftrum, or fnout, in fifhes, varies very much in figure, and ferves as a confiderable article of diftinction. It is, 1. In fome plagioplateous, or depreffed, as in the pike, &c. 2. In fome it is conic in fhape, as in the oxyrynchus, &c. 3. In fome it is extended into a long and fharp point, as in the common ones. And, 4. In others it is triangular, or nearly fo, as in the rays. See Fish.

Rostrum is alfo ufed to fignify an inftrument, with which paper is ruled for mufical compofitions.

Rostrum, in *Chemiftry*, fignifies the nofe, or beak, of the common alembic, which conveys the liquor diftilled into its receiver.

Rostrum is alfo a fort of crooked fciffars, which the furgeons, ſurgeons, in ſome caſes, make uſe of for the dilatation of wounds.

ROSTRUM *Leporinum*, in *Surgery*, the piece of fleſh ſituated betwixt the margins of a hare-lip.

ROSTRUM *Seminis*, in *Botany*, the beak of the ſeed, is an elongation of the apex of a naked ſeed, originating either in the baſe of the ſtyle itſelf, remaining in a hardened ſtate (ſee DICHROMENA); or it conſiſts of an appendage to the whole fruit, compoſed of two naked ſeeds; as in *Scandix*. The ſame term applies to a ſimilar elongation of certain ſeed-veſſels; as in *Geranium* and its allies, whoſe beaks bear a ſtrong analogy to thoſe of *Scandix;* and in *Helleborus*, *Delphinium*, and abundance of other genera, where they originate from the indurated ſtyles.

ROSWEIDE, HERIBERT, in *Biography*, a learned Dutch Jeſuit, and writer in eccleſiaſtical antiquities, was born at Utrecht in the year 1569. He entered among the diſciples of Loyola, at Doway in Flanders, when he was 20 years of age, and ſoon diſcovered the ſubjects of ſtudy peculiarly adapted to his genius, by ſpending the time which he was allowed to devote to exerciſe and recreation, in examining the libraries of the monaſteries in that city, and reſcuing the ancient manuſcripts contained in them from duſt and oblivion. Having completed his courſe of academical ſtudies, he filled ſucceſſively the chairs of philoſophy and divinity, firſt at Doway and afterwards at Antwerp, with great reputation for ſeveral years. After this he devoted his time to the compoſition and publication of his various works. He died in 1629, at the age of 60. He publiſhed, in 1607, "Faſti Sanctorum quorum Vitæ in Belgicis Bibliothecis Manuſcriptæ aſſervantur," which he intended as a ſpecimen of a larger work, and which was the prototype of the immenſe collection by Bollandus and others, under the title of Acta Sanctorum. He was author of many other works, among which is "An Account of the Hermits of Egypt and Paleſtine," "An Eccleſiaſtical Hiſtory from the Time of Chriſt to Pope Urban VIII." in two vols. folio; and "The Hiſtory of the Belgic Church."

ROSWALD, in *Geography*, a town of Moravia, in the circle of Prerau, inſulated in Sileſia; 6 miles N. of Jagendorf.

ROSWICK, a town of Sweden, in Weſt Bothnia; 10 miles N. of Pitea.

ROSYCRUSIANS, ROSICRUCIANS, *Roſacrucians*, or *Brothers of the Roſy-croſs*, a name aſſumed by a ſect or cabal of hermetical philoſophers, or of *Theoſophiſts;* who arofe, as it has been ſaid, or at leaſt became firſt taken notice of, in Germany, in the beginning of the 14th century.

They bound themſelves together by a ſolemn ſecret, which they all ſwore inviolably to preſerve; and obliged themſelves, at their admiſſion into the order, to a ſtrict obſervance of certain eſtabliſhed rules.

They pretended to know all ſciences, and chiefly medicine; of which they publiſhed themſelves the reſtorers. They pretended to be maſters of abundance of important ſecrets; and, among others, that of the philoſopher's ſtone; all which they have affirmed to have received by tradition from the ancient Egyptians, Chaldeans, the Magi, and Gymnoſophiſts.

Their chief was a German gentleman, called Chriſtian Roſencruz, educated in a monaſtery, where he learnt the languages. About the cloſe of the 14th century he went to the Holy Land, and viſited the holy ſepulchre; and falling ſick at Damaſcus, he conſulted the Arabs, and other eaſtern philoſophers, by whom he was ſuppoſed to be initiated into this wonderful art. At his return into Germany, he formed a ſociety, to whom he communicated the ſecrets he had brought with him out of the Eaſt, under an inviolable oath of ſecrecy, and finally died in 1484.

This ſociety remained concealed till the beginning of the 17th century, when two books were publiſhed; the one entitled "Fama Fraternitatis laudabilis Ordinis Roſæcruſis," The Report of the laudable Fraternity of Roſicrucians; the other, "Confeſſio Fraternitatis," The Confeſſion of the Fraternity. In theſe works the world was informed, that the fraternity was enabled, by divine revelation, to explain the moſt important ſecrets both of nature and grace; that they were appointed to correct the errors of the learned world, particularly in philoſophy and medicine; that they were poſſeſſed of the philoſopher's ſtone, and underſtood both the art of tranſmuting metals and of prolonging human life; and in fine, that by their means the golden age would return. As ſoon as theſe grand ſecrets were divulged, the whole tribe of the Paracelſiſts, Theoſophiſts, and chemiſts, flocked to the Roſicrucian ſtandard, and every new and unheard-of myſtery was referred to this fraternity. Various were the opinions that were formed of this ſociety; but though its laws and ſtatutes had appeared, no one could tell where the ſociety itſelf was to be found, or who really belonged to it. It was imagined by ſome ſagacious obſervers, that a certain important meaning was concealed under the ſtory of the Roſicrucian fraternity, though they were wholly unable to ſay what it was. One conjectured that ſome chemical myſtery lay hid behind the allegorical tale; another ſuppoſed that it foretold ſome great eccleſiaſtical revolution. At laſt Michael Brele, in the year 1620, had the courage publicly to declare, that he certainly knew the whole ſtory to have been the contrivance of ſome ingenious perſons, who choſe to amuſe themſelves by impoſing upon the public credulity. This declaration raiſed a ſuſpicion againſt the whole ſtory; and as no one undertook to contradict it, this wonderful ſociety daily vaniſhed, and the rumours which had been ſpread concerning it ceaſed. The whole was probably a contrivance to ridicule the pretenders to ſecret wiſdom and wonderful power, particularly the chemiſts, who boaſted that they poſſeſſed the philoſopher's ſtone. It has been conjectured, ſays Brucker, and the ſatirical turn of his writings, and ſeveral particular paſſages in his works, favour the conjecture, that this farce was invented and performed, in part at leaſt, by John Valentine Andrea, a divine of Wartenburg.

We ſhall here ſubjoin ſome further particulars concerning the Roſicrucians.

They have been diſtinguiſhed by ſeveral names, accommodated to the ſeveral branches of their doctrine.

Becauſe they pretend to protract the period of human life, by means of certain noſtrums, and even to reſtore youth, they were called *immortales*.

As they pretended to know all things, they have been called *illuminati:* and becauſe they have made no appearance for ſeveral years, but have kept altogether incognito, they have been called the *inviſible brothers*.

Their ſociety is frequently ſigned by the letters F. R. C., which ſome among them interpret *fratres roris cocti;* it being pretended, that the matter of the philoſopher's ſtone is dew concocted, exalted, &c.

Some, who are no friends to free-maſonry, make the preſent flouriſhing ſociety of free-maſons a branch of Roſicrucians; or rather the Roſicrucians themſelves, under a new name or relation; *viz.* as retainers to building. And it is certain, there are ſome free-maſons who have all the characters of Roſicrucians; but how the era and original of maſonry, as traced by Mr. Anderſon, and that of Roſicrucianiſm, crucianifm, here fixed from Naudæus, who has written exprefsly on the fubject, confift, we leave others to judge.

Notwithftanding the pretended antiquity of the Roficrucians, it is probable that the alchemifts, Paracelfifts, or *fire philofophers*, who fpread themfelves through almoft all Europe, about the clofe of the 16th century, affumed, about this period, the obfcure and ambiguous title of Roficrucian brethren, which commanded, at firft, fome degree of refpect, as it feemed to be borrowed from the arms of Luther, which were a *crofs* placed upon a *rofe*.

But the denomination evidently appears to be derived from the fcience of chemiftry. It is not compounded, fays Mofheim, as many imagine, of the two words *rofa* and *crux*, which fignify *rofe* and *crofs*, but of the latter of thefe words, and the Latin word *ros*, which fignifies *dew*. Of all natural bodies, dew was efteemed the moft powerful diffolvent of gold; and the *crofs*, in the chemical language, is equivalent to *light*, becaufe the figure of a crofs + exhibits, at the fame time, the three letters of which the word *lux*, or *light*, is compounded. Now *lux* is called, by this fect, the feed or menftruum of the red dragon, or, in other words, that grofs and corporeal light, which, when properly digefted and modified, produces gold. Hence it follows, if this etymology be admitted, that a Roficrucian philofopher is one, who, by the intervention and affiftance of the dew, feeks for light, or, in other words, the fubftance called the philofopher's ftone.

The true meaning and energy of this denomination did not efcape the penetration and fagacity of Gaffendi, as appears by his Examen Philofophiæ Fluddanæ, fect. 15. tom. iii. p. 261. And it was more fully explained by Renaudot, in his Conferences Publiques, tom. iv. p. 87.

At the head of thefe fanatics were Robert Fludd, an Englifh phyfician, Jacob Behmen, and Michael Mayer. The common principles, which ferve as a kind of centre of union to the Roficrucian fociety, are the following. They all maintain that the diffolution of bodies, by the power of fire, is the only way by which men can arrive at true wifdom, and come to difcern the firft principles of things. They all acknowledge a certain analogy and harmony between the powers of nature and the doctrines of religion, and believe that the Deity governs the kingdom of grace by the fame laws with which he rules the kingdom of nature; and hence they are led to ufe chemical denominations to exprefs the truths of religion. They all hold, that there is a fort of divine energy, or foul, diffufed through the frame of the univerfe, which fome call the *archeus*, others the *univerfal fpirit*, and which others mention under different appellations. They all talk in the moft fuperftitious manner of what they call the fignature of things, of the power of the ftars over all corporeal beings, and their particular influence upon the human race, of the efficacy of magic, and the various ranks and orders of demons. In fine, they all agree in throwing out the moft crude incomprehenfible notions and ideas, in the moft obfcure, quaint, and unufual expreffions. Brucker's Hift. Philof. by Enfield, vol. ii. Mofh. Eccl. Hift. vol. iv. Eng. ed. 8vo. See BEHMISTS and THEOSOPHISTS.

ROT, in *Rural Economy*, a fort of putrid decay, taking place gradually in different fubftances, either from the effects of moifture or other caufes. Much mifchief is frequently done in this way to different kinds of materials of the farm fort.

This fort of decay in materials, whether of the manure or other kinds, is greatly promoted by their being kept in a continued moift condition, by the atmofpheric air being freely admitted to them; and where they are of a ftrawy, littery, or light nature, by their being thrown together in rather an open manner. The contact of the earth or mould alfo promotes this kind of rot in a very great degree. There is likewife a great variety of other caufes, which have a tendency to bring on and expedite the decay of fubftances both of the hard and lefs firm kinds. See PUTREFACTION.

ROT, among fheep-farmers, a difeafe incident to fheep and other animals, in which both the liver and lungs are affected, and there is often a dropfical tendency. It is moftly connected with moifture or moift fituations; but its caufes are far from being perfectly inveftigated. Dr. Harrifon of Lincolnfhire has, however, lately done much in this way, and drawn many ufeful and fcientific conclufions. The difeafe is readily known to experienced fhepherds by a careful examination of the eye, which is done by placing the fheep between his thighs, and holding the head with both hands. He then proceeds to raife the upper, and deprefs the under eye-lid, by which means the blood-veffels of the tunica albuginea, or white, are brought into view. When they are red, and in great numbers, the fheep is fuppofed to be in good health. The caruncula lacrymalis, or haw and inner furface of the eye-lids, fhould be as red as the veffels on the eye-ball. If they are pale, and the veins are in fmall quantities, and faint-coloured, or livid, the fheep is in a debilitated ftate, or afflicted with the rot. And in all cafes where the blood-veffels have entirely difappeared, the mutton is bad. By frequently examining the eyes in dangerous feafons, fhepherds may always difcover the rot before the fheep begin to fhrink, and, confequently, in time to prevent any material injury to their profits.

The above intelligent writer traces the nature and effects of the difeafe in the following manner: when in warm, fultry, and rainy weather, fheep that are grazing on low and moift lands feed rapidly, and fome of them die fuddenly, there is reafon to fear that they have contracted the rot. This fufpicion will be further increafed, if in a few weeks afterwards the fheep begin to fhrink, and become flaccid in their loins. By preffure about the hips at this time, a crackling is fometimes perceptible. Now, or foon afterwards, the countenance looks pale, and upon parting the fleece, the fkin is found to have exchanged its vermilion tint for a pale red; and the wool is eafily feparated from the pelt. As the diforder advances, the fkin becomes dappled with yellow, or black fpots. About this time the eyes lofe their luftre, and become white and pearly, from the red veffels of the tunica adnata, and eye-lids, being contracted or entirely obliterated. To this fucceed debility and emaciation, which increafe continually till the fheep die; or elfe afcites, and perhaps general dropfy fupervene, before the fatal termination. Thefe fymptoms are rendered more fevere by an obftinate purging, which comes on at an uncertain period of the diforder. In the progrefs of the complaint, fheep become what the graziers call *chockered*, that is, affected with a fwelling under the chin, which proceeds from a fluid contained in the cellular membrane, under the throat. And he adds, that in five or fix days after contracting the rot, the thin edge of the fmall lobe of the liver becomes of a tranfparent white, or blueifh colour, and this fpreads along the upper and lower fides, according to the feverity of the complaint. Sometimes it does not extend more than an inch from the margin. In fevere cafes, the whole peritoneum invefting the liver is difeafed; and then it commonly affumes an opaque colour, interfperfed with dark red lines or patches. The upper part of the liver is fometimes fpeckled like the body of a toad, to which it is faid to bear a ftriking refemblance; round the ductus communis choledocus and hepatic veffels, a jelly-like matter is depofited, which

which varies according to the feverity of the attack, from a table-fpoonful, or lefs, to five or fix times that quantity. Upon boiling, the liver lofes its firmnefs, and feparates into fmall pieces in the water, or remains foft and flaccid. And it is obferved, that graziers and butchers having remarked that fheep are much difpofed to feed during the firft three or four weeks after being tainted, avail themfelves of this circumftance very' commonly to increafe their profits. When the firft ftage is over, flukes begin to appear in the pori biliarii, the ductus communis choledocus, and in the gall-bladder. At firft the number of thefe creatures is fmall; but as the difeafe advances they increafe, and before death, are often very numerous. In the laft part of the complaint, they are fometimes to be found in the ftomach as well as in the inteftines and liver. This, like the vifceral diforders of the human body, may terminate in refolution, effufion, fuppuration, or fchirrus. 1ft. The complaint is faid to terminate in refolution, when the inflammatory action goes off, without deftroying the ftate and texture of the parts. However, he is ftrongly inclined to believe, that every confiderable inflammation in the human body, and in other animals, although it ends in refolution, leaves behind it fome remains, which may be difcovered by an experienced anatomift. When the veffels are thrown into inflammatory action for a few days only, effufion commonly takes place, and the coats become thicker, and affume a buff-like colour. Thefe changes in the fanguinary fyftem often continue through life, and lay the foundation of many chronic and incurable diforders. Sheep that recover from the rot exhibit very different appearances after death, according to the feverity of the attack; but the taint is feldom or never entirely removed. The liver of an old ewe, that lately died fat, and contained fourteen pounds of fuet in her body, had the following appearances: the back part of the fmall lobe was dappled with whitifh fpots; the coats of the ductus communis and pori biliarii were confiderably thickened, and more folid than ufual. In colour they refembled the human aorta in old people, and were full of flukes: in other refpects the liver appeared to be found and natural. The butcher afferted that the variegated appearance and alteration in the ducts were occafioned by a flight taint of long ftanding, which had not been confiderable enough to diforder the economy, or impair the health of the animal fufficiently to prevent its feeding.

2dly. That when fheep die fuddenly in the firft ftage of the diforder, an effufion of ferum, or of wheyifh-coloured fluid, may be commonly difcovered in the cavity of the abdomen, and then the peritoneum furrounding the liver is generally covered with a membrane or coat of coagulable lymph. This form of the rot has been frequently confounded with the refp or red water, though it differs from the latter diforder in the colour of the effufed liquid, in being much lefs expofed to putrefaction, and in feveral other particulars.

3dly. And that abfceffes in the liver exhibit another termination of this malady. They are feldom confiderable enough to kill immediately; but, in confequence of the abforption of purulent matter from them, the fheep frequently wafte away, and die hectical or dropfical. When the collections are fmall, fheep will recover fufficiently to bear lambs for three or four feafons, and afterwards become tolerable mutton. 4thly. That the moft common termination is in fchirri, or what the fhepherds call knots in the liver. The whole fubftance of this important vifcus has been found fo full of fmall roundifh lumps, or fchirrous bodies, that it was difficult to find any found part in it. The firft attack is unfortunately fo very infidious, that the diforder is fcarcely obfervable before the animal begins to wafte and lofe flefh. In this advanced ftate it is faid to labour under the rot or pourriture, from overlooking the commencement of the diforder. And hydatids are obferved to effect fchirrous and purulent livers more frequently than others. When livers are much difeafed, the butchers carefully conceal them from the public eye. To him it is always matter of furprife to find the mutton faleable in thefe fevere cafes. It fhews, in an extraordinary manner, the accommodating power of living matter, which is able to maintain life, and increafe corpulence, under fuch unfavourable circumftances. Shepherds and breeders, who make it a general rule to kill every fheep that becomes indifpofed, from an opinion that very few of them ever recover from any illnefs, would do well to examine the livers and other vifcera of flaughtered fheep. By fuch a practice they would foon be convinced that fheep are able to endure a great deal.

But in refpect to the caufes of the difeafe, it has been imputed, 1ft, to a vitiated dew; 2dly, to a cruft, which adheres to grafs after wet weather, or the overflowing of running water; 3dly, to the luxuriant and quick growth of plants, in hot, moift feafons; 4thly, to grazing certain herbs; 5thly, to fafciolæ hepaticæ, or their ova, being introduced into the ftomachs of animals, by feeding on fwampy and low grounds in moift weather; 6thly, it has been called the *fheep-pox* by profeffor Vibourg, of the veterinary college at Copenhagen; but this is not properly the caufe of the rot. And, 7thly, it is afcribed, by Daubenton, to poor diet, and drinking too much water. Thefe different caufes are objected to, and fhewn not well founded by the firft writer, who thinks that, 8thly, it feems to be occafioned by poifonous effluvia, which, under certain circumftances, are emitted from marfhy foils, in fupport of which it is ftated that the following facts afford ftrong proofs.

His refidence confifts of high and low lands, of a loamy and tenacious nature. While a brook which runs through the farm remains overflowed, and the water continues upon the adjoining flat grounds, his fheep never fuffer any inconvenience, though they are frequently obliged to wade for their provifions. As foon as the flood is fubfided, the fheep can at any time be tainted in a quarter of an hour, while the land retains its moifture, and the weather is hot and fultry. The butchers are fo well acquainted with the importance of this fact, that when his friend has difpofed of any fat fheep, they are ufually turned upon this rotten ground to make them thrive fafter. But by judicious management he has laid the greateft part of his farm completely dry, and is now little troubled with the rot, unlefs when he wifhes to give it to fome particular animals. His neighbours, who have been lefs provident, are ftill fevere fufferers by it; nor are their misfortunes confined to fheep alone. Pigs, cows, affes, horfes, poultry, hares and rabbits, become rotten in this lordfhip, and have flukes in their livers. Many years fince, his grandfather removed ninety fheep from a confiderable diftance to his own refidence. On coming near to a bridge, which is thrown over the Barling's river, one of the drove fell into a ditch, and fractured its fore-leg. The fhepherd immediately took it in his arms to a neighbouring houfe, and replaced the limb. During this time, which did not occupy more than one hour, the remainder were left to graze in the ditches and lanes. The flock were then driven home, and in a month afterwards, the other fheep joined its companions. The fhepherd foon difcovered that all had contracted the rot except the lame fheep; and as they were never feparated upon any other occafion, it is reafonable to conclude that the diforder was acquired by feeding in the road

road and ditch bottoms. And he adds, that a Lincolnſhire farmer purchaſed ſome turnips in Nottinghamſhire, upon which he intended to winter a flock of ſheep. The firſt diviſion, conſiſting of about forty, were detained one night at a village near to the place formerly alluded to, by the overflowing of the Barling's Ean, and were put upon a piece of flat land which leads to the river. The water had not returned to its former channel more than a day or two. Every one of the forty ſheep became rotten; whereas the other diviſion, which ſtopped no where by the way, eſcaped the diſorder, and remained well. Sheep were formerly admitted into ſome adjoining paſtures, in travelling to and from the neighbouring fairs and markets; but ſo many of them contracted the rot, that, for ſome time paſt, the graziers in this county will not ſuffer their flocks to ſtop for a moment near the village. He has repeatedly examined the ſuſpected ditches and paſtures, but never obſerved either flukes, or any of the plants, to which the rot has been attributed: though he muſt candidly acknowledge that he ought to have ſought for them with more care and attention. Theſe ditches communicate with a rivulet, which frequently overflows its banks, and the incloſures are then deluged with water. The ſoil conſiſts chiefly of loam or clay, and the ſurface is ſo flat and level on both ſides of the river, that for want of proper deſcent, the water is a long time detained upon the grounds. He is credibly informed, that in this place the rot affects ſwine, hares, and rabbits, as well as ſheep.

It is further ſtated, that he has likewiſe been informed by Mr. David Wright, that a few years ſince, as a drove of ſheep were paſſing through a long lane in the pariſh of Irby, one of them, being weary, fell down in the middle of the road. The others were permitted to range at large, till their companion was able to travel. They were then driven all together into a paſture, and it was ſoon diſcovered that only the *tired* ſheep had eſcaped the rot. As the flock had never been ſeparated upon any occaſion, we are entitled to conclude that the diſorder was contracted while the tired animal remained upon the road. From theſe and other caſes, the writer thinks himſelf juſtified in aſcribing the rot in ſheep, and other animals, to *paludal* effluvia; but in regard to the nature and conſtitution of which he acknowledges it is very difficult to form any rational opinion, as they have hitherto eluded the moſt ſubtile and delicate inquiries.

In reſpect to the prevention of the diſorder, he ſuggeſts, that where neceſſity requires the paſturage of moiſt grounds in ſummer or autumn, the ſhepherd ought carefully to remove his flock into a dry ſituation before the evening, and provide them with corn, and good hay, or green food. He ſays that a conſiderable farmer of Bohemia kept his ſheep ſound in the wet and fatal year of 1769, by feeding them every night, when turned under a ſhed, or into ſtables, with haſhed ſtraw; and by eating it greedily they were all ſaved. By this judicious practice, the ſheep were removed to ſleep in better air, as well as preſerved in a more vigorous ſtate of body. Sir John Pringle informs us, that perſons have maintained themſelves in good health, during ſickly ſeaſons, by inhabiting the upper ſtories of their houſes; and he has reaſon to believe, that by merely confining ſheep on high grounds through the night, they have eſcaped the rot. He adds, that after the dew is exhaled by the ſun's heat, ſheep may be ſuffered to range in moiſt and ſwampy places, with leſs danger, becauſe the miaſmata, which are formed in the night, and remain entangled among the graſs, or float in the lower part of the atmoſphere, are chiefly diſſipated with the dew. Therefore, unleſs they be very copiouſly produced in the day time, or are unuſually virulent, they will not be ſufficiently concentrated to do much injury to healthy ſheep. While at reſt and aſleep, the operations of the ſyſtem are more feebly performed, and then ſheep are peculiarly expoſed to diſeaſed actions. By conforming to theſe regulations, he has known one flock eſcape entirely, while others have ſuffered materially in the ſame open field.

And it is confidently aſſerted, that decoctions of bitter herbs, with ſalt, have frequently preſerved ſheep from the rot. Salt is ſuppoſed to conſtitute a part of Fleet's celebrated noſtrum; and we know that bitters are deſervedly recommended to prevent intermittents, the dyſentery, and other diſorders, which originate from exhalations. In Oxfordſhire, Dr. Lower has frequently known ſix or ſeven ſpoonsful of ſtrong brine and ſtale urine, with ſoot ſteeped in it, to be given with great ſucceſs. This is done at ſpring and the fall of the year, when the dew is counted moſt dangerous. This courſe of phyſic is continued eight or ten days, or till the ſheep eat their meat heartily; and if they were taken in time, there ſeldom died any in a whole flock. For the ſame purpoſe, Ellis recommends the following medicine in his "Practical Huſbandry." Take a peck or more of malt, and maſh it, as though you would brew it into ale or beer, and make eleven or twelve gallons of liquor; then boil in it a quantity of ſhepherd's purſe, comfrey, ſage, plantain, penny-royal, wormwood, and bloodwort: add yeaſt, and afterwards ſalt the mixture; then turn the liquor into a veſſel. After April comes in, give ſeven or eight ſpoonsful to every ſheep, once in the week, if the weather be wet, and if dry not ſo often.

Some have ſuppoſed that there are various objections to the above notions concerning the nature and cauſes of the rot in ſheep; but eſpecially that of its not being met with in the ſheep of ſome other diſtricts where *marſh miaſmata*, and the diſeaſes which depend upon it, greatly prevail. It has, indeed, been ſtated in the view of eliciting the truth of the matter, by Dr. George Pearſon, that there is an apparent difficulty or objection to the above writer's concluſion—that the rot in theſe animals is occaſioned by the ſame morbific agent which occaſions intermittent and remittent fevers—in the circumſtance that in ſome of the marſhes of the county of Kent, where intermittent fevers affect a great proportion of the inhabitants; and even perſons reſiding in the neighbourhood, although living on dry chalky lands, where ſuch diſeaſes never ſhew themſelves, if at ſome diſtance from the low grounds, unleſs in conſequence of importation; and in Chitney marſh, on the river Medway, near the iſle of Sheppey, one of the moſt prolific ſituations for agues to be found in the kingdom; and which is equally famous for its paſturage, by which very great numbers of ſheep are fed and kept; where the ſallow and indeed cadaverous countenances of the inhabitants, ſhewed that moſt of them were ill, or were recovering from agues; on inquiring into the health of the ſheep, beſides the evidence of the fine healthy condition of the animals, it was found, on the authority of a ſhepherd who had lived thirty-ſix years in the marſh, that he had only ſeen the diſorder once, and that was in the firſt year of his reſidence there; nor is the rot at all common in any part of the county of Kent. The Leiceſter breed of ſheep, he aſſerted, were ſubject to it, but not the ſheep bred in the marſh; nor were theſe animals ſubject to any other diſeaſe more frequently than in other ſituations in general, or particularly in the uplands. On theſe grounds, the doctor thinks, it would appear that one kind of miaſmata of marſhes which produce agues, do not in all ſituations alſo produce the rot. He does not, however, conceive it logically juſt to conclude, from the inſtance which has been given,

given, that miafmata paludum of a different fpecies may not occafion the rot, and alfo agues. It is poffible alfo, he fuppofes, that fome concomitant agents or circumftances may render the fame miafmata productive of one of the difeafes in certain fituations, but not of the other diforder.

The fame circumftances occur in other fituations, as there is a prevalence of miafmata in the Romney Marfh, another great fheep diftrict, which frequently produces intermittent and remittent fevers; while the rot is fcarcely ever known to happen in it. And in Effex there are agues in plenty, in many parts, without the rot in the fheep of them being at all known.

Some of thefe remarks and directions deferve the notice of the grazing farmer, as by proper attention to them much mifchief may often be prevented. But there are fome who fuppofe that moft dependence in the cure of this affection is to be placed upon the removal of fheep into dry fituations, keeping them warm and fheltered, and giving them dry food in the yard. In the Report on Agriculture for Lincolnfhire, fome circumftances are given that may direct the farmer on this point. It is ftated, that in rotting years, the fheep that feed on the falt marfhes over which the fpring-tides come, fell very high in confidence that they are fafe. And that a fhepherd, who when young was fhepherd's boy to an old man who lived at Netlam, a place noted for the rot, fays he is perfuaded that fheep only take the rot in a morning before the dew is off, as by keeping them up till the dew is gone they have been preferved from the difeafe, while others, where this precaution has been neglected, have become difordered.

Others think that the beft and fureft remedy, in thefe cafes, is that of combining plenty of dry food with the free ufe of fea-falt, and at the fame time removing the animals to the found, rich, dry, pafture lands. The rot is never known to be caught on the South Downs of Suffex. When the fheep fuffer in this way, the difeafe is always got while they are keeping in the weald, or other low lands. Such marfhes as are occafionally overflowed by falt-water, are never known to rot fheep, but are moft admirable for keeping them found and healthy; and fhould any thing be capable of curing the rot, it is the fheep feeding on fuch land. Some have obferved, that if, after a froft, even when very early, fheep be turned into fuch meadows and brooks as are at other times particularly liable to rot them, they will not, under this circumftance, fuffer at all; as it is fuppofed the animalculæ which the infects depofit in the fummer among the herbage, are deftroyed by the froft. The flounders found in the livers of the animals, are believed to be taken up with their food. It is more probable, however, that it is only the very minute ova of fuch infects which are taken into the ftomachs of fuch fheep. The autumnal months, when there is no froft, are the moft difpofed to bring on the rot in the above diftrict; but after one fingle night of hard froft, the danger is over for that year.

Rotten fheep have, in a great many inftances, been cured by feeding them on the herbage growing on a thin foil on lime-ftone rock. Hundreds have been known to have become found on lime-ftone land; their livers being completely healed, and the fheep healthy in every refpect.

In the original Agricultural Report of the county of Stafford, it is fuggefted, that the rot in fheep may be removed by the ufe of medicine. The difeafe is conceived as perhaps rather fimilar in its nature to the dropfy, as there is a preternatural abundance of water. The writer remarks, that of fix rotten fheep which he had about fix years before the time of writing, he fucceeded in curing five of them, but the fixth died full of water. One of the five which were cured brought him a lamb the following year, which with its mother, continued healthy, and became fat on grafs; the lamb was fold in the fummer, and the ewe in the beginning of winter, to a butcher. The other four alfo fattened, but in lefs time, on grafs alone, and were parted with in the like manner. On April the 25th, in the year 1802, he alfo drenched two rotten ewes, one of them in the laft ftage of the difeafe; they both became found, acquired fat, and were fold, with many others, in October, to the butcher, undiftinguifhed from the reft. Since that time he has repeatedly tried the fame remedy; and on the whole number of cafes, has not loft more than one in fix or feven.

His method of performing the cure is this: the rotten fheep is to be fafted one night, then one table fpoonful of the fpirits of turpentine is to be taken, and mixed with two of the fame fpoonsful of foft cold water; which is to be given to each fheep for one dofe. The fheep is then to be kept on dry food for three or four days; at the end of which time, the fame dofe of the medicine is again to be repeated, and the fheep continued on dry food for three days longer; at the conclufion of which period fuch fheep may be permitted to join the flock. When affected with a confiderable degree of loofenefs, fheep have often been cured in this manner with great facility.

In fhort, it may be concluded, in regard to the cure of this difeafe, which feems to be caufed by a general debility or weaknefs of the whole fyftem, accompanied with a local affection of the fame nature in the liver, that all fuch foods and remedies as are of a dry nourifhing quality, and which excite and ftrengthen the conftitution, will conftantly be found of great utility, if not wholly capable of affording a perfect cure of the difeafe.

The following receipt was prefented to the Royal Society, by Mr. Boyle, and is preferved in their regifter, vol. ii. p. 303. Some time before Allhollantide, the fheep is to be blooded under the eye, and, if neceffary, again in the fpring; and, in October, his gums may be rubbed at three or four different times with Spanifh falt. But the principal remedy confifts in this: that about Allhollantide, or fomewhat fooner, you take a fmall handful of the forementioned falt, and making the fheep hold up his head, compel him to fwallow it, and keep him from drinking any thing for about an hour after.

Rot, *Dry*, in *Rural Economy*, a highly deftructive vegetable difeafe, affecting the timber in the foundations, and other parts of buildings, in particular foils and fituations. It affects the wood, or ligneous parts, in fuch a manner as to leave it connected by nothing but the fmall hard fibrous portions, which give it a curious tremulous appearance, but all of which, when touched by the hand in the more advanced ftages of the difeafe, readily moulder into a brownifh fnuff-like duft. It is attended with a peculiar earthy fmell, fimilar to that which iffues from frefh dug up wood, which has lain fome time in the ground in contact with decaying animal matter. It is very materially different from that natural fort of decay which takes place in wood from the prefence of wetnefs. This has been fuppofed to originate from very different caufes, fuch as the ufe of wood in too green a ftate, exceffive dampnefs in the foundations of the buildings which are affected with it, the want of a free circulation of air in fuch fituations, and more lately to be the effect of a plant of the fungus tribe, which has leaves as in the miffletoe, &c. the boletus lachrymans. And on the former fuppofitions it has been ftated to the Society for the Encouragement of Arts, &c. by Mr. Bramley of Leeds, in the thirty-firft volume of their Tranfactions, that to bring the matter to the teft by experiments, would require the obfervations of a long

long period, and in ſelected ſituations. And that wood uſed for the general purpoſes of man is cut down at different periods; and although it may be felled at the proper ſeaſon, or when moſt free from ſap or moiſture, it is not always to be effected. Nay, even admitting it to have been cut down in the moſt favourable ſituation, it ſtill abounds with ſuch an extra proportion of moiſture, as to require a regular expoſure to the air prior to its being applied to uſe, if we wiſh to guard againſt that ſhrinking which always takes place where this precaution has not been taken. And although the fir kind contains leſs of this watery portion, yet it aſſuredly poſſeſſes a conſiderable ſhare; and it is in this ſpecies, he apprehends, that the evil called the dry rot moſt generally occurs, as from the facility of working the ſame it is moſt generally applied in buildings. But ſuppoſing it to be fir, or any other ſpecies, wood felled when abounding with any extra proportion of ſap, and applied to uſe without the proper ſeaſoning or expoſure to a free current of air, until ſuch extra moiſture has had time to exhale, is moſt liable to the diſeaſe in queſtion; and the cure, or principal prevention againſt it, would be the precaution of felling all wood only at the proper ſeaſon, or when the ſap is not in circulation. The next mode of prevention would be to uſe ſuch wood only as has been for a conſiderable period expoſed to the influence of a free current of air, or, where convenience will admit, to that of air heated to a moderate degree; ſuch air extracting with greater facility the encloſed moiſture, and in a more certain ratio than the irregularity of our atmoſphere will allow, under other circumſtances.

And it is ſuggeſted, that in all rapidly-improving countries, this evil is likely to be an increaſing one, as the current demand for wood generally exceeds the ſupplies laid by in ſtore, ſo as to be applied to uſe in regular ſucceſſion, after being properly ſeaſoned. And that another cauſe that affects all wood moſt materially, when not fully dried, is the application of paint, the nature of which prevents all exhalation, and confines the encloſed moiſture, till it occaſions a fermentation through the whole fibrous ſyſtem of the wood, and brings on a premature ſtate of decompoſition, or the dry rot. It is likewiſe ſuppoſed that a ſimilar evil may be induced, in conſequence of any newly finiſhed building having all the doors and windows ſhut up, and that for ſome length of time, particularly in moiſt weather. The wood, even though unpainted, is thus frequently placed in our atmoſphere more charged with vapour than in its own internal contents, and it is conſequently in an imbibing inſtead of an exhaling ſtate, and tending to decay. Wood placed in dampiſh ſituations, and the ends of timbers near to moiſt walls, ſuffer from ſimilar cauſes, but what particularly attracted his obſervation to the circumſtances was this, that both oak and fir poſts were brought into this premature ſtate of decay, from their having been painted prior to the due evaporation of their moiſture; and then extending the obſervation, and tracing the hiſtory of other wood affected in a ſimilar manner, he is convinced that the evil frequently thus originates, and its prevention would be in uſing timber previouſly well dried and ſeaſoned for ſuch purpoſes.

And it is added, that ſince theſe obſervations were made, having been buſily engaged in draining from 4000 to 5000 acres of ground, further ideas on the ſubject of the dry rot have occurred to him from the work he has been engaged in. Where houſes are troubled with damp walls, near to the earth's ſurface, it is generally, if not univerſally, occaſioned by the percolation of water from the higher adjoining ground, which, thus intercepted in its current, attempts to follow the general hydroſtatic law, of elevating itſelf, by the ſyphon line, to a height equal to that from whence it has its origin. Thus in houſes differently ſituated, we ſee the damp ariſing to varying degrees of height on the walls, and thoſe are probably correſponding to the height at which the moiſture circulates in the adjoining ground. At its firſt entrance to the building, and whilſt the moiſture is in ſmall quantity, the excavated part of the foundation wall, he thinks, may abſorb, and gradually quit ſuch proportion: but the exceſs, as is generally the caſe in moiſt weather, exceeding that power, the foundation ſtones are then ſaturated in a more rapid proportion than the adjoining rarefied internal atmoſphere can evaporate: the watery particles then creep up, in degrees proportionate to the aſcent from which they originally deſcended, excepting when prevented, or driven off by the ſuperior heat of the adjoining rooms, when, in addition to the diſagreeable damp they cauſe, they frequently occaſion conſiderable damage to the pictures, furniture, &c. Drains laid out athwart the aſcending ground, with a very ſlight deſcent or fall, and made of the depth of one yard for each yard of aſcent, and from the foundation until equal the height that ſuch damp ever riſes, would, there is little doubt, completely ſecure the houſe and furniture from the inconveniencies hitherto ſuſtained, and would generally prove an effectual prevention to moſt caſes of the dry rot, where it originates in extreme moiſture. He is of opinion that the fungus which pervades decaying wood is not the firſt cauſe, but a dependent on the peculiar ſtate to which ſuch wood has been reduced by prior cauſes. The diſſeminated ſeeds finding a proper bed, or nidus, like to the muſhroom, toadſtool, &c. fix their abode, and pervade the whole ſubſtance, thus accelerating the general law of Providence, which tends to make all matter reproductive.

Upon theſe grounds cellars, or ſuch other places, ſhould be drained in the manner he has mentioned, by taking off the percolating water prior to its gaining admiſſion to or contact with the walls: and it is probable that, in moſt caſes, a ſingle drain will have complete effect; it would aſſuredly, he thinks, do ſo, if it was not for the variation of the earth's internal ſtrata, which are not eaſily diſcernible. And that if attention to this rule was paid prior to the building any new ſtreets in towns, it would prove eſſentially uſeful in preventing ſuch miſchief.

And it has alſo been ſuggeſted to the above ſociety, that mortar made of lime from burnt chalk is much more deſtructive to timber than ſtone-lime, or that burnt from lime-ſtone. Chalk-lime attracts moiſture; and communicating it to any timber which it touches, occaſions its decay. And further, likewiſe, that ſea-ſand is prejudicial, if made into mortar, from a ſimilar quality of attracting moiſture from the atmoſphere: this, it is ſuppoſed, may in ſome degree be corrected by waſhing the ſand well in freſh water, where good ſand cannot be procured. But that good mortar, where any is required to be in contact with timber, may be made from a mixture of ſtone-lime freſh burnt, and river-ſand, to which a very ſmall quantity of common brown, or yellow iron ochre ſhould be added, and well incorporated therewith in the operation of making it up. See QUICKLIME.

And it has been ſuggeſted by Mr. Johnſon of Ipſwich, in the ſame volume of the Tranſactions of the above ſociety, that ſome time between 1771 and 1773, he went, at the requeſt of a friend, to the chapel at the Lock hoſpital, through curioſity, to examine a pew there that had frequently been repaired for damages by the dry rot. And that after a cloſe inveſtigation, he found it was the operation of a plant, whoſe leaf reſembled that of the vine. Wherever it had touched, the effect of its poiſonous quality got through the wood to the paint, which he has ſeen a mere ſkin. He propoſed to cover

cover the floor with bricks, laid in mortar, which was accordingly done. He called twice ſince, the laſt time about ſeven years ago, and has reaſon to think that it never appeared again. That the next opportunity of examining it carefully was at Mark-hall, in Eſſex, the ſeat of Mr. Montague Burgoyne. In a parlour there were three pillars of about ten inches in diameter, the outwood of which was between two and three inches thick. Two of them were eaten through in leſs than ſeven years, from the baſes, about two feet upward, within the hollow, and were as rotten as if it had been the effect of a hundred years ſtanding. The gardener of this gentleman was a botaniſt; and found the plant where he directed him to ſearch for it, and ſaid it was the boletus lachrymans. And, he adds, that ſome authors call it a paraſitical plant; and it is ſometimes to be found with the willow and ſallow tribe; but this is not to the purpoſe. Till within a few months he has never been without ſome leaves of the plant. For many years they appear exhauſted and dead, and ſoon crumble into duſt; but he ſuſpects that freſh wood attracts a freſh growth from the root.

At another time, he ſaw it in a houſe at Whitehall, built by ſir John Vanbrugh, whoſe nephew then lived in it. The houſe is, he thinks, only two ſtories high; the plant had aſcended to the upper ſtory, committing devaſtation on the wainſcot all the way. It will deſtroy half-inch deal wainſcotting in a year. He has alſo had it twice in houſes he inhabited, one in Suffolk, and the other in Glouceſterſhire. He bore with the firſt; in the other caſe he undertook to ſtop it, and did it effectually.

It is ſuppoſed, that the cauſe is from the floor being laid on the earth, which has been, where he has obſerved it, of a gravelly or ſandy loam nature. The moiſture from a water-courſe at hand, or a north aſpect, where the outer wall ſtands in a garden-bed, ſo that the rain percolates, are great encouragers; it requires moiſture, he ſuſpects. But it never riſes in the middle of the floor; becauſe, if the ſeed were there, it could not germinate for want of air; but it is eaſy to ſuppoſe that after the floor is ſhrunk, an air may be created between that and the vacancy between the wainſcot and the outer wall, ſufficient for the purpoſes of vegetation. He ſays, he ſaw an inſtance laſt ſummer in the houſe of a friend, a ſtudent in botany. He was ſurpriſed when he told him it was a viſit from a plant; but ſo it proved, and always is, and ever was ſo; nor does it originate from any other cauſe.

With the view of removing it in his own caſe, he removed the original ſoil near the part affected, and ſupplied its place with ſand. He then placed pieces of tile; on thoſe he laid mortar, and tiles over them, puſhing them under the wainſcot, ſo that it had no communication with the joiſts or floor. Pillars in like manner ſhould, he thinks, be kept from the earth. And in laying a floor upon the ground, he ſhould take away the earth for a foot in breadth, and four inches in depth, all round the walls, and place the ends of the joiſts in mortar, covering them with tiles preſſed under the floor and wainſcot, quite to the outward wall. Iron or tin plates would do; but are not ſo cheap as mortar and tiles, and probably much leſs durable in ſuch ſituations. It is ſuppoſed that this plant has no adheſive powers, but in contact with wood. If it could paſs over brick and mortar, it might be ſeen to ſpring from the cellars and infect half the houſes in the kingdom. He recommends, in ſhort, that the wainſcot be kept free from contact with the joiſts and floor.

It is obſerved that the leaves of the plant appearing exhauſted and dead, is owing to their having imparted all their juices to the wood, which change it to a fungus, and not to a powder, like rottenneſs from length of time. And that nothing is more eaſy than to prevent the damage from the plant. Beſides what he has ſaid above, he is poſitive that a tile laid cloſe along the walls round the room, would prevent the growth of the plant, even without mortar; and perhaps it is only neceſſary where the walls are next to the air. And charring the ends of the joiſts for a few inches, and the ſide of the wainſcot at bottom next the wall, would, he ſuppoſes, be ſufficient; for the plant cannot adhere to any thing but wood, and that poſſeſſed of its natural juices, to a certain degree; ſo that he queſtions if old dry oak would receive it. But all the white ſoft woods, as beach, poplars, and deals, are for a long time ready to receive it. Repairing the damage with freſh wood, without removing the earth and plant, is only feeding the evil, or extending the diſeaſe. It is ſuppoſed, that as the plant is of the creeping kind, and cannot riſe two inches, the wood, in all caſes, muſt be in contact with the earth to ſupport it. He adds, that a fungus broader than the palm of one's hand, and an inch or more in thickneſs, is commonly ſeen at the bottom of an old poſt, on the ſurface of the earth; but it is not eaſy to diſcern whether the wood or the earth furniſhes the matter.

The writer further remarks, that he had lately a converſation with an old friend, who ſhewed him two parcels of rotten wood, from an oak barn-floor laid about ſixteen years ago. After lying twelve years, it ſhook upon the joiſts. On examination it was found to be rotted in various parts, and the planks, two inches and a half in thickneſs, were nearly eaten through, though the outſide was gloſſy, and without blemiſh. The joiſts, and a large middle beam, were laid at the ends, in brick and mortar, to create a firm level. No earth was near the wood; and, he thinks, that no air could find a paſſage. The rottenneſs was partly an impalpable powder, of the colour of Spaniſh ſnuff, and other parts were black, as if burnt; the reſt was clearly a fungus. And that this gentleman is a perſon of undoubted veracity; but a nice and exact obſervation is neceſſary in ſuch examinations. He thought nothing of any plant, and it is likely there was none of the boletus; ſo that his aſſertion that it was always to be found, was rather too ſyſtematic. He aſked him if the timber was dry when laid down. He could not however ſay that had been particularly adverted to. It had been ſawed from a large oak, and was, as he thought, in all reſpects proper for a barn-floor. As this ſeems not the operation of the boletus, he aſks, how did it happen? We know that the oak, when in vegetation, is ſubject to what we ſhall call an exudation of juices, which produces the fungus, named the agaric of the oak, with which the Druids of old played many tricks. The oak, then, if ſawed into thick quantities, may emit theſe ſame juices, as the progreſſive courſe of nature to its entire decay. It is added that we have all ſeen oaks of vaſt ſize and ancient record, with a great part of the outſide whole, and all the inſide gone; perhaps the work of a century. In all hollow trees fungus is diſcoverable. To uſe a law term, it is a miſnomer to call it dry rot; for the rotting principle is in moiſture. He further ſtates, that he had never ſeen the rot upon ſo large a ſcale in timber, till lately. The prevention then of beams, rafters, large joiſts, and poſts put into the earth, from decay by the rot, is by charring only, which will dry up all the fungus juices of wood in large ſubſtance. Paint, or a bituminous preparation, may probably ſtop up the pores, and prevent the rot in ſlight work, where the treatment he before obſerved, with fire, might be incom-

incommodious, as to half-inch wainſcot, &c. The incorruptibility of charcoal is proved by a variety of indiſputable facts.

A great many uſeful facts on this ſubject have been ſtated by Mr. Batſon, of Limehouſe, in the twelfth volume of the ſame Tranſactions, in reſpect to his methods of preventing the dry rot in a room much affected with it. The mode he adopted was to clear the ends of his timbers, to take away the infected earth to the depth of two feet, and to fill up that ſpace with anchor-ſmith's aſhes, or aſhes from a foundry, before his flooring boards were laid.

And on minute examinations being made under the direction of the ſociety, at the diſtances of ſix and twelve years after the flooring was laid, the boards, wainſcot, and timbers, were all found entirely free from any appearance of the dry rot. The uſe of ſtone-work next the ground, as the foundations of poſts, door frames, partitions, &c. has alſo been found uſeful in preventing ſuch wood-works from being attacked by this diſeaſe. And alſo the cauſing a more free circulation of air about ſuch foundations by the fixing of iron gratings in ſtone-work in different places, ſo as to produce the moſt perfect ventilation. But notwithſtanding all that has yet been done in reſpect to the nature and modes of preventing this ſort of rot, much ſtill remains to be effected both in regard to the nature of its origin, and the moſt certain means of eradicating it under different circumſtances.

It will probably, however, be found the beſt and moſt effectual plan, until further trials and diſcoveries have thrown more full and complete light on its nature and cauſes, to take care that the wood-works near the ground in all buildings in ſuch places as rot timber have as little contact with it as poſſible, by being raiſed and ſupported at ſome diſtance from it, by means of ſolid ſtone or brick and mortar work, by a full and free circulation of air being every where admitted in the foundations near ſuch wood-works, by being careful to make uſe of ſuch timber only as is perfectly well ſeaſoned and prepared, and by having conſtantly a ſufficient number of drains made all round to diſcharge any moiſture that may occur. It may likewiſe be of farther advantage in all ſuch caſes to avoid painting or coating over the wood-work near the parts which are liable to be diſeaſed or become rotten, for ſome conſiderable length of time after they have been done; as well as to allow of large fires to be occaſionally made, where convenient, as near to ſuch ſituations as poſſible, in order that every ſort of moiſture and dampneſs, together with the peculiar rawneſs of ſuch new works, may always be removed as much as they are capable of in the firſt inſtance, or as ſoon after the works have been finiſhed as may be compatible with their nature and extent.

In regard to the boletus lachrymans being the cauſe of the dry rot in timber, it has lately been contended that the different ſorts of fungus, which are met with upon decaying timber of different kinds, are the production of the remaining powers of life in the ſap of the unſeaſoned wood; and that the ſame ſort of living organizable matter, which, whilſt its powers continued in their perfect condition, would have generated the branch of an oak, will, when debilitated and enfeebled, give exiſtence to a certain kind of fungus, and become the cauſe of this diſeaſe.

Mr. T. Wade, in a recent publication, obſerves, that the term dry rot ſeems to be improperly applied to the decay in timber, which it is generally employed to deſignate, and that the impropriety of the expreſſion, probably, has not a little contributed to involve this ſubject in obſcurity. A very ſhort advance in the inveſtigation of this ſubject will ſhew, that moiſture is a condition neceſſary to the putrefactive proceſs, and that water is the moſt efficient agent in the decompoſition of organized bodies.

By capillary attraction fluids are carried to the tops of the higheſt trees, a phenomenon which has been long obſerved, but has not been ſatisfactorily explained. Preciſely the ſame effect takes place when one end of a piece of timber is immerſed in water, or placed in a damp ſituation. It happens even in vacuo.

Timber, ſo placed, at firſt ſwells, after ſome time it changes colour, then it emits gaſes which have a mouldy or muſty ſmell. In the more advanced period of decay, the maſs dries, and cracks in tranſverſe directions. Laſtly, it becomes pulverulent, and forms vegetable mould. Generally, in ſome of theſe ſtages of decompoſition, the different ſpecies of fungus are found to vegetate on the moſs.

When a vegetable is deprived of life, the matter conſtituting it begins to undergo changes in order to enter into new combinations. It is reduced to ſimple principles by the aid of warmth, and the preſence of air and water. In houſes, ſhips, &c. we cannot prevent the influence of theſe powerful agents, but it may be retarded. It ſeems the uſual mode of ſeaſoning timber by exſiccation is of little uſe. Timber, thus prepared, is found, indeed, to ſhrink and loſe much of its weight; but even very old oak timber, (procured from ancient buildings,) when immerſed in water, or expoſed in a damp ſituation, readily acquires the weight, and ſwells to the dimenſions of green timber, from which, in its properties, it does not materially differ.

Mr. Wade therefore endeavoured to diſcover ſome other means by which timber may be made to reſiſt change, or decay.

Lignum vitæ, box, ebony, &c. are nearly indeſtructible, owing to their being of ſo cloſe a texture that water cannot be abſorbed by them, neither do they give out any ſoluble matter to water, at leaſt not without long boiling, or digeſting at a very high temperature. Therefore the great agent that determines the changes in wood in general, here has not any influence.

Other durable woods, ſuch as teak, cedar, &c. though of an open grain, and very porous, contain reſinous, or oleaginous matter, repelling moiſture, which cannot inſinuate itſelf, as is the caſe with the feathers of ſome fowls, &c. On theſe principles the common periſhable woods may be made to reſemble thoſe which are very laſting, or, indeed, nearly indeſtructible.

Thus, to prevent the decay of oak, &c. it is neceſſary either to cauſe it to be incapable of abſorbing moiſture, or to render the ligneous fibre inſoluble.

Some of the effects produced bear conſiderable analogy with tanning, by which proceſs a ſkin, entirely ſoluble in water, forming jelly or glue, and quickly ſuſceptible of putrefaction, is made into leather, a ſubſtance not at all ſoluble in water, and capable of enduring for a long period, ſometimes for ſeveral centuries.

For various methods of performing this, we beg to refer the reader to Mr. Wade's book, in which the operations recommended ſeem ſimple and economical.

Rot *in Timber*, a diſeaſe in trees which quickly injures and deſtroys the woody parts of them by inducing a ſort of rotting and decay. It has been ſtated to proceed from different cauſes, but the principal, according to the author of the Practical Planter, are thoſe of external wounds or bruiſes, the trees growing in unfavourable ſoils, the roots of which have been barked at the period of planting, or in cutting out plants. And ſecondly, by the tree growing in ſpouty

ſpouty ſoil, whoſe larger roots have been injudiciouſly hacked at the time of tranſplanting, or in cutting out a neighbouring plant. In this caſe the diſeaſe affects the pith, eats upward, and often conſumes the heart to ſuch a degree, while the bark remains in a perfectly ſound ſtate, that the trunk is enfeebled, and eaſily broken. This is demonſtrated by cutting affected trees at different ages, and the *rot* is generally found leſs or more advanced upward, according to the ſize of the cavity. He here ſtates a very curious inſtance of this ſpecies of rot, that occurred at Wemyſs caſtle, in Scotland, in 1795. In thinning a wood, whoſe trees conſiſted chiefly of elm and aſh, in one part of it the ſoil was obſerved to be ſpouty, and the elm-trees in rather a ſickly condition. Every elm-tree cut in this part was more or leſs affected; ſome were rotted a foot, others two, three, &c. feet upwards, and the wood above, to the extremity of the bole, was uniformly ſound, and ſold at two ſhillings a foot. One beautiful aſh-tree, in particular, was ſold ſtanding, at the rate of half a crown a foot of timber; nor was there the ſmalleſt outward blemiſh from the ground to the very top. When it was cut down, a completely ready made *pump*, fifteen feet in length from the ground upwards, was diſcovered, and actually, as he was afterwards informed, applied as ſuch. It is conceived that in this caſe the remedy is to be at all due pains to prevent the cauſe, by carefully draining the ſoil of poiſonous, ochry water, and when neceſſity occaſions the cutting of large roots, to treat them in the manner of an amputated branch.

And a third cauſe of the rot which he notices, is that of ſtagnant water lodging in the angle formed by the ſtem and an upright branch, or in the angle formed by rival ſtems, where no actual ground has ever been made; but, which often happens, if the tree be in a youthful vigorous ſtate, a cup or hollow is formed, reſembling that between the thumb and finger half opened. Here the water lodging, in time penetrates the bark, and forms the firſt receptacle of corruption, which being once begun advances apace to the great injury of the trees. In this caſe the firſt thing neceſſary towards a cure, or prevention of further injury, is to clean out the water, (for which a ſyringe may be uſeful,) duſt, &c. and dry the whole well by aid of a mop or woollen cloth; then to fill it up, until it run over, with tar; after which to fix on an apron of thin lead, in ſuch a manner as that its edges may reach about a foot upwards on each limb of the tree, being joined cloſe, and faſtened with ſaddle tacks, &c.

The compoſition adviſed by Mr. Forſyth is probably much better for the purpoſe, as being leſs liable to decompoſition; and at the ſame time capable of being applied with greater exactneſs. It is remarked by the firſt writer that knots or excreſcences are frequently found on the boles and branches of trees, particularly of elms. What may have occaſioned them, in many caſes, is not eaſily accounted for; but it is ſometimes obvious that they proceed from bruiſes, or the mal-treatment of trees in youth. In this caſe we frequently find them hollow within, and full of water, which, if not removed, will of a certainty induce the rot. And he adviſes that when the knot is quite entire on all ſides, and perfectly ſound, which may be known by ſtriking it with a mallet, it ſhould be ſuffered to remain. But that when it is found hollow, as above, it ſhould be ſawn clean off, the wound ſhould be ſmoothed, as already directed, cleaned, dried, and laid over with tar, &c. The compoſition before-mentioned is, however, here probably preferable for the ſame reaſon as in that caſe. See *Compoſition for* Trees, and Timber-*Trees*.

In caſes where the internal parts of trees of the timber kind become rotten, and get hollow, in conſequence of the above, or other cauſes, as not unfrequently happens to the oak and elm, as well as different other kinds, eſpecially when they are of ſome conſiderable length of growth, it has been directed, in order to reſtore them, that the decayed and rotten wood ſhould be cut out at different times, as the new wood comes in contact with it; great care being taken not to cut too much at any one time, but to leave enough to ſupport the trees, and prevent them from being blown down by high winds, until the new wood is ſtrong enough for that purpoſe: the remainder may then be cut out, as there will be no danger. By theſe means, the application of his compoſition, and heading down, it has been aſſerted by the late Mr. Forſyth, that a great number of rotten hollow trees, which had, when taken in hand, little more than the bark remaining ſound, have within a few years been entirely filled up; and others, that were headed down within a few feet of the ground, have had their ſtumps completely covered by the leading ſhoots, forming handſome trees; the places at which they were headed being only diſcerned by faint cicatrices.

It is ſtated that a lime-tree, about 18 inches in diameter, whoſe trunk was decayed, rotten, and hollow, from the top to the bottom, and to which, after cutting out the decayed wood, the compoſition had been applied about 16 years before, was lately cut down for the purpoſe of aſcertaining the progreſs it had made in the interior part, and was found entirely filled up with new ſound wood, which had completely incorporated with what little old wood remained, when it was firſt taken in hand. Its body has been cut into ſhort lengths, in order to be ſhewn, for the ſake of convincing thoſe who may be doubtful on the ſubject.

Alſo an old elm, the inſide of which was totally decayed, and out of which were taken, at different times, two large cart-loads of rotten wood, has made ſhoots more than 20 feet high in the courſe of ſix years. Several others of different ſorts are likewiſe ſtated to have made equally fine ſhoots in this mode of treating them, and are now fine thriving trees; the marks of the places at which they were headed down being ſcarcely perceivable. A lime, the hollow part of which is 11 feet in height, is now, it is ſaid, filling up: the tree is about a foot in diameter. A decayed part, 4 feet long and 28 inches broad, in a large elm, is now, too, ſtated to be rapidly filling up with ſound wood. About two feet and a half in length on one ſide, which was for ſome time left to nature, ſtill continued, it is ſaid, to decay, till the compoſition was applied: new wood and bark are now aſſerted to be forming in the part. Beſides theſe, a great many other trees of the ſame kind, ſome of which had wounds ten feet long and two feet broad, are now alſo ſaid to be entirely filled up, as well as many ſycamores, oaks, and other foreſt-trees, reſtored to a flouriſhing ſtate by having the dead wood cut out, and the compoſition applied.

However, notwithſtanding theſe and many other ſimilar ſtatements, a variety of doubts and objections have been raiſed and entertained againſt this mode of filling up and curing the decayed and rotten parts of foreſt-trees, by perſons of much information and experience on the ſubject of vegetable economy; ſo that additional facts, and more careful and exact concluſions from them, are probably neceſſary before the utility or inutility of the method can be fairly appreciated or fully aſcertained.

Rot *in Hops*, a diſeaſe in this ſort of crops, which is very ſimilar to that of the mould. See Hop and Mould.

Rot, in *Geography*, a river of Wurtemberg, which runs into the Lein.

incommodious, as to half-inch wainſcot, &c. The incorruptibility of charcoal is proved by a variety of indiſputable facts.

A great many uſeful facts on this ſubject have been ſtated by Mr. Batſon, of Limehouſe, in the twelfth volume of the ſame Tranſactions, in reſpect to his methods of preventing the dry rot in a room much affected with it. The mode he adopted was to clear the ends of his timbers, to take away the infected earth to the depth of two feet, and to fill up that ſpace with anchor-ſmith's aſhes, or aſhes from a foundry, before his flooring boards were laid.

And on minute examinations being made under the direction of the ſociety, at the diſtances of ſix and twelve years after the flooring was laid, the boards, wainſcot, and timbers, were all found entirely free from any appearance of the dry rot. The uſe of ſtone-work next the ground, as the foundations of poſts, door frames, partitions, &c. has alſo been found uſeful in preventing ſuch wood-works from being attacked by this diſeaſe. And alſo the cauſing a more free circulation of air about ſuch foundations by the fixing of iron gratings in ſtone-work in different places, ſo as to produce the moſt perfect ventilation. But notwithſtanding all that has yet been done in reſpect to the nature and modes of preventing this ſort of rot, much ſtill remains to be effected both in regard to the nature of its origin, and the moſt certain means of eradicating it under different circumſtances.

It will probably, however, be found the beſt and moſt effectual plan, until further trials and diſcoveries have thrown more full and complete light on its nature and cauſes, to take care that the wood-works near the ground in all buildings in ſuch places as rot timber have as little contact with it as poſſible, by being raiſed and ſupported at ſome diſtance from it, by means of ſolid ſtone or brick and mortar work, by a full and free circulation of air being every where admitted in the foundations near ſuch wood-works, by being careful to make uſe of ſuch timber only as is perfectly well ſeaſoned and prepared, and by having conſtantly a ſufficient number of drains made all round to diſcharge any moiſture that may occur. It may likewiſe be of farther advantage in all ſuch caſes to avoid painting or coating over the wood-work near the parts which are liable to be diſeaſed or become rotten, for ſome conſiderable length of time after they have been done; as well as to allow of large fires to be occaſionally made, where convenient, as near to ſuch ſituations as poſſible, in order that every ſort of moiſture and dampneſs, together with the peculiar rawneſs of ſuch new works, may always be removed as much as they are capable of in the firſt inſtance, or as ſoon after the works have been finiſhed as may be compatible with their nature and extent.

In regard to the boletus lachrymans being the cauſe of the dry rot in timber, it has lately been contended that the different ſorts of fungus, which are met with upon decaying timber of different kinds, are the production of the remaining powers of life in the ſap of the unſeaſoned wood; and that the ſame ſort of living organizable matter, which, whilſt its powers continued in their perfect condition, would have generated the branch of an oak, will, when debilitated and enfeebled, give exiſtence to a certain kind of fungus, and become the cauſe of this diſeaſe.

Mr. T. Wade, in a recent publication, obſerves, that the term dry rot ſeems to be improperly applied to the decay in timber, which it is generally employed to deſignate, and that the impropriety of the expreſſion, probably, has not a little contributed to involve this ſubject in obſcurity. A very ſhort advance in the inveſtigation of this ſubject will ſhew, that moiſture is a condition neceſſary to the putrefactive proceſs, and that water is the moſt efficient agent in the decompoſition of organized bodies.

By capillary attraction fluids are carried to the tops of the higheſt trees, a phenomenon which has been long obſerved, but has not been ſatisfactorily explained. Preciſely the ſame effect takes place when one end of a piece of timber is immerſed in water, or placed in a damp ſituation. It happens even in vacuo.

Timber, ſo placed, at firſt ſwells, after ſome time it changes colour, then it emits gaſes which have a mouldy or muſty ſmell. In the more advanced period of decay, the maſs dries, and cracks in tranſverſe directions. Laſtly, it becomes pulverulent, and forms vegetable mould. Generally, in ſome of theſe ſtages of decompoſition, the different ſpecies of fungus are found to vegetate on the moſs.

When a vegetable is deprived of life, the matter conſtituting it begins to undergo changes in order to enter into new combinations. It is reduced to ſimple principles by the aid of warmth, and the preſence of air and water. In houſes, ſhips, &c. we cannot prevent the influence of theſe powerful agents, but it may be retarded. It ſeems the uſual mode of ſeaſoning timber by exſiccation is of little uſe. Timber, thus prepared, is found, indeed, to ſhrink and loſe much of its weight; but even very old oak timber, (procured from ancient buildings,) when immerſed in water, or expoſed in a damp ſituation, readily acquires the weight, and ſwells to the dimenſions of green timber, from which, in its properties, it does not materially differ.

Mr. Wade therefore endeavoured to diſcover ſome other means by which timber may be made to reſiſt change, or decay.

Lignum vitæ, box, ebony, &c. are nearly indeſtructible, owing to their being of ſo cloſe a texture that water cannot be abſorbed by them, neither do they give out any ſoluble matter to water, at leaſt not without long boiling, or digeſting at a very high temperature. Therefore the great agent that determines the changes in wood in general, here has not any influence.

Other durable woods, ſuch as teak, cedar, &c. though of an open grain, and very porous, contain reſinous, or oleaginous matter, repelling moiſture, which cannot inſinuate itſelf, as is the caſe with the feathers of ſome fowls, &c. On theſe principles the common periſhable woods may be made to reſemble thoſe which are very laſting, or, indeed, nearly indeſtructible.

Thus, to prevent the decay of oak, &c. it is neceſſary either to cauſe it to be incapable of abſorbing moiſture, or to render the ligneous fibre inſoluble.

Some of the effects produced bear conſiderable analogy with tanning, by which proceſs a ſkin, entirely ſoluble in water, forming jelly or glue, and quickly ſuſceptible of putrefaction, is made into leather, a ſubſtance not at all ſoluble in water, and capable of enduring for a long period, ſometimes for ſeveral centuries.

For various methods of performing this, we beg to refer the reader to Mr. Wade's book, in which the operations recommended ſeem ſimple and economical.

Rot *in Timber*, a diſeaſe in trees which quickly injures and deſtroys the woody parts of them by inducing a ſort of rotting and decay. It has been ſtated to proceed from different cauſes, but the principal, according to the author of the Practical Planter, are thoſe of external wounds or bruiſes, the trees growing in unfavourable ſoils, the roots of which have been barked at the period of planting, or in cutting out plants. And ſecondly, by the tree growing in

ſpouty

ſpouty ſoil, whoſe larger roots have been injudiciouſly hacked at the time of tranſplanting, or in cutting out a neighbouring plant. In this caſe the diſeaſe affects the pith, eats upward, and often conſumes the heart to ſuch a degree, while the bark remains in a perfectly ſound ſtate, that the trunk is enfeebled, and eaſily broken. This is demonſtrated by cutting affected trees at different ages, and the *rot* is generally found leſs or more advanced upward, according to the ſize of the cavity. He here ſtates a very curious inſtance of this ſpecies of rot, that occurred at Wemyſs caſtle, in Scotland, in 1795. In thinning a wood, whoſe trees conſiſted chiefly of elm and aſh, in one part of it the ſoil was obſerved to be ſpouty, and the elm-trees in rather a ſickly condition. Every elm-tree cut in this part was more or leſs affected; ſome were rotted a foot, others two, three, &c. feet upwards, and the wood above, to the extremity of the bole, was uniformly ſound, and ſold at two ſhillings a foot. One beautiful aſh-tree, in particular, was ſold ſtanding, at the rate of half a crown a foot of timber; nor was there the ſmalleſt outward blemiſh from the ground to the very top. When it was cut down, a completely ready made *pump*, fifteen feet in length from the ground upwards, was diſcovered, and actually, as he was afterwards informed, applied as ſuch. It is conceived that in this caſe the remedy is to be at all due pains to prevent the cauſe, by carefully draining the ſoil of poiſonous, ochry water, and when neceſſity occaſions the cutting of large roots, to treat them in the manner of an amputated branch.

And a third cauſe of the rot which he notices, is that of ſtagnant water lodging in the angle formed by the ſtem and an upright branch, or in the angle formed by rival ſtems, where no actual ground has ever been made; but, which often happens, if the tree be in a youthful vigorous ſtate, a cup or hollow is formed, reſembling that between the thumb and finger half opened. Here the water lodging, in time penetrates the bark, and forms the firſt receptacle of corruption, which being once begun advances apace to the great injury of the trees. In this caſe the firſt thing neceſſary towards a cure, or prevention of further injury, is to clean out the water, (for which a ſyringe may be uſeful,) duſt, &c. and dry the whole well by aid of a mop or woollen cloth; then to fill it up, until it run over, with tar; after which to fix on an apron of thin lead, in ſuch a manner as that its edges may reach about a foot upwards on each limb of the tree, being joined cloſe, and faſtened with ſaddle tacks, &c.

The compoſition adviſed by Mr. Forſyth is probably much better for the purpoſe, as being leſs liable to decompoſition; and at the ſame time capable of being applied with greater exactneſs. It is remarked by the firſt writer that knots or excreſcences are frequently found on the boles and branches of trees, particularly of elms. What may have occaſioned them, in many caſes, is not eaſily accounted for; but it is ſometimes obvious that they proceed from bruiſes, or the mal-treatment of trees in youth. In this caſe we frequently find them hollow within, and full of water, which, if not removed, will of a certainty induce the rot. And he adviſes that when the knot is quite entire on all ſides, and perfectly ſound, which may be known by ſtriking it with a mallet, it ſhould be ſuffered to remain. But that when it is found hollow, as above, it ſhould be ſawn clean off, the wound ſhould be ſmoothed, as already directed, cleaned, dried, and laid over with tar, &c. The compoſition before-mentioned is, however, here probably preferable for the ſame reaſon as in that caſe. See *Compoſition for* Trees, and Timber-*Trees*.

In caſes where the internal parts of trees of the timber kind become rotten, and get hollow, in conſequence of the above, or other cauſes, as not unfrequently happens to the oak and elm, as well as different other kinds, eſpecially when they are of ſome conſiderable length of growth, it has been directed, in order to reſtore them, that the decayed and rotten wood ſhould be cut out at different times, as the new wood comes in contact with it; great care being taken not to cut too much at any one time, but to leave enough to ſupport the trees, and prevent them from being blown down by high winds, until the new wood is ſtrong enough for that purpoſe: the remainder may then be cut out, as there will be no danger. By theſe means, the application of his compoſition, and heading down, it has been aſſerted by the late Mr. Forſyth, that a great number of rotten hollow trees, which had, when taken in hand, little more than the bark remaining ſound, have within a few years been entirely filled up; and others, that were headed down within a few feet of the ground, have had their ſtumps completely covered by the leading ſhoots, forming handſome trees; the places at which they were headed being only diſcerned by faint cicatrices.

It is ſtated that a lime-tree, about 18 inches in diameter, whoſe trunk was decayed, rotten, and hollow, from the top to the bottom, and to which, after cutting out the decayed wood, the compoſition had been applied about 16 years before, was lately cut down for the purpoſe of aſcertaining the progreſs it had made in the interior part, and was found entirely filled up with new ſound wood, which had completely incorporated with what little old wood remained, when it was firſt taken in hand. Its body has been cut into ſhort lengths, in order to be ſhewn, for the ſake of convincing thoſe who may be doubtful on the ſubject.

Alſo an old elm, the inſide of which was totally decayed, and out of which were taken, at different times, two large cart-loads of rotten wood, has made ſhoots more than 20 feet high in the courſe of ſix years. Several others of different ſorts are likewiſe ſtated to have made equally fine ſhoots in this mode of treating them, and are now fine thriving trees; the marks of the places at which they were headed down being ſcarcely perceivable. A lime, the hollow part of which is 11 feet in height, is now, it is ſaid, filling up: the tree is about a foot in diameter. A decayed part, 4 feet long and 28 inches broad, in a large elm, is now, too, ſtated to be rapidly filling up with ſound wood. About two feet and a half in length on one ſide, which was for ſome time left to nature, ſtill continued, it is ſaid, to decay, till the compoſition was applied: new wood and bark are now aſſerted to be forming in the part. Beſides theſe, a great many other trees of the ſame kind, ſome of which had wounds ten feet long and two feet broad, are now alſo ſaid to be entirely filled up, as well as many ſycamores, oaks, and other foreſt-trees, reſtored to a flouriſhing ſtate by having the dead wood cut out, and the compoſition applied.

However, notwithſtanding theſe and many other ſimilar ſtatements, a variety of doubts and objections have been raiſed and entertained againſt this mode of filling up and curing the decayed and rotten parts of foreſt-trees, by perſons of much information and experience on the ſubject of vegetable economy; ſo that additional facts, and more careful and exact concluſions from them, are probably neceſſary before the utility or inutility of the method can be fairly appreciated or fully aſcertained.

Rot *in Hops*, a diſeaſe in this ſort of crops, which is very ſimilar to that of the mould. See Hop and Mould.

Rot, in *Geography*, a river of Wurtemberg, which runs into the Lein.

ROTA, a town of Spain, in the province of Seville, on the coaſt of the Atlantic, celebrated for its wine; 3 miles W. of Puerto de Santa Maria.

ROTA. See ZARPANA.

ROTA, in *Mechanics*. See WHEEL.

ROTA *Ariſtotelica*, *Ariſtotle's Wheel*, is the name of a celebrated problem in mechanics, founded on the motion of a wheel about its axis; thus called, becauſe firſt, that we know of, taken notice of by Ariſtotle.

The difficulty is this. While a circle makes a revolution on its centre, advancing at the ſame time in a right line along a plane, it deſcribes, on that plane, a right line, equal to its circumference. Now if this circle, which we may call the *deferent*, carry with it another ſmaller circle, concentric with it, and which has no motion but what it receives from the deferent; which is the caſe of the nave of a coach-wheel carried along by the wheel; this little circle, or nave, will deſcribe a line in the time of the revolution, equal, not to its own circumference, but to that of the wheel: becauſe its centre advances in a right line as faſt as that of the wheel does; as being in reality the ſame with it.

The matter of fact is certain; but how it ſhould be, ſeems a myſtery. It is obvious that the wheel, advancing during the revolution, muſt deſcribe a right line equal to its circumference; but how would the nave, which revolves like the wheel, deſcribe a right line ſo much greater than its circumference?

The ſolution Ariſtotle gives is no more than a good explication of the difficulty. Galileo, who next attempted it, has recourſe to an infinity of infinitely little vacuities in the right line deſcribed by the two circles; and imagines that the little circle never applies its circumference to thoſe vacuities; but in reality only applies it to a line equal to its own circumference; though it appears to have applied it to a much larger.

But it is evident, that this is all gratis dictum. The vacuities are imaginary; and why does not the great circle apply its circumference to them? Laſtly, the magnitude of theſe vacuities muſt be augmented or diminiſhed, according to the different proportion of the two circles.

F. Tacquet will have it, that the little circle, making its rotation more ſlowly than the great one, does on that account deſcribe a line longer than its circumference; yet without applying any point of its circumference to more than one point of its baſe. But this is no more allowable than the former.

The attempts of ſo many great men proving vain, M. Dortous de Meyran, a French gentleman, had the good fortune to hit on a ſolution, which he ſent to the Royal Academy of Sciences; where being examined by Meſſrs. de Louville and Saulmon, appointed for that purpoſe, they made their report, that it was ſatisfactory. The ſolution is to this effect:

The wheel of a coach is only acted on, or drawn in a right line; its circular motion or rotation ariſes purely from the reſiſtance of the ground on which it is applied.

Now this reſiſtance is equal to the force with which the wheel is drawn in the right line, inaſmuch as it defeats that direction; of conſequence, the cauſes of the two motions, the one right, the other circular, are equal; and, therefore, their effects, *i. e.* the motions, are equal. And hence the wheel deſcribes a right line on the ground equal to its circumference.

As for the nave of the wheel, the caſe is otherwiſe. It is drawn in a right line by the ſame force as the wheel; but it only turns round becauſe the wheel turns, and can only turn with it, and at the ſame time therewith.

Hence it follows, that its circular velocity is leſs than that of the wheel in the ratio of the two circumferences; and, therefore, its circular motion is leſs than its rectilinear one.

Since then it neceſſarily deſcribes a right line equal to that of the wheel, it can only do it by ſliding, or what they call the motion of rotation; that is, a part of the circular nave cannot be applied to a part of a right line greater than itſelf but by ſliding along that part, and that more or leſs, as the part of the nave is leſs than that of the circle. See ROTATION.

ROTA is alſo uſed for a particular court of juriſdiction in Rome, eſtabliſhed for taking cognizance of beneficiary matters, &c.

The rota conſiſts of twelve doctors choſen out of the four nations of Italy, France, Spain, and Germany; three of them being Romans, one a Florentine, one a Milaneſe, one of Bologna, one of Ferrara, one a Venetian, one a Frenchman, two Spaniards, and one a German; each having four clerks or notaries under him.

Their office is to judge of all beneficiary cauſes, both within Rome, and throughout the ſtate of the church, in caſe of appeal, and of all civil proceſſes which are for above five hundred crowns.

They are alſo called *chaplains* of the pope, as ſucceeding the ancient judges of the ſacred palace, who held their court in his chapel.

The denomination *rota*, *wheel*, ſome will have derived hence, that they officiate by rotation; others, becauſe the moſt important affairs of the Chriſtian world turn upon them. Du-Cange derives it from *rota porphyretica*, becauſe the pavement of the chamber where they formerly ſat was of porphyry, and faſhioned like a wheel.

ROTA, LA, in *Biography*, an admirable bravura ſinger in the Incurabili Conſervatorio at Venice, in 1770, under the regency of Galuppi.

ROTAB, in *Geography*, a river of Saxony, which runs into the Saale, three miles S. of Lena.

ROTACEÆ, in *Botany*, the 20th natural order among the *Fragmenta* of Linnæus, named from *rota*, a wheel, in alluſion to the form of the *corolla*, which is wheel-ſhaped, *rotata*. No commentary upon this order is found in the lectures of Linnæus, publiſhed by Giſeke. The genera ſtand thus; *Trientalis*, *Centunculus*, *Anagallis*, *Lyſimachia*, *Phlox*, *Exacum*, *Chlora*, *Gentiana*, *Swertia*, *Chironia*, and *Sarothra*. To which are ſubjoined, in a ſeparate ſection, *Aſcyrum*, *Hypericum*, and *Ciſtus*; theſe ſurely have little affinity to the reſt.

ROTACH, in *Geography*, a river of Bavaria, which runs into the Maine, near Lichtenfels, in the biſhopric of Bamberg.

ROTAI, or ROTTE, a ſmall iſland in the Eaſt Indian ſea, where a Dutch factor reſides, who trades with the natives in the chief article of their produce, which is ſugar. The north end of this iſland, and the ſouth end of *Timor* (which ſee), lie N. $\frac{1}{2}$ E. and S. $\frac{1}{2}$ W., and are about three or four leagues diſtant from each other. At the weſt end of the paſſage between Rotte and *Semau* (which ſee), are two ſmall iſlands, one of which lies near the Rotte ſhore, and the other off the ſouth-weſt point of Semau, with a good channel between them, about ſix miles broad. The iſle of Rotte has not ſo lofty and mountainous an appearance as Timor, though it is agreeably diverſified by hill and valley. On the north ſide are many ſandy beaches, near which grow ſome trees of the fan palm; but the far greater part was covered

covered with a kind of brushwood without leaves. Cook's Voyage by Hawkesworth, vol. iii. p. 264.

ROTALA, in *Botany*, so named by Linnæus, from *rota*, a wheel; apparently in allusion to the spoke-like appearance of its numerous radiating whorled leaves.—Linn. Mant. 2. 143. Schreb. 33. Willd. Sp. Pl. v. 1. 189. Vahl. Enum. v. 2. 26. Mart. Mill. Dict. v. 4. Juss. 303.—Class and order, *Triandria Monogynia*. Nat. Ord. *Caryophyllei, sect.* 3, Linn. *Caryophylleis affine*, Juss.

Gen. Ch. *Cal.* Perianth inferior, of one leaf, tubular, membranous, three-toothed, permanent. *Cor.* none. *Stam.* Filaments three, capillary, the length of the calyx; anthers roundish. *Pist.* Germen superior, ovate; style thread-shaped; stigma three-cleft. *Peric.* Capsule ovate, obscurely triangular, inclosed in the calyx, of three cells, and three valves. *Seeds* numerous, roundish.

Ess. Ch. Calyx three-toothed. Corolla none. Capsule of three cells, with many seeds.

1. R. *verticillaris*. Linn. Mant. 2. 175. (Ene pael; Rheede Malab. v. 9. 159. t. 81.)—Native of wet situations in the East Indies, from whence it was sent by Koenig to Linnæus. A small annual *herb*, quite smooth, four inches, or more, in height, erect, branched, having the aspect of an *Ammannia*, as Vahl, from the inspection of the only known specimen, in the Linnæan herbarium, remarked. *Root* with many rows of whorled fibres. *Stem* and *branches* reddish; quadrangular in the upper part. *Leaves* from four, or five, to eight in each whorl, sessile, linear, entire, bluntish, or somewhat emarginate, at the end, about half an inch long; paler, with a prominent rib, beneath. *Flowers* axillary, small, sessile, solitary, pale; their permanent *calyx* membranous and pellucid, globular, investing the *fruit*, about the size of a mustard seed.

ROTAS, in *Geography*, a town of Hindoostan, in Lahore, $81\frac{1}{2}$ miles N.W. by N. from Lahore. N. lat. 32° 58′.

Rotas, a circar of Hindoostan, in the soubah of Bahar, bounded on the N.E. by Boujapour, on the E. by Bahar Proper, on the S. by Palamow, on the W. by the circar of Bidzigur, on the N.W. by Chunar; its form approaching to a square about 58 miles each way. The chief towns are Rotasgur and Saseram.

ROTASGUR, a town of Hindoostan, in the abovementioned circar, situated on the river Soane; 94 miles S.W. of Patna. N. lat. 24° 38′. E. long. 84° 2′.

ROTATA, Corolla, in *Botany*, a monopetalous corolla, whose tube is as short as possible, and the limb horizontally extended, like the form of a wheel. This differs from a salver-shaped corolla, in the want of an elongated tube. See Corolla.

ROTATION, in *Mechanics*, is a term used to denote the motion of the several parts of a solid body about an axis, called the axis of rotation, and which may be either *fixed* or *spontaneous*, according as the body is constrained to make its revolution about a determinate point or line, or is free to revolve in any direction from a momentum impressed upon it in space.

We have already treated of several cases of rotatory motion, under our articles Center *of Gyration*, Percussion, Oscillation, &c. and it therefore only remains, in this place, to offer some general remarks with regard to such motion, and to enumerate a few of the most important particulars relating to this interesting branch of mechanics.

When a solid body turns round an axis, retaining its shape and dimensions unaltered, every particle is absolutely describing a circle round this axis; which axis passes through the centre of the circle, and is perpendicular to its plane. Moreover, in any instant of its motion, the particle is moving at right angles with the radius vector, or line joining it with the centre of rotation: therefore, in order to ascertain the direction of the particle, we may draw a line from that particle perpendicular to the axis of rotation. This line will be in the plane of the circle of rotation of that particle, and will be its radius vector; and a line drawn from the particle, perpendicular to its radius vector, will be a tangent to the circle of rotation, and will represent the direction of the motion of this particle.

The whole body being supposed to turn together, it is evident, that when it has made one complete rotation, each point has described the circumference of a circle, and the entire paths of the different particles will be in the proportion of these circumferences, and therefore of their radii: and this is also true of any portion of these circumferences; that is, the velocities of the different particles are proportional to their radii vectores, or to their distances from the axis of rotation; and all these motions are in parallel planes, to which the axis of rotation is perpendicular. Hence it follows, that when we compare the motion of different revolving bodies with respect to velocity, it is evident that it cannot be done by directly comparing the velocity of any particle in one of these bodies with that of any particle of the other; for as all the particles of each have different velocities, this comparison can establish no ratio. But we may familiarly compare such motions, by the number of complete turns which they make in any equal portions of time; and, therefore, as the length or number of feet described by any body, in rectilinear motion, is a proper measure of its progressive velocity, so the angle described by any particle of a revolving body is a proper measure of its motion or rotation: and in this manner may the motion of two or more bodies be compared, and this velocity is with propriety called the angular velocity.

Again, with respect to the motion of bodies at liberty to move freely by the action of any force impressed: if any such body receives an impulsion in any direction, which does not pass through the centre of gravity, the motion which ensues is a rotatory one. For if, at the same moment, a body is impelled according to any direction A B, (*Plate* XXXVII. *Mechanics, fig.* 9.) not passing through the centre of gravity, an equal and opposite force is exerted upon the body in a parallel direction, C G passing through the centre of gravity, that centre will manifestly be kept at rest: nevertheless it is clear, that the other parts of the body will not be in a state of quiescence, because the two forces, though equal, are not directly opposite; so that the only motion that the body can have, its centre of gravity being at rest, is evidently a motion of rotation about that centre. Now the fixed axis, about which the body revolves, is pressed by the impelling force, while it generates rotatory motion; but the axis, being by hypothesis immoveable, re-acts equally against that pressure; and, when it passes through the centre of gravity, would, as above stated, cause each particle to move with the same velocity, and in the direction of the force. If, then, the force which presses against a fixed axis, in given circumstances, be ascertained, the motion of the body in free space, when the axis is removed, will be known; for the latter motion will consist of the rotatory motion about the axis passing through the centre of gravity, considered as fixed, compounded with the motion of the centre of gravity caused by the force now at liberty to impel the centre, the fixed axis which passes through it being removed.

When a solid body receives an impulse on any one point, or or that point is urged in any way by a moving force, it cannot move unlefs the other points, with which it is connected by the force of cohesion, move alfo; except the force of impulfion is fufficient to overcome that of cohesion, a cafe which is not meant to be confidered here. And whatever is the motion of any particle, that particle muft be conceived as urged by a force precifely competent to the production of that motion, by acting immediately on the particle itfelf. The particle, immediately impelled by the external force, is either preffed towards its neighbouring particles, or is drawn from them; and by this endeavour to change its place, the connecting forces are exerted, or brought into action. We are but little acquainted with thefe connecting forces; but this is of little importance in a mechanical point of view; for the fact, that the forces by which the moleculæ of bodies act on each other are equal, is quite fufficient for our prefent purpofe.

After thefe general remarks, let us endeavour to illuftrate the principles above laid down in the folution of a few of the moft obvious and moft practical cafes relating to this important branch of dynamics.

Let A F G H (*Plate* XXXVII. *Mechanics*, *fig.* 1.) reprefent the circumference of a wheel, which turns in its own plane round a horizontal axis, paffing through S, its centre; and let a weight P, fixed at the extremity of a line A P, communicate motion to the wheel. Let alfo the whole weight of the wheel be Q, and fuppofe this weight to be collected uniformly into the circumference A F G H: then during the defcent of the weight P, each point of the circumference muft move with a velocity equal to that with which P defcends; and confequently fince the moving force is the weight P, and the mafs moved P + Q, the force which accelerates P in its defcent will be that part of the accelerating force of gravity which is expreffed by the fraction $\frac{P}{P+Q}$. The velocity, therefore, that is generated in P, in any given time, is found by means of the general formula, given under the article Accelerated *Motion*; that is, $v = 2ft$, $v = \frac{2Pgt}{P+Q}$; and the fpace through which it has paffed in the fame time is $s = \frac{Pgt^2}{P+Q}$. Thus, for example, if P and Q were equal to each other, then $\frac{P}{P+Q} = \frac{1}{2}$, $v = gt$, and $s = \frac{1}{2}gt^2$.

The parts of the weight Q, which are uniformly difpofed over the circumference A F G H, balance each other round the common centre of gravity S; their weight, therefore, has no effect in accelerating or retarding the defcent of P; and this will be the cafe, whenever the axis of motion paffes through the common centre of gravity. But in order to render the properties of rotatory motion more obvious, it will be convenient to difpofe the parts of the revolving fyftem, fo that the axis of motion fhall not neceffarily pafs through the common centre of gravity. Thus, referring to the preceding figure, inftead of fuppofing the weight Q to be uniformly collected over the circular rim A F G H, let it be collected into any point Q. Here it is evident, that if the mafs Q be acted upon by gravity, the force which communicates motion to the fyftem round S will be variable; it being the greateft, when S Q is horizontal; and gradually diminifhing, till Q has defcended to its loweft point.

But in order to begin firft with the fimpleft cafe, the moving force fhould be conftant, as it will be, if we fuppofe the mafs that is collected in Q to be deftitute of weight, and to poffefs inertia only: it follows, therefore, that during the revolution of Q round S as an axis, the moving force will be conftantly equal to P, and the mafs moved $= P + Q$, and confequently the force which accelerates the defcending weight, or any point in the circumference, will be that part of gravity which is expreffed by $\frac{P}{P+Q}$, the fame as before.

In thefe cafes, the force which communicates motion to the fyftem has been fuppofed a weight, or body, acted on by the earth's gravity, and confequently conftitutes a part of the mafs moved, at the fame time that it acts as a moving force. But motion may be communicated by a force, which fhall add nothing to the inertia of the matter moved; as, for inftance, fteam, mufcular power, &c.: and it will, therefore, be convenient, in many inveftigations, to affume the moving force of this kind. The inertia of the moving force P, therefore, in the fubfequent propofitions, will not be taken into the account, unlefs exprefsly mentioned. Thus, if any number of bodies without gravity, being collected into the points F, H, Q, are caufed to revolve round the axis S, by a moving force P, the force which accelerates thefe bodies in their revolution will be $\frac{P}{F+H+Q}$, when P is without inertia; or it will be $\frac{P}{F+H+Q+P}$, when P is poffeffed of inertia; the bodies F, H, and Q, as alfo the power P, being fuppofed to act at equal diftances from the axis of motion.

But when bodies revolve at unequal diftances from the axis, their velocities being different, other formulæ will be neceffary for determining the force whereby any given point of the fyftem is accelerated.

Let B (*fig.* 2.) reprefent a material point, moveable about an axis of motion paffing through S: with the centre S, and diftance S D, defcribe a circle D G H. Now if B be connected with every point in the area of the circle, which is an inflexible fubftance, no force can be applied to move the circle, but what muft communicate the fame angular motion to B. Let us fuppofe this force to be P, acting on the circumference of the inflexible circle D G H, by means of a line paffing over the fame, to which P is connected. Now the abfolute force of P to move D, or any point in the circumference, will be P; but the communication of motion to this point D is refifted by the inertia of the body B, which being moved with a different velocity, and acted on by a different moving force, its inertia is not to be eftimated by its quantity of matter only, but by confidering what mafs or quantity of matter which, when difpofed at the diftance S D, will oppofe the fame refiftance to the defcent of the weight P, as the body B itfelf does, when acting at the diftance S B.

In order to eftimate this, we muft confider that when any two bodies are put in motion by two conftant forces acting for the fame time, the quantities of matter moved are in a direct ratio of the moving forces, and in the inverfe ratio of the velocities generated; that is, if $\frac{M}{m}$ expreffes the ratio of the moving forces, $\frac{Q}{q}$ that of the quantities of matter, and $\frac{V}{v}$ that of the velocities generated; the relation

tion of these quantities is defined by the equation $\frac{Q}{q} = \frac{M}{m} \times \frac{V}{v}$, by the laws of rectilinear motion. To apply this, it must be observed, that although the absolute force of the weight P, acting upon the point D, remains constantly the same, yet its effect upon bodies placed at different distances from the axis of motion are in the inverse proportion of those distances; therefore, the moving forces exerted by P, on the points B and D, will be in the proportion of S D to S B. Also, by the problem, the angular motion of D and B are equal; and, consequently, the velocity of B is to the velocity of D, as S B to S D. And since the quantities of matter in B, D, are in the direct proportion of the moving forces, or of S D to S B, and in the inverse proportion of the velocities generated, or of S B to S D, we shall have the quantity of matter in B to that contained in D, as $SD^2 : SB^2$; and consequently the weight sought $= B \times \frac{SB^2}{SD^2}$.

The same may be otherwise found thus: let $x =$ the quantity of matter required to be collected in D, M the moving force which acts on B, m that which acts on D, V the velocity of B, and v the velocity of D; then $\frac{B}{x} = \frac{M}{m} \times \frac{v}{V}$, but $\frac{M}{m} = \frac{SD}{SB}$, by the property of the lever; and $\frac{v}{V} = \frac{SD}{SB}$, by the nature of angular motion; therefore, $\frac{B}{x} = \frac{SD^2}{SB^2}$, and $x = B \times \frac{SB^2}{SD^2}$, as above.

Whenever, therefore, a body B revolves round an axis, by the action of a constant force P, applied at a given distance, S D, from the axis, in order to find the force which accelerates D, the mass B may be supposed to be removed, and instead of it an equivalent mass $B \times \frac{SB^2}{SD^2}$ collected in the point D, to which the force is applied. After which, the acceleration of the point D, or any other point of the circumference, will be determined from the principles already explained; for the moving force being P, and the mass moved $B \times \frac{SB^2}{SD^2}$, the acceleration of P, or D, will be that part of gravity expressed by the fraction $\frac{P}{B \times \frac{SB^2}{SD^2}} = \frac{P \times SD^2}{B \times SB^2}$, while we suppose the power P void of inertia; or by $\frac{P}{B \times \frac{SB^2}{SD^2} + P} = \frac{P \times SD^2}{B \times SB^2 + P \times SD^2}$, when the inertia of P is considered.

On the same principle, if any number of bodies, A, B, C, &c. (*fig.* 3.) be put in motion round a fixed axis, passing through S, by a constant force P, applied at D, the point D will be accelerated in the same manner, and consequently the whole system will have the same angular velocity. If, instead of A, B, C, &c. placed at the distances S A, S B, S C, &c. we substitute the bodies $\frac{A \times SA^2}{SD^2}$, $\frac{B \times SB^2}{SD^2}$, and $\frac{C \times SC^2}{SD^2}$; these being collected into the points a, b, and c, respectively; and the moving force in this case being P, and the mass moved $\frac{A \times SA^2}{SD^2} + \frac{B \times SB^2}{SD^2} + \frac{C \times SC^2}{SD^2}$; the force which accelerates D will be that part of the force of gravity that is expressed by the fraction,

$$\frac{P \times SD^2}{A \times SA^2 + B \times SB^2 + C \times SC^2};$$

or, if the inertia of P be considered, by

$$\frac{P \times SD^2}{A \times SA^2 + B \times SB^2 + C \times SC^2 + P \times SD^2}.$$

The velocity of the point D is uniformly accelerated, because the force above determined is invariable: it follows also, that the angular velocity of the system is uniformly accelerated, because the absolute velocity of any point at a given distance from the axis of motion, is as the angular velocity of that point, and consequently of the whole system. It is also manifest, that it is of no consequence whether the bodies A, B, C, &c. revolve in the same or different planes, if their distances from the axes S A, S B, S C, &c. are the same, these distances being estimated by lines drawn from A, B, and C, perpendicular to the common axis of motion; if, therefore, they should be situated in various planes, they may be referred to any one given plane perpendicular to the axis.

It is obvious likewise, that changing the position of the bodies A, B, C, in the same plane will not affect the force which accelerates the system, provided their respective distances from the axis of motion be not altered; thus, with the centre S, and distances S B, S C, let the arcs of circles be described; if B is transfered to b', or C to c', the moving force which acts on these bodies respectively will not be altered, and consequently the masses moved being likewise constant, the accelerating force will be the same.

All these propositions are equally true, whatever may be the force by which the angular motion is generated, provided it be constant; or, if variable, should its action be considered for an evanescent particle of time only.

We have here followed the method employed by Mr. Atwood in his treatise on "Rectilinear and Rotatory Motion;" being, as we conceive, the best calculated to convey a correct and elementary idea of the laws of rotatory motion. But it is obvious, that, instead of considering the given bodies A, B, C, (*fig.* 3.) to be equivalent to other bodies placed at the distance S D, we might enquire, at what distance from the centre of motion S all these bodies must be collected, without changing their masses, so that the same angular motion may be generated in the system? This point is called the *centre of gyration*; and as the method of finding this point has been already treated of under the article Center, we shall, in the subsequent part of this article, consider it as known, and shall proceed to the solution of a few such problems as appear best calculated for illustrating the subject under consideration.

Prop. I.

Let D, E, F, (*fig.* 4.) represent a wheel, or cylinder, turning about an axis passing through its centre of gravity S; round the circumference of which a perfectly flexible line is made to pass, and to the end of which a body, P, is suspended;

pended; then, having given the radius S D, the power P, and the weight of the wheel, or cylinder, D E F, it is required to determine the angular velocity generated in the fyftem in a given time.

Let R reprefent the centre of gyration, and make $SR = r$, $SD = d$, the weight of the cylinder $EDF = w$, and the given power $= p$; then the force which accelerates the point D is $\frac{pd^2}{wr^2}$, if we fuppofe p void of inertia; but if the inertia of p be confidered, the force of acceleration is $\frac{pd^2}{wr^2 + pd^2}$, the force of gravity being affumed unity; but if the force of gravity be taken $16\frac{1}{12} = 193$ inches $= l$; and $3.14159 = c$, then, in the time t, the velocity generated in the point D, or defcending weight P, will be reprefented by

$$v = \frac{2ltpd^2}{pd^2 + wr^2} \text{ inches in a fecond.}$$

And fince the circumference of the circle $EFD = 2cd$, the angular velocity generated in the time t, will be

$$\frac{360° \times 2ltpd^2}{2cd\,(pd^2 + wr^2)} = \frac{360°\,ltpd}{c\,(pd^2 + wr^2)} \text{ degrees, or}$$

$$\frac{ltpd}{cpd^2 + cwr^2} \text{ revolutions in a fecond.}$$

1. On the fame principles it will be found, that the angular velocity generated in the fyftem during the defcent of the weight p, through any fpace S, is

$$\text{ang. vel.} = \sqrt{\left(\frac{lsp}{c^2d^2p + c^2r^2w}\right)} \times 360° \text{ degrees, or}$$

$$\text{ang. vel.} = \sqrt{\left(\frac{lsp}{c^2d^2p + c^2r^2w}\right)} \text{ revol. in a fecond.}$$

2. The fpace defcribed by the weight p in its defcent from reft during t feconds, is $s = \frac{lt^2d^2p}{d^2p + r^2w}$, and confequently, the time of defcribing s is,

$$t = \sqrt{\frac{sd^2p + sr^2w}{lpd^2}} \text{ feconds.}$$

3. The fpace defcribed by p from reft, while an angular velocity of n revolutions in a fecond is generated, is

$$s = \frac{n^2c^2d^2p + n^2c^2r^2w}{lp}.$$

4. The force which accelerates the centre of gyration R, is $f = \frac{pdr}{d^2p + r^2w}$.

5. The abfolute velocity generated in the weight p, while it defcends from reft through the fpace S, is

$v = \sqrt{\frac{4lspd^2}{d^2p + r^2w}}$, and the velocity of the point R, is

$v = \sqrt{\frac{4lspr^2}{d^2p + r^2w}}$, and the velocity generated in the point R, in the time t, is

$$v = \frac{2ltdpr}{{}^2p + r^2w}.$$

All thefe refults are drawn immediately from the known formulæ for accelerated motion, by making $f = \frac{pd^2}{wr^2 + pd^2}$ the accelerating force, as determined in the preceding part of this propofition.

In the above inveftigation we have confidered the revolving fyftem to be a uniform wheel, or cylinder; but, it is obvious, the fame will have place for any fyftem of bodies, provided only that the axis of motion paffes through its centre of gravity, and that R be the centre of gyration of the fyftem.

Prop. II.

Let A B C (*fig.* 5.) reprefent a wheel and axle, and let the axis be horizontal, having given its weight w, and the weight q applied to the circumference of the axle, and p applied to the circumference of the wheel, in order to raife q; it is required to affign the fpace defcribed by the elevated weight q from reft in any given time; the proportion of the radii of the wheel and axle being alfo known.

Here the abfolute force which impels D is p, and fince q acts in a direction contrary to p, with a force $= \frac{q \cdot SA}{SD}$, this muft be fubucted from p, which gives $p - \frac{q \cdot SA}{SD}$ $= \frac{p \cdot SD - qSA}{SD}$ for the motive force which impels D. Let the centre of gyration of the wheel and axle be R; then fuppofe the mafs of matter in the whole fyftem removed, if the mafs $\frac{w \cdot SR^2 + q \cdot SA^2 + p \cdot SD^2}{SD^2}$ be concentrated in D, the point D will be accelerated in the fame manner, as when the parts of the fyftem are difpofed as defcribed in the problem. Since, then, the force which impels $D = \frac{p \cdot SD - q \cdot SA}{SD}$, it follows that this force, divided by the whole inertia, or the mafs fuppofed to be concentrated in D, will give for the accelerative force on $D = \frac{p \cdot SD^2 - q \cdot SA \cdot SD}{w \cdot SR^2 + p \cdot SD^2 + q \cdot SA^2}$, and the accelerative force on $q = \frac{p \cdot SD \cdot SA - qSA^2}{w \cdot SR^2 + p \cdot SD^2 + q \cdot SA^2}$.

Or, if we make $SD = n$, $SA = m$, $SR = r$, then the accelerating force on D is $\frac{pn^2 - qmn}{wr^2 + pn^2 + qm^2}$.

If the inertia of the wheel and axle is not confidered, the above becomes $= \frac{pn^2 - qmn}{pn^2 + qm^2}$. And if the inertia of p alfo $= 0$, then we have $\frac{pn^2 - qmn}{qm^2}$; or, if the mafs moved have no weight, but poffeffes inertia only, as when it is drawn along a perfectly polifhed plane, as reprefented alfo in *fig.* 5, then the accelerative force is fimply $\frac{pn^2}{pn^2 + qm^2}$.

Let this accelerative force in any of the cafes we have fuppofed ſuppoſed be put $= f$; then the ſpace, velocity, time, &c. will be found immediately from the general formula

$$s = \frac{1}{2} t v = g f t^2 = \frac{v^2}{4 g f}.$$

Suppoſe, for example, $SD = n = 6$, $SA = m = 2$, then $SR = r = 6 \surd \frac{1}{2}$. (See CENTER *of Gyration.*) Let alſo $w = 10$, $p = 100$, $q = 40$. Then, by our firſt formula,

$$\frac{n^2 p - n m q}{w r^2 + p n^2 + q m^2} = \frac{36 \cdot 100 - 6 \cdot 2 \cdot 40}{10 \cdot 18 + 100 \cdot 36 + 40 \cdot 4} = \frac{3600 - 480}{180 + 3600 + 160} = \frac{3120}{3940} = \frac{156}{197},$$ the accelerative force on D, that of gravity being 1. Whence the ſpace paſſed through by the deſcending weight p in 1″, is $s = g f t^2 = \frac{156 \cdot 16\frac{1}{12}}{197}$ feet, or $\frac{193 \cdot 156}{197}$ inches.

Whenever motion is communicated to any body, a certain reſiſtance muſt have been overcome by the moving force: this reſiſtance is of various kinds. 1. The inertia of the maſs moved, whereby it endeavours to perſevere in its ſtate of quieſcence, or of uniform motion in a right line. 2. That of a weight, or other abſolute force, oppoſed to the action of the moving power. 3. Obſtacles upon which the moving body impinging is retarded in its progreſs; ſuch, for example, is the reſiſtance which ariſes from the particles of a fluid through which a body moves. The eſtimation of theſe reſiſtances, and their effects in retarding the motion of bodies acted on by a given force, are deducible from the laws of motion, and conſtitute a part of the ſolution of almoſt every problem relating to the motion of bodies.

The moving forces alſo are of various kinds; *viz.* gravity, muſcular power, the impact of bodies ſolid or fluid, &c.; and the effect of theſe moving forces, which are exerted on bodies in order to create motion, excluſive of the reſiſtance oppoſed to them, depend on the various circumſtances of the time in which they act, and on the ſpaces through which the bodies moved are impelled, &c. Whence it follows, that, from the great variety of undetermined conditions which may enter into mechanical problems, there muſt be of courſe various ways of producing the ſame mechanical effect; and it is a very material part of the art, conſidered either in a theoretical or practical point of view, to proportion the means to the end, and to effect this with all the advantages that the nature of the caſe is capable of. It is the due obſervation of theſe particulars, which contribute to render the mechanic inſtruments complete, and the neglect of them defective, in their conſtruction. This proper choice of means to produce mechanical effect, is frequently the reſult of long and continued experience, independent of theory; the knowledge of which, however, when immediately applied to practice, would ſave the artiſt much time and trouble; and, at the ſame time, be productive of other advantages which experience alone muſt be deſtitute of.

PROP. III.

In order to illuſtrate this application of theory to practice, let A B C (*fig.* 5.) be a wheel and axle moveable round an horizonal axis, paſſing through S, and a given weight q, which applied to the circumference of the axle, to be raiſed by the application of a given moving force, p, which is applied to the circumference of the wheel; let it be required to aſſign the proportion of the radii of the wheel and axle, ſo that the time in which the weight w aſcends through any given ſpace ſhall be the leaſt poſſible.

Let the given radius of the axle $SA = m$, $SR = r$, $SD = x$; then, by the laſt propoſition, the accelerative force on p is $\frac{x^2 p - q m x}{w r^2 + p x^2 + q m^2}$, and that which accelerates q is $\frac{m x p - m^2 q}{w r^2 + p x^2 + q m^2}$; the ſquare of the time, therefore, in which any ſpace S is deſcribed by the aſcending weight q, is

$$t^2 = \frac{s}{l} \times \frac{w r^2 + p x^2 + q m^2}{m p x - m^2 q}, \quad (l \text{ being } = 193 \text{ in.})$$

and which, by the queſtion, is to be a minimum. And which, therefore, put into fluxions, and reduced, gives

$$x = \frac{m q + \surd (m^2 q^2 + p w r^2 + q p m^2)}{p},$$

the radius required.

Or, if we do not conſider the inertia of the wheel, then $x = \frac{m q + \surd (m^2 q^2 + q p m^2)}{p}$; if $p = q$, then $x = m + m \surd 2 = m (1 + \surd 2)$, the radius of the wheel in this particular caſe.

To give an example in numbers, let $q = 100$, $p = 33$, $w = 20$, $r = \surd 50$, or $r^2 = 50$, $m = 1$, then the diſtance ſought is $\frac{100 + \surd (10000 + 33000 + 3300)}{33} = \frac{315.17}{33} = 9.55$ inches.

This, therefore, will be the moſt convenient diſtance to apply the given moving force, when the chief object is to leſſen the time of aſcent. If it be required to aſſign the diſtance S D, when the momentum communicated to w, while it aſcends through a given ſpace, is the greateſt poſſible, the ſolution will be the ſame as before, which, therefore, anſwers to two conditions; that is, it will render the time in which q aſcends through a given ſpace the leaſt, and the momentum generated during the ſame aſcent the greateſt poſſible.

If the weight q, inſtead of aſcending in a vertical direction, is drawn along an horizontal plane, as in *fig.* 5, the ſurface of which is ſuppoſed perfectly poliſhed; then the weight q, as oppoſed to the moving force $= 0$, poſſeſſing in this caſe only inertia, we ſhall have for the radius of the wheel

$$x = \frac{\surd (p w r^2 + p q m^2)}{p} = \sqrt{\frac{w r^2 + q m^2}{p}}$$

which, if the inertia of w be rejected, becomes ſimply $x = \sqrt{\frac{q}{p}}$.

Hence, if the quantity of matter to be drawn along the plane is four times greater than that which is contained in the moving force, the radius of the axle S A being given, in order that it may be impelled with the greateſt velocity poſſible, and with the greateſt momentum, the radius of the wheel ſhould be double that of the axle, when the inertia of the wheel is not conſidered.

PROP. IV.

As a further application of our theory, let A B C, (*fig.* 5.) be a wheel and axle; when, having given a moving force or weight p, acting on the circumference of the

the wheel in order to raise a weight q, which is applied to the circumference of the axle, it is required to assign the quantity q, when the momentum generated in it in any given time shall be the greatest possible; the inertia of the wheel and axle not being considered.

Making, as before, $SD = n$, $SA = m$, the force which accelerates q is $f = \frac{nmp - m^2 q}{n^2 p + m^2 q}$; therefore, if $l = 193$ inches, the velocity generated in q in the time t will be $2tl \times \frac{nmp - m^2 q}{n^2 p + m^2 q}$, and the momentum generated in q will be $2tl \times \frac{nmpq - m^2 q^2}{n^2 p + m^2 q}$; and as this is to be a maximum by the problem, its fluxion $= 0$, which being taken and reduced gives $q = \frac{\sqrt{(n^4 p^2 + n^3 m p^2)} - n^2 p}{m^2}$.

Therefore, if $SD : SA :: n : 1$, then $q = p\sqrt{(n^4 + n^3)} - n^2 p$; if the radius of the axle equal the radius of the wheel, that is, $n = 1$; then the weight $q = p(\sqrt{2} - 1)$, and consequently the weight moved must be about $\frac{5}{12}$ths of the moving force.

But if we introduce the weight of the wheel, and call it w, r being the distance of the centre of gyration from the axis, then the momentum generated in the time t will be expressed by $2lt \times \frac{nmpq - m^2 q^2}{wr^2 + n^2 p + m^2 q}$, which is the greatest possible when $q = \frac{\sqrt{(n^4 p^2 + 2n^2 r^2 pw + r^4 w^2 + r^2 nmpw + n^2 mp^2)} - (n^2 p + r^2 w)}{m^2}$.

Prop. V.

Again, let A B C H (*fig.* 7.) be a system of bodies moveable round a vertical axis, which passes through the common centre of gravity of the system. And suppose D E G to be a wheel, the axis of which is vertical, and coinciding with that of the system; let motion be communicated by means of a line going round this wheel, the string D P being stretched by a given weight p; let it be required to assign the radius of the wheel E G D, so that the angular velocity communicated to the system in a given time may be the greatest possible. Let the weight of the system $= w$, and the distance of the centre of gyration from the axis of motion $= r$, the radius sought $SD = x$; then the motive force being p, the velocity generated in a given time in that descending weight will be proportional to $\frac{px^2}{wr^2 + px^2}$, and the angular velocity generated in the same time as $\frac{px}{wr^2 + px^2}$, which is to be a maximum by the conditions of the problem, we have, therefore, $\frac{pwr^2\dot{x} + p^2x^2\dot{x} - 2p^2x^2\dot{x}}{(wr^2 + px^2)^2} = 0$, whence $pwr^2 = p^2x^2$, or $x = r\sqrt{\frac{w}{p}}$, the distance sought.

Supposing, therefore, the moving force $= \frac{1}{4}$ of the weight of the system w, we shall have $x = r\sqrt{\frac{w}{\frac{1}{4}w}} = 2r$; that is, the weight should be applied at a distance from the axis, equal to twice the distance of the centre of gyration, in order to produce the greatest angular velocity in a given time.

Prop. VI.

In order to increase the action of a given moving force against a weight to be raised, or resistance to be overcome, a combination of two or more mechanic powers is frequently made use of. Thus, let p be a power applied by means of a line to the vertical wheel C, (*fig.* 6.), and suppose the circumference of the axle K to be in contact with the circumference of the wheel B, so that the circumference of the wheel B may always move equally fast with that of the axis which belongs to C; let also the axle of B communicate motion to the vertical wheel A, to the axle of which a weight, q, is suspended, so as to act in opposition to p; moreover, let lmn to 1, be the sum of the ratios of the radius of each wheel to that of its axle; then if $plmn = q$, the two weights, p and q, will sustain each other in equilibrio; but if $plmn$ be greater than q, the equilibrium will be destroyed, and the weight q will ascend; and it is required to assign the space which, under those circumstances, will be described by q in a given time.

Let the radii of the wheel and axle A be in the ratio of l to 1; those of B as m to 1; and those of C as n to 1; the distance of the centre of gyration in A from the axis $= r$, the same of $B = r'$, and of $C = r''$; the weight of the wheel and axle $A = w$; that of $B = w'$; and that of $C = w''$.

Now the absolute moving force is p, but since q acts in opposition to it, it must be subducted from p, in order to obtain the real motive force of the system. And since q would balance a weight $= \frac{q}{lmn}$, if applied at p, the force which impels p on the whole will be $\frac{plmn - q}{lmn}$. In the next place, the inertia which resists the communication of motion to p must be ascertained. Now motion is communicated to the wheel A, from the circumference of the axle B, and the inertia of A, and of the weight q, which resists the communication of a force applied at $S = \frac{wr^2 + q}{l^2}$; in regard, therefore, to the inertia of A and q, these may be supposed to be removed, and the equivalent mass $\frac{wr^2 + q}{l^2}$ collected into the circumference of the wheel A, or of the axle B. And since motion is communicated to B, by the circumference of the axle C, the inertia of B, together with the equivalent mass $\frac{wr^2 + q}{l^2}$ will be $\frac{r'^2 l^2 w' + wr^2 + q}{l^2 m^2}$.

In like manner, since motion is communicated to C by the weight p acting at D, the inertia which resists the communication of motion to D or p, will be

$$\frac{pn^2 + w''r''^2}{n^2} + \frac{r'^2 l^2 w' + wr^2 + q}{l^2 m^2 n^2} = \frac{l^2 m^2 n^2 p + l^2 m^2 w'' r''^2 + r'^2 l^2 w' + wr^2 + q}{l^2 m^2 n^2},$$

and the force which accelerates p in its descent from rest

$$= \frac{lmn(plmn - q)}{l^2 m^2 n^2 p + l^2 m^2 w'' r''^2 + r'^2 l^2 w'^2 + wr^2 + q},$$

and

and that which accelerates q

$$= \frac{p\,l\,m\,n - q}{l^2 m^2 n^2 p + l^2 m^2 w''^2 r''^2 + r'^2 l^2 w' + w r^2 + q};$$

if, therefore, we make this force $= f$, all the circumſtances of the motion may be determined by the general formula $s = \frac{1}{2} t v = g f t^2 = \frac{v^2}{4 g f}$; as before ſhewn. See a variety of other propoſitions in Atwood's treatiſe on "Rotatory Motion."

In all the preceding propoſitions, the axis of the revolving ſyſtem has been ſuppoſed fixed; but there are other caſes by which rotatory motion may be produced, which ought to be attended to in this article; ſuch as that which enſue from a body deſcending down an inclined plane, having a ribbon or cord wound about it, one end of which is fixed at the upper part of the plane, which, by preventing the body ſliding freely, cauſes a rotatory motion. The ſame effect alſo follows from the friction of the body againſt the plane; and the ſame may be imagined when there is no plane, but the body is left to fall freely, except ſo far as the cord wound about it ſhall produce a rotatory motion in its deſcent. We ſhall not attempt the inveſtigation of theſe caſes, but merely ſtate the reſults that have been obtained; and muſt refer the reader for the former to the ſeveral treatiſes on dynamics, enumerated under the articles Dynamics and Mechanics.

Let a body (*fig.* 8.) have a cord wound about it, either at its circumference, or any other part, as C, having one end fixed at a point above, as at D; then if the body be left to deſcend by the action of gravity, it will acquire a motion of rotation by the unwinding of the cord, and the ſpace actually deſcended by the body in this caſe, will be to the ſpace deſcended in the ſame time, when falling freely, as C G to C O; O and G repreſenting the centres of oſcillation and gyration when the point of ſuſpenſion is at C. And the weight of the body will be to the tenſion of the cord, as C O to C G. The ſame ratios have place when the body deſcends down an inclined plane; the forces which generate the motion being both decreaſed in the ſame ratio.

The force by which ſpheres, cylinders, &c. are cauſed to revolve as they move down an inclined plane (inſtead of ſliding), is the adheſion of their ſurfaces, occaſioned by their preſſure againſt the plane. This preſſure is part of the weight of the body; for this weight being reſolved into its component parts, one in the direction of the plane, the other perpendicular to it, the latter is the force of the preſſure; and which, while the ſame body rolls down, the plane will be expreſſed by the coſine of the plane's elevation. Hence, ſince the coſine decreaſes, will the arc or angle increaſe. After the angle of elevation arrives at a certain magnitude, the adheſion may become leſs than what is neceſſary to make the circumference of the body revolve faſt enough; and in this caſe, it will proceed partly by ſliding, and partly by rolling; but the angle at which this circumſtance takes place, will evidently depend upon the degree of adheſion between the ſurfaces of the body and plane. This, however, will never happen, if the rotation is produced by the unwinding of a ribbon, and it is on this latter ſuppoſition that the following particular caſes are deduced.

Let W be the weight of the body, s the ſpace deſcended by a heavy body falling freely, or ſliding freely down a plane; then the ſpace S, deſcribed by rotation in the ſame time, by the following bodies, will be in theſe proportions.

1. A hollow cylinder or cylindrical ſurface $S = \frac{1}{2} s$; tenſion $= \frac{1}{2}$ W.
2. A ſolid cylinder $S = \frac{2}{3} s$; tenſion $= \frac{1}{3}$ W.
3. A ſpheric ſurface $S = \frac{3}{5} s$; tenſion $= \frac{2}{5}$ W.
4. A ſolid ſphere $S = \frac{5}{7} s$; tenſion $= \frac{2}{7}$ W. See Gregory's Mechanics, vol. i.

Rotation, *Spontaneous*, is that rotatory motion which a body acquires when acted upon by any external force in free ſpace. And the *centre of ſpontaneous rotation* is that point which remains at reſt the inſtant the body receives its impulſion, or it is that point about which the body begins to revolve.

The moſt general method of treating this ſubject is with reference to three rectangular co-ordinates, after the method of Lagrange and other modern French writers; but as that method is not commonly adopted by Engliſh mathematicians, we muſt neceſſarily either enter at great length into explanation, or run the riſk of not being underſtood by many of our readers, on which account we ſhall here adopt a ſimilar mode of inveſtigation to that which we have followed in the preceding part of this article.

Firſt, then, we may obſerve, that when a body, B, (*fig.* 9.) of any ſhape whatever, receives an impulſe, the direction of which does not paſs through the centre of gravity, and takes in conſequence two motions, as we have ſtated in the early part of this article, it is evident, that for an inſtant of time we may conſider it as having only one motion, namely, a motion of rotation about a point or fixed axis, C, which may be either within the body, or out of it, according to its ſhape, and the diſtance, G S, between the centre of gravity and the direction of impact. If, while the line G S is carried parallel to itſelf from G S to G′ S′, we imagine that it revolves about the moveable point G, as the particles of the body have greater or leſs velocities, as they are more or leſs diſtant from G, it is manifeſt that there is upon S G a certain point, C, which will be found to deſcribe from C′ towards C an arc equal to G G′, which, during an evaneſcent inſtant, may be regarded as a right line; in that caſe the point C will have been carried as far backward by its motion of rotation, as it will have been advanced parallel to G G′ by the velocity common to all the parts of the body; the point C has, therefore, during this inſtant, been actually at reſt in C; and may conſequently be conſidered as a fixed point about which the body during ſuch inſtant has a rotatory motion. This point is the centre of ſpontaneous rotation, and is the ſame as the centre of ſuſpenſion, correſponding to the centre of percuſſion, the centre of percuſſion being the point where the body is ſtruck.

Without entering into a minute demonſtration of this property, we may convince ourſelves of its truth, by conſidering that the action of a body againſt an immoveable obſtacle, in the centre of percuſſion, muſt have the ſame effect upon the body, as if that body had been at reſt, and it had been ſtruck by the obſtacle; in which latter caſe, the centre of ſuſpenſion would not be affected, and therefore it becomes the centre of ſpontaneous rotation. On which account it alſo follows, that the centre of ſpontaneous rotation is wholly independent of the magnitude of impact; but depends entirely on the diſtance that the force φ S, or the reſult of all the forces, acts from the centre of gravity, G; and conſequently, when that force acts in the direction, or coincides with G G′, there will be no motion of rotation, as is obvious.

We may alſo farther obſerve, that if an impact be made on any point of the axis of a ſymmetrical body, or a ſolid of revolution, and that point be conſidered as the point of ſuſpenſion, the wheel in order to raife a weight q, which is applied to the circumference of the axle, it is required to affign the quantity q, when the momentum generated in it in any given time fhall be the greateft poffible; the inertia of the wheel and axle not being confidered.

Making, as before, $SD = n$, $SA = m$, the force which accelerates q is $f = \frac{nmp - m^2 q}{n^2 p + m^2 q}$; therefore, if $l = 193$ inches, the velocity generated in q in the time t will be $2tl \times \frac{nmp - m^2 q}{n^2 p + m^2 q}$, and the momentum generated in q will be $2tl \times \frac{nmpq - m^2 q^2}{n^2 p + m^2 q}$; and as this is to be a maximum by the problem, its fluxion $= 0$, which being taken and reduced gives $q = \frac{\sqrt{(n^4 p^2 + n^3 m p^2)} - n^2 p}{m^2}$.

Therefore, if $SD : SA :: n : 1$, then $q = p\sqrt{(n^4 + n^3)} - n^2 p$; if the radius of the axle equal the radius of the wheel, that is, $n = 1$; then the weight $q = p(\sqrt{2} - 1)$, and confequently the weight moved muft be about $\frac{5}{12}$ths of the moving force.

But if we introduce the weight of the wheel, and call it w, r being the diftance of the centre of gyration from the axis, then the momentum generated in the time t will be expreffed by $2lt \times \frac{nmpq - m^2 q^2}{wr^2 + n^2 p + m^2 q}$, which is the greateft poffible when $q = \frac{\sqrt{(n^4 p^2 + 2n^2 r^2 pw + r^4 w^2 + r^2 nmpw + n^2 mp^2)} - (n^2 p + r^2 w)}{m^2}$

Prop. V.

Again, let A B C H (*fig.* 7.) be a fyftem of bodies moveable round a vertical axis, which paffes through the common centre of gravity of the fyftem. And fuppofe D E G to be a wheel, the axis of which is vertical, and coinciding with that of the fyftem; let motion be communicated by means of a line going round this wheel, the ftring D P being ftretched by a given weight p; let it be required to affign the radius of the wheel E G D, fo that the angular velocity communicated to the fyftem in a given time may be the greateft poffible. Let the weight of the fyftem $= w$, and the diftance of the centre of gyration from the axis of motion $= r$, the radius fought $SD = x$; then the motive force being p, the velocity generated in a given time in that defcending weight will be proportional to $\frac{px^2}{wr^2 + px^2}$, and the angular velocity generated in the fame time as $\frac{px}{wr^2 + px^2}$, which is to be a maximum by the conditions of the problem, we have, therefore, $\frac{pwr^2\dot{x} + p^2x^2\dot{x} - 2p^2x^2\dot{x}}{(wr^2 + px^2)^2} = 0$, whence $pwr^2 = p^2x^2$, or $x = r\sqrt{\frac{w}{p}}$, the diftance fought.

Suppofing, therefore, the moving force $= \frac{1}{4}$ of the weight of the fyftem w, we fhall have $x = r\sqrt{\frac{w}{\frac{1}{4}w}} = 2r$; that is, the weight fhould be applied at a diftance from the axis, equal to twice the diftance of the centre of gyration, in order to produce the greateft angular velocity in a given time.

Prop. VI.

In order to increafe the action of a given moving force againft a weight to be raifed, or refiftance to be overcome, a combination of two or more mechanic powers is frequently made ufe of. Thus, let p be a power applied by means of a line to the vertical wheel C, (*fig.* 6.), and fuppofe the circumference of the axle K to be in contact with the circumference of the wheel B, fo that the circumference of the wheel B may always move equally faft with that of the axis which belongs to C; let alfo the axle of B communicate motion to the vertical wheel A, to the axle of which a weight, q, is fufpended, fo as to act in oppofition to p; moreover, let lmn to 1, be the fum of the ratios of the radius of each wheel to that of its axle; then if $plmn = q$, the two weights, p and q, will fuftain each other in equilibrio; but if $plmn$ be greater than q, the equilibrium will be deftroyed, and the weight q will afcend; and it is required to affign the fpace which, under thofe circumftances, will be defcribed by q in a given time.

Let the radii of the wheel and axle A be in the ratio of l to 1; thofe of B as m to 1; and thofe of C as n to 1; the diftance of the centre of gyration in A from the axis $= r$, the fame of $B = r'$, and of $C = r''$; the weight of the wheel and axle $A = w$; that of $B = w'$; and that of $C = w''$.

Now the abfolute moving force is p, but fince q acts in oppofition to it, it muft be fubducted from p, in order to obtain the real motive force of the fyftem. And fince q would balance a weight $= \frac{q}{lmn}$, if applied at p, the force which impels p on the whole will be $\frac{plmn - q}{lmn}$. In the next place, the inertia which refifts the communication of motion to p muft be afcertained. Now motion is communicated to the wheel A, from the circumference of the axle B, and the inertia of A, and of the weight q, which refifts the communication of a force applied at $S = \frac{wr^2 + q}{l^2}$; in regard, therefore, to the inertia of A and q, thefe may be fuppofed to be removed, and the equivalent mafs $\frac{wr^2 + q}{l^2}$ collected into the circumference of the wheel A, or of the axle B. And fince motion is communicated to B, by the circumference of the axle C, the inertia of B, together with the equivalent mafs $\frac{wr^2 + q}{l^2}$ will be $\frac{r'^2 l^2 w' + wr^2 + q}{l^2 m^2}$.

In like manner, fince motion is communicated to C by the weight p acting at D, the inertia which refifts the communication of motion to D or p, will be

$$\frac{pn^2 + w''r''^2}{n^2} + \frac{r'^2 l^2 w' + wr^2 + q}{l^2 m^2 n^2} = \frac{l^2 m^2 n^2 p + l^2 m^2 w'' r''^2 + r'^2 l^2 w' + wr^2 + q}{l^2 m^2 n^2},$$

and the force which accelerates p in its defcent from reft

$$= \frac{lmn(plmn - q)}{l^2 m^2 n^2 p + l^2 m^2 w'' r''^2 + r'^2 l^2 w'^2 + wr^2 + q},$$

and

and that which accelerates q

$$= \frac{p\,l\,m\,n - q}{l^2 m^2 n^2 p + l^2 m^2 w''^2 r''^2 + r'^2 l^2 w' + w r^2 + q};$$

if, therefore, we make this force $= f$, all the circumftances of the motion may be determined by the general formula $s = \frac{1}{2} t v = g f t^2 = \frac{v^2}{4 g f}$; as before fhewn. See a variety of other propofitions in Atwood's treatife on "Rotatory Motion."

In all the preceding propofitions, the axis of the revolving fyftem has been fuppofed fixed; but there are other cafes by which rotatory motion may be produced, which ought to be attended to in this article; fuch as that which enfue from a body defcending down an inclined plane, having a ribbon or cord wound about it, one end of which is fixed at the upper part of the plane, which, by preventing the body fliding freely, caufes a rotatory motion. The fame effect alfo follows from the friction of the body againft the plane; and the fame may be imagined when there is no plane, but the body is left to fall freely, except fo far as the cord wound about it fhall produce a rotatory motion in its defcent. We fhall not attempt the inveftigation of thefe cafes, but merely ftate the refults that have been obtained; and muft refer the reader for the former to the feveral treatifes on dynamics, enumerated under the articles Dynamics and Mechanics.

Let a body (*fig.* 8.) have a cord wound about it, either at its circumference, or any other part, as C, having one end fixed at a point above, as at D; then if the body be left to defcend by the action of gravity, it will acquire a motion of rotation by the unwinding of the cord, and the fpace actually defcended by the body in this cafe, will be to the fpace defcended in the fame time, when falling freely, as C G to C O; O and G reprefenting the centres of ofcillation and gyration when the point of fufpenfion is at C. And the weight of the body will be to the tenfion of the cord, as C O to C G. The fame ratios have place when the body defcends down an inclined plane; the forces which generate the motion being both decreafed in the fame ratio.

The force by which fpheres, cylinders, &c. are caufed to revolve as they move down an inclined plane (inftead of fliding), is the adhefion of their furfaces, occafioned by their preffure againft the plane. This preffure is part of the weight of the body; for this weight being refolved into its component parts, one in the direction of the plane, the other perpendicular to it, the latter is the force of the preffure; and which, while the fame body rolls down, the plane will be expreffed by the cofine of the plane's elevation. Hence, fince the cofine decreafes, will the arc or angle increafe. After the angle of elevation arrives at a certain magnitude, the adhefion may become lefs than what is neceffary to make the circumference of the body revolve faft enough; and in this cafe, it will proceed partly by fliding, and partly by rolling; but the angle at which this circumftance takes place, will evidently depend upon the degree of adhefion between the furfaces of the body and plane. This, however, will never happen, if the rotation is produced by the unwinding of a ribbon, and it is on this latter fuppofition that the following particular cafes are deduced.

Let W be the weight of the body, s the fpace defcended by a heavy body falling freely, or fliding freely down a plane; then the fpace S, defcribed by rotation in the fame time, by the following bodies, will be in thefe proportions.

1. A hollow cylinder or cylindrical furface $S = \frac{1}{2} s$; tenfion $= \frac{1}{3}$ W.
2. A folid cylinder $S = \frac{2}{3} s$; tenfion $= \frac{1}{3}$ W.
3. A fpheric furface $S = \frac{3}{5} s$; tenfion $= \frac{2}{5}$ W.
4. A folid fphere $S = \frac{5}{7} s$; tenfion $= \frac{2}{7}$ W. See Gregory's Mechanics, vol. i.

Rotation, *Spontaneous*, is that rotatory motion which a body acquires when acted upon by any external force in free fpace. And the *centre of fpontaneous rotation* is that point which remains at reft the inftant the body receives its impulfion, or it is that point about which the body begins to revolve.

The moft general method of treating this fubject is with reference to three rectangular co-ordinates, after the method of Lagrange and other modern French writers; but as that method is not commonly adopted by Englifh mathematicians, we muft neceffarily either enter at great length into explanation, or run the rifk of not being underftood by many of our readers, on which account we fhall here adopt a fimilar mode of inveftigation to that which we have followed in the preceding part of this article.

Firft, then, we may obferve, that when a body, B, (*fig.* 9.) of any fhape whatever, receives an impulfe, the direction of which does not pafs through the centre of gravity, and takes in confequence two motions, as we have ftated in the early part of this article, it is evident, that for an inftant of time, we may confider it as having only one motion, namely, a motion of rotation about a point or fixed axis, C, which may be either within the body, or out of it, according to its fhape, and the diftance, G S, between the centre of gravity and the direction of impact. If, while the line G S is carried parallel to itfelf from G S to G′ S′, we imagine that it revolves about the moveable point G, as the particles of the body have greater or lefs velocities, as they are more or lefs diftant from G, it is manifeft that there is upon S G a certain point, C, which will be found to defcribe from C′ towards C an arc equal to G G′, which, during an evanefcent inftant, may be regarded as a right line; in that cafe the point C will have been carried as far backward by its motion of rotation, as it will have been advanced parallel to G G′ by the velocity common to all the parts of the body; the point C has, therefore, during this inftant, been actually at reft in C; and may confequently be confidered as a fixed point about which the body during fuch inftant has a rotatory motion. This point is the centre of fpontaneous rotation, and is the fame as the centre of fufpenfion, correfponding to the centre of percuffion, the centre of percuffion being the point where the body is ftruck.

Without entering into a minute demonftration of this property, we may convince ourfelves of its truth, by confidering that the action of a body againft an immoveable obftacle, in the centre of percuffion, muft have the fame effect upon the body, as if that body had been at reft, and it had been ftruck by the obftacle; in which latter cafe, the centre of fufpenfion would not be affected, and therefore it becomes the centre of fpontaneous rotation. On which account it alfo follows, that the centre of fpontaneous rotation is wholly independent of the magnitude of impact; but depends entirely on the diftance that the force ϕ S, or the refult of all the forces, acts from the centre of gravity, G; and confequently, when that force acts in the direction, or coincides with G G′, there will be no motion of rotation, as is obvious.

We may alfo farther obferve, that if an impact be made on any point of the axis of a fymmetrical body, or a folid of revolution, and that point be confidered as the point of fuſpenſion, the correſponding centre of oſcillation will be the centre of ſpontaneous rotation. This follows immediately from the properties of the centre of percuſſion and oſcillation. (See CENTER.) To which we may alſo add, that ſince the force divided by the body acted upon, is a general expreſſion for the velocity of the centre of gravity of that body; therefore the velocity of the centre of gravity of the body will be the ſame, whatever may be the direction of the impelling force; ſo that the permanency of the quantity of motion obtains the ſame in motions about a centre of ſpontaneous rotation, as in all other caſes.

PROP. I.

When ϕ S, (*fig.* 9.) the direction of impact, paſſes through the centre of the impelling body, the centre of gravity of the body ſtruck, will move with a velocity equal to the product of the quantity of motion of the impelling body into the diſtance between the centre of gravity and ſpontaneous rotation, divided by the ſum of the products of the impelling body into the diſtance of the point of impact from the centre of ſpontaneous rotation, and of the impelled body into the diſtance of the impelled body, into the diſtance between the centres of ſpontaneous rotation and of gravity.

Let the quantity of matter of the impinging body be b, its velocity v, or $bv = \phi$; and when the body B is ſtruck in the direction ϕ S, (in which the centre of the body b is always found), let the velocity of its centre of gravity be V, the centre of ſpontaneous converſion being at C. Then C G : C S :: V : *the velocity of the point* S, which is therefore $V \cdot \frac{CS}{CG}$; conſequently, $v - V \cdot \frac{CS}{CG}$ = the velocity loſt by b in the direction ϕ S; whence, by the third law of motion, $b \times \frac{v \cdot GC - V \cdot CS}{CG} = B \cdot V$, and by reduction, $V = \frac{b \cdot v \cdot CG}{B \cdot CG + b \cdot CS}$, as was to be demonſtrated.

Hence, if the inertia of the ſtriking body be evaneſcent, the velocity V will become $\frac{bv}{B} = \frac{\phi}{B}$, being the ſame as would be generated if the body b impinged directly on it with the velocity V.

PROP. II.

The inertia of the ſtriking body being evaneſcent, the angular velocity of the ſyſtem about the centre of gravity is equal to the momentum of the impelling body, divided by twice the product of the maſs of the impelled body, and the diſtance C G, into the periphery of a circle whoſe diameter is unity.

If the fixed axis paſſed through C, the centre of gravity would deſcribe a circle, whoſe radius is C G, with the velocity $\frac{bv}{B}$. But, in the preſent caſe, the motion of the ſyſtem will be compounded of the uniform rectilinear motion of the centre of gravity, in the direction G′ C, perpendicular to C S, and the angular motion $x G' p = G C G'$, generated round the centre of gravity. And ſince the periphery of a circle, whoſe radius is C G, is $2\pi \cdot CG$ (π being = 3.1416), we have this analogy, $\frac{bv}{B} : 2\pi \cdot CG :: 1'' : \frac{2\pi \cdot B \cdot CG'}{bv}$, the time of one revolution in ſeconds. Whence it follows, that the number of revolutions, or parts of a revolution, in a ſecond, or the angular velocity U, will be $1 \div \frac{2\pi \cdot B \cdot CG}{bv} = \frac{bv}{2\pi \cdot B \cdot CG}$.

And ſince C is the centre of percuſſion to S as a centre of motion, if Q be the centre of gyration with reſpect to G as a centre of motion (that is, if Q be the principal centre of gyration), we ſhall have $GC \cdot GS = GQ^2$, or $CG = \frac{GQ^2}{GS}$. This value of G C being ſubſtituted for it in the preceding expreſſion for the angular velocity, it becomes $U = \frac{b \cdot v \cdot GS}{2\pi B \cdot GQ^2}$. It follows alſo from what is ſhewn above, that the centre of ſpontaneous rotation, during the motion of the ſyſtem, deſcribes the common cycloid. For the motion of any point in the ſyſtem is compounded of the uniform rectilinear motion of the centre of gravity, and of the angular motion generated round that centre; but the velocity with which the centre of ſpontaneous rotation would move round the centre of gravity, if there only exiſted a rotatory motion in the ſyſtem, would be equal to that with which the centre of gravity would move round it, if the centre C were fixed; conſequently, ſince the centre C has both a rotatory and progreſſive motion, each of which is equal to that of the centre of gravity, it will deſcribe a cycloid.

PROP. III.

In the body, or ſyſtem B, (*fig.* 9.) to which, when quieſcent, motion has been communicated by the impulſe of a force, ϕ, without inertia, that is, rectilinear motion to the centre of gravity meaſured by the ſpace V, which that centre would deſcribe uniformly in any given time, and angular motions meaſured by the revolutions U, or parts of a revolution, which it would deſcribe uniformly round G in the ſame time; then if the notations in the preceding propoſitions be retained, and Q be the principal centre of gyration, when the ſyſtem revolves about its centre of gravity, the perpendicular diſtance from the centre of gravity, at which the impelling force muſt act ſo as to have generated theſe progreſſive and rotatory motions, will be $GS = \frac{2\pi \cdot U \cdot GQ^2}{V}$.

Let ϕ S be the direction of the impulſe, and let ϕ be equal to the momentum of an evaneſcent body b, moving with the velocity V, B being the weight of the ſyſtem; then the velocity communicated to the centre of gravity of the ſyſtem, will, by the laſt propoſition, be $= \frac{b \cdot v \cdot SG}{2\pi \cdot B \cdot GQ^2}$. But by the propoſition, the velocity communicated to the centre of gravity of the ſyſtem is V; and the angular motion, that is, the number of revolutions, or parts of a revolution, deſcribed while the centre of gravity paſſes over the ſpace V, is U; ſo that from the conditions there ariſes this equation, $U = \frac{b \cdot v \cdot GS}{2\pi \cdot B \cdot GQ^2} = \frac{V \cdot GS}{2\pi \cdot GQ^2}$, by putting V for its equal $\frac{bv}{B}$. Hence $GS = \frac{2\pi \cdot U \cdot GQ^2}{V}$.

If

If the body B be a ſphere, whoſe radius is r, then $GQ^2 = \frac{2}{5}r^2$, and if u be the abſolute velocity of rotation of an equator of the ſphere, we have $U = \frac{u}{2\pi r}$; whence the preceding value of G S is transformed to this, $GS = \frac{2}{5}r \cdot \frac{u}{V}$.

This propoſition may be applied to the double motion of the planets. The earth revolves about an axis paſſing through its centre of gravity, while, by a motion of tranſlation, that centre is carried on in free ſpace in an orbit nearly circular; and a ſimilar kind of double motion has been diſcovered in ſeveral of the planets, and analogy leads us to believe it obtains in the others. Now, ſuppoſing the bodies of the planets to be ſpherical, as they are nearly, the uſe of this propoſition at once appears. Having given, for inſtance, the magnitude of an impulſe, with reſpect to the maſs of the earth, and the direction ϛ S, in which it was applied, at any given diſtance S G from the centre of gravity, the angular motion round G would be inferred; and converſely if the actual rotatory velocity of the earth's equator, and the velocity in its orbit, be aſcertained, the diſtance G S from the centre, at which it may have received a ſingle impulſe ϛ S adequate to produce the double motion, may be readily found.

Thus, any point in the earth's equator paſſes over 25,020 miles by rotation in one ſidereal day; and if the mean diſtance of the earth from the ſun be 95 million miles, the earth will paſs over nearly 596,904,000 miles by its orbital motion in a year, or in about 366 ſidereal days; hence $596,904,000 \div 366 = 16,308,852$, will be equal to V in our theorem, while $25,020 = u$. Conſequently, $GS = \frac{2}{5}r \cdot \frac{u}{V} = \frac{r}{163.2}$. So that if an impulſe be impreſſed upon a quieſcent ſphere, and the direction of force ſhould be at a diſtance S G from its centre of gravity of about $\frac{1}{163}$d part of its radius, the angular motion of that ſphere, and the abſolute motion of its centre, will have the ſame relation to each other, as thoſe which actually obtain in the earth.

The time of the rotations of Mercury, Uranus, and the laſt new planets, are unknown; but for the following planets it is aſcertained, ſo that, by the ſame theorem, we obtain theſe values of G S; *viz.* Mars, $\frac{r}{195}$; Jupiter, $\frac{r}{2.8125}$; Saturn, $\frac{r}{2.588}$; the Moon, $\frac{r}{555}$.

We have not ſufficient data for the ſun; but the very circumſtance of his having a rotation of $27^d\ 7^h\ 47^m$, makes it very probable that he, with all his attendant planets, is alſo moving forward in celeſtial ſpace, perhaps round ſome centre of ſtill more general and extenſive gravitation; for the perfect oppoſition and equality of two forces, for giving a rotation without a progreſſive motion, has the odds againſt it of infinity to unity. This corroborates the conjectures of philoſophers, and the obſervations of Herſchel and other aſtronomers, who think that the ſolar ſyſtem is approaching to that quarter of the heavens in which the conſtellation Aquilea is ſituated.

Prop. IV.

If a body revolves about an axis paſſing through its centre of gravity with the angular velocity U, while this axis is carried round another axis, alſo paſſing through its centre of gravity, with the angular velocity U, theſe two motions compoſe a motion of every particle of the body, round a third axis lying in the plane of the other two, and inclined to each of the former axes in angles whoſe ſines are inverſely as the angular velocities round them; and the angular velocity V round this new axis, is to that about one of the primitive axes, as the ſine of the inclination of the latter axis, to the ſine of the inclination of the new axis to the other primitive axis.

Thus, if a body turns round an axis A G a, (*fig.* 10.) paſſing through its centre of gravity G, with the angular velocity U, while this axis is carried round another axis B G b, with the angular velocity u; and if G D be taken to G E as U to u, (the points B and E being taken on that ſide of the centre where they are moving towards the ſame ſide of the figure,) and the line D E be drawn, the whole and every particle of the body will be in a ſtate of rotation, about a third axis C G c parallel to D E, lying in the plane of the other two, and the angular velocity v about the axis C G c, will be to U as D E : D G; and to u as D E : G E. For let P be any particle of the body, and ſuppoſe a ſpherical ſurface, whoſe centre is G, to paſs through P. Draw P R perpendicular to the plane of the figure; then is P R the common ſection of the circle of rotation I P; round the axis A a, and the circle K P k of rotation round the axis B b. Let F and O be the centres of theſe circles of rotation, and I i, and K k, their diameters. Draw the radii P F, P O, and the tangents P M, P N; theſe tangents are in the plane M P N, which touches the ſphere in P, and the plane of the axis in the line M N, to which a line drawn from G, through R, would be perpendicular. Suppoſe P N to repreſent the velocity of rotation of the point P, about the axis B b, while P f repreſents its velocity of rotation about A a, and complete the parallelogram P N t f; then is P t the direction and velocity of the reſultant of the compoſition of P N, P f, and it is manifeſtly in the ſame plane as the conſtituent lines. Let perpendiculars f F, t T, be drawn to the plane of the axis, and the parallelogram P N t f will be orthographically projected on that plane, its projection being alſo a parallelogram R N T F. Draw the diagonal R T. Then, ſince P R is perpendicular to the plane of the primitive axis, P R t T is ſo likewiſe; and conſequently the compound motion P t is in the plane of a circle of revolution about ſome axis ſituated in the plane of the other two. Produce I R, and draw G C interſecting it perpendicularly in H; and let L P l be the circle of rotation, its diameter being L l = 2 L H; then is P t a tangent, and perpendicular to P H, and it will meet I R in ſome point Q of the line M N. The particle P is in a ſtate of rotation about the axis C G c; its velocity is to the velocities round A a, or B b, as P t to P F, or P T to P N. Now P N the tangent is perpendicular to O P, and P R is perpendicular to O N; therefore O P : P N :: P R : R N, or $RN = \frac{PN \cdot RN}{PO}$. But the velocity of P about the axis B b, is $u \cdot OP$; whence $RN = \frac{U \cdot OP \cdot PR}{OP} = u \cdot PR$.

In like manner, R F = U . P R; conſequently R F : R N :: U : u :: G D : G E. But N T : R N :: ſin. N R T : ſin. N T R :: ſin. G E D : ſin. G D E; hence ſin. N R T : ſin. N T R :: ſin. G E D : ſin. G D E. Now, ſince N R is perpendicular to E G, and N T (parallel to F I) perpendicular to D G, we have R N T = E G D. Hence T R is perpendicular, and C c parallel to E D. Alſo, ſince R N, R F, R T, are as the velocities u, U, v, about theſe different axes, and vary reſpectively, as E G, D G, D E, we have v : U : u :: E D : G D : G E; which was to be demonſtrated.

Hence, if every particle of a body, whether ſolid or fluid, receives at the ſame time two ſeparate impulſes, the one

one competent to the production of a motion of the particle round an axis with a certain angular velocity, and the other competent to the production of a rotatory motion about another axis with a certain velocity, the combined effect of all these impulsions, will be a motion of the whole system about a third axis, given in position, with an angular velocity which is also given; and this motion will obtain, without any separation or disunion of parts, except such as may be occasioned by the action of the centrifugal forces resulting from the rotation.

Hence, also, if a body be turning round any axis, and every particle, in one instant, get precisely such an impulse as is competent to produce a given angular velocity round another axis, the body will turn round a third axis given in position, with a given angular velocity.

Lastly, when a rigid body acquires a rotation about an axis, by an impulse on one part of it, and either at the same time, or afterwards, receive an impulse on any part which alone would have produced a certain rotation about another axis, the joint effect of these impulses will be a rotation about a third axis, in conformity with this proposition. For when a rigid body acquires a motion about an axis, not by the simultaneous impulse of the precisely competent force on each particle, but by an impulse on one part, there has been propagated to every particle, (by means of the cohesive forces,) an impulse precisely competent to the production of that motion which the particle actually acquires; and when a rigid body already turning round an axis A a, receives an impulse which makes it actually turn about another axis C c, there has been propagated in each particle a force precisely adequate to the production, not of the motion but of the *changes* of motion which takes place in that particle; that is, a force which, when compounded with the inherent force of its primitive motion, produces the new motion, that is, by the proposition a force which alone would have caused it to turn about a third axis B b, with a rotation making the other component of the actual rotation about C c.

This elegant theorem, the enunciation of which is due to P. Frisi, is very important, and gives a great extension to the doctrine of the composition of motion. It is of great use in many curious problems, and particularly that of the precession of the equinoxes. Those who wish for farther information on the subject of rotatory motion, may consult Gregory's "Mechanics," from which we have taken the three last propositions; Simpson's "Tracts;" Frisi's "Cosmographia;" "Philosophical Transactions," 1780; Landen's "Memoirs;" Atwood "On the Rotatory Motion of Bodies;" Lagrange's "Méchanique Analytique;" and a memoir "Sur le Mouvement de Rotation," by Français, Paris, 1813; in which latter work the subject is treated with all the generality it seems to admit of, and which method we should have adopted in this article, but for the reasons stated in the commencement of it, that is to say, the length to which we must have extended it, in order to have rendered it intelligible to the English reader.

Rotation is also synonimous with Rolling, which see.

Rotation, in *Geometry*, the circumvolution of a surface round a line, called the *axis of rotation*.

By such rotation of planes, the figures of certain regular solids are formed or generated.

The method of cubing solids, generated by such rotation, is laid down by M. de Moivre, in his specimen of the use of the doctrine of fluxions. For the fluxions of such solids take the product of the fluxion of the abscissa, multiplied by the circular base, and suppose the ratio of a square to the circle inscribed to be as $\frac{n}{1}$; the equation expressing the nature or property of any circle, whose diameter is d, is $yy = dx - xx$. Therefore $4\,\frac{d x \dot{x} - x^2 \dot{x}}{n}$ is the fluxion of a portion of the sphere, and consequently the point itself $4\,\frac{\frac{1}{2} x d x - \frac{1}{3} x^3}{n}$, and the circumscribed cylinder is $4\,\frac{d x x - x^3}{n}$; therefore the portion of the sphere is to the circumscribed cylinder as $\frac{1}{2} d - \frac{1}{2} x$ to $d - x$. Phil. Trans. N° 216.

For other instances of this kind, and a view of the application of the doctrine of fluxions, to find the contents of solid bodies, see Solidity. See also Centrobaryc *Method*.

Rotation, *Revolution*, in *Astronomy*. See Revolution.

Rotation, *Diurnal*. See Diurnal, and Earth.

Rotation, in *Anatomy*, the action of the musculi rotatores; or the motion which they give to the parts they are fixed to.

There are two muscles, the great and the little obliquus, used to perform the rotation of the eye. The obturator internus and externus effect the rotation of the thighs.

Mr. Winslow has given an account of this, as well as of pronation, and other circulatory animal motions. See Mem. de l'Acad. des Sciences, 1729. See also Extremities.

Rotation *of Crops*, in *Agriculture*, the several means of cropping lands of the arable kind in such a manner as to prevent their being exhausted as much as possible, and at the same time to preserve them free from weeds in the most complete and perfect mode. The proper alternation of different sorts of crops in this intention, is a matter of vast importance to the interests of agriculture, and in which immense improvements have been made in this and other countries within this last half century, but which is still far from any thing like perfection. See *Course of* Crops.

In addition to what has been stated under the head referred to above, it may be observed, in this place, that the nature and state in which the manure is, when applied to the lands, should likewise be attended to in fixing the rotations of the crops, in order that the first and all the succeeding ones may be supported in the best and most effectual manner by the changes that are always taking place afterwards in such materials, when united and incorporated with the soils; and in this way, those parts of them which are not fitted to or suitable for one kind of crop, may be converted to the nourishment and support of the next, and so on in the same manner. Thus, where the turnip is the first crop in the rotation, and manure of the fresh dung kind is used, which directly affords it the necessary supply of soluble matter, while the heat which is generated in its decomposition assists the sprouting and growth of the seed, it should be succeeded by barley, or some other similar sort of grain crop, with suitable grass seeds, as the land will have been but little robbed of its fertility by the preceding turnip crop, and of course will plentifully supply the soluble portions of the gradually decomposing substance of the manure to that crop; while the grasses that remain on the land, which, in many cases, draw only a small portion of the matter of which they are composed from the earth, and in all probability take up the gypseous substance contained in the manure, which would be of little utility to other sorts of crops, and

and which, in confequence of their large fupply of leaves, derive a confiderable proportion of their nutriment from the furrounding atmofphere, when they become ultimately ploughed down into the ground, afford a confiderable fupply of manure to the fucceeding wheat crop, by the gradual decay and decompofition of their roots and leaves, and befides, the woody fibrous parts of the farm-yard manure, which was at firft applied, and which contains in its compofition the phofphate of lime, as well as fome other foluble parts which are of difficult reduction, are now broken down, and brought into a fuitable ftate for the fupport of that crop.

After this deteriorating and exhaufting crop has been taken from the ground, recourfe muft again be had to frefh manure, and the rotation be renewed.

And in the ftrong clayey foils, after the land has remained for two years in the ftate of grafs, from the time of taking a well frefh dunged foil for barley crop, the leys may be ploughed down and fown with pea and bean crops; after which the pea and bean ftubble may be turned in for a wheat crop; and in many cafes this may be followed by crops of winter tares and winter barley to be eaten off upon the land in the fpring feafon, previoufly to its being prepared by their being ploughed in, and other means for the fowing of turnips.

In thefe cafes, the rotation may ceafe and begin again, either after taking the wheat crop, or thofe of the tares and winter barley, according as the circumftances of the different cafes may be in refpect to the land.

It may be noticed, that pea and bean crops, in all cafes of this nature, appear to be very well fuited to form and prepare the land for wheat crops, as is clearly afcertained, from their being alternately cultivated for many years together in fome fuch fituations. This may probably depend, in fome meafure, upon the fmall proportion of fubftance fimilar to that of albuminous matter which they contain, and afford, as well as upon the principles fupplied by the decay of the bean roots in the ground, which may be capable of forming a part of the glutinous material in wheat crops.

In the bufinefs of cropping lands, it may likewife be neceffary to have regard to the nature and manner in which the different forts of plants are fed and fupported, for though the compofition of them in general may be very fimilar, the fpecific differences in the products of a number of them, as well as many other facts and circumftances, fully demonftrate that they muft draw different forts of matters from the earth or foil, and although it muft be obvious that fuch vegetables as have the fmalleft fupplies of leaves, will, in proportion, be the moft exhaufting to the earth or foil of its common nutrient materials, yet that particular forts of plants, as they are principally fupported by particular kinds of matters, will, where their produce is carried off the land, require peculiar principles of fuch natures to be fupplied to the foil on which they grow.

The cafe of the potatoe, as well as fome other plants, is highly illuftrative of this point, as it is well known that it produces the moft fully, and in the moft luxuriant manner at firft, while the ground or mould is in a frefh or virgin ftate, and juft turned up from old ley or pafture; but that in the courfe of a few years it degenerates and declines, ftanding in need of a new frefh foil; and the nature of its production has a conftant tendency to fearch for this, as the fibrous radicles afford new bulbs or roots at a confiderable diftance from the old plant.

Such grounds alfo as have been long cropped with fome kinds of artificial graffes, as red clover, &c. frequently ceafe to yield good and full crops of them; they becoming, in the language of the farmer, fick of, or tired with them; one principal and probable reafon of which is, perhaps, the deficiency or abfolute want of the peculiar fort of material which is neceffary for their growth and fupport, as above, which in this inftance is that of gypfum. This, therefore, may be proper to be regarded in determining the rotations in fuch cafes.

A moft remarkable cafe of this property and capability of particular plants to drain and exhauft the land of the particular principles and fubftances fuited to their growth and fupport, is met with in the mufhroom tribe, which are afferted never to appear in fucceffion on the fame point of ground.

In fhort, in every rotation of crops, it is of effential importance that every part of the land fhould, in its turn or fucceffion, be made to contribute, as fully as it is capable, to the different plants as crops, by their being properly chofen and adapted in this refpect.

In many inftances of ftrong loamy land, great benefit may be derived from cropping with beans, which have been fully dunged for, after barley and clover, as the latter of the above crops and the manure will fupply abundant fupport for the bean crop, and that crop, in its ftubble and roots, afford an admirable preparation and fupply of food for wheat, as already noticed; which may be properly and beneficially fucceeded by tares, which again prepare the ground well by their being fed off on the land, or foiled for another crop of wheat. The rotation may then begin again.

Some think that all plants, the feeds of which yield oil, exhauft land in a very high degree. Thus cole, which is a fort of cabbage, efpecially when it perfects its feed, as well as the cabbage itfelf, which is believed by many to deteriorate the land greatly, is improper as a crop in preparation for wheat, though it is had recourfe to in many diftricts, and thought highly of for that purpofe. Great caution is conftantly neceffary in the rotations of cropping with fuch forts of plants as crops.

In fome cafes of the lighter kinds of mixed foils, peas are found full as good a preparation for the wheat crop as beans, having the advantage of being off the land fo much fooner. Peafe or tares alfo prepare well for wheat, after ray-grafs, on the ftone-brafh lands in many inftances, when well cultivated.

That bean crops fhould always precede the wheat, and not follow it, as is too frequently the cafe in a number of diftricts, is fufficiently evident from the above remarks. Peas may fometimes be fubftituted in the place of the bean crop, with confiderable propriety and utility.

It may be concluded on this moft interefting fubject, that of all the figns which denote the progrefs or perfection of the art of hufbandry in any diftrict or country, there is none which is more certain and correct than that of the rotations of the crops, which are purfued by the farmers in the management of their arable lands. Where there is no regular and appropriate change in the kinds of the crops, fo as to fuit them to the nature of their fupport, and the ftates and circumftances of the land, the fyftem of farming muft be in a wretched ftate indeed; but where the arable grounds are regularly preferved in a productive ftate, by fuitable rotations well applied, not only the intereft of the tenant is promoted, his judicious conduct rendered evident, and the advantage of the proprietor fecured by the improvement which is effected, but the good of the community greatly increafed, by the products of the earth being rendered fo much more abundant for its ufe and fupport.

The practice of applying manure and cropping, fo as to draw out the ſtrength of it, and that of the ſoil, as ſoon as it can be done, until the land is rendered quite barren and incapable of affording any more produce without ſome reſpite, is moſt miſerable, and deſerves the higheſt reprobation, though not uncommon.

It has been contended, that a well-ſelected rotation of crops is capable of doubling the ſupport of the preſent population, and of vaſtly increaſing the wealth and reſources of the nation. Alſo, that having recourſe to proper modes of cropping, may ſometimes be highly beneficial in preventing the ruſt or mildew in wheat, as over-dunging immediately for ſuch crops is found to be productive of the diſeaſe, while the application of it previouſly to ſome ſort of ſmothering crop, ſuch as rape or cole in ſtrong lands, and potatoes on thoſe that are light, is an almoſt effectual means of avoiding it. Some maintain that this diſeaſe ſeldom or ever takes place in wheat crops after rape or cole, and others aſſert the ſame to be nearly the caſe in them after potatoes. And that, as wheat after clover on light ſoils is liable to be affected in this way, it may occaſionally be of importance to take it before that crop ſomewhat in this manner, potatoes, wheat, clover, barley.

Rotation *of Crops*, in *Gardening*, the introduction of the moſt proper and ſuitable courſes of crops, for the production of good garden vegetables of different kinds, and for the keeping of the ground in the richeſt and moſt proper condition for the cultivation and growth of them. This is equally important and neceſſary in the garden as in the field, but it cannot, by any means, be ſo fully and effectually accompliſhed in the former as in the latter, on account of the ſmallneſs of the uſual limits of it, and the greatneſs of the number of different articles which are required to be raiſed and cultivated, as well as their more intimate relation to each other. See Crops, *Courſe of*.

In addition to what has been ſaid under the head above alluded to, it may be obſerved, that the management of this buſineſs may, in ſome meaſure, be effected by a ſuitable diviſion and arrangement of the cultivated culinary vegetables into different claſſes, as crops for the purpoſe, as their natures, habits, methods of culture, and difference in duration and other circumſtances may indicate. And by the application of the manure which is uſed in ſuch ſtates, kinds, and manners, as that it may go the fartheſt, be conſumed to the greateſt advantage in the raiſing of the different ſorts of vegetables in ſucceſſion, and produce them of the beſt and moſt healthy kinds.

Manure ſhould be applied in the firſt inſtance only for thoſe crops that are not injured in any way by it, but which receive great benefit from its uſe, and cannot be grown well without its being always employed in ſuch ſtates as are moſt favourable to them, according to their different natures, habits, and kinds, as the potatoe, cabbage, bean, celery, &c. When theſe crops have taken up the more groſs parts, the finer and more delicate vegetables may ſucceed on the ſame land in their proper order, ſo as to conſume the remaining parts of the manure in the moſt advantageous ways, both to the produce and the land.

On this principle, the rotations ſhould obviouſly begin either with the potatoe, cabbage, bean, celery, or ſome other crop of a ſimilar kind, well manured for; and be followed by thoſe of the more delicate ſorts, in their moſt ſuitable courſes, ſo as not to be hurt in their growth or flavour. The uſe of graſs ſeeds on well manured land may alſo ſometimes be had recourſe to by market gardeners, for laying down their lands in the view of refreſhing them, and ſoon breaking them up again.

By proper attention to the different circumſtances which have been noticed above, and others of the ſame nature that may occur, different uſeful and advantageous rotations of crops may be introduced into garden culture, and the art be, in this way, very greatly improved.

ROTATOR, in *Anatomy*, a name given to the oblique muſcles of the eye, called alſo, from the direction of the fibres, *circulares*, and from the effect of their action, *amatorii.* See Eye.

ROTCHET, in *Ichthyology*, an Engliſh name for the fiſh called by authors *cuculus*, and more frequently by us the red *gurnard*. See Trigla *Cuculus*.

ROTE, an old muſical inſtrument, frequently mentioned in the French Fabliaux, and ſuppoſed to mean the *valle*, an inſtrument played with a wheel, inſtead of a bow.

Rote, in *Geography*, a river of Germany, which runs into the Itch, two miles N. of Coburg.

ROTEBRO, a town of Sweden, in the province of Upland; 30 miles N.N.W. of Stockholm.

ROTELE, in *Ichthyology*, a name by which ſome call the *rutilus latior*, or *rubellus fluviatilis*, more frequently known by the name of the roach, a river-fiſh, with red belly-fins and tail. See Cyprinus *Rutilus*.

ROTELSEE, in *Geography*, a town of the duchy of Wurzburg; 4 miles E. of Kitzingen.

ROTENBACH, a town of the archduchy of Auſtria; 9 miles N.W. of Schwanaſtadt.

ROTENBERG, a town of Auſtria; 18 miles S.W. of Freyſtatt.

ROTENBURG, a town of Switzerland, in the canton of Lucerne; 4 miles N. of Lucerne.—Alſo, a town of Wurtemberg, on the N. ſide of the Neckar, oppoſite to Ehingen; 21 miles S.W. of Stuttgart. N. lat. 48° 32′. E. long. 9° 3′.—Alſo, a town of Germany, in the county of Verden, on the Wumme; 12 miles N.N.E. of Verden. N. lat. 53° 8′. E. long. 9° 24′.—Alſo, a town of Germany, in the principality of Heſſe, on the Fulda; 25 miles S.S.E. of Caſſel. N. lat. 51° 1′. E. long. 9° 42′.—Alſo, a town of Brandenburg, in the New Mark, on the Oder; 12 miles E.S.E. of Croſſen. N. lat. 52° 5′. E. long. 15° 30′.—Alſo, a town of the duchy of Baden; 14 miles E.S.E. of Spire. N. lat. 49° 15′. E. long. 8° 48′.—Alſo, a town of the duchy of Magdeburg; 40 miles S. of Magdeburg.

ROTENSTEIN, a town of the duchy of Carinthia; 10 miles S.W. of Saxenburg.

ROTGANS, Luke, in *Biography*, an eminent Dutch poet, was born of a good family at Amſterdam, in 1645. His education led him to the cultivation of polite literature, which, for a time, he quitted to take up arms in defence of his native country, when invaded by the French in 1672. When his ſervices were no longer required, he retired to a villa between Amſterdam and Utrecht, where he reſumed with new vigour his favourite purſuits. When peace was concluded between France and Holland, he paid a viſit to Paris. He died of the ſmall-pox in 1710, in the 66th year of his age. He was author of a number of poems, highly eſteemed in his own country. Of theſe, one is a "Life of William III.," in eight books. His other pieces are moral and miſcellaneous, which, with two tragedies, were printed, in 1715, at Lewarden.

ROTH, in *Geography*, a town of Germany, in the principality of Anſpach, at the union of the Roth and Rednitz, containing an aſylum for thoſe who have been guilty of manſlaughter; and manufactures of ſtockings, Spaniſh lace, and ſtuffs; 15 miles S. of Nuremberg. N. lat. 49° 10′. E. long. 10° 59′.—Alſo, a river of Germany, formed from two ſprings, called the Ober and the Unter Roth, which unite

unite near Hilpolſtein, on the borders of Franconia; and after this union, it falls into the Rednitz, near the town of Roth.—Alſo, a river of Bavaria, which riſes about 10 miles S. of Landeſhut, and runs into the Inn, oppoſite to Scherding.—Alſo, a town of Germany, in the lordſhip of Limberg; 4 miles W.N.W. of Gaildorf.—Alſo, a river of Germany, which runs into the Danube, S.W. of Leipheim.

Roth, *Ajeſt*, a town of Bohemia, in the circle of Prachatitz; 4 miles N.E. of Piſek.

Roth, *Haus*, a town of Sileſia, in the principality of Neiſſe; 7 miles E.N.E of Neiſſe.

ROTHA, a town of Saxony, in the circle of Leipſic; 6 miles S. of Leipſic. N. lat. 51° 12′. E. long. 12° 21′.

ROTHALS, in *Ornithology*, a name given by Geſner, and ſome others, to the pochard, or red-headed wigeon, the *anas ferina;* a bird diſtinguiſhed from all others of the duck-kind, by having no variegation in its wings. See Duck (Ferina).

ROTHARIS, in *Biography*, king and legiſlator of the Lombards, was duke of Breſcia, at the time of the death of king Ariovald, in the year 638, who left a widow, named Gundeberg, but no male iſſue. The Lombards gave this lady the privilege of raiſing to the throne the perſon whom ſhe ſhould fix on for her huſband, and her choice fell upon Rotharis, the ſubject of this article. For the ſake of uniting himſelf with the queen, he repudiated his own wife, whom, however, he promiſed to maintain in the dignity of a queen. This engagement he did not long regard, but ſhut her up in an apartment of the palace of Pavia, where ſhe remained five years; when, through the mediation of Clovis II., ſhe was reſtored to her rank in ſociety. Rotharis had ſcarcely aſcended the throne, when he had to contend with all the power of certain nobles diſaffected to his government, which, however, he quelled, and afterwards reigned with equal glory and proſperity at home and abroad. His predeceſſor had bound himſelf by a treaty with the exarch of the empire, to reſtrain himſelf within certain boundaries; but Rotharis did not conceive himſelf under any obligation to obſerve this treaty, and ſuddenly burſt into the province of the Cottian Alps, which he reduced, and then made himſelf maſter of all the towns in the Venetian territories. The exarch, at the ſame time, made an incurſion into the Lombard territory, which called away Rotharis from his conqueſts: an engagement enſued, in which the exarch was totally defeated, and obliged to ſave the relics of his army by ſpeedy flight. Rotharis likewiſe penetrated into Liguria, and took Genoa, Albenga, and other maritime towns, which he pillaged and diſmantled, carrying away the inhabitants as priſoners. Rotharis has the high merit of having firſt given to his nation a code of written laws. In the fifth year of his reign he ſummoned a general diet of his nobles at Pavia, where, with their conſent, he enacted a number of laws, which were made public in an edict iſſued in 643, conſiſting of 386 articles. Theſe, though they bear the ſtamp of a rude age and people, are accounted more judicious than the laws of ſome other barbaric people. It has been obſerved, that Rotharis was ſufficiently enlightened not only to deride the ſuperſtition of witchcraft, but to protect the victims of that reputed crime from popular rage. He alſo practiſed religious toleration, and provided in all the cities of his kingdom a biſhop for each of the two prevailing perſuaſions, the Arian and the Catholic. He died in 653, at the age of 47 years, having reigned more than 15 years. Univer. Hiſt.

ROTHBEIN, in *Ornithology*. See Scolopax *Calidris*.

ROTHBURY, in *Geography*, a market-town and pariſh in Coquetdale ward, in the county of Northumberland, England, is ſituated 29½ miles N. by W. from Newcaſtle, and 306½ miles N.N.W. from London. In the oldeſt records, this place is called Robirie, Rathbury, and Routhbiry; and its name has by ſome been derived from the Britiſh word *Rhath*, ſignifying *a cleared ſpot*, or the Gaelic *Rath*, denoting *a ſurety* or *place of ſafety;* but it is more probable, on account of its Saxon termination, that it was ſo called from *roth*, *red*, from the ferruginous appearances around it, where iron mines and ochre abound. Soon after the Conqueſt, Rothbury, though itſelf only a member of the barony of Warkworth, appears to have been a large manor, including alſo thoſe of Thropton and Snitter. King John enfeoffed the barons of Whalton, in this manor, for the payment of one knight's fee. It reverted to the crown, together with Warkworth, by ſettlement; and was, in 1330, granted to the Percies, and entailed upon their male poſterity. The duke of Northumberland is now lord of the manor, but poſſeſſes very little freehold property in the town. No remarkable hiſtorical event has ſignalized this place. Previous to the union of England with Scotland, the inhabitants of Rothbury and its vicinity appear to have retained longer than moſt others the ferocity and lawleſsneſs of the ancient race of borderers. The reformation was late in finding its way hither; and there are yet ſome traits remaining of the ruder ages, but which are gradually wearing away. A foot-ball play on Shrove-Tueſday, at which all the males above eight years old are required to attend, is one; and the continuance of the cuſtom of bondage-ſervice, in the foreſt of Rothbury, is another. But this laſt injurious uſage having been abandoned upon the property of the duke of Northumberland, by his grace, it will ſoon, it is to be hoped, be only remembered by tradition.

According to the parliamentary returns in 1811, the town contains 133 houſes, and 750 inhabitants: the pariſh, however, includes 27 other townſhips, which compriſe 712 houſes, and 3732 inhabitants.

Rothbury ſtands in a ſequeſtered and romantic glen, on the north ſide of the river Coquet. The town is wide, airy, and tolerably well built, and is much frequented, during the ſummer ſeaſon, by valetudinarians, to drink goats' whey; theſe animals abounding very much amongſt the adjacent cliffs and rocks. There is a weekly market, but very indifferently ſupplied, and it has four fairs in the year. The church is a very ancient ſtructure, dedicated to All-Saints, in the form of a croſs, and contains a font of very curious workmanſhip, and ſeveral reſpectable monuments. Witton or Whitton tower, one of a line of towers, which, in the border-wars, extended from Hepple to Warkworth, a ſtrong ancient building, with the arms of Unfranville on its weſt ſide, is now the rector's manſion. The living is worth about 1200*l. per annum*. Here is a bridge of three arches over the Coquet.

On the top of a hill, between this town and Thropton, is a circular intrenchment, with a double ditch and vallum, called Old Rothbury; and not far from it, in a ſand-ſtone rock, is a large cave.

Rothbury-foreſt is about ſeven miles from eaſt to weſt, and four miles from ſouth to north. There is now very little wood upon it, and the whole land is nearly incloſed. It contains mines of lime-ſtone, coal, iron, and ochre; though, ſince the wood has diſappeared, nothing but coal is dug, and that only to a very limited extent. In that part of the foreſt, north of the Coquet, and eaſt of Rothbury, near the road leading from Alnwick, are Dibden-wells, the

waters

waters of which were formerly held in high eftimation, and were much reforted to for the cure of fcorbutic eruptions.

Halyftone, a fmall village, about five miles weft from Rothbury, is fuppofed to have been a place of fome confequence in the time of the Saxons; for here, according to the venerable Bede, Paulinus baptized, in a copious adjoining fpring, called our Lady's well, upwards of 3000 perfons. There was alfo a priory of Benedictine nuns, a few veftiges of which are now in exiftence.

Harbottle caftle, about a mile from Halyftone, was once a formidable fortrefs, but is now in ruins. It was given by William the Conqueror to Robert de Unfranville, lord of Tours and Vian, by a general grant of the lordfhip of Redefdale, to hold, by defending that country for ever from wolves and enemies, by the fame fword which the Conqueror wore when he entered Northumberland. In 1173 it was facked by the Scots; but in 1296 it was befieged in vain by them. It is now the property of Thomas Clennels, efq., who has built a modern manfion near it.

At Hepple, on the Coquet, about five miles from Rothbury, there was alfo a ftrong caftle, or tower, of which there are very few remains at prefent. Cartington caftle, two miles north-weft from Rothbury, was formerly the feat of the Ratcliffes: the part of it which remains is kept in good repair, and is very ftrongly built. Here is an afylum for fix females of the Roman Catholic religion, who, from their fecluded life, are ufually called nuns. See Hiftorical and Defcriptive View of the County of Northumberland, &c., 2 vols. 8vo. 1811, drawn up by Mr. Mackenzie of Newcaftle. Beauties of England, vol. vii. Northumberland, by the Rev. Mr. Hodgfon.

ROTHEM, a river of Germany, which runs into the Danube, 5 miles above Ulm.

ROTHEMSEE, a lake of Germany, in the principality of Anfpach; 6 miles E. of Gerhardfbron.

ROTHENBACH, a town of Germany, in the circle of the Lower Rhine; 30 miles E.S.E. of Francfort on the Maine.—Alfo, a town of Bavaria, in the bifhopric of Bamberg; 2 miles E. of Forcheim.—Alfo, a town of Bavaria, in the territory of Nuremberg; 3 miles N.W. of Altorf.

ROTHENBURG, a town of Lufatia, on the river Neiffe; 14 miles N. of Gorlitz. N. lat. 51° 23′. E. long. 15° 2′.—Alfo, a city of Bavaria, capital of a territory, and imperial, near the Tauber, fituated on a mountain. The water of the Tauber fupplies the town by means of a machine, which raifes it to a part called the Klingenthurn, and from thence it falls down, forming three fountains in the town. The city is encompaffed with ditches and walls, the latter being fortified with towers. It has five churches, and the inhabitants are Lutherans. This is a very ancient place, and it continued imperial till the year 1802, when it was affigned among the indemnities to the elector of Bavaria; 18 miles W. of Anfpach. N. lat. 49° 22′. E. long. 10° 14′.—Alfo, a town of the duchy of Magdeburg; 40 miles S. of Magdeburg.

ROTHENFELS, a caftle giving name to a county, called Konigfegg Rothenfels, and ceded to Bavaria among the indemnities; one mile N.W. of Immerftadt.—Alfo, a town of the duchy of Wurzburg, on the Maine, the caftle of which was demolifhed by the peafants in the year 1525; 16 miles W.N.W. of Wurzburg.

ROTHENSIRBEN, a town of Silefia, in the principality of Breflau; 8 miles S. of Breflau.

ROTHENSTEIN, a town with a caftle, in the duchy of Wurzburg; 8 miles S.S.E. of Königfhofen.

ROTHER, a river of England, in Suffex, which runs into the fea at Rye.—Alfo, a river in the county of Derby, which runs into the Don, near Rotheram, in Yorkfhire.

ROTHER-*Beafts*, a word ufed in old ftatutes, and ftill in the northern parts of England, for any horned beafts; as oxen, cows, fteers, heifers, &c.

Whence *rother-foil*, in Herefordfhire, is taken for the dung or foil of fuch cattle.

ROTHER-*Nails*, are fuch as have a very large head, and are ufed to faften the rudder-irons in fhips. See RUDDER.

ROTHERAM, in *Geography*, a market-town and parifh in the upper divifion of the wapentake of Strafford and Tickhill, Weft-Riding of Yorkfhire, England, is fituated near the confluence of the rivers Rother and Don, at the diftance of 45 miles S. by W. from the city of York, and 160 miles N.N.W. from London. It is defcribed by Leland as "a meatly large town, with a fare collegiate chirch," which was founded by Thomas Scott, archbifhop of York, and a native of Rotheram, in 1481, for a provoft, five priefts, a fchool-mafter in fong, and fix chorifters, alfo a fchool-mafter in grammar, and another in writing. This eftablifhment was diffolved by king Henry VIII. Camden calls Rotheram "a large footy market town," and not unaptly, for even at the prefent day it is far from meriting the appellation of handfome or agreeable. The ftreets are narrow and irregular; and the houfes, which are moftly conftructed of ftone, have a dull and dingy appearance. A confiderable trade in coals and other articles is carried on here, by means of the river Don. The market day for corn, cattle, and butcher's meat is on Monday, weekly; and on every alternate Monday is a fair for fat cattle, fheep, and pigs; there are alfo two annual fairs, on Whit Monday, and the firft day of December. Both markets and fairs are well attended; indeed Rotheram is one of the two greateft marts in Yorkfhire for fat cattle and fheep. The chief public buildings are the town-hall, the parifh-church, and two meeting-houfes, one for Independents and another for Methodifts. The church, according to Burton, in his "Monafticon Eboracenfe," was erected in the reign of Edward IV. It is a handfome and fpacious edifice, in the early pointed ftyle, and confifts of a nave, with two fide aifles, a chancel, and a tower at the weft end. Annexed to the church is a fchool-houfe, for the education of thirty poor children of the parifh of Rotheram. The clergyman for the time is governor, and has the nomination of the children; but the truftees of the founder, Thomas Hollis, of London, efq. appoint the mafter. This inftitution is managed under very excellent regulations, a copy of which is delivered to the parents of all children admitted to its benefits. In this town is likewife an academical inftitution, or college, for the education of Proteftant diffenters. It is called "The Rotheram Independent Academy," becaufe more immediately connected with the clafs of religionifts called Independents. It was firft opened in November, 1795, under the fuperintendance of the Rev. Dr. Williams, who prefided as divinity tutor, and is defigned for the education of young men propofing to become Independent clergymen. This academy is fupported by voluntary contributions. The building appropriated to it was erected by the late Samuel Walker, efq. and is calculated for the convenient accommodation of fixteen ftudents. The library contains above 1200 volumes, chiefly prefented by patrons of the inftitution; and there is likewife a tolerable collection of philofophical apparatus. The term of ftudy is four years, but the managers have a difcretionary power to prolong it if they think proper.

According to the parliamentary returns of 1811, the town of Rotheram alone contained 731 houfes, and 2950 inhabitants; and the reft of the parifh, including the townfhips ſhips of Brinſworth, Catliffe, Dalton, Orgreave, and Tinſley, 209 houſes, and 986 inhabitants.

On the oppoſite ſide of the river from Rotheram is the townſhip, or village, of Maxborough, where very extenſive iron-works are carried on by Meſſrs. Walker. At theſe works cannon of the largeſt calibre are manufactured, as are alſo almoſt every kind of caſt-iron articles, with many of wrought-iron, ſuch as bar, ſheet, ſlit, or rod iron. Tin plates, and ſteel of every deſcription, are likewiſe made here in great quantities; and the iron bridges at Sunderland and Yarm were caſt at theſe founderies. The coal, and the iron-ſtone for the blaſt-furnaces, are chiefly ſupplied from the mines on the eſtates of the earl of Effingham, and thoſe of earl Fitzwilliam. Theſe works were commenced, in 1746, by Mr. Samuel Walker, and his brothers Aaron and Jonathan, and have ever ſince been progreſſively increaſing in extent and importance. In the Methodiſt meeting-houſe is a monument in memory of Mr. S. Walker; the epitaph was compoſed by the celebrated poet, the Rev. William Maſon, who was one of his moſt intimate friends.

The environs of Rotheram are agreeable and pictureſque. On an eminence to the eaſtward of the town ſtands an elegant manſion, belonging to the Walker family, which, in point of ſituation, can ſcarcely be excelled. Aldwark-Hall, the ſeat of J. S. Foljambe, eſq. ſituated at the diſtance of four miles from Rotheram, is alſo remarkable for its fine ſituation. Near it is the village of Wickerſley, noted for its manufacture of grindſtones, of which about 5000, of various ſizes, are ſtated to be formed annually, and ſent to Sheffield. The other principal ſeats in the neighbourhood of Rotheram, beſides thoſe mentioned, are Thundercliffe Grange, the ſeat of the earl of Effingham, and Wentworth Houſe, the princely reſidence of earl Fitzwilliam. The latter houſe conſiſts of a centre and two wings, extending about 600 feet in length. Many of the apartments are moſt ſuperb, eſpecially the hall and gallery, the latter of which is ſupported by beautiful Ionic columns, having intervening niches filled with marble ſtatues. Here, and in other parts of the houſe, are likewiſe many paintings; and among others the famous picture of lord Strafford and his ſecretary. Some fine antiques are preſerved in a room called the muſeum. Wentwork-park compriſes upwards of 1500 acres of ground, beautifully diverſified with wood, water, and lawn, and is enriched by ſeveral ornamental buildings. Among theſe is a moſt magnificent mauſoleum, erected by the preſent earl Fitzwilliam, in honour of his uncle, the late marquis of Rockingham. It is conſtructed of a very fine free-ſtone, and conſiſts of three diviſions; the firſt is a ſquare Doric baſement; the ſecond of the ſame form, but of the Ionic order; and the third preſents a cupola, ſupported by twelve columns of the ſame character. Within is an apartment riſing into a dome, which reſts upon eight pillars, encircling a white marble ſtatue of the marquis in his robes of ſtate, executed by Mr. Nollekens. Beauties of England and Wales, vol. xvi. by J. Bigland.

Rotheram *Plough*, in *Agriculture*, a particular ſort of plough, which is found very uſeful, and much employed about the town of that name, in Yorkſhire, as well as in many other places in the kingdom. See Plough.

ROTHERHITHE, in *Geography*, a village and pariſh in the eaſtern diviſion of the hundred of Brixton, and county of Surrey, England, is ſituated on the ſouth bank of the river Thames, at the diſtance of a mile and a half E. of London bridge. The pariſh is bounded on the N. and E. by that river, on the S. by the pariſhes of Bermondſey and Camberwell, on the W. by Horſley-Down, and on the S.E. by the pariſh of Deptford, in Kent. In this pariſh are eleven dock-yards, at ſome of which ſhips are built for the ſervice of the Eaſt India Company. The manor anciently belonged to the "Abbot of Graces," but was granted, in the reign of Richard II. to the priory of St. Magdalen, Bermondſey. After the ſuppreſſion of monaſteries, it continued annexed to the crown till the reign of Charles I. when it was granted to a gentleman of the name of White, and has ſince been poſſeſſed by various families. This manor has a court-leet and a court-baron. Rotherhithe, not being mentioned in Domeſday-book, it ſeems probable that it was then only a hamlet to Bermondſey. The church was erected in 1715, inſtead of a former one, which had then become ruinous. It conſiſts of a nave, chancel, and two ſide aiſles, with a ſquare tower, ſurmounted by a ſpire at the weſt end. The living is a rectory in the dioceſe of Wincheſter and deanery of Southwark. The only remarkable monument here is that of the Pelew prince, Lee Boo, who died of the ſmall-pox December 29th, 1784, in the 20th year of his age. This young man was the ſon of Abba Thulle, king of the iſland of Goo-roo-raa, and came to England with captain Wilſon, whoſe ſhip, the Antelope, was wrecked off that iſland 9th Auguſt, 1783, on which occaſion the natives treated the crew with the utmoſt humanity and kindneſs. In this pariſh is a free-ſchool, at which about 30 boys and 20 girls are clothed and educated.

According to the parliamentary returns of 1811, Rotherhithe pariſh contains 2719 houſes, and 12,114 inhabitants. The Hiſtory and Antiquities of the County of Surrey, by the Rev. Owen Manning, continued by William Bray, eſq. folio, vol. i. Antiquities of Surrey, by N. Salmon, L. L. B. Lond. 8vo. 1736. Aubrey's Natural Hiſtory and Antiquities of Surrey, vol. v. 8vo. Lond. 1719. Lyſons's Environs of London. vol. i. 4to. Lond. 1796. And Supplement to the latter, 1813.

ROTHESAY, or Rosay, a royal borough-town and pariſh in the county and iſle of Bute, Scotland, is ſituated on the bank of a fine bay, at the N.W. ſide of the iſland. The ancient Gaelic and patronimic name of this pariſh is Cilla-bhruic, which ſignifies the church dedicated to St. Broke. The town is yet called, in the Gaelic language, Bailea-Mhoide, or the town where the courts of juſtice are held. Rotheſay is undoubtedly of high antiquity; but it does not ſeem to have been conſtituted a royal borough till the year 1400, when king Robert III., who was then reſident at the caſtle, raiſed it to that dignity. At that period it was a conſiderable town, but in ſucceeding years it declined greatly both in extent and population, as was apparent in the early part of the laſt century, by the number of ruinous houſes, and foundations of others, which were then viſible. About fifty years ago, indeed, it was reduced to the condition of a mean village, poſſeſſing only one decked veſſel of inconſiderable burthen. Under the auſpices of the late earl of Bute, however, the induſtry and emulation of the inhabitants began to revive, and the town has again advanced to a ſtate of comparative proſperity and opulence. Even ſo early as 1790, the inhabitants had accumulated ſhipping to the amount of 4246 tons, and it is believed the eſtimate of tonnage is now nearly doubled. This change has been principally effected by the encouragement given to the herring-fiſheries, in which the inhabitants of Rotheſay have about 100 ſmall veſſels employed annually; but in part it is likewiſe to be attributed to the eſtabliſhment of ſome cotton-mills in the immediate vicinity. Rotheſay, as a royal borough, unites with Cambletown, Irvine, Inverary, and Ayr, in the election of a repreſentative to the great council of the nation. It is the ſeat of the county courts of juſtice; and has the honour of giving the

title

waters of which were formerly held in high eftimation, and were much reforted to for the cure of fcorbutic eruptions.

Halyftone, a fmall village, about five miles weft from Rothbury, is fuppofed to have been a place of fome confequence in the time of the Saxons; for here, according to the venerable Bede, Paulinus baptized, in a copious adjoining fpring, called our Lady's well, upwards of 3000 perfons. There was alfo a priory of Benedictine nuns, a few veftiges of which are now in exiftence.

Harbottle caftle, about a mile from Halyftone, was once a formidable fortrefs, but is now in ruins. It was given by William the Conqueror to Robert de Unfranville, lord of Tours and Vian, by a general grant of the lordfhip of Redefdale, to hold, by defending that country for ever from wolves and enemies, by the fame fword which the Conqueror wore when he entered Northumberland. In 1173 it was facked by the Scots; but in 1296 it was befieged in vain by them. It is now the property of Thomas Clennels, efq., who has built a modern manfion near it.

In this town is likewife an academical inftitution, or college, for the education of Proteftant diffenters. It is called "The Rotheram Independent Academy," becaufe more immediately connected with the clafs of religionifts called Independents. It was firft opened in November, 1795, under the fuperintendance of the Rev. Dr. Williams, who prefided as divinity tutor, and is defigned for the education of young men propofing to become Independent clergymen. This academy is fupported by voluntary contributions. The building appropriated to it was erected by the late Samuel Walker, efq. and is calculated for the convenient accommodation of fixteen ftudents. The library contains above 1200 volumes, chiefly prefented by patrons of the inftitution; and there is likewife a tolerable collection of philofophical apparatus. The term of ftudy is four years, but the managers have a difcretionary power to prolong it if they think proper.

According to the parliamentary returns of 1811, the town of Rotheram alone contained 731 houfes, and 2950 inhabitants; and the reft of the parifh, including the townſhips of Brinſworth, Catliffe, Dalton, Orgreave, and Tinſley, 209 houſes, and 986 inhabitants.

On the oppoſite ſide of the river from Rotheram is the townſhip, or village, of Maxborough, where very extenſive iron-works are carried on by Meſſrs. Walker. At theſe works cannon of the largeſt calibre are manufactured, as are alſo almoſt every kind of caſt-iron articles, with many of wrought-iron, ſuch as bar, ſheet, ſlit, or rod iron. Tin plates, and ſteel of every deſcription, are likewiſe made here in great quantities; and the iron bridges at Sunderland and Yarm were caſt at theſe founderies. The coal, and the iron-ſtone for the blaſt-furnaces, are chiefly ſupplied from the mines on the eſtates of the earl of Effingham, and thoſe of earl Fitzwilliam. Theſe works were commenced, in 1746, by Mr. Samuel Walker, and his brothers Aaron and Jonathan, and have ever ſince been progreſſively increaſing in extent and importance. In the Methodiſt meeting-houſe is a monument in memory of Mr. S. Walker; the epitaph was compoſed by the celebrated poet, the Rev. William Maſon, who was one of his moſt intimate friends.

The environs of Rotheram are agreeable and picturesque. On an eminence to the eaſtward of the town ſtands an elegant manſion, belonging to the Walker family, which, in point of ſituation, can ſcarcely be excelled. Aldwark-Hall, the ſeat of J. S. Foljambe, eſq. ſituated at the diſtance of four miles from Rotheram, is alſo remarkable for its fine ſituation. Near it is the village of Wickerſley, noted for its manufacture of grindſtones, of which about 5000, of various ſizes, are ſtated to be formed annually, and ſent to Sheffield. The other principal ſeats in the neighbourhood of Rotheram, beſides thoſe mentioned, are Thundercliffe Grange, the ſeat of the earl of Effingham, and Wentworth Houſe, the princely reſidence of earl Fitzwilliam. The latter houſe conſiſts of a centre and two wings, extending about 600 feet in length. Many of the apartments are moſt ſuperb, eſpecially the hall and gallery, the latter of which is ſupported by beautiful Ionic columns, having intervening niches filled with marble ſtatues. Here, and in other parts of the houſe, are likewiſe many paintings; and among others the famous picture of lord Strafford and his ſecretary. Some fine antiques are preſerved in a room called the muſeum. Wentwork-park compriſes upwards of 1500 acres of ground, beautifully diverſified with wood, water, and lawn, and is enriched by ſeveral ornamental buildings. Among theſe is a moſt magnificent mauſoleum, erected by the preſent earl Fitzwilliam, in honour of his uncle, the late marquis of Rockingham. It is conſtructed of a very fine free-ſtone, and conſiſts of three diviſions; the firſt is a ſquare Doric baſement; the ſecond of the ſame form, but of the Ionic order; and the third preſents a cupola, ſupported by twelve columns of the ſame character. Within is an apartment riſing into a dome, which reſts upon eight pillars, encircling a white marble ſtatue of the marquis in his robes of ſtate, executed by Mr. Nollekens. Beauties of England and Wales, vol. xvi. by J. Bigland.

ROTHERAM *Plough*, in *Agriculture*, a particular ſort of plough, which is found very uſeful, and much employed about the town of that name, in Yorkſhire, as well as in many other places in the kingdom. See PLOUGH.

ROTHERHITHE, in *Geography*, a village and pariſh in the eaſtern diviſion of the hundred of Brixton, and county of Surrey, England, is ſituated on the ſouth bank of the river Thames, at the diſtance of a mile and a half E. of London bridge. The pariſh is bounded on the N. and E. by that river, on the S. by the pariſhes of Bermondſey and Camberwell, on the W. by Horſley-Down, and on the S.E. by the pariſh of Deptford, in Kent. In this pariſh are eleven dock-yards, at ſome of which ſhips are built for the ſervice of the Eaſt India Company. The manor anciently belonged to the "Abbot of Graces," but was granted, in the reign of Richard II. to the priory of St. Magdalen, Bermondſey. After the ſuppreſſion of monaſteries, it continued annexed to the crown till the reign of Charles I. when it was granted to a gentleman of the name of White, and has ſince been poſſeſſed by various families. This manor has a court-leet and a court-baron. Rotherhithe, not being mentioned in Domeſday-book, it ſeems probable that it was then only a hamlet to Bermondſey. The church was erected in 1715, inſtead of a former one, which had then become ruinous. It conſiſts of a nave, chancel, and two ſide aiſles, with a ſquare tower, ſurmounted by a ſpire at the weſt end. The living is a rectory in the dioceſe of Wincheſter and deanery of Southwark. The only remarkable monument here is that of the Pelew prince, Lee Boo, who died of the ſmall-pox December 29th, 1784, in the 20th year of his age. This young man was the ſon of Abba Thulle, king of the iſland of Goo-roo-raa, and came to England with captain Wilſon, whoſe ſhip, the Antelope, was wrecked off that iſland 9th Auguſt, 1783, on which occaſion the natives treated the crew with the utmoſt humanity and kindneſs. In this pariſh is a free-ſchool, at which about 30 boys and 20 girls are clothed and educated.

According to the parliamentary returns of 1811, Rotherhithe pariſh contains 2719 houſes, and 12,114 inhabitants. The Hiſtory and Antiquities of the County of Surrey, by the Rev. Owen Manning, continued by William Bray, eſq. folio, vol. i. Antiquities of Surrey, by N. Salmon, L. L. B. Lond. 8vo. 1736. Aubrey's Natural Hiſtory and Antiquities of Surrey, vol. v. 8vo. Lond. 1719. Lyſons's Environs of London. vol. i. 4to. Lond. 1796. And Supplement to the latter, 1813.

ROTHESAY, or ROSAY, a royal borough-town and pariſh in the county and iſle of Bute, Scotland, is ſituated on the bank of a fine bay, at the N.W. ſide of the iſland. The ancient Gaelic and patronimic name of this pariſh is Cilla-bhruic, which ſignifies the church dedicated to St. Broke. The town is yet called, in the Gaelic language, Bailea-Mhoide, or the town where the courts of juſtice are held. Rotheſay is undoubtedly of high antiquity; but it does not ſeem to have been conſtituted a royal borough till the year 1400, when king Robert III., who was then reſident at the caſtle, raiſed it to that dignity. At that period it was a conſiderable town, but in ſucceeding years it declined greatly both in extent and population, as was apparent in the early part of the laſt century, by the number of ruinous houſes, and foundations of others, which were then viſible. About fifty years ago, indeed, it was reduced to the condition of a mean village, poſſeſſing only one decked veſſel of inconſiderable burthen. Under the auſpices of the late earl of Bute, however, the induſtry and emulation of the inhabitants began to revive, and the town has again advanced to a ſtate of comparative proſperity and opulence. Even ſo early as 1790, the inhabitants had accumulated ſhipping to the amount of 4246 tons, and it is believed the eſtimate of tonnage is now nearly doubled. This change has been principally effected by the encouragement given to the herring-fiſheries, in which the inhabitants of Rotheſay have about 100 ſmall veſſels employed annually; but in part it is likewiſe to be attributed to the eſtabliſhment of ſome cotton-mills in the immediate vicinity. Rotheſay, as a royal borough, unites with Cambletown, Irvine, Inverary, and Ayr, in the election of a repreſentative to the great council of the nation. It is the ſeat of the county courts of juſtice; and has the honour of giving the title

title of a Scottish dukedom to the heir apparent of the British throne.

The castle of Rothesay is now a mere ruin, and is so completely enveloped with ivy, that only small portions of its walls are discernible to the eye. It was erected at different periods; part of it, forming the present entrance, by king Robert III., and the remainder at a much more remote date. The latter division is quite circular, and is strengthened by projecting round towers. This castle, in remote times, was the scene of several events of military note in Scottish history. According to Torfæus, Husbec, grandson of Somerled, was killed in an attack on a castle in Bute, most probably of this. In 1263, Haco, king of Norway, obtained forcible possession of it, and of the whole island; and in 1334 it was seized by Edward Baliol, because its then owner, the high steward of Scotland, was related to the Bruces, and was next heir to the throne. The year following, the island was invaded by the English under lord Darcy, and given up to plunder; which so exasperated the natives, that, in conjunction with those of Arran, they made an attack upon the castle soon after lord Darcy left it, and succeeded in regaining possession of it. Subsequent to this period it became a royal residence. King Robert II. and III. lived in it for a considerable time; and it would appear that much attention was bestowed on it, for in the reign of James V. we find that one of the articles of accusation exhibited against sir James Hamilton, was his not accounting for three thousand crowns destined for the "reform of the castle and palace of Rosay." In 1544, the earl of Lennox, assisted by the English, made himself master of this place; after which it became the principal residence of the Stuarts, ancestors of the present family of Bute, and continued so till the year 1685, when it was burnt by the duke of Argyle. The earl of Bute, however, yet ranks among his titles that of hereditary keeper of this palace.

The parish of Rothesay extends about ten miles in length, and from three to four in breadth. In the time of episcopacy, it was within the diocese of the Isles, and on the establishment of Presbyterianism, was included in the presbytery of Irvine, or Cuninghame, and the synod of Glasgow and Ayr. In 1639, however, it was disjoined from that presbytery and synod, and annexed to the presbytery of Denoon, and synod of Argyle, to which it continues united. According to the parliamentary census of 1811, this parish contained 702 houses, and 4970 inhabitants, of whom 3544 are resident within the borough. The Statistical Account of Scotland, by Sir John Sinclair, bart. vol. i. 8vo. 1791. Pennant's Tour in Scotland, &c. 4to. vol. i. Lond. 1776. Beauties of Scotland, vol. v. 8vo. 1808. Carlisle's Topographical Dictionary of Scotland, 2 vols. 4to. 1813.

ROTHEWASSER, a river of Saxony, which runs into the Elbe, about three miles below Pirna.

ROTHHAUSEN, a town of Germany, in the county of Henneberg; 8 miles S. of Meinungen.

ROTHHEIM, a town of the duchy of Wurzburg; 5 miles N.E. of Aub.

ROTHIA, in *Botany*, received its name from Schreber, in honour of Dr. Albert William Roth, a physician of the duchy of Bremen, born in 1755; whose *Flora Germanica*, though as yet unfinished, his *Catalecta Botanica*, and various other works, have procured him a distinguished rank amongst European botanists.—Schreb. Gen. 531. Willd. Sp. Pl. v. 3. 1611. Mart. Mill. Dict. v. 4. Ait. Hort. Kew. v. 4. 463. Lamarck Illustr. t. 667. Gærtn. t. 174. Roth. Catal. v. 1. 103.—Class and order, *Syngenesia Polygamia-æqualis*. Nat. Ord. *Compositæ semiflosculosæ*, Linn. *Cichoraceæ*, Juss.

Gen. Ch. *Common Calyx* rounded, finely villous; of about seven equal, linear, acute scales. *Cor.* compound, imbricated, uniform, of numerous equal florets, all perfect, whose partial corolla is of one petal, ligulate, linear, abrupt, with five teeth. *Stam.* Filaments in each floret five, capillary, very short; anthers united into a cylindrical tube. *Pist.* Germen in each floret ovate; style thread-shaped, the length of the stamens; stigmas two, reflexed. *Peric.* none, the calyx closing over the *seeds*, which are solitary in each floret; those of the disk cylindrical, somewhat turbinate, striated, with sessile capillary down, feathery in its lower part; those of the radius cylindrical, striated, enveloped in scales of the receptacle, but destitute of down. *Recept.* flat; hairy in the disk; chaffy at the radius; the chaffy scales in several rows, linear, channelled, erect, rather acute, tubular at the base, the outermost equal in length to the calyx, the inner ones gradually shorter.

Eff. Ch. Receptacle hairy; chaffy in the circumference. Calyx of many equal scales. Seed-down hairy, sessile in the disk; none in the radius.

Obs. This genus, as every body observes, is very near *Andryala*, and we greatly fear ought not to be separated from it. Dr. Roth at first named it, after a friend of his. *Voigtia*, in Roemer and Usteris' Magazine, Fasc. 10. 17. What Gærtner has delineated and described for *Andryala*, v. 2. 361. t. 158, is now made a species of *Rothia;* to which circumstance however he does not advert at p. 371 of the same volume, where *Rothia* is described; neither does Roth, in his original description of this genus, seem to have had *Andryala* at all in his contemplation, or he would surely have contrasted their essential characters. In fact the genus of *Andryala* itself depends upon two of the species now called *Rothia*, with which the third indubitably accords. If *A. lanata* of Linnæus constituted a distinct genus, the name of *Andryala* might remain with it; but there is much reason to believe this plant ought to be referred to *Hieracium*, the hairiness of its receptacle being uncertain or variable. *A. cheiranthifolia* and *ragusina* have so precisely the habit of *Rothia*, that we can hardly allow them to be separated from it by any technical characters that we can discern. In this difficulty we shall here give the species of *Rothia* as we find them; only premising that, by any thing here said, we mean not to invalidate Dr. Roth's claim to be commemorated by some certain and immutable genus, to which his high botanical merits richly entitle him.

1. R. *andryaloides*. Andryaline Rothia. Gærtn. v. 2. 371. Roth. Catal. n. 1. Willd. n. 1. (Voigtia tomentosa; Roth in Roem. and Ust. Mag. fasc. 9. 17.)—Stem much branched from the very base. Leaves downy, ovato-lanceolate, clasping the stem, nearly entire.—Native of Spain. *Root* annual, branched, somewhat woody. *Stem* twelve or eighteen inches high, erect, brown, downy; its branches alternate, widely spreading. *Leaves* alternate, distant, recurved, rather wavy, downy, and hoary. *Flower-stalks* axillary and terminal, solitary, nearly twice as long as the leaves, naked, erect, single-flowered, extremely downy. *Bractea* solitary under each flower, lanceolate, very downy, scarcely longer than the *calyx*, which is also downy and whitish; contracted and globose before the *flower* opens, but afterwards lax, consisting of from five to seven scales. *Corolla* yellow; the florets of the circumference purplish at the back. The outer row of scales of the *receptacle* is exactly like the *calyx;* the rest gradually smaller, downy on the outside. The *flowers* are open before noon only. The

The whole herb has ftraight, prominent, capitate hairs, intermixed with its downy pubefcence. *Roth.*

2. R. *cheiranthifolia.* Stock-leaved Rothia. Roth. Catal. n. 2. Willd. n. 2. Ait. n. 2. (Andryala finuata; Linn. Sp. Pl. 1137. A. integrifolia β; Syft. Nat. ed. 12. v. 2. 525.)—Stem erect, corymbofe. Leaves finely woolly, lanceolate, finuated, or deeply toothed; the uppermoft feffile, ovate, taper-pointed, entire. Native of Spain and the fouth of France, flowering there in May. It is marked in Hort. Kew. as a hardy annual, flowering in July and Auguft. *Herb* milky, clothed with denfe, white, woolly down, intermixed in the upper part with copious, prominent, capitate, tawny hairs, giving it a reddifh hue, efpecially when old. *Stem* twelve or eighteen inches high; branched above, at firft corymbofe, then racemofe. *Leaves* feffile, alternate, rather diftant, obtufe; the lower ones about a finger's length, with fhort, triangular, diftant teeth, and intermediate finufes; the uppermoft gradually fmaller and entire. *Flower-ftalks* naked, or with here and there a linear *bractea.* *Calyx* of from three to five fcales. Outer fcales of the *receptacle* like the calyx in ftructure, but rather longer, very downy at the back; inner ones fhorter, fmooth, and more membranous. *Corolla* of a golden yellow in every part.—We cannot help fufpecting that what Dr. Roth thus defcribes as the outer fcales of the *receptacle,* do in fact belong to the *calyx,* which appears to us compofed of a row of very numerous equal woolly fcales, furrounded with a few fhorter external ones, as ufual in many of this tribe.

3. R. *runcinata.* Hoary Rothia. Roth. Catal. n. 3. Willd. n. 3. Ait. n. 2. (Andryala integrifolia; Linn. Sp. Pl. 1136. Syft. Nat. ed. 12. v. 2. 525. α. Sonchus lanatus; Dalech. Hift. v. 2. 1116.)—Stem erect, corymbofe. Leaves downy; the lower ones oblong, runcinate; upper lanceolate, flightly toothed. Flower-ftalks villous, glandular.—Native of the fouth of Europe. Biennial, twice as large as the foregoing, and varying much in luxuriance. The lower *leaves* are ftalked. Whole *herb* clothed with fine, denfe, velvet-like pubefcence, very thick and woolly about the *calyx,* which is moreover befet with long golden hairs. Roth, very paradoxically, defcribes the *calyx* as confifting of only one or two leaflets, or fcales, reckoning as fcales of the *receptacle* what all the world, furely, would call a *calyx.* This, therefore, is only a difference of words, and appears ftill further to invalidate the diftinction between *Rothia* and *Andryala.* Thefe plants, in reality, require to be all examined and compared, in a living ftate, by fome botanift accuftomed to confider genera on a large fcale, and who is particularly acquainted with fyngenefious plants. We do not profefs to be, at prefent, furnifhed with materials for the purpofe.

ROTHIA, in *Geography,* a town of the ifland of St. Vincent, in York bay. N. lat. 13° 7′. W. long. 61° 16′.

ROTHLA, a town of Bavaria, in the territory of Rothenburg; 8 miles N. of Rothenburg.

ROTHMUNSTER, a princely abbey of Germany, on the Neckar, given as an indemnity, in the year 1802, to the prince of Hohenlohe; 2 miles S. of Rothweil.

ROTHWEIL, a town of Wurtemberg, fituated on the Neckar, being a very ancient imperial town, and which the emperors Charles IV. and Wenceflaus engaged to maintain as fuch. It is chiefly remarkable for its imperial tribunal, the firft traces of which are to be found in the provincial court of Swabia, which feems to have originated in the time of the emperor Louis of Bavaria, and, till the middle of the 15th century, was fometimes called the provincial court of the emperor, and fometimes the imperial tribune of Rothweil. In the year 1802 it was given to the duke of Wurtemberg; 44 miles S.S.W. of Stuttgart. N. lat. 48° 7′. E. long. 8° 34′.

ROTHWELL, called alfo ROWELL, a town and parifh in the hundred of Rothwell, and county of Northampton, England, is fituated 4 miles N.W. by W. from the town of Kettering, and 78 miles N.W. by N. from London. This place is faid to derive its name from two remarkable fprings in the vicinity, the water of one of which is of a petrifying quality, and in the other are frequently found numerous fmall bones, conjectured to be thofe of frogs. Here was a fmall priory of Auguftine nuns, dedicated to St. John Baptift, and which was probably founded by the Clare family, whofe fucceffors in the manor appear, upon record, as its patrons. Rothwell was formerly a confiderable market-town, but the market has been long difcontinued. The market-houfe is worthy of attention, from the ftyle of the building. It was begun by fir Thomas Trefham, but never completed, owing to his death, which happened in the third year of James I. His fon and fucceffor, Francis Trefham, was providentially the inftrument of the difcovery of the gunpowder-plot, by fending a letter to lord Monteagle, who had married Mr. Trefham's fifter, and thus led to the detection of the confpiracy.

In the church are feveral monumental memorials of the Trefham family, and others for different perfons. Rothwell has an annual fair, held on Trinity-Monday. According to the returns to parliament in 1811, the parifh contains 330 houfes, and 1451 inhabitants.

In the hundred of Rothwell, at Great Oxendon, is a remarkable echo in the belfry of the church-tower. To a perfon ftanding at the diftance of 673 feet, on the weftern part of the elevated ground on which the church is built, this echo returns diftinctly thirteen fyllables. An echo, but not to an equal extent, is obtainable from the top of an adjacent hill to the fouth; but fcarcely any exifts on the eaftern or northern fides of the tower. But it is faid, that the effect has lately been confiderably diminifhed, by alterations which have been made in the belfry-windows.

Braybrooke church, between Oxendon and Rothwell, exhibits a very curious and highly decorated monument, erected for fir Nicholas Griffin, knight, who died in 1509. It difplays an affemblage of pedeftals, fhields, crefts, and other ornaments, very characteriftic of the age of queen Elizabeth.

Kelmarfh-hall, on the one fide of Rothwell, and Rufhton-hall, on the other, are noble family manfions; and the latter in particular is very beautifully fituated.

Robert Talbot, one of our early Englifh antiquaries, who flourifhed about 1546, was a native of Thorpe Malfor, a village between Rothwell and Kettering. He was the friend and affociate of Leland, and both Camden and Burton feem to have made confiderable ufe of his annotations on the Itinerary of Antoninus. Hiftory, &c. of Northamptonfhire, by Bridges and Whalley, 2 vols. folio. A new edition, with large additions and corrections, of this work, is now preparing by Mr. George Baker of Northamptonfhire.

ROTHWENSDORF, a town of Saxony, in the margraviate of Meiffen; 3 miles S. of Pirna.

ROTIME, a town of Fez, near the Atlantic.

ROTKNUSSEL, in *Ornithology,* a name by which the Germans call the *gallinula melampus* of Gefner. It is a bird fomewhat approaching to the fnipe-kind; its back is brown, with a flight admixture of reddifh, and fome fpots of a dufky colour; its wings are variegated with black and white, and its

its beak and legs are black. It is common in many parts of Germany. See GLAREOLA *Nævia*.

ROTLESREUT, in *Geography*, a town of Germany, in the principality of Culmbach; 5 miles S.E. of Culmbach.

ROTMEINSDORF, a town of the duchy of Wurzburg; 2 miles E. of Ebern.

ROTNEBY, or RONNEBY, a fea-port town of Sweden, near a river of the fame name, which runs into the Baltic. It has fome trade, a harbour, medicinal fprings, and feveral manufactures. The inhabitants are free of Carlfcrona; 9 miles W. of it.

ROTOLO, an Egyptian weight of twelve ounces, each ounce confifting of twelve drachms, and each drachm of fixteen carats. See ROTTOLO.

ROTONDO, ROTUNDO, in *Architecture*, a popular term for any building that is round both within and withoutfide, whether it be a church, hall, a faloon, a veftibule, or the like.

The moft celebrated rotondo of antiquity is the Pantheon at Rome, dedicated to Cybele, and all the gods, by Agrippa, fon-in-law of Auguftus; but fince confecrated by pope Boniface IV. to the Virgin, and all the faints, under the title of Sta. Maria della Rotondo.

The chapel of the Efcurial, which is the burying-place of the kings of Spain, is alfo a rotondo; and, in imitation of that of Rome, is alfo called Pantheon.

ROTONDO, in *Geography*, a town of Naples, in the province of Bafilicata; 6 miles S.S.E. of Turfi.

ROTROU, JOHN DE, in *Biography*, a French dramatic writer, was born, in 1609, of an ancient family at Dreux. He diftinguifhed himfelf by a great facility in compofing dramatic pieces, both in tragedy and comedy. In this line of literature he was fo far fuperior to his predeceffors, that he is denominated by Voltaire "the founder of the theatre." He was patronized by cardinal Richelieu, and Corneille ufed to call him his father. He was always a needy man, and wrote moft of his pieces under the preffure of immediate neceffity, fo that he never had an opportunity of giving a finifh to them. At length, however, he was enabled to purchafe the office of lieutenant-particular of his native place, where he conftantly refided. A peftilential diforder breaking out, and making great ravages at Dreux, he was intreated by his brother to quit that town, and come to Paris; but his reply fhewed that he was refolved to remain on the fpot where his duty placed him. In one of his letters he faid, "At the moment I am writing, the bell is tolling for the twenty-fecond death this day: my turn will come when it pleafes God." He died in a very fhort time after this, in the 41ft year of his age. Of his numerous plays, the beft are "Chofroes," "Antigone," and "Wencellaus." The latter was revived by Marmontel, and Voltaire fpeaks of feveral parts of it in the higheft terms.

ROTSCHOWALM, in *Geography*, a fea-port of Ruffia, in the government of Viborg, fituated on the north coaft of the gulf of Finland, on the borders of Sweden, formed by feveral iflands, fortified with forts and redoubts.

ROTSCHWENTZEL, in *Ornithology*, the name of a bird defcribed by Gefner, and fome other authors, and feeming to be the fame with our *ruticilla*, or red-ftart. See MOTACILLA *Phœnicurus*.

ROTSIMPA, in *Ichthyology*, a name given by the Swedes to a fpecies of cottus, called by Jonfton and Schonveldt *fcorpius marinus*. It is different from the fcorpæna of the generality of writers, and is of the cottus kind. It is diftinguifhed by Artedi under the name of the *fmooth cottus*, with many thorns upon the head, and with the upper jaw fomewhat longer than the under one. See COTTUS *Scorpius*.

ROTSUSTA, in *Geography*, a river of Walachia, which runs into the Podrus, 5 miles N.W. of Strehaja.

ROTTBOLLIA, in *Botany*, fo named by the younger Linnæus, after Dr. Chriftian Friis Rottböll, Profeffor of Botany, as well as of Anatomy, in the univerfity of Copenhagen, who died in 1797, aged 70. He is particularly diftinguifhed by his defcriptions and figures of new or rare plants, a thin folio, publifhed in 1773, with 21 very neat and accurate plates. As this volume contains only plants of the order of *Calamariæ*, it is ufually quoted *Rottboll's Gramina*, or Graffes, though that appellation is not precifely correct. The fame writer has publifhed feveral botanical treatifes befides, either in the form of univerfity effays, or in the Medical Tranfactions of Copenhagen.—Linn. fil. Nov. Graminum Genera, 23, with a figure. Suppl. 13. Schreb. 721. Willd. Sp. Pl. v. 1. 463. Mart. Mill. Dict. v. 4. Ait. Hort. Kew. v. 1. 175. Sm. Fl. Brit. 151. Prodr. Fl. Græc. Sibth. v. 1. 71. Brown Prodr. Nov. Holl. v. 1. 206. Juff. 31. Lamarck Illuftr. t. 48.—Clafs and order, *Triandria Digynia*. Nat Ord. *Gramina*, Linn. Juff.

Gen. Ch. *Common Receptacle* cylindrical, thread-fhaped, jointed, with an oblong excavation on one or two fides of each joint, at the bottom. *Cal.* Glume lateral, fixed, fimple or divided, clofing the hollows of each joint, and containing one or two florets. *Cor.* Glume concealed by the calyx, of one or two membranous unawned valves. *Stam.* (in each floret) Filaments three, capillary; anthers linear, forked at each end, hanging out of the floret. *Pift.* (in one floret only of each joint) Germen oblong, abrupt, convex at one fide, concave at the other; ftyles two, capillary; ftigmas feathery, prominent. *Peric.* none, except the hollow of each finally feparated joint, clofed with the calyx. *Seed* folitary, the fhape of the germen.

Eff. Ch. Calyx fixed, nearly fingle-flowered, fimple or divided. Flowers alternate, on a jointed common ftalk.

Obf. The genera which our learned friend Mr. Brown has feparated from *Rottbollia* will be found mentioned under the articles HEMARTHRIA, LEPTURUS, OPHIURUS, and MICROCHLOA. The laft we conceive to be the moft diftinct. We fhall here take the genus *Rottbollia* as it ftands in Linnæus and Willdenow, and have drawn up the generic character accordingly.

1. R. *incurvata*. Sea Hard-grafs. Linn. Suppl. 114. Willd. n. 1. Ait. n. 1. Fl. Brit. n. 1. Fl. Græc. t. 91. Engl. Bot. t. 760. Knapp. Gram. t. 103. Fl. Dan. t. 938. (Aegilops incurvata; Linn. Sp. Pl. 1490.)—Spike round, awl-fhaped, incurved. Glume of the calyx awl-fhaped, clofe-preffed, deeply divided. Stipula very fhort, abrupt.—Native of the fandy fea-coafts of Europe. A fmall annual grafs, flowering in Auguft. The *root* confifts of numerous long capillary fibres. *Stems* numerous, decumbent at the bafe, from three inches to a foot long, branched, jointed, leafy, round, flender, very fmooth. *Leaves* linear, acute, narrow, rough on the upper furface and edges; their *fheaths* a little fwelling, fmooth, ftriated, fhorter than the leaves, each crowned with a fhort blunt *ftipula*. *Spikes* folitary at the end of each branch, rigid, long and flender, more or lefs curved. *Calyx* fpreading whilft in full bloom. *Florets* folitary, perfect, all fertile.

2. R. *filiformis*. Thread-fhaped Hard-grafs. Roth. Catal. v. 1. 21. Nardus gangitis; Herb. Linn. (Gramen junceum nodofum minimum capillare; Barel. Ic. t. 117. f. 1.)—Spike thread-fhaped, flightly compreffed, erect.

erect. Glume of the calyx sword-shaped, deeply divided. Stipula elongated, lanceolate, obtuse, jagged.—Native of the south of Europe. Much more slender than the former, with a purplish *stem*, and smaller, rougher, channelled *leaves*. *Florets* more crowded together. This is certainly what Linnæus had in his herbarium for *Nardus gangitis*, when he described that plant in his Sp. Pl. ed. 1. 53, though the mark of a cross indicates that he had some doubts concerning it. Those doubts arose from the synonyms quoted in the Sp. Pl. which have nothing to do with the grass before us. Their history may be found in Transf. of Linn. Soc. v. 1. 116.

3. R. *cylindrica*. Stout Hard-grass. Willd. n. 3. (Gramen loliaceum junceum majus; Barel. Ic. t. 5. G. loliaceum, spicis articulosis erectis; Mont. Gram. 43. f. 28. G. myuros, &c.; Bocc. Mus. 70. t. 59.)—Spike round, awl-shaped, slightly curved. Glume of the calyx undivided.—Native of the south of Europe. This appears to be of a stouter habit than even the first species, but we know nothing of it, except from the authors quoted. Monti says it differs from *R. incurvata* in having the glume of the *calyx* undivided.

4. R. *Thomæa*. Mouse-tail Hard-grass. Willd. n. 4. Roxb. Corom. v. 2. 17. t. 132. (R. pilosa; Willd. n. 7. Nardus Thomæa; Linn. Suppl. 105.)—Spike linear, compressed, nearly straight. Florets imbricated, in two rows.—Gathered by Koenig on the mountain of St. Thomas in Tranquebar. A small, glaucous, densely tufted grass, whose *leaves* are fringed with long hairs. *Spikes* solitary on each stem; their common stalk zigzag at each of the flat sides of the spike, but not perceptibly jointed. *Florets* imbricated closely, in an alternate order, along each edge of the spike. Glume of the *calyx* keeled, undivided, a little recurved at the point.

5. R. *repens*. Creeping Hard-grass. Forst. Prodr. 9. Willd. n. 5. (Lepturus repens; Brown Prodr. Nov. Holl. v. 1. 207.)—Spike round, awl-shaped. Glume of the calyx undivided. Sheath of the leaves bearded at the top. Root creeping.—Native of the South Sea islands, and the tropical part of New Holland, on sandy sea-shores. *Branches* ascending. *Leaves* imperfectly two-ranked, straight, linear, rather involute; their sheaths bearded, with scarcely any visible *stipula*. *Spike* thread-shaped, acute, beardless; its joints separable. *Glumes* of the calyx pointed, longer than their corresponding joints. *Brown*.

6. R. *lævis*. Smooth Hard-grass. Retz. Obs. fasc. 3. 11. Willd. n. 6.—Spike cylindrical. Joints two-flowered. Glumes of the calyx oblong, obtuse, undivided, very smooth, the length of the joint.—Native of Tranquebar. *Roots* apparently perennial, with strong fibres. *Stems* ascending, a foot or more in height, scarcely branched, leafy. *Leaves* densely tufted at the root, short, broad and flat, smooth; their sheaths densely bearded, without any membranous *stipula*: stem-leaves short, distant, with long sheaths. *Spikes* terminal, solitary, erect, three or four inches long, pale, smooth, each joint furrowed, with two lateral, not quite opposite, hollows. *Glume* of the calyx very smooth and even like ivory, with an obtuse, oblique, greenish point, and a little furrowed at the very base.

7. R. *compressa*. Flat-spiked Hard-grass. Linn. Suppl. 114. Willd. n. 8. Retz. Obs. fasc. 3. 12. Roxb. Corom. v. 2. 30. t. 156. (Hemarthria compressa; Brown Prodr. Nov. Holl. v. 1. 207.)—Spike compressed, awl-shaped, incompletely jointed. Joints two-flowered. Outer glume of the calyx undivided; the points of all the glumes straight.—Native of the East Indies, China, and New South Wales, about ponds. *Stems* compressed, leafy. *Leaves* smooth, naked, with compressed sheaths. A stalked tuft of *spikes*, accompanied by a leafy *involucrum*, springs from the upper sheaths. *Calyx* of two valves; one of them internal.

8. R. *uncinata*. Hooked Hard-grass. (Hemarthria uncinata; Brown Prodr. Nov. Holl. v. 1. 207.)—Spike compressed, awl-shaped, incompletely jointed. Joints two-flowered. Outer glume of the calyx undivided; the point of the inner one hooked.—Gathered by Mr. Brown in the island of Van Diemen.

9. R. *hirsuta*. Great Hairy-spiked Hard-grass. Vahl. Symb. fasc. 1. 11. Willd. n. 9. (Triticum ægilopoides; Forsk. Ægypt-Arab. 26.)—Spike awl-shaped, very hairy. Calyx of the perfect florets spreading; of the male ones close-pressed. Stem angular in the upper part.—Native of Egypt; not unfrequent about Alexandria, flowering in March. We have specimens from Dr. Delile, who informs us that a figure of this grass is destined for the great work, descriptive of Egypt, part of which has already appeared at Paris. The *stem* is branched, rigid, about two feet high, leafy, jointed, the upper joints angular, being flattened at one side, striated, a little roughish. *Leaves* involute, rigid; their sheaths smooth, strongly furrowed, crowned with a tuft of hairs; the upper ones somewhat inflated. *Spike* solitary, partly enveloped in the uppermost sheath, about three inches long, rather compressed. *Glumes* lanceolate, taper-pointed, emarginate, clothed externally with copious, long, white hairs.

10. R. *Cymbachne*. Boat-valved Hard-grass. Willd. n. 10. (Cymbachne ciliata; Retz. Obs. fasc. 6. 36.)—Spikes in pairs, flowering at one side only. Calyx of the perfect florets with an inner, boat-like glume. Leaves fringed at the base.—Found by Koenig in Bengal. A slender grass, a foot high, with several, simple or branched, *stems*; the latter bearing one leaf, the others leafless. *Leaves* short, thin, fringed at the margin, above the sheath, with long, white, separate hairs; sheath abrupt, pale-brown at the summit, fringed. *Spikes* terminal, in pairs, linear, an inch and a half long, some consisting of perfect, the others of female, *flowers*. *Common stalk* linear, membranous, flat at the back, with three longitudinal furrows; zigzag, with alternate hollows, in front. *Calyx* of the *perfect flowers* of two valves, single-flowered, both of them parallel and exposed to view, close-pressed to the common stalk, or receptacle; the outermost valve linear, obtuse, fringed at the back; innermost half-ovate, acute, boat-shaped, greatly compressed, striated, coloured, fringed at the back, inclosing the corolla. *Anthers* and *stigmas* black. *Female flowers* with a single-valved, close-pressed, ovate, fringed *calyx*, slightly cloven at the point. *Corolla* and *stamens* wanting. *Stigmas* longer than in the former. *Retzius*.

11. R. *Coelorachis*. Hollow-stalked Hard-grass. Forst. Prodr. 9. Willd. n. 11.—"Spike round, flowering at one side only. Florets in pairs; one of them stalked. Calyx of two valves."—Native of the island of Tanna. We have seen no specimen. Mr. Brown mentions this as one of the few certain *Rottbölliæ*, according to his own strict limitation of the genus. We presume, from the name, that Forster had originally considered this plant as constituting a distinct genus; and that he named it in allusion to the hollows of the common receptacle; which, nevertheless, are proper to *Rottböllia*.

12. R. *dimidiata*. Half-spiked Hard-grass. Linn. Suppl. 114, excluding the synonym. Willd. n. 12.—Spikes

compressed,

compreſſed, flowering at one ſide; ſtriated with undulating lines at the other. Flowers two to each joint, one rather above the other, with ſhort abrupt ſcales at their baſe.—Native of the Eaſt Indies, and of the Braſils, in ſandy ground. Whether Thunberg's Cape plant be the ſame, we are not certain, there being ſome confuſion between our *Rottböllia* and the *Panicum dimidiatum* of Linnæus; which latter we have never ſeen, but Koenig and Retzius inſiſted on their being two very different things. *R. dimidiata* is a ſtout, branched, ſmooth graſs, with very broad, obtuſe, ſpreading *leaves*, whoſe ſheaths, like the *ſtem*, are very much compreſſed. *Spikes* ſeveral, on ſolitary or cluſtered, ſimple, axillary and terminal, ſtalks, two or three inches long, about their own length. Each *ſpike* is tapering, ſtout, jointed, curiouſly ſtriated at the back, with alternately curved and recurved lines; bearing, at the oppoſite ſide, on each joint, two angular *flowers*, one elevated above the other, and each accompanied by a ſhort ſcale at the baſe. The ſtructure of the *flowers* we have not been able to examine.

13. R. *exaltata*. Tall Hard-graſs. Linn. Suppl. 114. Willd. n. 13. Brown Prodr. n. 1. Roxb. Corom. v. 2. 30. t. 157. (Stegoſia cochinchinenſis; Loureir. Cochinch. 51, on the authority of a ſpecimen from the author, in the Bankſian herbarium.)—Spike round, flowering on every ſide, beardleſs. Glumes obtuſe, rough as well as the common receptacle. Leaves and their ſheaths hairy.—Native of the Eaſt Indies, and of Cochinchina. A tall graſs, with a ſolid *ſtem*. Sheaths of the *leaves* furrowed, beſprinkled with elevated points, each bearing a briſtle. *Spikes* ſolitary, lateral, four or five inches long.

14. R. *formoſa*. Silky Hard-graſs. Brown n. 2.—"Spike round, flowering on every ſide; its joints, as well as the outer glumes of the perfect flowers, ſilky; thoſe of the neuter ones ſmoothiſh and empty."—Gathered by Mr. Brown in the tropical part of New Holland.

15. R. *perforata*. Perforated Hard-graſs. Roxb. Corom. v. 2. 43. t. 182.—Spike round, flowering on every ſide, beardleſs. Glumes obtuſe, ſmooth. Common receptacle perforated in each joint, between the oppoſite flowers. Leaves ſmooth. Sheaths woolly at their ſummit.—Native of low rich paſture-ground on the coaſt of Coromandel, but rare. *Root* fibrous. *Stems* ſeveral, about two feet high, erect, round, jointed, ſolid, ſlender, ſmooth, leafy. *Leaves* ſmall, narrow, ſmooth, except at their edges. *Sheaths* very woolly at the ſummit within, which woollineſs extends a little way up the leaf. *Spikes* ſolitary, ſtalked, terminal and axillary, ſlender, erect, four or five inches long. *Flowers* two to each of the lower joints, oppoſite; one to each of the upper ones; ſometimes all perfect; ſometimes many of them have *ſtamens* only. This, like moſt of the other ſpecies, is a coarſe graſs, not eaten by cattle.

16. R. *corymboſa*. Corymboſe Hard-graſs. Linn. Suppl. 114. Willd. n. 14. Roxb. Corom. v. 2. 42. t. 181. (R. punctata; Retz. Obſ. faſc. 3. 12. Ægilops exaltata; Linn. Mant. 575. Retz. Obſ. faſc. 2. 27. Ophiurus corymboſa; Brown Prodr. Nov. Holl. v. 1. 207.)—Spikes aggregate, thread-ſhaped, ſmooth. Glume of the calyx ovate, obtuſe, undivided, with reticulated depreſſions.—Native of ditches on the coaſt of Malabar, as well as of the tropical region of New Holland. The *ſtem* is tall, round, leafy, finely ſtriated, ſmooth. *Leaves* flat, with long ſmooth ſheaths. *Spikes* purpliſh, many together, ſlender, in tufts, on ſimple or compound, ſmooth, cylindrical ſtalks, from the ſheaths of the ſhort uppermoſt leaves. Glume of each *calyx* the length of the joint, a little ſpreading, at leaſt in the dry ſpecimen, and curiouſly reticulated at the outſide.

17. R. *digitata*. Finger-ſpiked Hard-graſs. Sm. Fl. Græc. Sibth. v. 1. 73. t. 92.—Spikes terminal, cluſtered. Receptacle angular, rough. Flowers partly ſtalked. Glumes keeled, taper-pointed. Sheaths of the leaves hairy. Gathered by Dr. Sibthorp in the low country about the baſe of the Bithynian Olympus. This is a large graſs, three feet high, with all the appearance of being perennial. *Stem* branched, leafy, round, ſmooth. *Leaves* a foot or more in length, moderately ſpreading, flat, acute, rather glaucous, with a pale central rib; their upper ſide rough, and often hairy; their ſheaths long, cloſe, ribbed, dotted and hairy. *Stipula* of a few ſhort hairs. *Spikes* ſeveral, from nine to twelve inches long, erect, forming an oblong tuft at the top of the ſtem; rarely ſolitary. *Receptacle*, or *common ſtalk*, of each zigzag, angular, rough-edged, every joint accompanied at its concave ſmooth ſide by two *flowers*, one ſeſſile, the other on a ſtout, angular, club-like ſtalk, half the length of the correſponding joint. *Calyx* of two unequal, awl-ſhaped, rough-keeled valves; that of the ſtalked flower containing two *florets*, one of which is male; that of the ſeſſile flower only a ſolitary *floret*, ſometimes perfect, ſometimes furniſhed merely with *ſtamens*. *Corolla* in all the florets of two pellucid white glumes, ſhorter than the calyx. *Anthers* and *ſtigmas* yellow.

18. R. *muricata*. Prickly Hard-graſs. Retz. Obſ. faſc. 3. 12. Willd. n. 15. (Ægilops muricata; ib. faſc. 2. 27.)—"Spikes round, ſeveral together, on long ſtalks. Calyx fringed with prickles; the neutral ones cloven."—Found in the Eaſt Indies, by Koenig.—*Stems* angular, leafy. Sheaths of the *leaves* fringed. *Spikes* axillary, two or three together, thicker than in *R. exaltata*, each on a long ſtalk. *Calyx* ſlightly downy, fringed with marginal prickles.

19. R. *ſanguinea*. Red-flowered Hard-graſs. Retz. Obſ. faſc. 3. 25. Willd. n. 16.—Spikes axillary, alternate, ſtalked, approximated. Corolla awned at the baſe.—Native of China.—*Stem* ſemi-cylindrical, jointed, leafy; the upper joints inveſted with dilated, hood-like ſheaths, from each of which ſprings a ſolitary ſpike, on a long ſtalk, the latter concealed by the ſheath. *Spikes* thread-ſhaped. *Flowers* alternate. *Corolla* red, with a long awn from its baſe. Retzius's deſcription of a *bractea*, as well as of the parts of the flower, is not clear to us without a ſpecimen. He ſays this graſs has entirely the aſpect of an *Andropogon*.

R. monandra, Cavan. Ic. v. 1. 27. t. 39. f. 1. Leccion. 52, ſeems rather a ſpecies of *Nardus*, and is, we believe, the *N. ariſtata* of Linnæus, under which name it was ſent to Mr. Davall, by ſignor Molineri, from Piedmont. See NARDUS, n. 2, where Cavanilles may ſafely be cited.

ROTTE, in *Geography*. See ROTAI.

ROTTELN, a town of the duchy of Baden; five miles N.N.E. of Bâle.

ROTTEN STONE, in *Mineralogy*, a decompoſed ſtone, uſed for poliſhing. See TRIPOLI.

ROTTENBACH, in *Geography*, a town of Bavaria, in the territory of Nuremberg; three miles S.S.W. of Lauf.

ROTTENBERG, a town of Bavaria; 14 miles N.N.W. of Landſhut.

ROTTENDEAN, a village of England, in Suſſex, very near the ſea, and frequented for ſea-bathing; four miles S. of Brighthelmſtone.

ROTTENEG, a town of Auſtria; 13 miles S.W. of Freyſtatt.

ROTTENMANN, a town of the duchy of Stiria; 20 miles

miles N.W. of Judenburg. N. lat. 47° 26′. E. long. 14° 8′.

ROTTENNESS, Putredo. See Putrefaction.

ROTTENSTEIN, in *Geography*, a town of Bohemia, in the circle of Konigingratz; eight miles W.N.W. of Geyersbe[illegible].

ROTTERDAM. See Anamooka.

Rotterdam, a fortress in the island of Celebes, near Macassar, belonging to the Dutch. It lies about 800 feet from the beach, opposite to the road of Macassar, where a pier-head extends, which serves for unloading of the ships, and close to which there are 15 or 16 feet of water. The church is a neat building, and has room for 200 persons. The walls of the fortress are high and strong, and constructed of rock-stone. See Vlaardingen.—Also, a small island in the gulf of Manaar, near the W. coast of the island of Ceylon; 10 miles N. of Manaar.—Also, a town of America, in New York, on the N. side of Oneida lake.—Also, a city and sea-port of Holland, situated on a river named "Rotter," where it joins the Meuse. This place had the privileges of a city not long after the year 1270. It has been accustomed to hold the first rank in the assembly of the states among the small cities of Holland; and next to Amsterdam it used to be reckoned the richest and most flourishing city of the whole state, on account of the convenience of its harbour, where depth of water allowed the largest vessels to enter, and canals facilitated their loading and unloading at the warehouses of the merchants. The port of Rotterdam was more frequented by British traders than that of Amsterdam, because when vessels had weighed anchor, one tide brought them out to sea. Among the principal buildings are the town-house, the bank, the East and West India houses, the arsenal, and some of the churches, particularly that dedicated to St. Laurens. On the E. side of the city are a large basin and dock, for the purpose of building and launching vessels in the service of the Admiralty, and the East India Company. The magistracy consists of a council of 24, out of which are elected four burgomasters, a grand bailiff, and seven echevins. Besides the magistracy of the city, here are also three other tribunals, *viz.* the college of the grand bailiff, or dyckgrave of Schieland, and council, composed partly of nobility and partly of the cities of Rotterdam, Goude, and Schiedam, that hold their assemblies at Rotterdam, in a house called Landhuys, whose business it is to inspect the dykes, superintend the roads and canals, and take care of every thing that pertains to the environs of the city; the second tribunal is that of the judges of Schieland, whose jurisdiction extends over what does not belong particularly to the magistrates of cities; the third is the college of the lords of the admiralty for the Meuse, who have a house appropriated to that business. Rotterdam was the birth-place of Erasmus, and it is said that his statue still remains, and also the house in which he was born. The streets are long and generally narrow, and the foot pavement is only distinguished by a clean line of bricks; the population is estimated at about 48,000 people; 30 miles S.S.W. of Amsterdam. N. lat. 51° 55′. E. long. 4° 24′.

ROTTES, a town of Norway; 50 miles N.E. of Romsdal.

ROTTI, an island in the gulf of Venice, near the coast of Friuli. N. lat. 45° 45′. E. long. 12° 9′.

ROTTINGEN, a town of the duchy of Wurzburg, on the Tauber; 13 miles W.N.W. of Rottenburg.

ROTTL, a river of Austria, which runs into the Danube, six miles above Lintz.

ROTTLERA, in *Botany*, is so called in honour of the Rev. Dr. Rottler, Danish missionary at Tranquebar, who like several of his Brethren in that remote situation, has alleviated his more serious occupations with the study of plants; and, besides acquiring himself a considerable knowledge of botany, has been eminently serviceable to the science, by his communications to his European friends. The original *Rottlera* of Willdenow proving the identical *Trewia nudiflora* of Linnæus, the present, chosen by Dr. Roxburgh, has been received subsequently by Willdenow, as well as in Hort. Kew. Thus the *Rottlera* of Vahl, in his *Enumeratio*, v. 1. 87, is superseded, and if a good genus, must have another name.—Roxb. Coromand. v. 2. 36. Willd. Sp. Pl. v. 4. 832. Ait. Hort. Kew. v. 5. 406.—Class and order, *Dioecia Icosandria*. Nat. Ord. *Tricoccæ*, Linn. *Euphorbiæ*, Juss.

Gen. Ch. Male, *Cal.* Perianth of one leaf; tube short; limb in four deep, ovate, reflexed segments; the two opposite ones rather the smallest. *Cor.* none. *Stam.* Filaments between thirty and forty, capillary, erect, inserted into the tube of the calyx, and about the length of its limb; anthers linear, cloven at each end.

Female, on a separate tree, *Cal.* Perianth inferior, bell-shaped, with four erect teeth. *Cor.* none. *Pist.* Germen superior, ovate, powdery; styles three, reflexed; stigmas feathery. *Peric.* Capsule roundish, powdery, three-lobed, three-celled, three-valved, the partitions from the centre of each valve. *Seeds* solitary, globose.

Ess. Ch. Male. Calyx deeply four-cleft, reflexed. Corolla none. Stamens thirty to forty.

Female. Calyx four-toothed, erect. Corolla none. Styles three. Capsule superior, three-lobed, three-celled. Seeds solitary.

1. R. *tinctoria*. Dyer's Rottlera. Roxb. Corom. v. 2. 36. t. 168.—Native of the inland mountainous parts of the circars of Hindoostan, flowering in the cold season. Dr. Roxburgh never found it any where else. This is a middle-sized, erect, branching *tree*. *Leaves* alternate, stalked, elliptic-oblong, acute, entire, from four to eight inches in length, three-ribbed and veiny; nearly smooth above; downy beneath; furnished at their base with two brown glands. *Footstalks* round, downy, from one to three inches long. *Flowers* small, in clusters, about the tops of the branches, axillary and terminal; the latter branched. *Capsules* the size of a small cherry, clothed with abundance of deep red granular powder, easily rubbed off. This powder is a valuable article of commerce, being much esteemed, especially among the Moors, for dyeing silk of a deep, bright, very beautiful and durable, full-orange or flame-colour. When the capsules are ripe, in February or March, they are gathered, and the powder carefully brushed off. It is preserved without any further process, and is sold to the merchants trading to Hydrabad, and other inland parts. This substance is but little acted upon by water, except with the admixture of alkaline salts, when it gives out a very deep blood-red colour. To spirits it communicates a rich, deep, reddish flame-colour; but in neither instance does it dissolve, the grains remaining entire, like sand. The inhabitants know this powder by the name of *Wassunta-gunda*, and use it in the following manner. To four parts of *Wassunta-gunda* are added one of alum, and two of salt of soda, native barilla. These are rubbed well together, with a portion of expressed oil of *Sesamum*, so small as hardly to be perceived. When well mixed, the whole is put into boiling water, in quantity proportioned to the silk which is to be dyed, and kept boiling smartly, more or less time, according to the shade required. The silk is turned frequently, to render the colour uniform.

ROTTO-

ROTTOCOMB, in *Geography*, a town of Africa, in Bornou; 8 miles S. of Bornou.

ROTTOFREDO, a town of the duchy of Piacenza; 5 miles W. of Piacenza.

ROTTOLO, in *Commerce*, a weight ufed in Italy and the Levant. At Aleppo, and its port Scanderoon, the cantaro contains 100 rottoli, each of which is fubdivided into 12 ounces, or 720 drachms; the great cantaro of Tripoli contains 175 rottoli, and the zurlo confifts of $27\frac{1}{2}$ rottoli. This rottolo, with which moft forts of goods are weighed, weighs 5lbs. avoirdupois nearly. The rottolo with which the filks from Tripoli, and other parts of Syria, are weighed, confifts of 700 drachms, anfwering to $4\frac{7}{8}$ avoirdupois. The rottolo ufed in weighing the Perfian filks contains 680 drachms, or nearly $4\frac{3}{4}$ lbs. avoirdupois. The rottolo of Damafcus, with which brafs, camphor, benzoin, fpikenard, balfam of Mecca, and other drugs are weighed, contains 600 drachms, or $4\frac{1}{5}$ lbs. avoirdupois. Five rottoli, or 3600 drachms, make what is called a *vefno*; which fee. At Saide, in Syria, (the ancient Sidon,) filk and fattin yarn are weighed with the rottolo of Damafcus, of 600 drachms; 100 fuch rottoli anfwering to about 410lbs. avoirdupois. Heavy goods are weighed with the rottolo of Acre, 100 of which are = 482 lbs. avoirdupois. At Conftantinople, the cantaro, or quintal, contains 44 okes, or 100 rottoli; and the cantaro weighs about $123\frac{3}{4}$ lbs. avoirdupois, the oke 2 lbs. 13 oz., and the rottolo $19\frac{4}{5}$ oz., and the chequee $11\frac{1}{4}$ oz. avoirdupois. At Leghorn, the rottolo is 3 lbs. At Naples, the cantaro groffo contains 100 rottoli, each weighing $33\frac{1}{3}$ ounces of the gold and filver weight, or $31\frac{2}{7}$ ounces avoirdupois. Hence 28 rottoli = 55lbs. avoirdupois, and the cantaro groffo = $196\frac{1}{7}$ lbs. avoirdupois. The cantaro piccolo is = 106 lbs. avoirdupois nearly.

In Sicily thefe different weights are ufed, *viz.* the rottolo groffo of 33 ounces, the rottolo fotile of 30 ounces, and the libra, or pound of 12 ounces. 10 lbs. of Sicily = 7 lbs. avoirdupois nearly; and, therefore, 40 rottoli groffi, or 44 rottoli fotile = 77lbs. avoirdupois. A cantaro groffo contains 100 rottoli groffi, or $192\frac{1}{2}$ lbs. avoirdupois; a cantaro fotile is 100 rottoli fottili, and is = 175 lbs. avoirdupois. At Smyrna, the cantaro, or kintal, contains 45 okes, or 100 rottoli. The batman is 6 okes, or 2400 drachms; and the oke is 400 drachms, and the rottolo = 180 drachms. The cantaro of 45 okes weighs 123 lbs. 4 oz. avoirdupois; and, therefore, the oke is = 2 lbs. 11 oz. 13 drs. avoirdupois. At Tripoli, the cantaro weight contains 100 rottoli, each of 6 ounces, or 128 termini; this cantaro anfwers to 168 lbs. pefo fotile of Venice, or about 12 lbs. avoirdupois. At Tunis, the cantaro contains 100 rottoli, each of 16 Tunis ounces, and weighs about 111 lbs. avoirdupois. Kelly's Cambift. See WEIGHT.

ROTULA, in *Anatomy*, the patella or knee-pan. See EXTREMITIES.

ROTULA, *Diflocations and Fractures of*, in *Surgery*. See FRACTURE, and LUXATION.

ROTULA, in *Natural Hiftory*, the name of a genus of the echini marini, of the general clafs of the placentæ. The characters of the rotulæ are, that they are flat fhells in form of a cake, compofed of various flat pieces, and formed into a round, fomething like that of a wheel, but wanting one or more parts of its outer ring, and radiated or dentated; their mouth is fituated in the middle of the bafe, and the aperture of the anus in the third region of the axis, and marked with a cinquefoil flower at the fummit. The great obvious character is, however, the dentated edge. Of this genus there are two known fpecies.

ROTULA, in *Ichthyology*, is alfo a name given by fome to the faber, or doree.

ROTULI *Magni Ingroffator*. See INGROSSATOR.

ROTULORUM CUSTOS. See CUSTOS.

ROTULUS, a roll. See ROLL.

ROTULUS *Contrarientium*. The earl of Lancafter taking part with the barons againft king Edward II., it was not thought fit, in refpect of their power, to call them rebels or traitors, but only *contrarients*; accordingly, we have a record of thofe times called *rotulus contrarientium*.

ROTULUS *Wintoniæ*, an exact furvey of all England, by counties, hundreds, and tithings, made under king Alfred, not unlike that of Domefday.

It was thus called, becaufe anciently kept at Winchefter among other records of the kingdom.

ROTUNDA FENESTRA, in *Anatomy*, an opening of the cochlea into the tympanum. See EAR.

ROTUNDA *Ligamenta Uteri*, two fibrous cords afcending from the uterus, and paffing through the abdominal rings. See GENERATION.

ROTUNDO. See ROTONDO.

ROTUNDUM FORAMEN, in *Anatomy*, an opening of the fphenoid bone. See CRANIUM.

ROTUNDUS, a name given to feveral mufcles from the roundnefs of their body.

Such are the *rotundus major*, called alfo *teres major*, and the *rotundus minor*, called alfo *teres minor*, and *tranfverfalis*.

ROTUNDUS, *Pronator Radii*. See PRONATOR.

ROTZ, in *Geography*, a town of Auftria; 24 miles N. of Tulln.

ROTZHOF, a town of the duchy of Stiria, on the river Muehr; 16 miles S. of Gratz.

ROU, or PULO ROU, a fmall ifland in the Chinefe fea, near the coaft of Malacca. N. lat. 6° 43′. E. long. 102° 10′.

ROUAD. See RUAD.

ROUAGE, *Battery en*. See BATTERY.

ROUAITHA, in *Geography*. See ROAITHA.

ROUALTHA, a town of Arabia, in the province of Hedsjas; 108 miles S.S.E. of Mecca.

ROVANIEMI, a town of Sweden, in the government of Ulea, on the Kemi; 55 miles N.N.E. of Tornea.

ROUARA, a town of South America, in Guiana.

ROVASIO, a town of France, in the department of the Sefia; 15 miles N. of Vercelli.

ROVATO, a town of Italy, in the department of the Mela; 10 miles W.N.W. of Brefcia.

ROUBAIX, a town of France, in the department of the North, and chief place of a canton, in the diftrict of Lille; 6 miles N.E. of Lille. The place contains 8091, and the canton 13,761 inhabitants, on a territory of 40 kiliometres, in four communes.

ROUBAN, a town of Arabia, in the province of Hedsjas; 40 miles S. of Calaat el Moilah.

ROUBBIE′, in *Commerce*, a gold coin of Turkey, which is one-third of the fequin, called Mahbub. See SEQUIN.

ROUCOU, or ROCOU, otherwife called *Annotto* and *Orlean*, is a red dye, formed in maffes, from the pellicles of the feeds of an American tree. That which is commonly met with among us is moderately hard and dry, of a brown colour on the outfide, and a dull red within. Labat informs us, that the Indians prepare a dye of this fort much fuperior to that which is brought to us; of a bright fhining red colour, almoft equal to carmine. For this purpofe, inftead of fteeping and fermenting the feeds in water, they rub them with the hands, previoufly dipt in oil, till the pellicles come off

off and are reduced into a clear paste, which is scraped off from the hands with a knife, and laid on a clean leaf, in the shade, to dry. De Laet, in his notes on Marcgrave's Natural History of Brasil, mentions two kinds of roucou, or annotto; one of a permanent crimson colour, used as a *fucus*, and another which gives a colour inclining more to that of saffron. This last, which is our annotto, he supposes to be a mixture of the first sort with certain resinous matters, and with the juice of the root of the tree. See Annotto.

ROUELLE, in *Geography*, a river of France, which rises near Le Quesnoy, and runs into the Scheldt, at Valenciennes.

ROUEN, a city of France, and capital of the department of the Lower Seine, situated on the Seine; before the revolution the capital of Normandy, and the see of an archbishop; 13 posts S.W. of Amiens. The place contains 87,000, and its six cantons 87,000 inhabitants, on a territory of 15 kiliometres, in one commune. Rouen is large and commercial, has several manufactures, particularly of cotton, and contains 36 parish churches. In the market-place is a statue of the celebrated maid of Orleans, who was burnt here by the English for a witch. In 1117, when the French were defeated by the English in a battle fought here, the city belonged to the king of England, as a part of Normandy; but in the year 1204, it was surrendered to the king of France. In 1418, Henry V. of England commenced a siege which lasted five months; the inhabitants defending the city with persevering firmness and ardour, and enduring the most severe hardships; but they were at last obliged to surrender, on condition of paying 345,000 crowns of gold, and taking an oath of allegiance to the conqueror, who entered on the 19th of January 1419. N. lat. 49° 26′. E. long. 1° 10′.

Rouen, in *Agriculture*, a term made use of to signify after-grass, or the hay made from this sort of grass. It is sometimes written *Rowet*. See After-*Grass*.

This sort of preserved grass is now found by many farmers, in different districts, to be of vast utility and advantage in the spring season for the support of some part of their store-sheep stock, as that of the ewes during the lambing-time, and those other sheep which are to be kept in good condition. In the county of Norfolk, Mr. Bevan has a high opinion of the great value and use of this kind of grass, sometimes preserving the quantity of twenty-eight or thirty acres of it in an excellent state for the ewes and lambs in the early spring. And near Swaffham, in the same county, Mr. Mason is in the practice of keeping grass of this nature from the end of July, and not turning at all into it until early in the spring of the following year, when the fattening bullocks and sheep, which have had hay during the winter, are put into it. The old grass is found to nurse up a great bite of young growth, and both together carry on the bullocks in a very favourable manner; it is also excellent for sheep; nothing at such a season is supposed to equal it. At Burnham, on an exposed piece of thirteen acres of this sort of grass, open to the sea, and the north-east wind, which Mr. Overman kept from Midsummer, ten score and sixteen ewes and their lambs were turned in on the 27th of March, and it kept them well a whole month. It is asserted, that they would have been half starved without it; but that by means of it they were fully supported, to the surprise of many who saw them feeding. This piece was fully *tathed* in every part.

The same system of practice is also found equally useful and important in the county of Essex. Mr. Kitcher, of this district, is in the habit of laying up a pasture of this sort of spring food for his sheep, finding it of such astonishing use, that he is determined not to be without so great a resource. And at Ongar, Mr. Dyer shuts up grass for the use of his sheep, both ewes and lambs, in March and the following month: it is found that the young grass shoots up with it in an extraordinary manner, and that his flock does better on it than on turnips. Also at Gosfield, Mr. Thurlow shuts up a space of grass from the beginning of September to the lambing-time, and finds it of very considerable advantage to his flock.

ROVER. See Pirate.

ROVERBELLA, in *Geography*, a town of Italy; 12 miles N.N.W. of Mantua.

ROVEREDO, or Rovereith, a town of the county of Tyrol, with a strong citadel, built by the lords of Castelbarco; but in the year 1414, it was taken from them by the Venetians, from whom Maximilian I. wrested it again by the sword, and incorporated it with the county of Tyrol. This town has a manufacture of fine silk, and carries on a great trade. The wine produced in this tract is called "Goccia d'oro," or golden drops. On Sept. 4th, 1796, Roveredo was taken by the French, after a battle in which the Austrians lost 7000 prisoners, 25 pieces of cannon, 50 waggons, and 7 standards; 8 miles S.E. of Trent. N. lat. 45° 53′. E. long. 11° 3′.

ROUERGUE, a province of France before the revolution, about 25 leagues in length, and 18 in breadth, bounded on the E. and S. by Languedoc, on the W. by Quercy, and on the N. by Auvergne. The land, though not very fertile, produces much wood, and here are mines of copper, iron, sulphur, vitriol, &c. The principal rivers are the Tarn and the Lot. The capital city was Rhodez. It now forms the department of the Aveyron.

ROVERO, a town of Italy, in the Trevisan; 9 miles E. of Cismone.

ROVERSANO, a town of Italy, in the department of the Rubicon; 20 miles W. of Rimini.

ROVERSCIO, Al, or *Per Roverscio*, Ital. in *Music*, reversed, inverted. See Rivolgimento, and Rivoltare.

ROVES, in *Ship-Building*, small square pieces of iron with a hole punched in the middle, through which the nail goes, where it is clenched, and binds together the boards of pinnaces, yawls, &c.

ROVETTA, Don Giovanni Batista, in *Biography*, a Venetian composer, in great favour in the middle of the 17th century, vice maestro di cappello of St. Mark's cathedral, and composer of five or six operas. He likewise was author of Masses and *Madrigali a sci voci concertati*: in scoring one of them, we found the instrumental parts consisted only of two violins, and a base, wholly different from the voice-parts; but, except an introduction or symphony to each movement, and short ritornels, they had little to do. These madrigals were first published in 1625.

ROUEZ *le Guillaume*, in *Geography*, a town of France, in the department of the Sarthe; 3 miles S. of Sille.

ROUFFACH, a town of France, in the department of the Lower Rhine, and chief place of a canton, in the district of Colmar. The place contains 3292, and the canton 11,882 inhabitants, on a territory of 112½ kiliometres, in eight communes.

ROUFFIGNAC, a town of France, in the department of the Dordogne; 9 miles S.W. of Montignac.

ROUGE′, a town of France, in the department of the Lower Loire, and chief place of a canton, in the district of Chateaubriant. The place contains 2134, and the canton 7349 inhabitants, on a territory of 160 kiliometres, in five communes.

Rouge, *Cape*, or *Red Cape*, a cape on the N. side of the island of St. Domingo; four leagues W. of Point Isabellica.

Isabellica.—Also, a cape called "Ras el Hamrah," on the coast of Algiers. N. lat. 37° 5′. E. long. 7° 42′.

ROUGE *River*, a river of America, in Louisiana, so called from the colour of its waters, which are said to tinge those of the Missisippi in the time of the floods, rises in New Mexico, and after running about 600 miles, joins the Missisippi 187 miles above New Orleans, 56¼ miles below Fort Rosalie, receiving 30 miles from its mouth the Noir, or black river. About 70 leagues up Rouge river the French had a considerable post, called Natchitoches, being a frontier to the Spanish settlements. Tobacco of a superior quality is cultivated at this post in considerable quantities, and sold at New Orleans.

ROUGE *Chapeau*, or *Red Hat*, a cape on the coast of North America. N. lat. 46° 31′. W. long. 55° 26′.

ROUGE-*Croix*, q. d. *Red Cross*. See POURSUIVANTS.

ROUGE-*Dragon*, q. d. *Red Dragon*. See POURSUIVANTS.

ROUGEMONT, in *Geography*, a town of France, in the department of the Doubs, and chief place of a canton, in the district of Baume; seven miles N. of Baume. The place contains 1260, and the canton 8290 inhabitants, on a territory of 170 kiliometres, in 26 communes.

ROUGET, in *Ichthyology*, a name given by the French to the fish called the *lyra* and *capo* by authors. It is a species of the trigla, and is distinguished by Artedi by the name of the trigla with a long bifid snout and tubulous nostrils. See TRIGLA.

ROUGH, ROUGHNESS, in *Mechanics*. See FRICTION, and RESISTANCE.

ROUGH *Casting*. See PLASTERING.

ROUGH *Diamond*. See DIAMOND.

ROUGH *Emerald*. See EMERALD.

ROUGH-*leaved Plants*. See PLANT.

ROUGH *Taste*. See TASTE.

ROUGH-*Tree Rails*, in *Ship-Building*, are rails along the waist and quarters of ships, nearly breast high, to prevent persons from falling overboard. This term originated from the practice in merchant vessels of carrying their rough or spare gear in crutch irons along their waist.

ROUGH *Rider*, a person who is indispensably necessary in every cavalry regiment. He is a sort of non-commissioned officer, and should always associate with the serjeants in preference to the private men.

Rough riders are the assistants of the riding-master, and one should always be appointed to each troop. The necessary qualifications for every rough rider (independently of a thorough knowledge of horsemanship) are activity, zeal, and good conduct.

No rough rider ought to be an officer's servant, as his situation places him above the level of common men.

Rough riders are generally paid five guineas a-year as a compensation for their trouble; they likewise receive 10*s*. 6*d*. from every officer who learns to ride, and from every officer who has a horse broke at the riding school. This money is divided equally amongst them.

Every rough rider must provide himself with a proper jacket for the riding school business, according to the pattern fixed upon in the regiment.

When it is found absolutely necessary to employ non-commissioned officers as rough riders, they must do as much troop duty as they can.

ROUGH *Horses, To*, a word in familiar use among the dragoons to signify the act of breaking in horses, so as to adapt them to military purposes.

ROUGH *it, To*, a cant word used among military men, signifying to face every sort of hardship.

ROUGH *Creek*, in *Geography*, a river of Kentucky, which runs into Green river, N. lat. 37° 12′. E. long. 87° 35′.

ROUGH *Skelly*, a cape on the E. coast of Scotland. N. lat. 56° 36′. W. long. 2° 28′.

ROUGHCAST WASH, in *Rural Economy*, a sort of liquid wash, or application, employed for the purpose of being laid over the surfaces of outside walls, or buildings, of this nature, in order to preserve and ornament them. It is noticed by Mr. Vancouver, in his report of the state of the agriculture of the county of Devon, that a wash of this kind is getting greatly into use in that district. It consists, in this case, of four parts of pounded lime, three of sand, two of pounded wood-ashes, and one of the scoria of iron, intermixed very intimately together, and made sufficiently thin or fluid as to be applied by means of a brush. It is remarked, that when dry, it gives to the work the appearance of new Portland stone, and affords an excellent protection against the penetrating force of the south-westerly storms in that exposed county. It is also found useful for applying over the outsides of stone buildings or walls.

ROUGHING CLOTH. See CLOTH.

ROUGHINGS, in *Agriculture*, a term sometimes applied to latter-grass, or aftermath, and sometimes to coarse pastures. They are always of the coarse rough tufty kinds, when this epithet is applied to them.

ROUGHY, in *Geography*, a river of Ireland, which falls with an impetuous current into the Kenmare river, about two miles E. of Kenmare town.

ROUGIES, a small island on the W. coast of France, being one of the group called the "Seven Islands." N. lat. 48° 54′. W. long. 3° 21′.

ROUGNAT, a town of France, in the department of the Creuse; nine miles S. of Evaux.

ROUHA. See OURFA.

ROUHAMON, in *Botany*, a Caribbean name, retained by Aublet for one of his genera. See LASIOSTOMA.

ROUIA, in *Geography*, a town of Syria, containing seven fine palaces, some of which are entire, and several churches built in a fine style; 36 miles S.S.W. of Aleppo.

ROUJAN, a town of France, in the department of the Herault, and chief place of a canton, in the district of Beziers; six miles N.W. of Pezenas. The place contains 1129, and the canton 5720 inhabitants, on a territory of 135 kiliometres, in 11 communes.

ROVIGNO, or TREVIGNO, a sea-port town of Istria, seated on a rock which projects into the sea, with two harbours capable of containing the largest vessels. It contains about 17,000 inhabitants, chiefly fishermen and boat-builders. In its vicinity are quarries of beautiful marble; 68 miles E. of Venice. N. lat. 45° 10′. E. long. 13° 45′.

ROVIGO, a town of Italy, and capital of the Polesine di Rovigo, on the river Adigetto, the see of the bishop of Adria, to the decline of which town it owes its increase. It was anciently called Buonvico; it is surrounded with walls, turrets, and battlements. The river divides it into the upper and lower towns, and to the E. is a fortified castle. Exclusive of its suburbs, it is about a mile and a half in circumference, and contains six gates, a collegiate and nine other churches, together with several religious houses and hospitals; 37 miles S.S.W. of Venice. N. lat. 45° 4′. E. long. 11° 48′.—Also, a town of Italy, in the Vincentin, on the Adige; 14 miles S.S.W. of Vicenza.

ROUILLAC, a town of France, in the department of the Charente, and chief place of a canton, in the district of Angouleme; 12 miles N.W of Angouleme. The place contains 1168, and the canton 13,531 inhabitants, on a territory of $252\frac{1}{2}$ kiliometres, in 19 communes.

ROUILLE', Peter Julian, in *Biography*, a learned Jesuit, born at Tours in 1681, was educated in the Jesuits college of that city, and made his profession in the society in 1715. He successively taught the languages, philosophy, and mathematics in its seminaries. In 1724 he was called to Paris to assist father Catrou in the composition of his Roman History. To this work he only contributed the dissertations. He also revised and corrected the work of father d'Orleans, on the revolutions of Spain, and had a considerable share in the "Memoires de Trevoux" from December 1733 to February 1737. He had previously to this, in 1716, delivered "A Discourse on the Excellency and Utility of Mathematics," printed at Caen in 1716. He was author of some other works, and died, highly respected and esteemed, in the year 1740.

ROUILLY, in *Geography*, a town of France, in the department of the Vienne; 15 miles W. of Poitiers.

ROUL, Roll, or *Rowl*, in the *Military Art*. Officers of the same rank, who mount the same guard, and take their turns in relieving one another, pursuant to some established roster, as captains with captains, subalterns with subalterns, and command according to the seniority of their commissions, are said to *roul* or *roll*.

ROULADE, Fr. in *Music*, a division or passage in a song of many notes to one syllable. (See Division and Neume.) A roulade is only an imitation of instrumental melody, either to grace a treble part, render an image more obvious, enforce the expression, or, when it is necessary, to suspend the discourse and prolong the melody. But it is likewise necessary that it should be on a long syllable, that the voice should be spirited, active, and capable of allowing the throat full liberty to warble and express with facility and neatness the notes of the division, without fatiguing the organs of the singer, and consequently the ears of the audience. Rousseau.

The vowels most proper for these flights are *a*, *o*, and *e*, open. The *i* and *u* are not sonorous, but distort the mouth: the diphthongs still more. (Rousseau is here considering the vocal properties of the French alphabet.) As to the nasal vowels or syllables, they should never be employed in roulades. The Italian language, in which the *a* and *o* abound, is more fit for inflexions of voice than the French; and these vowels are not spared by Italian composers, but brought into action as frequently as possible. On the contrary, the French, obliged to compose almost all their melodies to syllables instead of vowels, on account of their defects, are constrained to give the notes a slow and heavy motion, or to admit a clash of consonants in accelerating syllables; which necessarily renders the melody languid or harsh. And we join with the citizen of Geneva in confessing, that we trow French vocal music can never surmount these inconveniencies.

"It is a vulgar prejudice to imagine, that divisions are improper in plaintive and pathetic airs; on the contrary, when the heart is moved and affected to an uncommon degree, the voice more easily finds accents of passion, than the mind can furnish words, and thence arise interjections in all languages. (See Neume.) It is equally erroneous to imagine that a division is always proper, whenever a favourable vowel or syllable occurs, without considering the situation of the singer, and whether the sentiment, which he ought to express, authorizes it.

"Roulades are of modern invention. It does not appear that the ancients ever admitted them in their music, or ever gave them more than two notes to a syllable. And this constitutes the difference between the two musics; one of which was subservient to the language, to which the other gives the law."

These reflections are admirable, deep, comprehensive, and convincing; yet, since they occurred to the penetrating author, more changes and refinements have happened in lyric poetry and singing, which make it necessary to extend this article, in order to keep pace with the times.

Till about the middle of the last century, many Italian composers gave divisions to *a*, *e*, and *o*, indiscriminately; all Farinelli's divisions are confined to the vowel *a*. (See a collection of them in Burney's Hist. Mus. vol. iv.) Even the vowel *o* closes the lips and teeth more than the Italian *a*, on which account, we suppose, it has been wholly refused divisions or roulades in its vocal music. See Language, *Euphony of*, where this subject has been fully discussed.

ROULAND l'Eglise, in *Geography*, a town of France, in the department of the Doubs; and chief place of a canton, in the district of Baume; nine miles N.E of Besançon. The place contains 423, and the canton 9066 inhabitants, on a territory of 250 kiliometres, in 33 communes.

ROULERS, a town of France, in the department of the Lys, and chief place of a canton, in the district of Courtnay. The place contains 8063, and the canton 13,587 inhabitants, on a territory of $37\frac{1}{2}$ kiliometres, in two communes.

ROULET, a town of France, in the department of the Charente; eight miles S.W. of Angouleme.

ROUM, *i. e.* the kingdom of the Romans, a name given to Natolia, by Solyman, sultan of the Turks, when he invaded and became master of it, in the 11th century. It is now chiefly applied to a part of Asiatic Turkey, extending from the Mediterranean to the Black sea, eastward of Caramania and Natolia, and westward of Armenia and the government of Diarbekir, including the governments of Sivas, Adana, and Marasch.

Roum *Kala*, a small town and fort of Persia, in the pachalic of Orfa, situated on the western bank of the Euphrates, and inhabited by Turks and Arabs. It was formerly called Zeugma, from a Grecian term signifying a bride, and was the great passage for the Roman armies into Macedonia. There were two small towns, one on each side of the river; the former was called Zeugma, and the latter Apamea. A few miles farther down the river, the caravans travelling from Aleppo to Orfa, pass the Euphrates on a bridge of boats, at a place called "Bir," which, according to M. D'Anville, represents the ancient Bèrtha, 144 miles from Aleppo and 67 from Orfa, in N. lat. 36° 58'. (See Bir.) It is situated on an eminence on the bank of the Euphrates, protected by a citadel and a wall in a dilapidated condition. At this town, the houses of which are in a ruinous state, a tax is levied on all travellers and merchants who cross the Euphrates, which is here deep, rapid, and about 130 yards broad.

ROUMIEU, a town of France, in the department of the Gers; six miles E. of Condom.

ROUND, Rotundus, in *Geometry*. See Circle, Globe, and Sphere.

Round, in *Anatomy*. See Rotundus.

Round, in *Music*. A round in catch-books is sometimes called *a canon in the unison*, and sometimes, but erroneously, *a catch*: but it is distinct from both, being no more than a song of as many strains or sections, as parts; which, instead of being begun together, are performed after each other.

other, always ſinging different words and different notes in harmony with the reſt; till a ſignal is given, by holding up the hand, for finiſhing upon the perfect chord of the key note, where the author has placed this final mark, 𝄐

ROUND is alſo uſed in muſic to denote a ſpecies of fugue. See ROUNDELAY.

ROUND, in *Military Language*, ſignifies a walk or turn, which an officer, commiſſioned or non-commiſſioned, attended with ſome ſoldiers, commonly ſix, takes in a garriſon, or fortified place, *around* the ramparts in the night-time, to liſten if any thing be ſtirring without the works, and to ſee that the ſentinels are watchful, and do their duty, and all things are in good order.

In ſtrict garriſon the rounds go every half hour, that the rampart may be always furniſhed. The ſentinels are to challenge at a diſtance, and to port their arms as the rounds paſs, and let no one come near them. All guards turn out, challenge, exchange the parole, and preſent their arms, &c.

Rounds are ordinary and extraordinary. The ordinary rounds are three; the *town-major's round*, the *grand round*, and the *viſiting round.*

ROUNDS, *Manner of going the.* When the town-major goes his round, he comes to the main guard, and demands a ſerjeant and four or ſix men to eſcort him to the next guard; and when it is dark one of the men is to carry a light.

As ſoon as the ſentry at the guard perceives the round coming, he ſhall give notice to the guard, that they may be ready to turn out when ordered; and when the round is advanced within about twenty or thirty paces of the guard, he is to challenge briſkly; and when he is anſwered by the ſerjeant who attends the round, *town-major's round*, he is to ſay, *ſtand, round!* and port his arms; after which he is to call out immediately, *ſerjeant, turn out the guard! town-major's round.* Upon the ſentry calling the ſerjeant to turn out the guard, he immediately draws up the men in good order with ſhouldered arms, and the officer places himſelf at the head of it, with his ſword drawn. He then orders the ſerjeant and four or ſix men to advance towards the round, and challenge; the ſerjeant of the round is to anſwer, *town-major's round;* upon which the ſerjeant of the guard replies, *advance, ſerjeant, with the parole!* at the ſame time ordering his men to reſt their arms. The ſerjeant of the round advances alone, and gives the ſerjeant of the guard the parole in his ear, that none elſe may hear it; during which period, the ſerjeant of the guard holds the ſpear of his halbert or pike at the other's breaſt. The ſerjeant of the round then returns to his poſt, whilſt the ſerjeant of the guard, leaving his men to keep the round from advancing, gives the parole to his officer. This being found right, the officer orders his ſerjeant to return to his men; ſays, *advance town-major's round!* and orders the guard to port their arms; upon which the ſerjeant of the guard orders his men to wheel back from the centre, and form a lane through which the town-major is to paſs (the eſcort remaining where it was) and go up to the officer and give him the parole, laying his mouth to his ear. The officer holds the point of his ſword at the town-major's breaſt while he gives the parole.

ROUNDS, *Grand,* the rounds which are gone by general officers, governors, commandants, or field-officers. When there are no officers of the day on picquet, the officer of the main guard in garriſon may go the grand rounds.

ROUNDS, *Viſiting,* rounds gone by captains, ſubalterns, and the town-majors of garriſons.

The grand rounds generally go at midnight; the viſiting rounds at intermediate periods, between ſun-ſet and the reveillé. The grand rounds receive the parole, and all other rounds give it to the guards.

There is alſo a ſpecies of baſtard rounds, if we may be permitted the expreſſion, which are gone by a corporal and a file of men; and which are in reality nothing more than a patrole. When challenged, they anſwer *pat. rounds.*

N. B. The governor of a garriſon can order the rounds to go as often as he may judge expedient. Extraordinary rounds are reſorted to when any particular event or occurrence is expected, and in caſes of tumult, &c.

ROUND *Robbin,* a compact of honour which officers enter into, (when they have cauſe of complaint againſt their ſuperior officer) to ſtate their grievances, and to endeavour to obtain redreſs, without ſubjecting one more than another to the odium of being a leader or chief mover. The term is a corruption of *ruban rond,* which ſignifies a round ribbon. It was uſual among French officers when they ſigned a remonſtrance, to write their names in a circular form, ſo that it was impoſſible to aſcertain who ſigned firſt. Hence to ſign a *round robbin* againſt any perſon, is for any ſpecific number of men to ſign, one and all, a remonſtrance againſt him. Colonels of regiments have been ſometimes treated in this manner. Great judgment, directing motives grounded upon ſtrong facts, ſhould always influence on theſe nice occaſions.

ROUNDS, *Way of the.* See WAY.

ROUNDS, *Counter.* See COUNTER-*Round.*

ROUND, *Quarter.* See QUARTER-*Round.*

ROUNDS, among *Maſons,* denote the broken pieces of ſtatues.

ROUND-*Heads.* See WHIG and TORY.

ROUND-*Head Nails.* See NAIL.

ROUND-*Houſe,* in *Ship-Building,* that part of the ſhip abaft, next above the quarter-deck, fitted up with cabins, &c. for the accommodation of the captain.

ROUND-*Houſes* at the head, conveniencies, or ſeats of eaſe, for the officers.

ROUND-*Houſe* alſo denotes a kind of priſon, for the nightly watch to ſecure perſons in, till they can be carried before a magiſtrate. See WATCH.

ROUND-*In,* or *Round-Aft,* at *Sea,* a term belonging to the main and fore-ſail. When the wind largeth, they ſay, *Let riſe the main-tacks,* or *the fore-tacks! Hale aft the fore-ſheet to the cat-head; and the main-ſheet to the cub-bridge-head!* And when theſe ſheets are thus haled down, they keep them from flying up with the paſſarado rope. This work is called *rounding-in,* or *rounding-aft the ſail.*

ROUND *Aft,* in *Ship-Building,* the ſegment of a circle which the ſtern partakes of from the wing-tranſom upward.

ROUND *Stern,* the ſtern of a veſſel whoſe bottom, wales, &c. are wrought quite aft, and unite in the ſtern-poſt. Few Engliſh veſſels are built on this conſtruction, excepting ſmall veſſels, as hoys, &c.

ROUND-*up of the Tranſoms,* the ſegment of a circle to which they are ſided, alſo of the beams and rails of the ſtern, to which they are moulded.

ROUND *Niche, Roof, Seam, Shot, Splice, Table, Top.* See the ſubſtantives.

ROUND, in the *Academies,* denotes a circular piſte or tread.

ROUND *a Horſe, To,* is a general term for all ſorts of maneges, upon a volt, or circular tread.

Hence, to round a horſe upon a trot, gallop, &c. is to make him carry his ſhoulders and haunches roundly or compactly, upon a larger or ſmaller circle, without traverſing or bearing to a ſide.

Round *Table*, the circular table at which the knights of old, who assembled together from different countries to perform the martial exercises of the tournament, were accustomed to eat, on such occasions, to prevent disputes about precedency. Such a table is seen fixed to the eastern wall of the county-hall at Winchester, being vulgarly called "Arthur's Round Table," though it does not appear to be more ancient than the reign of king Stephen. From the use to which these tables were appropriated, the diversion itself of the tournament, or tilting, was called the round table. "Illustris miles, Rogerus de Mortuo-mari apud Kenilworth ludum militarem quem vocant rotundam tabulam centum militum ac tot dominarum constituit." Th. Walsingham, Hist. p. 49.

Round *Towers*, those tall slender towers which are almost peculiar to Ireland (some few being found in Scotland), rising to the height of from 50 to 100 feet, or more, and containing not more than five or six feet in diameter in their upper chamber. They have a single entrance-door, of from five to fifteen feet from the ground, and a loop-hole, to give light to each story, of which there are generally six or seven in each round tower. The uppermost story, however, which was the usual dwelling-place of the solitary inhabitant, was furnished with four loop-holes or windows, corresponding with the four cardinal points of the compass. From the nature and situation of these singular structures, they being always very near to the scite of an ancient church, it appears that each of them was built for the habitation of a single *Inclusus*, or hermit, who, living in the highest chamber of it, enjoyed his beloved solitude as much as if he had dwelt in a desart. It appears from Giraldus Cambrensis, that Ireland was full of these towers in the 12th century, and there is reason to ascribe the erection of them to the sixth, seventh, and eighth centuries, namely, before the Danish invasions, and during the period of the Irish transmigration into various countries in quest of solitudes. The idea of them and their use were evidently borrowed from the columns and stylites of the East. See Stylites.

Round *Bay*, in *Geography*, a bay with good anchorage, on the W. coast of St. Lucia.

Round, *Cape*, a cape on the coast of Patagonia, in the straits of Magellan. S. lat. 53° 47'. W. long. 71° 32'.

Round *Hill*, an island in the North Pacific ocean, near the E. coast of Labrador. N. lat. 53° 25'. W. long. 55° 16'.

Round *Hill Bluff*, a cape on the N. coast of Jamaica, W. of Montego bay. N. lat. 18° 29'. W. long. 77° 58'.

Round *Heads*, Indians of North America, inhabiting the territory on Round river. The number of warriors is about 2000.

Round *Island*, a small island of England, in Pool harbour.—Also, a small island near the E. coast of Borneo, in the bay of Gunong Tellu. S. lat. 0° 28'. E. long. 123° 30'.

Round *Key*, a small island near the coast of West Florida, which is well timbered. N. lat. 30° 15'. W. long. 88° 28'.

Round *Rock*, one of the Virgin islands, in the West Indies. N. lat. 18° 10'. W. long. 62° 53'.

ROUNDELAY, or Roundo, a kind of ancient poem, thus called, according to Menage, from its form; and because it still turns back again to the first verse, and thus goes round.

The word is formed from *round* and *lay*. The French call it *rondeau*; the Spaniards *gloses*.

The common roundelay consists of thirteen verses, eight of which are of one rhyme, and five in another. It is divided into couplets; at the end of the second and third of which, the beginning of the roundelay is repeated; and that, if possible, in an equivocal or punning sense.

The roundelay is a popular poem among the French, but little known among us. Marot and Voiture have succeeded the best in it.

Rapin observes, that if the roundelay be not very exquisite, it is intolerably bad. In all the ancient roundelays, Menage observes, that the verse preceding has a complete sense, and yet joins agreeably with that of the close; without depending necessarily on it. This rule, well observed, makes the roundelay more ingenious, and is one of the finesses of the poem.

Some of the ancient writers speak of the roundelay, or roundel, as a kind of air appropriated to dancing; and in this sense the term seems to indicate little more than dancing in a circle, with the hands joined. See Rondeau.

ROUNDELET. See Rundlet.

ROUNDING, in *Sea Language*, denotes certain old ropes wound firmly and closely about that part of a cable which lies in the hawse, or under the ship's bow, or athwart the stem. It is used to prevent the surface of the cable from being chafed or fretted in those places.

Rounding-*in* generally implies the act of pulling upon any rope which passes through one or more blocks, in a direction merely horizontal; as round-in the weather-braces, &c. It seems to be derived from the circular motion of the rope about the sheave or pulley through which it passes.

Rounding-*up* is expressed of a tackle which hangs in a perpendicular position, without sustaining or hoisting any weighty body; in which case it is the operation of pulling the blocks closer to each other, by means of the rope which passes through them, to compose the tackle; and is opposed to over-hauling, by which the blocks are drawn farther asunder.

ROUNDNESS, Rotundity, in *Physics*. See Sphericity.

ROUNDO, or Roundelay, in *Music*, a kind of burden or ritornello; where the beginning of each couplet is repeated at the end of it.

ROUNDSTONE Bay, in *Geography*, a harbour of the county of Galway, Ireland, in Ballinahinch. It is separated from Birterbui bay by the island of Inishkeele, lying on the west of it.

ROUNREAK, a town of Pegu, on an island formed by the Ava; 42 miles S. of Lundsay.

ROUP, in *Commerce*, a silver coin of Turkey, containing 10 paras, the para being equal to 3 aspers, and 40 paras being equal to the dollar or piastre.

Roup, in *Poultry*, is a filthy boil or swelling upon their rumps, known by the staring, or turning back of the feathers.

The roup, if not soon remedied, will corrupt the whole body; to prevent which, the feathers are to be pulled away, the swelling laid open, and the matter pressed out; after which the part is to be washed with salt and water, or brine.

ROUPALA, in *Botany*, a name of Aublet. See Rhopala.

ROUPEYROUX, in *Geography*, a town of France, in the department of the Aveyron; 7 miles S.E. of Villafranche.

ROUPIA, or Rupee. See Rupee.

ROUREA, in *Botany*, a name of Aublet's. See Robergia.

ROUSAY, in *Geography*, one of the Orkney iſlands, Scotland, is ſituated to the north-weſt of the Mainland of Orkney, from which it is ſeparated by a ſtrait about a mile in breadth. It conſiſts chiefly of a ridge of lofty hills declining on all ſides towards the coaſt. The beſt cultivated parts of this iſland are its eaſtern and ſouth-weſtern ſides; but there is a narrow ſtrip of arable land extending round the whole ſhore. The hills are moſtly covered with heath, intermixed with various kinds of graſſes, which afford ſuſtenance to a great number of ſheep, ſwine, and black cattle. Oppoſite to the Mainland, in a romantic ſituation, ſtands the houſe of Weſtneſs, which in remote ages was the abode of the celebrated earl Sigard, who fell in the famous battle of Clontarf in Ireland, and is ranked by hiſtorians among the greateſt heroes of his age. On a flat tract of land, cloſe to the ſhore, about a quarter of a mile weſtward from the place, are ſeveral "immenſe piles of ſtones, evidently the ruins of ſome ancient ſtructure, around which are to be ſeen graves formed with ſtones ſet on edge, as in ſome other places; and the name of Swendrow, which it bears, points it out, with great probability, as the ſcene of the capture of earl Paul, by Swein, the ſon of Aſleif, and the ſlaughter of his attendants, when he was, with the baſeſt intention, carried a priſoner into Scotland." The ridge known by the whimſical name of the camp of Jupiter Fring, is ſituated about two miles eaſtward from Weſtneſs. Several ſtanding ſtones are to be met with in different parts of the iſland; and there are ſome tumuli on the ſouth ſide, near the Froit, alſo a few Picts-houſes.

Contiguous to Rouſay, on the north-weſt, is the ſmall iſland of Eagleſhay, which yields to none of the Orkney iſles in beauty of appearance, or conveniency of ſituation. This iſland is about two miles long and one broad, and, in conjunction with Rouſay, forms one pariſh; which, according to the population cenſus of 1811, contained 189 houſes, and 965 inhabitants. Eagleſhay is remarkable in hiſtory for having been the ſcene of the unjuſt and barbarous murder of St. Magnus, the tutelary ſaint of the Orkney iſlands. The church, which is very ancient, is ſaid to occupy the ſpot on which the aſſaſſination was committed. Owing to the natural attractions of this iſland, ſeveral of the counts of Orkney made it their uſual place of reſidence, and their example was followed in later times, when it became the property of the Douglaſes and the Monteaths. Hiſtory of the Orkney Iſlands, by the Rev. Dr. Barry, 2d edit. by the Rev. James Headrick, 4to. London, 1808.

ROUSE *up a Hare*, among *Hunters*. See HUNTING.

ROUSE, *To*, among *Falconers*, is when a hawk lifts up and ſhakes himſelf.

ROUSHOLM HEAD, in *Geography*, a cape on the S.W. coaſt of the iſland of Stronſa. N. lat. 58° 56′. W. long. 2° 34′.

ROUSSE, *Grand* and *Petit*, rocks in the Engliſh Channel; 5 miles N.E. from the iſland of Jerſey.

ROUSSEA, in *Botany*, was ſo called by the writer of the preſent article, in memory of the celebrated Jean Jacques Rouſſeau. Botany had ſpread a charm over the latter years of this diſtinguiſhed man, and ſoothed their real or imaginary ills. Whenever he touches on this favourite ſubject, he communicates the ſame charm to his readers. Such has been the effect of his example, perhaps above all others, that he would now no longer have to deplore "the groſs ignorance and barbariſm" of the French, who, about fifty years ago, ſtared at a botaniſt with ſovereign contempt. His letters on the ſcience have rendered the Linnæan ſyſtem popular all over Europe. He correſponded with Linnæus, who had dedicated a genus to his name; which the younger Linnæus, through miſapprehenſion, publiſhed as *Ruſſelia*, and which is now called *Vahlia*, there being already a *Ruſſelia*, named by Jacquin. What we are about to deſcribe was therefore ſelected as a very fine and ſingular genus, and it has been generally adopted, both in France and elſewhere.—Smith Plant. Ic. faſc. 1. 6. Schreb. Gen. 792. Willd. Sp. Pl. v. 1. 607. Mart. Mill. Dict. v. 4. Juſſ. in Sims and Kon. Ann. of Bot. v. 2. 568. Lamarck Illuſtr. t. 75.—Claſs and order, *Tetrandria Monogynia*. Nat. Ord. *Campanaceæ*, Linn. Juſſ.

Gen. Ch. *Cal.* Perianth inferior, of one leaf, in four deep, equal, widely ſpreading, tongue-ſhaped, permanent ſegments. *Cor.* of one petal, externally rugoſe; tube nearly globular, almoſt as long as the calyx; limb in four equal, lanceolate, acute, revolute ſegments. *Stam.* Filaments four, erect, equal, linear, flattened, ſomewhat tapering upwards, longer than the corolla; anthers terminal, ſmall, arrow-ſhaped. *Piſt.* Germen ſuperior, pyramidal, quadrangular; ſtyle terminal, ſquare, permanent, the length of the ſtamens; ſtigma funnel-ſhaped. *Peric.* Berry? pyramidal, quadrangular, of one cell? with a coriaceous coat. *Seeds* very numerous, lenticular, imbedded in pulp.

Eſſ. Ch. Calyx in four deep ſegments. Corolla bell-ſhaped, four-cleft, inferior. Berry? quadrangular, with many ſeeds.

1. R. *ſimplex*. Sm. Ic. t. 6. Willd. n. 1.—Gathered by Commerſon in the iſland of Mauritius, and communicated by Thouin to the younger Linnæus, with about 1500 fine plants beſides. This appears to be a *ſhrub*, of a fleſhy habit, climbing over moſſy rocks, or ſtems of trees, in moiſt ſituations. The *ſtem* is thick and knotty. *Leaves* oppoſite, in pairs croſſing each other, ſtalked, ſimple, obovate, rather fleſhy, diſtantly toothed, pointed, quite ſmooth on both ſides, with a ſolitary rib, and many fine tranſverſe veins; their length about three inches; breadth one, or one and a half. *Footſtalks* an inch long, even, channelled, ſmooth. *Stipulas* oppoſite, between the footſtalks, triangular, acute, membranous. *Flowers* ſolitary, axillary, large, fleſhy, on drooping round *ſtalks*, rather ſhorter than thoſe of the leaves, accompanied at the baſe of the ſtalk by ſeveral crowded, membranous, acute *bracteas*, very like the *ſtipulas*. *Calyx* ſmooth, an inch long. *Corolla* ſomewhat downy at the outſide; of its colour we have no means of judging. The *fruit* appears to be a coriaceous berry, about an inch in diameter, but we have not ſeen it fully formed, nor has Commerſon left any note reſpecting the qualities of the plant. In the texture, and external downineſs, of the *corolla*, this genus accords not ſo much with *Campanula* itſelf, as with others of the ſame order, *Goodenia*, *Scævola*, &c. To ſome of theſe the form of its *ſtigma* approaches, while the *anthers*, ſo widely differing among themſelves in this order, are, in the preſent inſtance, very unlike moſt of the other genera. The oppoſite *leaves*, and intermediate *ſtipulas*, evince, as M. de Juſſieu obſerves, an approach in habit to the natural order of RUBIACEÆ. See that article.

ROUSSEAU, JOHN BAPTIST, in *Biography*, a French poet, of conſiderable celebrity, was born at Paris in 1671. His father, though only a ſhoe-maker, contrived to give him a liberal education. By his literary talents he obtained, while very young, admiſſion among perſons of rank and taſte. In 1688 he attended the French ambaſſador to the court of Denmark, in quality of page. After this he went with marſhal Tallard to England, where he contracted an intimacy with Saint Evremond. In 1703 he was domiciliated with M. Rouille, director of the finances, whom he accompanied to court, and elſewhere, living in tranquillity

in

in the midſt of ſplendour, and cultivating the Muſes, to the neglect of thoſe opportunities which occurred to him of making his fortune. When he was at the height of his reputation, he involved himſelf in an affair which put an end to his happineſs, and rendered him wretched for the remainder of his life. A number of men of letters were accuſtomed to meet at a coffee-houſe in Paris, among whom were Rouſſeau and La Motte, when, in 1708, the opera of Heſione made its appearance. Rouſſeau wrote ſome verſes upon the authors of the words, the muſic, and the ballet of the piece, which were highly ſatirical. Theſe were anonymous, and were imputed to Rouſſeau, who not only denied them, but attempted to fix the blame upon M. Saurin, a man of ſcience and letters, who, from a Calviniſt miniſter, had become a convert to Popery, and reſided in Paris. The nature of this diſcuſſion it is not neceſſary to go into, it is ſufficient to ſay, that by an arrêt of parliament, in 1712 Rouſſeau was condemned to perpetual baniſhment from the kingdom, not only as a ſuborner in the accuſation of Saurin, but as the author and diſtributor of the ſatirical verſes. He had already retired to Switzerland, where he was protected by the count de Luc, the French ambaſſador to the Cantons. He publiſhed in Soleure the firſt edition of his collected works, in the preface to which he ridiculouſly gives himſelf the air of one who wrote verſes for mere amuſement, although it was by his poetry alone he obtained public notice and the favour of the great. When De Luc went to Baden, in 1714, as plenipotentiary for concluding peace with the emperor, Rouſſeau accompanied him. He there became known to prince Eugene, and by him was taken to Vienna. Here he reſided three years, but not being able to reſtrain himſelf from exerciſing his ſatirical talent, he was obliged to quit that capital for Bruſſels, in haſte. At Bruſſels he became acquainted with Voltaire, with whom he formed a confidential intimacy, which however did not laſt very long: jealous of each other's fame, they became bitter enemies, not only endeavouring to blacken each other's moral character, but each, at the expence of his own judgment, depreciating the literary merit of his adverſary. Rouſſeau longed much to reviſit Paris, and made interceſſion with the regent duke of Orleans, who granted him letters of recall, but the poet inſiſted upon a previous reviſion of his trial, which he could not obtain. In 1721 he came to England, where he prepared a new edition of his works. This was publiſhed in 1723, in two vols. 4to. and produced him 10,000 crowns, which he placed in the fund of the Oſtend company. The failure of this company ſunk all his fortune, and he was reduced, in the decline of life, to ſubſiſt on the benevolence of his friends. Boutet, a notary of Paris, ſupplied his moſt urgent wants, but he met with more effectual aſſiſtance from the duke d'Aremberg, who, when he quitted Bruſſels in 1733, ſettled upon him a handſome penſion, beſides giving him an apartment and his table in his palace. Rouſſeau diſpleaſed this patron, by calumniating Voltaire, and determined to go to Paris, with the hope of finally obtaining a repeal of his baniſhment. He had prepared his way by two epiſtles to perſons of weight in that city, and by an ode to the praiſe of cardinal Fleury on the peace. His efforts were, however, unſucceſsful. He could not even obtain a ſafe-guard for paſſing a ſingle year in Paris: he accordingly returned to Bruſſels, where he died in March 1741, at the age of 70. In his laſt moments he declared he was not the author of the couplets for which he had been baniſhed. The eſtimate of his moral character depends ſo much on the belief of his guilt or innocence, in the points reſpecting which he was accuſed, that nothing can be more different than its ſtatement by his friends and enemies. There is more agreement in the opinions of his countrymen relative to his poetical character, and it is pretty generally acknowledged that he ſtands at the head of the ode writers in the French language. "To theſe compoſitions," adds his biographer, "he brought great fire and force of expreſſion, copiouſneſs, and grandeur of imagery, and all the harmony of which his language is capable; but the ſentiment is generally common, and nothing indicates a ſoul of the ſuperior order." Of his "Odes" there are four books, of which the firſt conſiſts of ſacred topics, taken from the Pſalms. He wrote two books of "Epiſtles" in verſe; "Cantatas;" "Allegories;" "Epigrams;" "Miſcellaneous Poems;" "Four Comedies in Verſe and three in Proſe;" and a "Collection of Letters." Theſe are ſaid to give an unfavourable idea of his temper, but ſome allowance ſhould be made for a man who was ſo long an object of the perſecution of his enemies, and of whom it was ſaid in his epitaph, that "thirty years he was an object of envy, and thirty of compaſſion." M. Seguy, in concert with M. the prince of la Tour Taſſis, has given a beautiful edition of his works, agreeably to the poet's laſt corrections. This edition was printed at Paris in 1743, in three vols. 4to. and in four vols. 12mo. containing nothing but what the author acknowledged as his own. Ferron ſpeaks of Rouſſeau as uniting in himſelf the excellencies of Pindar, Horace, Anacreon, and Malherbe. He was in habits of correſpondence with the abbè d'Olivet, the two Racines, the celebrated Rollin, and other illuſtrious French characters.

Rousseau, Jean Jacques, was born at Geneva in the year 1712. His father was a watch-maker. At his birth, which, he ſays, was the firſt of his misfortunes, he endangered the life of his mother, and he himſelf was for a long time in a very languiſhing ſtate of health; but as his bodily ſtrength increaſed, his mental powers gradually opened, and afforded the happieſt preſages of future greatneſs. His father, who was a citizen of Geneva, was a well-informed man, and in his ſhop, he always kept by him ſome literary works of authority, among which were Plutarch's Lives, with which he intermixed ſuch converſations as might be expected from an ardent republican. In his "Confeſſions," to which all the biographers of Rouſſeau muſt go for information, he has recorded ſeveral circumſtances, which, in his opinion, exerted a laſting influence upon his character; but it is more probable that his ruling propenſities were determined by his bodily conſtitution. This he repreſents as of the warmeſt kind, burning with ſenſuality from his very birth. His ſchool education was very imperfect, and he grew up in habits of idleneſs, and in the vices of a weak unſteady temper. He was firſt put apprentice to an attorney, who ſoon diſcharged him for his negligence: after this he was put out to an engraver, who diſguſted him by his harſhneſs. The fear of chaſtiſement, which he probably well merited, rendered him a fugitive from his maſter, when he was in his 15th year, at which time he was a reſtleſs diſcontented being, conſumed with deſires of which he knew not the object, and careſſing his fancies for want of realities. He went into Savoy, where he was hoſpitably entertained by a pariſh prieſt, who pleaſed himſelf with the idea of making a proſelyte from the Genevan reformed church. For this purpoſe he ſent the youth to Annecy, to a Madame de Warrens, an ingenious and very amiable lady, who had, in 1726, left part of her wealth, and the Proteſtant religion, in order to throw herſelf into the boſom of the church. This generous lady ſerved in the triple capacity of a mother, a friend, and a lover to the new proſelyte, whom ſhe regarded as her ſon. For farther inſtruction ſhe ſent him to a ſeminary at Turin, where his converſion was completed, and

and he got twenty florins in exchange with his new religion. When this money was fpent, he found no better refource than to enter into the fervice of a countefs: here he committed a crime, which he acknowledges, in his "Confeffions," with the moft heartfelt remorfe. He ftole a ribbon, and when it was found in his poffeffion, he not only denied the theft, but charged an innocent and amiable young woman in the houfe with it, to whom, in fact, he meant to have prefented the ribbon. After the death of the countefs, he entered into the family of a nobleman, whofe fon, a literary man, took pains to inftruct him, and treated him rather as a companion or pupil than a fervant. But the flattering profpects opened to him by this connection he deftroyed by his imprudence and mifconduct, and being turned out of doors, after paffing fome time as a vagabond, he returned to Madame de Warrens. This lady had found means to ally her devotional turn of mind with the indulgence of amorous propenfities, of which young Rouffeau was an object, though not the only one. Through her intereft he obtained a place as fecretary to a commiffion, appointed by the king of Sardinia for furveying lands, and in this employ he continued two years, during which he applied himfelf to the ftudy of arithmetic and geometry. Mufic, however, became his paffion, and growing difgufted with his other occupation, he renounced it, and took up the profeffion of mufic-mafter at Chamberry. Here he paffed eight years, intimately connected with Madame de Warrens, though not without following her example of occafional deviations to other favourites. At length a coldnefs took place, and Rouffeau was recommended by her to the office of tutor to the children of M. Mably, at Lyons. He did not retain this fituation very long, but went to Paris, where he lived in obfcurity till 1743, when he obtained the appointment of fecretary to the French ambaffador to the republic of Venice. It was not long before he quarrelled with his fuperior, and returning to Paris, with an improved knowledge and tafte in mufic, he lived by it, at the fame time employing his leifure in the ftudy of natural philofophy and botany. He was for fome time clerk to a farmer-general, and with part of the profits which he gained in this fituation he repaid fome of the pecuniary affiftance he had received from Madame de Warrens, who now ftood in need of it. In 1748 he began to feel the attacks of a painful diforder, which troubled him during the remainder of his life, and by incapacitating him for active employments, might perhaps be a remote caufe of his literary fame. The year 1750 was the commencement of his literary career. The academy of Dijon had propofed the following queftion, "Whether the revival of the arts and fciences has contributed to the refinement of manners." Rouffeau, it is faid, at firft inclined to the affirmative fide of the queftion; but by the perfuafion of Diderot he was induced to fupport the negative, as moft likely to attract notice. His difcourfe againft the advantages of the fciences accordingly having been found to be the beft written, and replete with the deepeft reafoning, was publicly crowned with the approbation of this learned body, and was generally read with the intereft ufually infpired by a fplendid paradox. Several anfwers appeared againft it, one of which was written by Staniflaus, king of Poland: it was enough for Rouffeau to have made his name known with fo much diftinction in the literary world. The part which he took feems to have made a lafting impreffion upon him, in preference of the favage to the civilized life, which was fo frequent a fubject of his declamation. Among other attacks which this difcourfe drew upon him, was that of being ridiculed on the ftage of Nancy, by Paliffot, in his "Comedié des Philofophes." The king of Poland, then duke of Lorraine, was fo much difpleafed with this infult, that he caufed a letter of apology to be written to Rouffeau, at the fame time acquainting him that he had deprived Paliffot of his place at the academy of Nancy, and it is highly to the credit of the philofopher, that he immediately interceded for him and obtained his reftoration.

In 1752 Rouffeau wrote a comedy, entitled "Narciffe, ou l'Amant de lui-même." He alfo compofed a mufical entertainment of "Le Devin du Village," which was reprefented with the greateft fuccefs at Paris. His next piece was "Lettre fur la Mufique Françoife," which was to prove that the French had no fuch thing as vocal mufic, and that, from the defects in their language, they could not have it. The letter was written with much tafte, and fhewed a deep knowledge of the fubject of which he was treating, but it brought down upon his head a ftorm of refentment, even to the burning of him in effigy. In 1754 he returned to Geneva, where he abjured the Catholic faith, and was reftored to the rights of citizenfhip. For this favour he made a return by the patriotic, and truly eloquent dedication to the republic, of his "Difcours fur les Caufes de l'Inégalité parmi les Hommes, et fur l'Origine des Sociétés." No one could give better advice to his fellow-citizens than Rouffeau has done in his dedication. The work itfelf is full of almoft unintelligible maxims and wild ideas; and was written with a view to prove that mankind are equal; that they were born to live apart from each other; and that they have perverted the order of nature in forming focieties. He beftows the higheft praife on the ftate of nature, and deprecates the idea of every focial compact. It is, however, rhetorical rather than argumentative, and is over-run with much idle declamation in praife of a favage, and depreciation of a civilized ftate, which the author repeated fo often till he probably believed the paradox. Our author did not remain long at Geneva, but returned to France, and lived fome time at Paris, after which he retired to Montmorency, as a ftudious folitary, and publifhed, in 1758, his "Lettre" to M. D'Alembert on the defign of eftablifhing a theatre at Geneva. This tract is written with great force of reafoning, and fhews that the author had made the moft profound obfervations on life and manners; and he feems to have carried his point in proving that a theatre could not be neceffary in a place circumftanced as Geneva was. This work is thought to have laid the foundation of that hatred which Voltaire never ceafed to entertain for the Genevan philofopher. Replies were written by D'Alembert and Marmontel.

In 1760 Rouffeau publifhed his celebrated novel, entitled "Lettres de deux Amans, &c." but generally known by the title of "Julie, ou la Nouvelle Héloife." This epiftolary romance, of which the plot is ill-managed, and the arrangement bad, like all other works of genius, has its beauties as well as its defects. Some of the letters are, indeed, admirable, from the force and the warmth of expreffion, from an effervefcence of fentiments, from the irregularity of ideas which always characterize a paffion carried to its height. By one critic it has been affumed that none of the perfonages of this novel are really interefting. "That of St. Preux is weak, and often forced. Julia is an affemblage of tendernefs and pity, of elevation of foul, and of coquetry, of natural parts and pedantry. Wolmar is a violent man, and almoft beyond the limits of nature. In fine, when he wifhes to change his ftyle, and adopt that of the fpeaker, he does not long fupport it, and every attempt embarraffes the author and cools the reader. In the Heloife, Rouffeau's talent of rendering every thing problematical, appears very confpicuous, as, in his arguments in favour of, and againft, duelling, which afford an apology for fuicide, and a juft condemnation

demnation of it; of his facility in palliating the crime of adultery, and his ſtrong reaſons to make it abhorred; on the one hand, in declamations againſt ſocial happineſs, on the other in tranſports in favour of humanity; here in violent rhapſodies againſt philoſophers; there by a rage for adopting their opinions; the exiſtence of God is attacked by ſophiſtry, and Atheiſts confuted by the moſt irrefragable arguments; the Chriſtian religion combated by the moſt ſpecious objections, and celebrated by the moſt ſublime eulogies." In the preface to this work the author attempts to juſtify his conſiſtency; he ſays public ſpectacles are neceſſary for great cities, and romances for a corrupted people. "I have," he adds, "viewed the manners of my age, and have publiſhed theſe letters. Why did I not live at a time when I ought to have thrown them into the fire." He affects alſo to ſay that they were not intended for an extenſive circulation, and that they will ſuit but few readers. With regard to their effects on the female ſex, he pretends to ſatisfy his conſcience with ſaying "No chaſte young woman ever reads romances; and I have given this book a deciſive title, that on opening it a reader may know what to expect. She who, notwithſtanding, ſhall dare to read a ſingle page is undone; but let her not impute her ruin to me—the miſchief was done before." This is mere rant, and the extreme of vanity. Rouſſeau rendered his work as ſeductive as poſſible, and would have been mortified beyond meaſure could he have believed that it could readily have been laid aſide by any one who had opened it. Beſides, had he been that moral man which he would affect to be, he ought, knowing its tendency, to have committed it to the flames, inſtead of ſending it to the preſs. In truth, he aſſumes in it the tone of a moral teacher of the higheſt order, nor will it be denied that, amidſt much improper matter, it contains many leſſons of domeſtic prudence and exalted virtue. "In warmth of painting, and eloquence of ſentiment, it muſt be allowed to have no ſuperior in its claſs; in moral inconſiſtency and improbability, ſcarcely an equal. With a profound knowledge of the human heart, it joins great ignorance of life and manners; with much ſober and uſeful truth, all the extravagance of exaggerated feeling. It is a dangerous work, but has been the parent of others ſtill more dangerous, becauſe affording eaſier objects of imitation."

Rouſſeau's next work was entitled "Du Contrât Social, ou Principes du Droit Politique," which was ſaid to be a mere extract from one on a much larger ſcale, which he had commenced, but which he had long ſince abandoned as beyond his powers. In this he is the fearleſs and intrepid vindicator of republicaniſm, and is ſuppoſed to have done much to excite the late diſaſtrous French revolution. The work was prohibited in France and Switzerland; and from its publication may be dated that warfare between the author, and the ſupporters of exiſting eſtabliſhments, civil and religious, which expoſed the remainder of his life to perſecution.

In 1762 Rouſſeau publiſhed his "Emilie, ou de l'Education," which may be regarded as his principal work, as it was that in which he moſt boldly attacked or oppoſed the commonly received opinions, and, in conſequence, excited againſt himſelf the greateſt maſs of hoſtility. The fundamental idea of Rouſſeau in education is to ſuffer the youthful mind to develope by itſelf, rather preventing it from imbibing any thing miſchievous, than haſtening to impreſs it with leſſons of preceptive inſtruction; preſenting to it objects of nature rather than of art, and regulating the conduct more by reſtraints of neceſſity than of principle, till a foundation is laid for the operation of reaſon unbiaſſed by habit and prejudice. Rouſſeau's pupil is to follow nature in every thing; the precepts of the philoſopher are expreſſed with the force and dignity of a mind full of the leading truths of morality. If he himſelf has not always been virtuous, nobody has felt its force more, or made it appear to more advantage; and he merits great applauſe for the manly and independent ſpirit, the contempt for luxurious indulgencies and idle parade, which he every where inculcates. The author excited againſt himſelf almoſt all the religious world, by the manner in which he ſpoke of the attempts to furniſh the youthful mind with theological ideas. Yet no one could more eloquently extol the morals of the goſpel and the character of its founder than he has done; by this praiſe, and his ſentiments of piety, he diſpleaſed the French philoſophers, ſo that there was ſcarcely any party of men to whom he did not ſtand in oppoſition. Of theſe, however, the moſt formidable of his antagoniſts were thoſe poſſeſſed of authority. The French parliament condemned this book in 1762, and entered into a criminal proſecution againſt the author, which forced him to a precipitate retreat. He directed his ſteps to his native country, but Geneva ſhut her gates againſt him. Both at Paris and Geneva, the "Emile" was burnt by the common hangman: ridiculous attempt of ridiculous governments to ſtop the circulation of opinions! The book ſtill exiſts, and, notwithſtanding the many and ſerious objections to which it is liable, deſerves to exiſt, while its tyrannical perſecutors have long ſince been forgotten, and their puny efforts laughed at by every man poſſeſſed of an underſtanding ſuperior to that of an idiot. Rouſſeau was for a time allowed to take ſhelter in Switzerland, where he was moſt hoſpitably treated by marſhal Keith. He there publiſhed a letter to the archbiſhop of Paris, in anſwer to his *Mandement* for the burning of the "Emile:" and alſo his "Lettres de la Montagne," which contained a ſevere remonſtrance againſt the proceedings of the republic of Geneva in his condemnation, the citizenſhip of which ſtate he formally renounced. That he thought very highly of this work is evident from the following paſſage: "How," ſays he, "can I enter into a juſtification of this work? I who think that I have effaced by it the faults of my whole life; I, who place the evils it has drawn upon me as a balance to thoſe which I have committed; I who, filled with confidence, hope one day to ſay to the ſupreme Arbiter, 'Deign in thy clemency to judge a weak mortal:' I have, it is true, done much ill upon earth, but I have publiſhed this writing." In theſe letters he again expreſſed his ſentiments concerning revealed religion, in a manner that excited againſt him great indignation among the clergy of Neufchatel. A conſiſtory was aſſembled to take his opinions into conſideration, but government interfered to ſtop its proceedings. The protection of the government was not, however, ſufficient to reſcue him from the obloquy which the clergy excited againſt him. They preached againſt the philoſopher, and their ſermons excited an uproar among the people. In September 1765, ſome miſguided zealots attacked his houſe and his perſon, and he ſought an aſylum in Berne, which was denied him. Neither the broken ſtate of his health, nor the approach of winter, could ſoften the hearts of his enemies: he entreated them to ſhut him up in their common priſon, which favour they even denied, and he was under the neceſſity of ſetting out on a long journey, in the beginning of a very inclement ſeaſon; he contrived, however, to reach Straſburg in a very deſtitute condition. He received from marſhal de Contade, who was then commander of that place, every accommodation that could be expected from humanity, compaſſion, and generoſity. Here he waited till the weather became more auſpicious, when he ſet out for Paris, where he appeared in the habit of an Armenian. The celebrated Hume was at this

this time a resident in that capital, as chargè d'affaires from the English court, and having been applied to in favour of Rousseau, who was desirous of making England his asylum, he willingly undertook to conduct him thither in the beginning of the year 1766. "At this period," says one of his biographers, "the persecutions which he had undergone, the hostility which he had experienced, and with which he had been hunted from place to place; the acrimony of his numerous opponents, and the ferment which his presence had excited in the different places of his residence, had so agitated his susceptible mind, and inflamed his vanity, that he imagined himself not only the most important, but almost the only important personage in Europe, and fancied that a general confederacy was formed against him of all sects and parties. This notion filled him with absurd suspicions, and rendered him prone to view every thing in a wrong light, and to magnify trifles into matters of great moment. In short, he was under the influence of a perversion of temper and intellect, nearly amounting to mental derangement: a malady which, indeed, in a certain degree, seems to have attended him through life, and which alone can account for his singularities and inconsistencies." Without this clue, his conduct to Mr. Hume must appear the extreme of baseness and ingratitude. This gentleman, sensibly affected with his various misfortunes, procured for him an agreeable situation in England, but Rousseau was not long satisfied with the new place. He had wished for peace, but peace and quiet he was utterly incapable of enjoying. He did not make such an impression upon the minds of the English as he had done upon the inhabitants of other countries. The freedom of his opinions, and the settled melancholy of his temper, were not deemed very remarkable or singular here. He was regarded only as an ordinary man: in the public prints he was satirized; his principles and conduct were represented as quite adapted to a modern Diogenes. He was rather regarded as an object of ridicule than of terror to any of the prevailing parties in England. Rousseau now imagined there was a plot between Hume and the French philosophers to destroy his glory. He sent a letter to him, filled with the most violent abuse, and at the same time refused to accept a pension from the crown, which had been obtained through the interest of Mr. Hume. He did not remain long in England after this, but went to France in the year 1767, where he met with various protectors, with whom he passed his time in different provinces. At this period he published his "Dictionnaire de Musique," which, though an excellent work, brought upon the author much severity of criticism. In the following year he resumed his botanical pursuits, by collecting and studying the plants which he found on the mountains of Dauphinè. In the year 1769, he married a lady with whom he had lived many years, and by whom he had already had five children, all of whom he had basely sent to the orphan hospital. This has been justly esteemed in this country as one of the greatest stains upon his character, though his foreign biographers take little notice of it, and seem to think he was justified by the indigence in which he lived. But how could a man venture to talk of morality, and write upon education, who had abandoned his own children? Notwithstanding his other merits, he must in this respect be held in abhorrence by every feeling mind. During the year 1770, he appeared at a coffee-house in Paris in his ordinary dress, and took much pleasure in the plaudits of the surrounding crowd. Though he affected the love of solitude, yet he was never easy unless he could in some way or other occupy the public attention. He could neither accommodate himself to the world, nor be content to live out of it. Nevertheless, some of his latter years he seems to have passed more tranquilly than any former period of his life, having, in a good measure, renounced all farther discussion of those controverted topics which had involved him in so many difficulties, and determined to keep his philosophy for his own use. Still he suspected that a confederacy was making against him, and he gladly accepted, in May 1778, an invitation from the marquis de Girardin, to retire with his wife to a small house near his beautiful seat of Ermenonville, where he died in the month of July in the same year, at the age of 66. His friend and patron, the marquis, erected a monument for him in the Isle of Poplars, in his pleasure grounds, with an inscription, to which Rousseau was by no means entitled: "Ici repose l'Homme de la Nature et de la Verité."

After the death of this philosopher, his "Confessions" were published, which give a minute account of every thing that happened to him till the 30th year. This singular piece of biography is itself a striking exemplification of character, for there is hardly any work in which circumstances so degrading and humiliating are related with so little reserve, while the air of importance given to the most trivial incidents in which he was any way concerned, and the contempt of shame implied by exhibiting himself thus naked to the world, prove it to have been dictated more by vanity and self-importance than by contrition. He would have passed for a better man if this work had not been published, but then he could not have had any pretext for talking so much of himself. "His Confessions," says M. Sennebier, author of the Literary History of Geneva, "appear to me a very dangerous book, and paint Rousseau in such colours as we should never have ventured to apply to him. The excellent analyses which we meet with of some sentiments, and the excellent anatomy which he gives of some actions, are not sufficient to counterbalance the detestable matter which is found in them, and the unceasing obliquities every where to be met with." There is no doubt that he has done much mischief to the interests of morality by these "Confessions," as well by the baseness of the vices which he has disclosed, as by the manner in which he united them with the virtues. Among the other pieces of Rousseau, not already noticed, and which were published after his death in a new edition of his works, are, 1. The Reveries of a solitary Wanderer, being a journal of the latter part of his life. In this he confesses that he preferred sending his children into hospitals destined for orphans, than to take upon himself the charge of their maintenance, and endeavours to palliate this shameful dereliction of duty. 2. Considerations upon the Government of Poland. 3. The Adventures of Lord Edward, a novel, being a sort of supplement to his Heloise. 4. Various memoirs and fugitive pieces, with a great number of letters. 5. Emilia and Sophia. 6. An opera and a comedy. 7. Translations of the first book of Tacitus' History, &c. &c. Like all the other writings of Rousseau, there are in these posthumous pieces many admirable and useful things; but at the same time they abound with contradictions, paradoxes, and ideas very unfavourable to religion. In his letters especially, we see a man chagrined with misfortunes, which he never attributes to his own want of conduct: he is suspicious of every body about him, calling and believing himself a lamb amidst wolves. All his works are marked with a peculiar warmth and energy of style, and with great vigour of thinking. He was one of the first writers who exercised the greatest influence upon the opinions of the age, and in the early periods of the French revolution, they were referred to as of the highest authority in political matters, and his memory was almost deified. His reputation has since been much in the wane; but as long as the French language

language remains, he muſt be regarded as one of its great authors. The beſt edition of his works collectively is in 27 vols. 4to. The principal authorities for the life of Rouſſeau, independently of his own Confeſſions, are Sennebier Hiſt. Lit. de Geneve, and Nouv. Dict. Hiſt.

In 1768, Rouſſeau's animated and inſtructive Muſical Dictionary was publiſhed, collected chiefly from his muſical articles in the Encyclopédie; and as he gave no quarter in it to French muſic, the admirers and defenders of that muſic have treated his opinions with equal ſeverity. It is, however, the buſineſs of true critics not only to point out the errors of a work, but, if it has any, the merit. There may be miſtakes in Rouſſeau's Dictionary, but are there no *good* articles, no marks of refined taſte and nice obſervation in ſpeaking of dramatic muſic? No ſhort, clear, and happy definitions of muſical technica? And is every thing he has ſaid of French muſic thought ſo abſurd and paradoxical at preſent, even in France, as it was thirty years ago? The abbé Rouſſier, and his diſciple M. de la Borde, who treat as *abſurd* and ſtupid whatever ſeems unfavourable to their doctrines, were awed perhaps by the thunder of Rouſſeau's eloquence, while alive; but no ſooner were they ſure that the lion was dead, than they plucked up a courage, and boldly attacked him at all points.

We muſt add, in juſtice to Jean Jacques, that more good taſte, intelligence, and extenſive views are to be found in his original articles, not only than in any former muſical dictionary, but in all the books on the ſubject of muſic which the literature of France can boaſt. And his "Lettre ſur la Muſique François," may be ſafely pronounced the beſt piece of muſical criticiſm that has ever been produced in any modern language.

It muſt, however, be confeſſed, that his treatment of French muſic is very ſarcaſtic, not to ſay contemptuous; but the muſic, the national character *avantageux*, and excluſive admiration of their own muſic, required ſtrong language. It had been proved long ſince, that they were not to be laughed out of their bad taſte in any one of the fine arts: the national architecture, painting, and ſculpture, were, in general, bad, and not what a traveller returning from Italy could bear to look at: though there have been now and then individual French artiſts of every kind, who have travelled and ſtudied antiquity as well as the great maſters of the Italian ſchool; and it is now ſaid, that at the Inſtitute they are trying ſeriouſly to correct their errors, and to eſtabliſh a claſſical taſte throughout the empire.

Yet, after all our ſincere encomiums on Rouſſeau as a muſical critic, particularly in the melodrama, and though we ſubſcribe to moſt of his muſical opinions, and defend them, yet we muſt leave him in the hands of his enemies with reſpect to Blainville's *new mode*, in recommending which he is totally indefenſible. But in the year 1751 he was young in muſical theory, and the laws of compoſition; he had read little, and not ſtudied much; but in 1768, after working ſo long for the Encyclopédie, in which labour to teach others he muſt have educated himſelf, nothing but the ſtate of war between him and the intolerant adherents to Rameau and the old ſchool, could have blinded him ſo far as not to ſee the abſurdity of Blainville's pretenſions to the merit of having invented a new mode, or third key in muſic, different from the major and minor modes in common uſe.

It may perhaps be alleged, even by the friends and admirers of his muſical writings, that he was more unwilling, than ſo acute and perſpicacious a logician ought to have been, to relinquiſh his new ſyſtem of *muſical notation*, which he publiſhed under the title of "Diſſertation ſur la Muſique moderne," in 1743, when very young, and his knowledge of muſic ſuperficial. Forty years had not weaned him from his partiality for this juvenile production; for he not only republiſhed it in 1768, in his Muſical Dictionary, but near the end of his life, in 1778, he ſtill perſiſted in explaining and recommending its adoption: as Fontenelle, at near 100, wrote and publiſhed a tract in favour of the Carteſian, and Troubillons againſt Newton's ſyſtem of gravitation.

Lord Stanhope, and Mr. Baldwyn of Cheſhire, are now (1804) at work on a new method of notation, expreſſing by letters of the alphabet what Rouſſeau did by numerical figures, with great confidence of ſucceſs. But neither Rouſſeau, nor ſubſequent ingenious framers of a new muſical notation, could or would ſee the inconvenience and even miſchief it would occaſion to the art, if ever it was generally adopted, by rendering all former muſic unintelligible, unleſs every muſician and muſical ſtudent were at the pains of learning two gamuts, or ſyſtems of muſical notation, inſtead of one.

Muſic is at preſent an univerſal language throughout Europe. All nations uſe the ſame characters, and write and read them with equal facility. Suppoſe a tyrant in any one kingdom only, were to inſiſt upon the inhabitants relinquiſhing at once their native language, and adopting another of which they were utterly ignorant, it is hardly poſſible to imagine that his mandate would or could be obeyed; but if the deſpot's will were attempted to be complied with in his particular dominions, would all the reſt of Europe burn their books, and ſet about learning a new alphabet, a new ſpelling-book, a new grammar, and the art of writing this new language? nothing but its general and univerſal adoption could render it uſeful to any one nation upon earth.

ROUSSEL, William, a learned French Benedictine monk of the congregation of St. Maur, was born at Conches, a ſmall town within the dioceſe of Evreux, in Normandy in the year 1658. He became a member of the congregation in the year 1680, and directed his attention principally to thoſe ſtudies which would qualify him for the office of a preacher. Having fine talents, he became very popular, and the general theme of commendation at Paris, but preferring retirement, he withdrew to Rheims, and afterwards to Argenteuil, where he ſpent the remainder of his life in devotion and ſtudy. He died in the year 1717. He publiſhed an excellent tranſlation of the Letters of St. Jerome, in 3 vols. 8vo. the firſt two of which appeared in 1704; and the third, containing the critical letters of that father on the Holy Scriptures, in 1707. They are accompanied with a preface and learned notes. He was author of an *éloge* on father Mabillon. He had employed many years of his life in making preparations for compoſing "A Literary Hiſtory of France," but death put an end to his labours, and his papers were placed in the hands of father Rivet, a member of the ſame congregation, who made uſe of them without acknowledging his obligation.

ROUSSELAER, in *Geography*, a town of France, in the department of the Lys, ſituated on the river Mandel; 10 miles S. of Bruges.

ROUSSIER, the *abbé*, in *Biography*, a profound writer on the theory of muſic, was born at Marſeilles in 1716. He is author of a conſiderable number of muſical tracts, of which the following are the titles:

1. A Treatiſe on Chords and their Succeſſion, 1764.
2. Obſervations on different Points of Harmony, 1765.
3. Memoir on the Muſic of the Ancients, 1770.
4. A Letter, in two parts, to the author of the Journal of the Arts and Sciences, concerning the diviſion of the zodiac, 1770. The ſecond part to the ſame concerning the Inſtitution of the Planetary Week, 1771.

5. Prac-

5. Practical Harmony, or Examples in Illustration of the Treatise on Chords, 1776.

6. He was engaged, in 1779, as editor of a memoir on the music of the Chinese, by the abbé Amiot, missionary at Pekin. The learned abbé has enriched this memoir with a great number of notes, observations, and a copious index. See CHINESE *Music*.

All this profound writer's treatises are built upon the principles of Rameau, but Rameau sublimed. The abbé's favourite discovery and systematic principle is the triple progression, upon which he endeavours to prove that the musical systems of the Egyptians, Greeks, and Chinese were founded. By triple progression is meant a series of perfect fifths, so that the word temperament equally disturbs his system and his temper. It is to be feared that the good abbé in this particular, and in his principles in general, is too rigid and inflexible a theorist for the fanciful melody, and licentious modulation of modern composers.

The French are always to have champions, *une homme armé*, to combat the music and musical writers of all other countries. At the beginning of the last century, Bonnet was the redoubted champion of the votaries of Lulli in the middle of that century. The abbé Roussier, with less fury, but more intelligence, threw down the gauntlet for Rameau and his basse fondamentale; and at the end of the century, the abbé Faitu, the most valourous and invincible of them all, has not only bid defiance to the enemies of Lulli and Rameau, but to the whole universe: a perfect Drawcansir, that spares nor friend nor foe, who dares be of a different opinion from himself.

ROUSSILLON, in *Geography*, a province of France before the revolution, once belonging to Spain, bounded on the N. by Languedoc, on the E. by the Mediterranean, on the S. by Catalonia, and on the W. by the Pyrenees, about 18 leagues in length, and 12 in breadth, and consisting of land that is generally fertile. Its principal rivers are the Tet and the Tech, and its capital is Perpignan. It now forms the department of the Eastern Pyrenees.

ROUSSILLON, a town of France, in the department of the Isere, and chief place of a canton, in the district of Vienne; 9 miles S. of Vienne. The place contains 963, and the canton 11,107 inhabitants, on a territory of 225 kiliometres, in 21 communes.—Also, a town of France, in the department of the Saone and Loire; 9 miles N.N.W. of Autun.

ROUSSIN, in the *Manege*, is a strong well-knit, well-stowed horse, such as are commonly brought into France from Germany and Holland.

ROUSSING, in *Sea Language*, is the act of pulling together upon a cable, hawser, &c. without the assistance of tackles, capsterns, &c. It is particularly used in the exercise of removing a ship from one place to another, by means of ropes and anchors.

ROUT, ROUTE, a public road, highway, or course; especially that which military forces take.

The word is French, *route*, formed from the Latin *rupta*, or *ruta;* or the French *roux*, an old word for *horse;* or rather from the old Celtic *rout*, *road*.

Sanson and Ogilby have made maps of the routs and post-roads of France and England. Soldiers are prohibited going out of their routs. Routs are frequently cut in parks, forests, &c. both for ornament, and for the conveniencies of hunting.

Some use route for a path cut across a wood; in opposition to *way*, which is a great road.

ROUT, in *Navigation*. See COURSE.

ROUT is also used for the defeat and flight of an army.

ROUT, in *Law*, is an assembly or combination of three or more persons, upon a common quarrel, going forcibly to commit an unlawful act: such as breaking down fences upon a right claimed of common, or of way, though they do not actually perform it.

If they go, ride, or move forwards, after their meeting, thus making some advances towards the execution of their purpose, it is a rout, though they do not put their purpose in execution; if they do, it is a riot.

A rout, therefore, seems to be an unlawful assembly; and a riot the disorderly fact committed thereby.

Two things, however, there are in common to *rout*, *riot*, and *unlawful assembly;* the one, that there be at least three persons together; the other, that, being together, they disturb the peace, either by words, shew of arms, turbulent gesture, or actual violence.

For the punishment incurred by routs, &c. see RIOT.

ROUT *of Wolves*, among *Hunters*, denotes a herd of those wild beasts.

ROUTIER, in *Navigation*. See WAGGONER.

ROUTOT, in *Geography*, a town of France, in the department of the Eure, and chief place of a canton, in the district of Pontaudemer; nine miles E. of it. The place contains 1169, and the canton 14,721 inhabitants, on a territory of 110 kiliometres, in 21 communes.

ROUTOU, a town of Thibet; 255 miles E.N.E. of Latac.

ROUVRAY, a town of France, in the department of the Côte d'Or; 11 miles S.W. of Semur en Auxois.

ROUVRE, a town of France, in the department of the Upper Marne; 15 miles S.W. of Langres.

ROUVRES, a town of France, in the department of the Vosges; four miles W. of Mirecourt.

ROUVROY, a town of France, in the department of the Somme; 15 miles E. of Peronne.

ROU-WADDE. See RUAD.

ROUX, CAPE, a cape of Africa, on the coast of Tunis. N. lat. 37° 10'. E. long. 8° 22'.

ROUXIERE, LA, a town of France, in the department of the Lower Loire; eight miles N.E. of Ancenis.

ROUY, a town of France, in the department of Nievre; 15 miles E. of Nevers.

ROW, a town of Scotland, in the county of Dumbarton; nine miles W. of Dumbarton.—Also, a town of Hindoostan, in Bahar; 20 miles S. of Bahar. N. lat. 24° 55'. E. long. 85° 52'.

ROW-*Culture*, in *Agriculture*, that method in which the crops are sown in rows or drills, and afterwards cultivated according to that system. See DRILL *Husbandry*.

This sort of cultivation is commonly divided into the narrow and distant kinds, the former comprising all sorts of grain, and some other kinds of crops, which are sown in rows at not more than six, eight, ten, and twelve inches apart; the latter, all those which have large spaces or intervals between the rows, as from a foot to a foot and a half, two feet and more, such as beans, peas, turnips, cabbages, beets, potatoes, carrots, parsneps, and many others. They all require to be wrought between suitable tools, such as hoes and ploughs, at different times, while they are growing upon the ground.

ROW-*Galley*, a long, low, flat-built vessel, furnished sometimes with a deck, and navigated with sails and oars, particularly in the Mediterranean.

ROWAH, in *Geography*, a town of Hindoostan, in Bahar; eight miles N.W. of Bettiah.

ROWALE, or KOWALE, a town of the duchy of Warsaw; 36 miles S. of Wladislaw.

ROWAN, a county of America, and one of the most populous

populous of North Carolina, in Salifbury diftrict; bounded N. by Iredell, and S. by Cabarrus, and containing 21,543 inhabitants.

ROWE, Elizabeth, in *Biography*, a lady greatly diftinguifhed for her piety and poetical talents, was daughter of the Rev. Walter Singer, a diffenting minifter near Frome, in Somerfetfhire. Under the difgraceful reign of Charles II. this gentleman was imprifoned on account of his non-conformity at Ilchefter, where he married, and where his daughter Elizabeth was born in 1674. From her childhood fhe difcovered a paffion for reading, together with a devotional turn of mind. At the age of twelve, fhe began to write verfes, and practifed mufic and drawing. Her poetical talents excited notice in the neighbourhood, and gave her an introduction to lord vifcount Weymouth, by whofe fon, the honourable Mr. Thynne, fhe was inftructed in the French and Italian languages. In her 22d year, at the requeft of her friends, fhe publifhed a volume of mifcellaneous poems, by which fhe is advantageoufly known. Poffeffing an agreeable perfon, and a large fhare of the accomplifhments of her fex, fhe attracted the attentions of many admirers, but fhe appears to have been in no hurry to marry, and it was not till 1710 that fhe gave her hand to Mr. Thomas Rowe, a very amiable man, a fcholar, and a poet, with whom fhe lived in the enjoyment of a large portion of conjugal felicity. This happinefs was not lafting; Mr. Rowe, who was of a confumptive habit, died at Hampftead in 1715, and left his widow overwhelmed with grief, which nothing but her fentiments of pious refignation could enable her to fupport. From this time fhe paffed her days, for the moft part, in retirement at Frome, but making occafional vifits to the countefs of Hertford. Her manners and attainments rendered her perfectly fuited to the beft company; and though fhe adhered to the laft to the principles of the Diffenters, fhe was entirely free both from narrownefs of fentiment, and from any forbidding aufterity of behaviour. Mrs. Barbauld has, in a few lines, given the manner in which fhe employed herfelf, and the perfons with whom fhe affociated.

"Yet in no ufelefs gloom fhe wore her days,
She loved the work, and only fhunned the praife:
Her pious hand the poor, the mourner, bleft;
Her image lived in every kindred breaft,
Thynne, Carteret, Blackmore, Orrery approved,
And Prior praifed, and noble Hertford loved.
Seraphic Kenn, and tuneful Watts were thine,
And Virtue's nobleft champions filled the line."

Mrs. Rowe compofed feveral works in her retreat, efpecially thofe letters from the dead to the living, which her own heavy lofs doubtlefs had fuggefted. She was bleffed with a good conftitution, and paffed through life with very little interruption of health. She died fuddenly in February 1737, in the 63d year of her age. A pious book was found lying open by her, and in her cabinet were found letters to feveral of her friends, which fhe intended for them after her death. Her works were, "The Hiftory of Jofeph," an heroic poem; "Friendfhip in Death," &c.; "Devout Exercifes of the Heart;" "Mifcellaneous Works," in two volumes. Few characters have been more juftly efteemed than that of Mrs. Rowe. With refpect to her poetical works, the general character is correct and melodious verfification, flowing language, and tender elevated fentiments. Among her profe compofitions the moft popular was that entitled "Friendfhip in Death, in twenty Letters," fuppofed to be written from the dead to the living. Thefe are the works of a lively and a feeling heart, exercifed in pious meditations, and they are always read with pleafure by the young, and thofe who are fufceptible of good impreffions. They have paffed through many editions, and are ufually accompanied by other pieces of the author's of a moral and religious kind. All her writings, though not calculated to ftand the teft of exact criticifm, infpire a favourable idea of the writer.

Rowe, Thomas, the hufband of the foregoing, was the fon of a diffenting minifter, who afforded him all the advantages of an excellent education, and he would probably have become a diftinguifhed literary character, had not his early marriage been followed by a premature death. He wrote fome excellent pieces of poetry, one of which was a tender ode to his wife, fome years after their marriage. Hiftory was his favourite purfuit, and he formed a defign of writing the lives of illuftrious characters in antiquity, omitted by Plutarch, of which eight were finifhed, and were publifhed after his death. He died in 1715, at the age of 28. Some of his original poems and tranflations were printed with Mrs Rowe's "Mifcellaneous Works."

Rowe, Nicholas, an eminent Englifh poet, the fon of John Rowe, efq. ferjeant at law, was born in 1673, at Little Berkford, in Bedfordfhire. After a preliminary education at Highgate, he was placed in Weftminfter fchool under the noted Dr. Bufby, as a king's fcholar, and purfued claffical ftudies with eagernefs and fuccefs. His poetical exercifes in Latin and Greek were particularly admired. He was removed from fchool at the age of 16, and entered a ftudent in the Middle Temple, and proceeded fo far in the purfuit of the law, as to be called to the bar; but the death of his father, when he was only 19, gave him liberty to follow his own inclination, and he devoted himfelf to poetry and polite literature. At the age of 25 he produced his firft tragedy, entitled "The Ambitious Step-mother;" the ftory of which appears to be founded on that of Solomon elevated to the throne by the machinations of his mother Bathfheba, but the fcene and circumftances are totally different. It was acted at Lincoln's Inn-Fields, and was very fuccefsful, which is faid to have rendered the author a decided deferter from the law. His next dramatic work was "Tamerlane," which was acted in 1702. This was intended to convey important political impreffions: the tyrant and defpot Bajazet being intended as the type of Lewis XIV., then confidered as the enemy of liberty, civil and religious, and the Tartar Tamerlane was metamorphofed into a perfect prince, intended to characterize the immortal William III. of England. In all the portraits there was much exaggeration, but the purpofe of the piece, and its many elevated and liberal fentiments, caufed it to be received with great applaufe. It was frequently acted during that and the following reign, till the year 1710, when different political opinions coming into fafhion, it was for a time intermitted, but the acceffion of the houfe of Hanover reftored it to the ftage, and it was for a great number of years reprefented on the anniverfary of king William's landing. In 1703, Mr. Rowe produced his "Fair Penitent," which is thought to be his moft ftriking piece; it is highly interefting, and abounds with poetry and fine fentiments. Mr. Rowe made an attempt at comedy in 1706, but did not fucceed. From this time to 1715, he brought out, in fucceffion, the tragedies of "Ulyffes;" "The Royal Convert;" "Jane Shore," and "Lady Jane Gray." Of thefe, the two laft have furvived on the ftage. Jane Shore is now occafionally acted; always when performed engages fome of the beft actors, and never fails to be viewed with the deepeft intereft. During this interval he appeared as an editor of Shakfpeare's plays, prefixing to this edition an account of the life of that tranfcendant genius. Rowe was not exclufively engaged in literary purfuits, he he was a man of bufinefs, and did not neglect thofe opportunities of entering into public life, which his reputation and connections afforded. He had joined the Whig party, and when the duke of Queenfberry was made fecretary of ftate, he was appointed by that nobleman his under fecretary. This poft he held about three years, when the duke died, and his fervices were no more required during the reign of queen Anne. It is faid he went, one day, to pay his court to the lord-treafurer Oxford, who afked him if he underftood the Spanifh language. He replied in the negative, but added, that he did not doubt but he could make himfelf mafter of it, fuppofing his lordfhip intended to give him employment at the court of Madrid. The earl feemed to approve his intention of ftudying the language: Rowe took his leave, and retired a few weeks or months to learn it, and then waited on his lordfhip to acquaint him with what he had done: "then, fir," replied the courtier, "I envy you the pleafure of being able to read Don Quixote in the original," and difmiffed him. On the acceffion of George I. the place of poet laureat was conferred upon him, and he was alfo made one of the land furveyors of the cuftoms of the port of London. The prince of Wales conferred upon him the clerkfhip of his council, and the lord chancellor Parker made him his fecretary for the prefentations. The emoluments of thefe offices, with his own fortune, enabled him to fupport a very refpectable ftation in fociety, but he did not live long to enjoy thefe acceffions to his fortune. He died in 1728, at the age of 45, and was interred among the poets in Weftminfter-Abbey. Mr. Rowe was twice married, and had a fon by his firft wife and a daughter by the fecond. He was a handfome and genteel man; and his mind was as amiable as his perfon. He lived beloved, and at his death was lamented by Pope, in an epitaph which is to be found in Pope's works, though it is not affixed on the monumental marble at Weftminfter. Mr. Rowe is chiefly known to the public as a tragic poet; if he does not poffefs in a very high degree the principal parts of tragic invention, fuch as the nice difcriminations of character, and the fkilful developement and varied play of paffion; his diction is poetical without being bombaftic or affected, his verfification is fingularly fweet, and his plays abound with fentiments, given with fuch force and elegance as are calculated to dwell upon the mind. In his Jane Shore he profeffes to be the imitator of Shakfpeare, but nothing can be more diffimilar than the mode and colour of writing in the two poets, as nothing could be lefs refembling than their genius. Mr. Rowe is well known alfo by his poetical tranflations. He gave verfions of the Golden Verfes of Pythagoras, and of the firft book of Quillet's "Callipædia," fee QUILLET; but his chief labour in this way was a tranflation of Lucan's "Pharfalia," which was not publifhed till 1728, ten years after the tranflator's death, and which Dr. Johnfon calls "one of the greateft productions of Englifh poetry;" but if critically compared with the original, it will be found frequently very diffufe. The "Poetical Works" of Mr. Rowe, confifting of his plays and mifcellaneous poems, were publifhed collectively in three vols. 12mo. in 1719; and his tranflation of the Pharfalia was publifhed foon after his death, with a dedication to the king by his widow.

ROWE, in *Geography*, a townfhip of America, in the N.W. corner of Hampfhire county, Maffachufetts, bounded N. by Vermont; watered by Deerfield river, and containing 839 inhabitants; 115 miles N.W. of Bofton.

ROWEL, among *Farriers*, a kind of iffue, made by drawing a fkain of filk, thread, hair, or the like, through the nape of the neck, or other part of a horfe; anfwering to what in furgery is called a *feton*.

The ROWELLING *of Horfes* is a method of cure frequently had recourfe to, in cafes of inward ftrains, efpecially about the fhoulders or hips; as alfo for hard fwellings not eafily to be refolved.

The operation is thus: a little flit being made through the fkin, about a hand's breadth below the part aggrieved, big enough to put a fwan's quill in; the fkin is raifed from the flefh, the end of the quill put in, and the fkin blowed from the flefh upwards, and all over the fhoulder.

Then the hole being ftopped by the finger, the place blown is beaten with a hazel ftick, and the wind fpread with the hand all over, and then let go.

This done, a fkain of horfe-hair, or red farfenet, half the thicknefs of the little finger, is put in a rowelling needle feven or eight inches long; the needle is put into the hole, and drawn through again fix or feven inches higher; then the needle is drawn out, and the two ends of the rowel tied together; anointing it every day, as well as before the putting it in, with fweet butter and hog's greafe, and drawing it backwards and forwards in the fkin, to make the putrid matter difcharge itfelf more plentifully.

Others, difliking thefe rowels, as making too great a fore and fcar, ufe the French rowel, which is a round piece of ftiff leather, with a hole in the midft, laying it flat between the flefh and fkin, the hole of the rowel juft againft that in the fkin; fewing it with a needle and thread drawn through the hole in the fkin; cleaning it once in two or three days, and then anointing it afrefh.

ROWELS *of a Spur*. See SPUR.

ROWEN, in *Geography*, a town of Bohemia, in the circle of Chrudim; 10 miles S.E. of Chrudim.

ROWEN-*Tree*, in *Hufbandry*, a term improperly applied to the mountain afh.

ROWENSKO, in *Geography*, a town of Bohemia, in the circle of Boleflaw; 6 miles S.E. of Turnau.

ROWET, a name fometimes applied to rouen. See ROUEN.

ROWETY-WOOL, among wool-dealers, a term applied to the young wool of fome forts of fheep, which rifes below the old fleece.

ROWING, is the action of impelling a boat or veffel along the furface of the water by oars, which are managed in a direction nearly horizontal. See OAR, BOAT, &c.

ROWING-*Guard*. See GUARD-*Boat*.

ROWLE, in a *Ship*, is a round piece of wood or iron, in which the whip goes, being made to turn about, that it may carry over the whip the eafier from fide to fide.

ROWLEY, in *Biography*, a monk, who is faid to have flourifhed at Briftol in the 15th century, and whofe poems, or thofe attributed to him, were publifhed, many years ago, by the unfortunate CHATTERTON. See his article.

ROWLEY, WILLIAM, who ftands in the third clafs of dramatic writers, lived in the reign of James I., and was one of the company of players belonging to the prince of Wales. Little is known of him, except that he was in clofe connection with all the principal wits and poetical geniufes of that age, with fome of whom he joined in their writings. By Wood he is ftyled "the ornament for wit and ingenuity of Pembroke-hall, Cambridge." He was a confiderable benefactor to the Englifh ftage, having left five plays of his own compofing, and lent his affiftance to feveral authors in the compofition of many others. The titles of all thefe are given in the Biographia Dramatica; which fee.

ROWLEY, in *Geography*, a town of Hindooftan, in Oude; 18 miles S. of Bahraitch.

ROWLEY, a townfhip of America, in Effex county, Maffachufetts;

fachufetts; the inhabitants, amounting to the number of 1682, are moftly farmers; incorporated in 1639, and fituated 4 miles N.W. by W. of Ipfwich.

ROWLEY *Rag*, in *Mineralogy*, a bafaltic ftone from Rowley, near Dudley, in Staffordfhire. It is ufed for polifhing in fome of the manufactures of Birmingham, and has been particularly recommended for grinding the fpecula of reflecting telefcopes. On this variety of bafalt, the fine-grained grunftein of Werner, fome moft interefting experiments were made by the late Mr. Gregory Watt, to determine the important queftion refpecting the igneous or aqueous origin of bafaltic rocks. Perhaps few experiments in the laft fifty years throw more light on fome of the myfterious operations of nature in the mineral kingdom, and have a better claim to the profound attention of philofophers, or are more deferving of being repeated and diverfified. (See Phil. Tranf. for 1804, p. 279.) Before a fhort account of thefe experiments, it may be proper to give a defcription of the ftone itfelf. Rowley rag is a fpecies of fine-grained bafalt, of a confufed cryftallized texture; its fracture, in fmall pieces, is uneven; in the large, conchoidal. Its hardnefs is fuperior to common glafs, but inferior to felfpar; its tenacity is confiderable; its action on the magnetic needle is ftrong, but without figns of polarity; its fpecific gravity is 2.868. The general colour of Rowley rag is a very dark grey, approaching to black: it reflects light from a variety of brilliant points, fome of which feem to be felfpar, the others hornblende. According to the analyfis of Dr. Withering, 1000 parts contain 475 filex, 325 argillaceous earth, and 200 of the oxyd of iron. The magnetic property of thefe rocks was firft obferved by Dr. Plott, who fays they turned the needle 6° from its proper direction. The fame power of affecting the magnet has fince been difcovered in feveral bafaltic mountains, particularly in the Giant's Caufeway in Ireland. This ftone is fimilar to the bafalt of the Clee hills, in Shropfhire, and the bafaltic ftones in various parts of Great Britain. In its characters and chemical compofition it nearly refembles fome of the compact lavas from Ætna and Teneriffe. It is eafily fufible into an opaque black glafs, which, however, tranfmits light through very minute fragments. The texture of this glafs is completely vitreous, with a few air-bubbles. Its fracture is conchoidal and undulated; the hardnefs is fuperior to felfpar, but inferior to quartz. This glafs poffeffes fcarcely any action on the magnetic needle. The fpecific gravity is 2.749.

For the purpofe of afcertaining the effect of a high degree of temperature on a confiderable quantity of this ftone, one of the common reverberatory furnaces, ufed in iron founderies for the fufion of pig-iron, was ftrongly heated by a fire maintained feveral hours. About feven hundred-weight of amorphous Rowley rag was broken in fmall pieces, and depofited gradually on the elevated part of the interior of the furnace, between the fire and the chimney; from whence, as it melted, it flowed into the deeper part, in which, in ordinary operations, the iron is collected. It was obferved by the perfons attending, that it did not require half the quantity of fuel to fufe the bafalt that would have been neceffary to melt an equal weight of pig-iron. When the whole was melted, it formed a liquid glafs, rather tenacious, from which a large ladleful was taken, which, being allowed to cool, retained the characters of perfect glafs. The fire was maintained, though with gradual diminution, for more than fix hours; after which time, the draught of the chimney was intercepted, the furface of the glafs was covered with heated fand, and the furnace was filled with coals, which were confumed very flowly. It was eight days before the mafs in the furnace was fufficiently cool to be extracted, and even then it retained confiderable heat.

The form of the mafs being given by the bottom of the furnace, approached to the fhape of a wedge. It was nearly three feet and a half long, and two feet and a half wide; about four inches thick at one end, and above eighteen inches at the other. Owing to this inequality of thicknefs, and alfo to the unequal diftribution of heat in the furnace, Mr. Watt ftates that the cooling of the mafs had been too irregular to permit it to attain an homogenous texture; but this circumftance fortunately difclofed fome very remarkable peculiarities in the arrangement of the particles of bodies, paffing from a vitreous to a ftony ftate.

Thefe peculiar changes were difcovered, by infpecting the various parts of the wedge-fhaped mafs, which had progreffively cooled, as they were more remote from the fire, and nearer to the fmall extremity. This circumftance, not being very diftinctly ftated by Mr. Watt, has led fome of the readers of the paper to believe that the changes were obferved by taking a portion of the fubftance out of the furnace at different times, during the procefs: hence they have not fufficiently attended to a moft important fact which this experiment difclofes, namely, that the particles of bodies in a folid ftate, and at a temperature much below that of fufion, are capable of a kind of internal motion, and of affuming a cryftalline arrangement, in all the various ftages from fluidity to a perfectly folid ftate.

The tendency towards arrangement in the particles of the fluid glafs is firft developed by the formation of minute globules, which are generally nearly fpherical, but fometimes elongated, and which are thickly diffeminated through the mafs. The colour of thefe globules is confiderably lighter than that of the glafs; they are commonly greyifh-brown, fometimes inclining to chocolate-brown; and when they have been formed near the interior furface of the cavities in the glafs, they project and refemble a clufter of fmall feeds. Their diameter rarely exceeds a line, and feldom attains that fize; as, in general, they are fo near to one another, that their furfaces touch before they can acquire confiderable magnitude. In the procefs of cooling, they adapt their form to their confined fituation, fill up every interftice, and finally prefent a homogenous body, wholly unlike glafs, and equally unlike the parent bafalt. When the union of the little globules has been imperfectly effected, the fracture of the mafs indicates its ftructure, by numerous minute conchoidal fractures, which difplay the form of each globule. But if the arrangement has extended a little farther, all thefe fubdivifions are entirely loft; the mafs becomes perfectly compact, has an even or a flat conchoidal fracture, is nearly of the fame hardnefs as the glafs, is commonly of a chocolate colour, graduating into a brownifh-black, and the intenfity of the colour increafes in proportion to the degree to which the arrangement has extended. Its afpect is rather greafy; and it much refembles fome varieties of jafper, in the compactnefs of its texture, and its opacity. Its magnetic action is extremely feeble. Its fpecific gravity appears to be 2.938. From this refemblance to jafper, Mr. Watt denominates the mafs in this ftate jafpideous.

If the mafs were now rapidly cooled, it is obvious, fays Mr. Watt, that the refult would be the fubftance I have juft defcribed; but if the temperature adapted to the farther arrangement of its particles be continued, another change is immediately commenced; by the progrefs of which it acquires a more ftony texture, much greater tenacity, and its colour deepens as thefe changes advance, till it becomes abfolutely black. Sometimes this alteration is effected

effected by a gradual transition, the limits of which cannot be assigned; but more generally by the formation of secondary spheroids, in the heart of the compact jaspideous substance. These spheroids differ essentially from those first described: the centres of their formation are more remote from each other, and their magnitude is proportionably greater, sometimes extending to a diameter of two inches, and seeming only to be limited by contact with the peripheries of other spheroids. They are radiated with distinct fibres: sometimes the fibres resemble those of brown hæmatites, and sometimes they are fasciculated irregularly, so as to be very similar in appearance to the argillaceous iron ores, rendered prismatic by torrefaction. They are generally well defined, and easily separable from the mass they are engaged in; and often the fibres divide at equal distances from the centre, so as to detach portions of the spheroid in concentric coats. The transverse fracture of the fibres is compact and fine-grained; the colour black; and the hardness somewhat inferior to that of the basaltic glass. When two of the spheroids come in contact by mutual enlargement, no intermixture of their fibres seems to take place: they appear equally impenetrable; and as neither can penetrate, both are compressed, and their limits are defined by a plane, at which a separation readily takes place, and each of the sides is invested with a rusty colour. When several spheroids come in contact on the same level, they are formed by mutual pressure into pretty regular prisms, whose division is perfectly defined; and when a spheroid is surrounded on all sides by others, it is compressed into an irregular polyhedron.

The transition from this fibrous state to a different arrangement, seems to be very rapid, for the centre of most of the spheroids becomes compact before they attain the diameter of half an inch. As the fibrous structure propagates itself by radiating into the unarranged mass, the compact nucleus, which supplies its place, gradually extends till it finally attains the limits of the spheroids; and the same arrangement pervades the matter comprehended between them. The mass has now assumed a compact stony texture, and possesses great tenacity. Its hardness is somewhat inferior to that of the glass from which it was formed. Its action on the magnetic needle is very considerable. Its specific gravity is 2.938. Its colour is black, inclining to steel grey; it is absolutely opaque, and only reflects light from a few minute points. Though the divisions between the spheroids are rendered imperceptible to the eye, they are not obliterated, and their rusty surfaces are often disclosed by an attempt to fracture the mass.

A continuation of the temperature favourable to arrangement speedily induces another change. The texture of the mass becomes more granular, its colour rather more grey, and the brilliant points larger and more numerous; nor is it long before these brilliant particles arrange themselves into regular forms; and finally the whole mass becomes pervaded by thin crystalline laminæ, which intersect it in every direction, and form projecting crystals in the cavities. The hardness of the basis seems to continue nearly the same; but the aggregate action of the basis and of the imbedded crystals on the magnetic needle, is prodigiously increased. It appears to possess some polarity, and minute fragments are suspended by a magnet. Its specific gravity is somewhat increased, as it is now 2.949. The crystals contained in it, when examined by a microscope, appear to be fasciculi of slender prisms, nearly rectangular, terminated by planes perpendicular to the axis; they are extremely brilliant, but their colour is greenish-black; they are harder than glass, and fusible by the blowpipe; they are suspended by the action of a magnet. They are arranged nearly side by side, but not accumulated in thickness, so that they present the appearance of broad thin laminæ; they cross one another at all angles, but always on nearly the same plane; and the laminæ thus formed are often three or four lines long, and from a line to a line and a half broad, but extremely thin.

It seems obvious that an equalized temperature would have rendered the whole similar to the substance last described; and it may be fairly inferred, that by a continuance of heat the minute crystals would have been augmented in their dimensions by the accession of similar particles still engaged in the basis, or by the union of several crystals, till they acquired sufficient magnitude for their nature to be absolutely determined by the usual modes of investigation. It is possible, however, if such precautions had been taken as might have secured this degree of perfection in the ulterior result, that the mass would only have exhibited an uniform aspect, and that the interesting initial phenomena would not have been discovered.

The appearances here described seem deserving of consideration in several points of view. Few things can be more at variance with commonly received opinion, than the diversified succession of changes of structure which this glass exhibits in its passage to a crystallized state. The generation of the globules which unite to form the jaspideous substance, is what we might be prepared to expect by observing the cooling of a common iron furnace slag. But it appears not very obvious to common apprehension that the species of arrangement requisite to form this intermediary substance, could be compatible with any fluidity permitting farther motion of the ultimate particles of the mass; yet immediately after the completion of this arrangement, they receive a new disposition, and the radiated fibrous structure commences. Sometimes this pervades even the unaltered glass; but Mr. Watt presumes this only to happen where the minute globules first formed were scattered so far asunder that their centres became fibrous before their peripheries came into contact. This view of the subject is justified by the analogous operation of the formation of crystals similar to those described in the heart of the radiated spheroids, while their exterior still retained the fibrous texture.

If it be considered as extraordinary that a change should be effected, converting an apparently solid and homogeneous mass into an accumulation of radiated spheroids, and that these radii should lose their fibrous structure, and assume the texture, aspect, and tenacity, of a compact, hard, and homogenous stone, it is certainly much more extraordinary that this stone should permit farther arrangement to proceed, and should enable the crystalline molecules which it contains in a state of confused aggregation, to arrange themselves, and to form regular crystals, which, although minute, are equal, in the perfection of their forms, and in the brilliancy of their natural polish, to the most precious products of crystallization. It is also well deserving of observation by how regular a march the magnetic influence of the substance keeps pace with the perfection of its arrangement, till it becomes so powerful that fragments of the regenerated stone are suspended by the magnet.

It has been most justly remarked by Mr. Smithson, that solution, far from being necessary to crystallization, effectually prevents its commencement; for while solution subsists, crystallization cannot take place. It may remain a question whether previous solution be essential as a preparatory means of obtaining, by subsequent evaporation or cooling, the small parts of bodies disengaged, so that they may unite to form regular crystals. If, by solution be only meant that simple action of heat, or water, which merely counteracts

teracts the force of aggregation, and relieves the molecules from their bonds of union with each other, it certainly is a requisite; but if by solution be meant that action of affinities, by which not only the force of aggregation is overcome, but the combinations which constitute the molecules are destroyed, it obviously is not only unnecessary, but prejudicial, to crystallization. Mechanical suspension in a fluid medium of such density that the crystalline polarity may be enabled to counteract the power of gravity, is, with justice, considered by Mr. Smithson the only requisite for the formation of crystals. The circumstances here detailed appear an additional confirmation of this remark, and perhaps go still farther, by shewing that even the fluidity (in the common sense of the word) of the suspending medium is not an indispensible condition. For it appears impossible to annex the idea of fluidity to the union of the minute globules which form the jaspideous substance, still less to that substance when formed, or to those spheroids whose obstinate impenetrability is so strongly defined. And if, by any power of imagination, these can be supposed to be fluid at the time they retain this conformation; how can it be supposed that the compact, hard, tenacious stone into which they are changed, could retain these characters in a fluid state? Yet the subsequent formation of crystals proves that either all these contradictions must be, or that the particles of bodies apparently solid, must be capable of some internal motion, enabling them to arrange themselves according to polarity, while they are solid and fixed, as far as they have reference to the ordinary characters of fluidity.

Instances, even more remarkable, of the motion of the particles of bodies in a solid state, have very long been known and authenticated, though perhaps they have not been generally regarded with the attention they deserve. Glass vessels are well known to be convertible into Reaumur's porcelain by the internal arrangement of their particles without losing their external form, and consequently at a temperature very much below that requisite for their fusion. The change of glass into Reaumur's porcelain does not arise from an evaporation of the alkali, as has been alleged, but from a regular arrangement of the particles of the glass. It commences by the formation of fibres perpendicular to the surface of the glass, and penetrating into it. At nearly the same time small radiated globules are formed in the interior of the glass, and the union of these with the fibres, by their mutual increase, forms the whole into a new substance; and if the requisite temperature be longer maintained, the fibres disappear, and the whole becomes fine-grained and almost compact. This substance, from the improved state of its aggregation, is much stronger and more tenacious than before, and is not fusible at a heat sufficient to fuse the glass it was formed from; but if that aggregation be once destroyed, the glass resulting from its fusion is equally fusible with the original glass; and a repetition of the process will again form Reaumur's porcelain, which may be again fused, and so on repeatedly; for the quantity of alkali evaporated during the operation is extremely small. The hardness and brittleness of metals rapidly cooled, contrasted with the softness and tenacity resulting from their gradual refrigeration, are all analogous instances; and all the processes in which annealing is employed, and more remarkably the tempering of steel, offer strong proofs of the internal motions and arrangements of the particles of matter at temperatures very much below the heat requisite for their fluidity. Mr. Watt further adduces the structure and texture of calcareous stalactites as offering proofs of the internal motion of the particles of solid bodies at the common temperature of the atmosphere. Successive depositions of calcareous carbonate form a stalactite which at first is fibrous. A continuance of the process causes the fibrous structure to disappear, and the stalactite becomes irregularly crystalline. The irregularities afterwards vanish, and it becomes perfect calcareous spar, divisible into large rhomboids, with the form peculiar to that mineral, and all the gradations may be found in the same specimen. For a more particular account of these experiments, and the ingenious observations of Mr. Watt, we must refer the reader to the volume of the Philosophical Transactions above cited. The proofs and illustrations of the arrangements which take place in the internal particles of solid bodies, offer the only plausible explanation, which has yet been given, of the formation and decomposition of crystals under various circumstances in which they occur in mineral veins, and also of the prismatic forms observable in currents of lava, and in basaltic and other rocks. See TRAP, and VOLCANIC *Products*.

ROW-LOCKS, among *Ship-Carpenters*, small spaces left in the gunwale, where two thoals are let in, at such a distance from each other, as to admit the oar, at the end of the loom, to lie on to row the boat.

In the sides of the smallest vessels of war, a number of little square holes, called *row-ports*, are cut for this purpose parallel to the surface of the water.

ROWNING, JOHN, in *Biography*, an English mathematician and philosopher of considerable ingenuity, was fellow of Magdalen college, Cambridge, and afterwards rector of Anderby, in Lincolnshire. He was chiefly known for mechanical contrivances and inventions. In 1738 he published a compendious system of natural and experimental philosophy, in 2 vols. 8vo. which was frequently referred to thirty or forty years ago, and which has passed through many editions, but is now superseded by many other similar works of more value. He has likewise two pieces in the Philosophical Transactions, one containing a description of a barometer, in which the scale of variation may be increased at pleasure; the other, giving directions for making a machine for finding the roots of equations universally. He published likewise "A Preliminary Discourse on the Fluxionary Method." Mr. Rowning died in November 1771, in the 72d year of his age.

ROWRAH, in *Geography*, a town of Hindoostan, in the circar of Gohud; 10 miles S. of Raat.

ROWS *of Trees*. See PARALLELISM.

ROWSING, in *Sea Language*, denotes pulling upon a cable or rope, without the assistance of capsterns, &c.

ROWT, in *Rural Economy*, a term signifying to low as cattle.

ROWTEE, in *Geography*, a town of Hindoostan, in the circar of Sumbul; 15 miles S.S.W. of Nidjibabad.

ROWTOMPOUR, a town of Hindoostan, in Oude; 16 miles S.S.W. of Kairabad.

ROWTY, in *Agriculture*, a term signifying over-rank, or too strong.

ROXBOROUGH, in *Geography*, a township of Philadelphia county, in Pennsylvania.

ROXBURGH, a village in Roxburghshire, Scotland, was formerly a place of considerable importance, as may be conjectured from the circumstance of its having given name to the county. It was for several centuries a royal burgh; and was regarded as one of the first towns in the Scottish kingdom, for opulence, and magnificence of appearance. It was totally destroyed by king James II., and never afterwards recovered; and as its scite is now converted into arable fields, the plough has nearly obliterated all traces of its existence. Some remains of its ancient castle, however, are yet visible about two miles eastward from the village. These

These occupy the summit of a bold eminence, which rises from the plain, near the junction of the Tweed and the Teviot. This fortress, in ancient times, was of great strength, and was accounted the most important strong-hold on the Scottish borders. It was environed by a deep ditch, which could be filled at pleasure by the garrison with the waters of the Teviot, and over which a drawbridge was thrown. Interior to the ditch was a wall, of which only a few fragments are standing, but enough to attest its prodigious thickness and solidity. Roxburgh castle, Pennant informs us, in his Tour in Scotland, was anciently called Marchidon, Marchmont, or the Hill on the Marches. The name of its founder is unknown, as is the period of its erection. The earliest mention of it in history occurs in 1132, when a treaty of peace is stated to have been concluded here, between king Stephen of England and king David I. of Scotland. In 1174, after king William the Lion was made a prisoner by the English, this castle, with four others, was delivered up to king Henry II. as a security for his royal hostage doing homage for his crown on his release from captivity. The successor of Henry restored it to the Scots, but it was again taken by king Edward I. in 1296. It was recovered doubtless by king Robert I., but appears to have been soon after possessed by the English, as it is recorded to have been surprised, in 1342, by sir Alexander Ramsay, who was appointed governor; an honour which the envious Douglas did not allow him to enjoy long. The Scots again lost this fortress in the reign of Edward III., who twice celebrated his birth-day here. After this period it was taken and retaken several times; but the most distinguished siege was that by king James II., when it was captured by the Scots; though, previous to the victory, the king was killed by the bursting of a piece of ordnance. A hollow tree is said to stand on the spot where the monarch fell, on the north side of the Tweed, and at a short distance below Fleur's house. The queen, who was with the army when this event took place, observing that the soldiers were disheartened, and that the commanders were disposed to raise the siege, used every exertion to excite their courage; and, among other things, told them, that though their king had fallen, he was but one man, and that she would soon give them another king, her son, James III., who next day arrived in the camp, and was crowned at Kelso, in the 7th year of his age. This heroic and well-timed address produced the desired effect; the spirits of the whole army were roused, and the attack having been renewed with redoubled ardour, the garrison surrendered in a few days. From that period the castle has remained in ruins, though it was in some degree repaired by the lord protector, Somerset, in the reign of Edward VI. of England.

The parish of Roxburgh extends eight miles in length, and about four in breadth. The general appearance is flat and sloping, and the soil is generally a rich loam, well calculated, either for the growth of wheat, or for the turnip husbandry. According to the parliamentary returns of 1811, it contains 225 houses, and 946 inhabitants. The Statistical Account of Scotland, by sir John Sinclair, bart. vol. x. 1797. Pennant's Tour in Scotland, vol. iii. 4to. 1779. Beauties of Scotland, vol. ii. 8vo. 1805.

ROXBURGHIA, in *Botany*, received that name, at the suggestion of the right honourable sir Joseph Banks, from the pen of the late Mr. Dryander, in just commemoration of the discoverer of this genus, Dr. William Roxburgh, F.L.S., member of the Asiatic Society. The researches of this indefatigable and enthusiastic observer of nature, among the botanical treasures of Hindoostan, and his liberal communications to his friends at home, have added very extensively to our knowledge of Indian plants. The East India Company have published his *Coromandel Plants* in a style worthy of the materials. From the remote situation of the author, many genera and species were left by him for the determination of his learned editor, to whom all the sources of literary information in Europe were open. But as the name of this editor is entirely kept out of sight, a French writer, De Theis, has been led into the mistake of charging Dr. Roxburgh with the unexampled arrogance of dedicating a genus to his own honour. No man can be further, than our candid and unassuming friend, from such presumption, and we feel it a duty to wipe away the unmerited reproach.—Dryand. in Rox. Coromand. v. 1. 29. Willd. Sp. Pl. v. 2. 321. Ait. Hort. Kew. v. 2. 347. Sm. Exot. Bot. v. 1. 111.—Class and order, *Tetrandria Monogynia* (*Octandria;* in Hort. Kew.) Nat. Ord. *Sarmentaceæ*, Linn. *Asparegi*, Juss.

Gen. Ch. *Cal.* none, unless the corolla be taken for such. *Cor.* Petals four, inferior, lanceolate, equal, ribbed, coloured chiefly on the upper side, permanent. *Stam.* Filaments four, opposite to the petals, and nearly as long, awl-shaped, fleshy, with a double cell at their inner side, near the base; anthers two-lobed, oblong, lodged in the cells of the filaments, and each crowned with a simple lanceolate appendage, much shorter than the naked summit of the filaments. *Pist.* Germen superior, small, sessile, ovate; style none; stigma roundish. *Peric.* Capsule of one cell, with two concave valves. *Seeds* numerous, erect, cylindrical, furrowed, each supported on a stalk clothed with little vesicles.

Eff. Ch. Petals four, spreading. Filaments lanceolate, keeled, bearing the anthers on their inside, near the base, crowned with an appendage. Capsule superior, of one cell, with two valves, and many seeds.

1. R. *viridiflora.* Green-flowered Roxburghia. Sm. Exot. Bot. v. 1. 111. t. 57. (R. gloriosoides; Dryand. in Ait. Hort. Kew. v. 2. 348. Roxb. Coromand. v. 1. 29. t. 32? R. gloriosa; Curt. Mag. t. 1500. Ubium polypoides album; Rumph. Amb. v. 6. book 9. 364. t. 129.)—Native of low moist woods and thickets in the valleys of Hindoostan and Amboyna, flowering in the cold season. Roots being sent by Dr. Roxburgh to the late lady Amelia Hume, they bore flowers in April 1805, for the first time in Europe. Each *root* consists of many oblong fleshy knobs. The *stem* climbs spirally to the height of many feet, without tendrils, and is branched, angular, smooth and leafy. Lower *leaves* alternate to the height of five feet, the rest opposite; all spreading, on smooth, channelled *footstalks*, ovate or partly heart-shaped, pointed, entire, smooth, thin and pliable, with about seven or nine ribs, and innumerable fine transverse veins. *Stipulas* none. *Flower-stalks* axillary, solitary, shorter than the leaves, smooth, deflexed, racemose, each bearing two, three, or four flowers. *Bracteas* lanceolate, solitary, under each partial stalk. *Flowers* ascending, large, fetid like corrupted water, or the Stinking Morel. (See Phallus.) *Petals* near two inches long, coriaceous, green, with purplish ribs, especially on the upper side. *Stamens* violet in the lower part; their points green. The *pollen*, consisting of highly polished globules, falls to the bottom of the flower, rolling about like quicksilver.

The figure given by Dr. Roxburgh differs from our plant, in having much smaller *flowers* with tawny *petals*, and yellow *anthers*. He thinks it likely that there may be more than one species of this genus, which he did not distinguish in India. Rumphius describes two, his *Ubium polypoides album* and *nigrum*. The former seems best to agree with our plant, except that his figure has solitary *flowers*. He says its *stems* extend to the length of 100 fathoms, and that the *roots*,

roots, previously prepared with lime-water, are candied with sugar, and taken with tea. Their flavour is insipid.

Our friend Dr. Sims, in Curtis's Magazine, while he follows the ideas of preceding authors respecting the characters and affinities of this singular plant, avows a preference for the very different view which we have taken; and we derive much confidence from his sanction. It is to be regretted, that, with the best possible intention, he has been misled by the French botanists, to change a faulty specific name much for the worse. The word *gloriosa*, whether designedly or not, serves but to perpetuate their unjust ideas of Dr. Roxburgh, as having, by an unexampled instance of *vain-glory*, inscribed a genus to himself. We most wonder at Dr. Sims's continuing to apply a specific name which, by his own confession, appears to belong to a different plant, whose flowers are "hardly half the size." For this, the original species, we would, as the least evil that presents itself, retain the name of *gloriosiformis*, which is at least correct, and very expressive. We had long ago detected Rumphius's synonym. It agrees best with our *viridiflora*.

ROXBURGHSHIRE, in *Geography*, one of the southern counties of Scotland, is situated between N. lat. 55° 7', and 55° 42', and between W. long. 1° 39', and 2° 36', from the meridian of London. It is bounded on the south by Cumberland and Northumberland, in England; on the east by the latter county only; on the north and north-east by Berwickshire; and on the west and northwest, by the counties of Dumfries, Selkirk, and Mid-lothian. In point of shape, it is so extremely irregular, that it is difficult to define its extent. Its greatest length, from the junction of the Mare-burn with the Liddel, to the junction of Carham-burn with the Tweed, is 41 miles; and its greatest breadth, on a line intersecting the above at right angles, is 29 miles. Its medium length is about 30, and its medium breadth a little more than 22 miles, making its contents about 672 square miles, or 430,080 square acres; of which, at the time of the last survey, in 1796, nearly three-fifths were in sheep pasture, and the remainder in arable cultivation, or occupied by woods, pleasure-grounds, towns, and villages. Politically speaking, this county comprehends twenty-nine entire parishes, and a portion of five others, which, united, contain, according to the parliamentary returns of 1811, 6518 houses, and 37,230 inhabitants.

Historical Events.—To narrate all the military transactions which history and tradition affirm to have occurred within this county, would be to occupy our pages with an almost endless detail of petty conflicts and depredatory excursions. Roxburghshire being a border district, and uniting, for above 60 miles, with England, was, for several centuries, a perpetual scene of border warfare; so that there is scarcely a spot throughout its whole extent, where some feat of valour, or deed of destruction, has not happened. Every parish presents, to the discerning eye of the antiquary, some relic of those wretched days when the restraints of law were set at defiance, and rapine and butchery constituted the chief delight both of the lord, and of his vassal peasantry. Of those events which do not bear the character of predatory warfare, the most prominent are the siege of Roxburgh castle, by king James II., before-mentioned, and the battle of Jedburgh, in which the Scots were completely defeated by the English under the earl of Surrey. The latter event happened in the year 1523.

General Aspect of the County.—The surface of Roxburghshire is finely diversified, and exhibits many scenes that are truly beautiful, but few that are romantic or sublime. It is commonly considered as divided into four natural districts; Hawick, Jedburgh, Kelso, and Melrose. Of these, the district of Hawick is the most mountainous; and there is also a chain of hills along the southern boundary of the county. The other divisions present to the eye a succession of hills and vallies. The hills have mostly sloping sides, and are covered with a green sward to their very summits. Very few of them are bleak, and none of them rugged or tremendous. The prospects from their highest points are extensive, variegated, and delightful. The numerous vales, whether of narrow, or of wide extent, are all watered by limpid streams; many of them naked, and others fringed with wood. Some afford excellent pasture, and others are in high cultivation. They are in general inclosed by very gentle declivities, though several are hemmed in by steep banks, over-run with brush-wood, or adorned with lofty trees, which form a scenery rather agreeable than magnificent. In a county so extensive, and, on the whole, so much elevated, the proportion of heath and moss is very inconsiderable, but cannot be calculated with any degree of exactness, as they are scattered every where in portions of unequal size. In Liddesdale, where improvement has made the least progress, patches of moss are seen by the edges, and even in the middle of fertile vales. There are indications of this having been formerly the case in other parts of the county, on which industry has now wrought a happy change.

Mineralogy.—Roxburghshire derives little importance from its mineral products. Coal has been discovered in several places, but is wrought only in one spot, near the southern extremity of the district of Liddesdale. Hence the county labours under the serious disadvantage of a want of fuel, which must be brought from Northumberland, or Mid-lothian, by land-carriage. Throughout the whole shire lime-stone is abundant, but little of it is calcined for sale, except in the neighbourhood of the Liddesdale collieries. Free-stone also is plentiful. The principal stratum extends in a north-east direction from the farthest point of Liddesdale to the neighbourhood of Spronstoun, where it is of a fine, hard, and durable nature. Different kinds of whinstone appear every where on the surface, in the beds of brooks, and in inexhaustible quarries. Vast beds of shell marle lie scattered throughout the contiguous parishes of Roberton, Ashkirk, Wilton, Minto, Lilliesleaf, Bowden, Galashiels, and Selkirk. There are likewise large marle pits at Eckford and Ednam; and some less considerable ones in various places. Pebbles are found in vast multitudes in the vicinity of the Cheviot hills. In the parish of Hobkirk, there is a place called Robert's Linn, where there are large rocks of pebbles, which are manufactured into seals and buttons of various kinds. Most parts of these rocks are of a light blue colour; but some portions of them are finely varied with streaks of red and yellow; and so much are they esteemed, that great numbers of them are conveyed to Sheffield, Birmingham, and other towns.

Rivers, &c.—No county in Great Britain can boast of more numerous, or more beautiful rivers and brooks. One flows through, and enlivens every little vale. The principal of them are, the Teviot, the Jed, Tweed, Rule, Kale, Oxnam, Gala, Slittridge, Ale, Catta, Borthwick, Ednam, Bowmont, Allan, Leader, Ettrick, Hermitage, and Liddel. The two last are discharged into the Esk, which runs into the Solway frith; the others fall into the Tweed, which empties itself into the sea. This river holds a majestic course along banks which, in several places, are steep and bold, jutting out, at Old Melrose, into a promontory, and forming around Dryburgh abbey a peninsula. It partly bounds, and partly intersects, the county; receiving on the north the Gala, which is the boundary with Selkirkshire and Mid-lothian for five miles; the Leader, which, for nearly the

the ſame ſpace, is the boundary with Berwickſhire; the Allan, a paſtoral rivulet; and the Eden, which takes its riſe in Berwickſhire, but runs a conſiderable way along the ſkirts, and through the lower diſtrict of this county. Ettrick, alſo a boundary of Selkirkſhire for two miles, falls into the Tweed on the ſouth. Teviot riſes in the weſtern part of the county, in a very elevated diſtrict, and deſcends at firſt from the mountains with a rapid courſe; but it afterwards flows with many delightful windings through a ſucceſſion of rich, extenſive, and well cultivated vallies, till it loſes itſelf in the Tweed between Roxburgh caſtle and Kelſo, one of the moſt enchanting ſpots which can be well imagined. The Ale and Borthwick are the northern branches of Teviot. Both of them have their ſources in Selkirkſhire, and in ſome places bound that county and Roxburghſhire. On the ſouth the Teviot is augmented by the Oxnam, the Jed, and the Kale. The two laſt iſſue from the border hills. The Kale frequently overflows the greater part of an expanded and valuable plain, adorned by clumps of trees; while the Jed, ruſhing along a rocky channel, through narrow and thick wooded vales, waſhes the bottom of ſeveral high precipices, winds round the town of Jedburgh, and terminates another, and ſtill more extenſive plain, called Crailinghaughs, through the centre of which the Oxnam finds its way to Teviot. Nearer to its ſource, the laſt-mentioned river receives the Rule, the Slittridge, and the Allan, all of which riſe on the confines of Liddeſdale. In the number and value of its trees, Rule may vie with "Silvan Jed," though not in wild and pictureſque ſcenery. Slittridge is not without the beauties of green hills, natural wood, and hollow vales. Southern Allan, like the ſtream of the ſame name north of Tweed, flows entirely through ſheep-walks. Bowmont, alſo a paſtoral river, has its ſource in the ſouth-eaſt diſtrict of the county, and after a rapid courſe of nine or ten miles, enters England. But of all the waters in Roxburghſhire, none are more indebted to nature, or might be more improved by art, than Hermitage, which riſes in the ſouthern declivity of the ſame ridge, whence the Allan and the Slittridge iſſue in different directions, and tumbling over a bottom of rough, ſhapeleſs ſtones, amidſt green hills, whoſe baſes are generally ſkirted with copſe-wood, loſes itſelf in the Liddel, and imparts its natural ornament to that larger ſtream which is celebrated by Armſtrong in the following ſtrains:

" ——————————— Such the ſtream
On whoſe Arcadian banks I firſt drew breath,
Liddel, till now, except in Doric lays,
Tun'd to her murmurs by her love-ſick ſwains,
Unknown in ſong; tho' not a purer ſtream
Through meads more flowery, more romantic groves,
Rolls towards the weſtern main. Hail ſacred flood!
May ſtill thy hoſpitable ſwains be bleſt
In rural innocence; thy mountains ſtill
Teem with the fleecy race; thy tuneful woods
For ever flouriſh; and thy vales look gay
With painted meadows, and the golden grain."

There are no lakes of any great extent in this county, but there are ſeveral pre-eminent for the beauty of their ſcenery, and the abundant ſupply of fine perch and pike which they contain. Alemuir-loch, which ranks firſt among the Roxburghſhire lakes, is ſomewhat more than two miles in circumference. Trouts of various ſizes and flavour abound in all the rivers, and the Tweed and Teviot, but particularly the former, are crowded with grilſe and ſalmon.

Climate.—In a county of ſuch extent as Roxburghſhire, the climate muſt of courſe be extremely various. In proportion to the elevation of the ground, the air is more moiſt and ſharp. The warmeſt and dryeſt months of the year are July and Auguſt, but prodigious thunder ſhowers are very frequent. In September and October the weather admits of every poſſible variation. It is often ſerene and pleaſant; but exceſſive rains, winds, and froſts, and even hail and ſnow, are by no means uncommon; and frequently do incredible damage to the crops. November is nearly of the ſame complexion; and what ſeems ſingular, in December the weather in general is moderate and uniform. Froſt and ſnow are ſeldom ſevere or of long duration before Chriſtmas. January and February are the months when ſnow is moſt common, and froſt moſt intenſe. With ſome ſhort interruptions they very frequently remain till diſſipated by the ſun in March. Cold eaſterly winds prevail much in April and May, and often even in June, either bringing conſtant rain for a ſucceſſion of days, or exhaling moiſture ſo rapidly from the earth, as to ſtint the tender ſtalks both of corn and graſs. But theſe aſſertions, though generally true, are at times reverſed. After an open and ſoft winter, great quantities of ſnow have fallen in March, April, and May. In other years April has been wonderfully mild, May and June the warmeſt, July and Auguſt the wetteſt, and September and October the moſt ſettled months.

Soil.—In the paſture diſtrict of Roxburghſhire the ſoil is dry, wet, or heathy. To the eaſtward of Jed Water, the hills are chiefly compoſed of red granite, and covered with a rich ſward of ſweet graſs: there is very little heath: the marſhes are few and not extenſive, and are interſected by numerous drains. To the weſt of Jed Water, including Liddeſdale, the dry ſoil either reſts upon lime-ſtone or gravel. In this diſtrict are many moſſes and much fenny land; likewiſe a large tract of ſtrong clayey ſoil, lying on a cold tilth, or hard clay, which is impervious to water. In the arable diviſion of the county the ſoil is partly light and partly heavy. The light conſiſts of a rich loam, or mixture of loam and ſand, of loam and gravel, of ſand, or gravel and clay, in every various proportion. The heavy ſoil is chiefly clay of different depths and degrees of ſtiffneſs or mixtures, where clay prevails placed on tilth, or other matter retentive of water. In very few ſpots this ſurface lies on a dry bottom; and not unfrequently different and oppoſite ſoils are ſtrangely blended in the ſame field. The light ſoil, however, is in general formed on low and level lands, near the beds of rivers, and their branches, and alſo on ſeveral eminences of conſiderable extent, eſpecially in the pariſhes of Linton, Crailing, Ancrum, Maxton, and Melroſe. The heavy ſoil rarely appears in the vallies, and chiefly occupies the higher grounds. The largeſt tract of it lies immediately ſouth of Eildon Hills, including nearly the whole pariſhes of Minto, Lillieſleaf, and Bowden, a portion of Melroſe, St. Boſwell, Ancrum, Maxton, and Roxburgh pariſhes. It comprehends in all about 10,000 acres, of which at leaſt one half is ſhallow, cold, and unkindly, difficult to labour and uncertain in its produce; on which many acres of it have been planted with trees. In the other half there is much rich and fertile land, which bears luxuriant crops both of corn and graſs, and not a little of a middle nature between theſe extremes. In the pariſhes alſo north of the Tweed, the heavy ſoil is rather moſt prevalent, and is, in general, of a good quality. Another conſiderable portion of it runs along the higher grounds ſouth of the Tweed, in the pariſhes of Spronſtoun, Kelſo, Roxburgh, and Exford, and there are detached fields of it in other parts of the diſtrict. In the boſom, or deeply indented into the fides of thefe clayey tracts, are pieces of dry land of an admirable quality for producing either white or green crops. Of the arable diftrict at large, at leaft two-thirds may be defignated light and dry.

Agriculture.—Farms in Roxburghfhire are of every fize, from 50 to 6000 acres; yielding from 50*l.* to nearly 3000*l.* annual rent. The arable farms include, in general, from 200 to 500 acres, but there are fome far lefs and fome much more extenfive. One tenant frequently poffeffes two or three farms, and there are inftances of the fame perfons leafing both an arable and a fheep farm, to obtain the double profit arifing from rearing fheep to a larger fize, by wintering them on after-grafs and turnips, and fattening both them and their lambs earlier, and better, for the market. With the breeders of that valuable animal, turnips have been for many years a greater object than formerly, and hence fome farmers have engaged more deeply in arable hufbandry, inftead of accumulating, as before, pafture farms. The character of farmers in this county, like the extent of the farms, admits of much variety: but it may be truly faid, that the greater part of them are men of refpectability and of agricultural enterprize. Rents are in every cafe paid in money. One or two clergymen, who have a right to tythes, have been accuftomed from time immemorial to accept of a fmall fum in lieu of them. Leafes differ in duration and conditions in the pafture and arable diftricts. In the former they extend only from feven to fifteen years; but in the latter they are given for nineteen or twenty-one years.

Confiderable tracts of land here, particularly in the extenfive diftrict of Liddefdale, remain in a ftate of nature. The cold wet foil, already noticed, and the expofed fituation, afford no encouragement for attempting agricultural improvements. This large tract is therefore wholly under fheep pafturage, except a few ftrips of land on the banks of the Hermitage and the Liddel. The moft ancient agriculture in this county would appear to have been very different from the prefent. The marks of the plough, and of regular ridges, are ftill every where to be feen upon lofty mountains, where no grain can now be produced, and upon a foil which has ceafed to be regarded as entitled to the appellation of arable land. Thefe facts prove that the furface of the country muft have formerly been in a very different ftate from that in which it now appears. The modern improvements in agriculture are all adopted here by the arable farmers. The firft perfon who fet the example of fpirited exertion was William Dawfon, efq. a farmer's fon, who, after receiving a liberal education, was fent by his friends into England, for the purpofe of obtaining a knowledge of the practical agriculture of that part of the united kingdom. He returned to his native country in 1753, and immediately introduced the practice of the turnip hufbandry. At firft his improvements were confidered as rafh and fpeculative, but his fuccefs foon effected a change of opinion. Mr. Dawfon's neighbour perceiving the advantages of the new plan, became eager to underftand and adopt it. The hinds which had once been in his fervice, were fure to find employment; his ploughmen were in the utmoft requeft; they were tranfported to Eaft Lothian and even to Angus, and every where diffufed the improved practice of that valuable art. Roxburghfhire became the fcene of the moft active agricultural enterprifes; and Mr. Dawfon, independently of having acquired a large property, had the fatisfaction to live to fee himfelf regarded, and hear himfelf called, the father of agriculture in the fouth of Scotland.

The rotation of crops ufed in this county have nothing peculiar, or particularly requiring notice. On a dry foil, it is confidered an object of importance to throw a large quantity of land under turnip or grafs, efpecially after lime. One part of Roxburghfhire has long been celebrated for an early fpecies of oats, denominated Blainfly oats, from the circumftance of their having been cultivated for time immemorial at Blainfly, a large diftrict in the parifh of Melrofe, near the northern extremity of the county: the average produce there is fix to one, but when they are grown on a rich dry foil, it is fometimes 16 or 18 to one. They are fold at an average of 3*s.* 6*d.* *per* boll dearer than common oats, and are only objectionable in one point of view, *viz.* that they are apt to fhake out. Abundant crops of wheat are reared in the lower and more fertile diftricts of the county. Bear is likewife raifed in confiderable quantities; but the culture of peas and beans has become very limited, fince the practice of turnip feeding has been fo generally introduced. Of potatoes, comparatively few are cultivated; neither are great crops of hay frequent in this county, on account of the want of towns in which they might find a ready fale. Little flax is grown, except as an object of domeftic manufacture. It is a remarkable fact, and a fubject of curiofity in agricultural hiftory, that this county was at one time likely to have become noted for the cultivation of tobacco. It was introduced by Mr. Thomas Mann, and was tried both at Newftead and at Kelfo with fuch fuccefs, that the legiflature deemed it requifite to interfere, and put an end to its culture.

Live Stock.—Very confiderable numbers of cattle are fed in Roxburghfhire, but fheep is the ftaple animal of the county. The latter are eftimated at nearly 300,000 in number, and are moftly of the Cheviot breed. A large quantity of ewe-milk cheefe, of the beft quality, has long been an object of manufacture here, but the practice is now on the decline. The horfes employed and bred here are either of the Englifh or of the Lanarkfhire breed. Swine are reared by almoft every cottager and farm-fervant who is married; alfo vaft quantities of poultry. Several cart-loads of the eggs of dunghill fowls are weekly collected by "egglers," who fell them in Berwick for the London market.

Inclofures.—A very fmall proportion of the lands in this county are inclofed. The fence chiefly ufed is ditch and hedge, of which there are two kinds, namely, the double and the fingle. The double confifts of two ditches, having a hedge planted in the embankment between them. Where ftones can be eafily procured, ftone-dike inclofures are preferred to the hedge and ditch. One of the moft fubftantial fences of this kind in the county inclofes about 600 acres, called the "Deer park of Holydean," on the Roxburgh eftate. It is traditionally ftated to have been conftructed before the year 1500. It is about four feet high, and though built of whinftone only, without lime or mortar, continues to be a good fence. In a few places dikes are formed of alternate layers of ftone and turf.

Towns, Villages, and Fairs.—There is only one royal borough in this county, that of Jedburgh, which, along with the boroughs of Haddington, Lauder, Dunbar, and North Berwick, elects a member to ferve in parliament. This place is the county town, and makes a confiderable figure in the hiftory of the border wars. (See JEDBURGH.) The other principal towns and villages are, Hawick, which is fituated at the confluence of the Teviot and Slittridge, near the lower part of the upper, or moft mountainous diftrict of the county; Kelfo, which ftands on the northern bank of the Tweed; and Melrofe, celebrated for its abbey, each of which the reader will find defcribed under their refpective names.

The greateft fair in the county is held in the parifh of Leffudden, Leſſudden, or St. Boſwell, whence it is called St. Boſwell's fair. It takes place on the 18th of July, and is the principal mart for ſheep and lambs in the ſouth of Scotland; but horſes, linen, and woollen cloths, are likewiſe ſold in conſiderable quantities. The cuſtoms of this fair belong to the duke of Buccleugh, and may be eſtimated at about 50*l.* *per annum.* Another great fair is held in the vicinity of Kelſo. It is called St. James's fair, from the circumſtance of its being holden within the ancient pariſh of that name, which is now merged in the pariſh of Kelſo.

Antiquities.—The veſtiges of ancient times ſtill viſible in Roxburghſhire are numerous. Mutilated encampments, and ruinated buildings of ſtrength, are diſcovered in a great variety of ſituations, and particularly in the high diſtrict of the county. In the pariſhes of Cavers, Hawick, and others, remnants may be traced of what is called the Cat-rail, which is conjectured to have been a boundary rampart, ſimilar to the Wanſdike and Offa's dike in England; but whether erected by the Romans, Saxons, or Britons is uncertain; though Whitaker, in his Hiſtory of Mancheſter, contends ſtrongly that it is of Britiſh origin. In the pariſh of Roberton, near the ſource of the Teviot, is a large ſquare encampment, which is ſtill denominated *Africa*, and in the vicinity are ſeveral ſmaller ſemi-circular intrenchments. There are likewiſe encampments on the Eildon hills, on Carberry hill, Sidehill, at Ancrum, and on the farm of Flight, in the pariſh of Clintwood. In the ſame pariſh are likewiſe numerous fortifications, called Picts' works, which are of a circular form, and conſtructed of large ſtones. On the farm of Millburn is a ſmall circle of nine upright ſtones, ſurrounded by a ditch, which is ſuppoſed to have been a Druidical temple. Cairns appear in different parts of the county. Of theſe, the moſt remarkable is at Whiſgills. The quantity of ſtones is immenſe, and they are moſtly of a very large ſize. Near it is a large upright ſtone, called the "ſtanding ſtone." This cairn is ſituated in the centre of an extenſive and deep moſs, where not a ſtone is to be diſcovered except thoſe employed in its conſtruction. Another immenſe cairn is placed on an eminence between the pariſhes of Caſtleſtown and Canonby. It is eighty-ſix yards long, and conſiſts of maſſes of free-ſtone, of great magnitude. A ſtanding ſtone, thirteen feet in circumference, and ſeven feet above ground, is fixed at the north end of it; and there are five other ſmaller ones, forming, with the larger ſtone, a circle round the cairn forty-five yards in diameter. How theſe enormous maſſes were originally collected, or for what purpoſe, it is very difficult to determine. At Milnholm, in the pariſh of Canonby, ſtands an ancient croſs, formed of one ſtone, eight feet four inches high, on which are ſculptured a ſword and ſome ancient writing; but the latter is ſo much mutilated, that it cannot be read. On the banks of the Ale Water, near Ancrum, is a ſeries of caves, ſome of which ſtill preſerve veſtiges of fire-places, and holes for the paſſage of ſmoke. Similar caves are diſcovered on the banks of the Jed.

Roxburghſhire formerly abounded with towers, or petty fortreſſes, erected by the border chieftains, for the defence of the country from the incurſions of the Engliſh borderers. Few of theſe, however, now remain; indeed the only ones entire are Delphiſtone tower, and another at Moſsburnford. Of the larger caſtles, the principal are Clintwood caſtle, Goldieland caſtle, Goſsford caſtle, and Roxburgh caſtle, the laſt of which is mentioned under Roxburgh. In this county are ſituated the ruins of three monaſteries, among the moſt important in Scotland, *viz.* Melroſe, Kelſo, and Jedburgh abbies. See Melrose, Kelso, and Jedburgh.

Eminent Natives.—Roxburghſhire boaſts to have been the birth-place of ſeveral characters diſtinguiſhed in the annals of literature and military glory. Of theſe, the moſt noted were Thomſon, author of the Seaſons; Armſtrong, author of the "Œconomy of Love," and various miſcellaneous poems; Gavin Douglas, who tranſlated ſeveral of the works of the Latin poets into Scottiſh verſe; and general Elliot, afterwards lord Heathfield, the gallant defender of Gibraltar, when it was attacked in 1786, by the combined powers of France and Spain. Beauties of Scotland, vol. ii. 1805. Agricultural Survey of the Counties of Roxburgh and Selkirk, by Robert Douglas, D.D., 8vo. 1800.

ROXBURY, a pleaſant town of America, in Norfolk county, Maſſachuſetts; 1 mile S.W. of Boſton. It is now divided into three pariſhes, and was ſettled in 1630. The three pariſhes contain 3669 inhabitants. The firſt of theſe pariſhes has been lately connected with Boſton harbour by a canal. The famous John Eliot, called the apoſtle of the Indians, was the firſt miniſter who ſettled in this place. He tranſlated the Bible, and other pious books, into the Indian language; and founded many religious ſocieties among the Indians. Some few remain to this day. He died in 1670, after being paſtor 60 years.—Alſo, a townſhip in the W. part of Orange county, Vermont, containing 361 inhabitants.—Alſo, a townſhip of Morris county, New Jerſey, on Muſconecunk river, 25 miles from its confluence with the Delaware, and 45 miles N. of Trenton; containing 1563 inhabitants. Near it is a mineral ſpring.—Alſo, a town in Litchfield county, Connecticut, containing 1217 inhabitants.—Alſo, a townſhip of Waſhington county, in the ſtate of Ohio, containing 408 inhabitants.

ROXCESTER. See Wroxeter.

ROXEN, a lake of Sweden, in Eaſt Gothland; 100 miles W.S.W. of Stockholm.

ROXO, Cape, a cape on the S.W. coaſt of Porto Rico. N. lat. 18° 1′. W. long. 65° 50′.—Alſo, a cape of Spain, on the coaſt of Valencia. N. lat. 37° 53′. W. long. 0° 50′.—Alſo, the S.E. point of a ſmall iſland in the gulf of Mexico, ſituated before the mouth of the river Panuco. N. at. 22° 30′. W. long. 100° 11′.—Alſo, a cape on the W. coaſt of Africa. N. lat. 12° 15′. W. long. 16° 35′.

ROY, Louis le, in *Biography*, a learned profeſſor, born at Conſtance, in Normandy, about the beginning of the 16th century. After having ſtudied in Italy and other places, he ſettled at Paris, where, in 1570, he was appointed to the profeſſorſhip of Greek. After this he ſtudied the law four years at Toulouſe; he frequented the bar at the parliament of Paris, in which he exerciſed ſome kind of magiſtracy. He ſometimes followed the armies; and had viſited the courts of the emperor, and king of England. His inattention to domeſtic affairs reduced him at laſt to depend upon the liberality of others for his daily ſubſiſtence. He died at an advanced age in the year 1571, leaving behind him, as monuments of his learning, many works in the Latin and French languages. In the former he gained conſiderable reputation, by an elegantly written life of the learned Budæus. He gave good tranſlations into the French of the works, or part of them, of Plato, Ariſtotle, and Demoſthenes, which he enriched with learned commentaries.

Roy, Julien-David le, an architect and antiquary, born at Paris in 1728, was the ſon of Julien le Roy, a celebrated mechaniſt, who excelled particularly in the art of watchmaking, ſo much ſo, that his time-pieces acquired the ſame celebrity in France as thoſe of Graham in England; he died at Paris in 1759, at the age of 74, leaving four ſons; of whom Julien, the ſubject of this article, was educated for the profeſſion of an architect, in which he became eminent. He is well known in the literary world by the following works;

works; "Ruines des plus beaux Monumens de la Grèce;" this obtained for the author admiſſion into the Academy of Inſcriptions; "Hiſtoire de la Diſpoſition et des Formes differentes des Temples des Chretiens;" "Obſervations ſur les Edifices des anciens Peuples;" "De la Marine des anciens Peuples." He publiſhed two other works on the conſtruction of the ſhips of the ancients; and a memoir on cutting maſts in the Pyrenées. This ingenious man died at Paris in the year 1803, at the age of 75.

ROY, PETER, brother of the above, was watch-maker to the king, and publiſhed memoirs for the clock-makers of Paris,—Etrennes Chronometiques—Treatiſe on the Labours of Harriſon and le Roy for the Diſcovery of Longitude at Sea. He died in 1785. It is well known, ſays a contemporary biographer, that the Engliſh, on account of their numerous diſcoveries in this art, had enjoyed ſuch a reputation for the excellence of their clocks and watches, that they found every where a market, in preference to any others, and that the French themſelves were obliged to come to England for their time-pieces. Julien le Roy, the father, had the honour of removing, in part, this pre-eminence, and of transferring it to the French. He made many diſcoveries in the conſtruction of repeating-clocks and watches: in ſecond and horizontal watches he invented an univerſal compaſs with a ſight;—an extremely uſeful and ſimple contrivance for drawing a meridional line, and finding the declination of the needle; and alſo a new univerſal horizontal dial. It is to him we are indebted for the method of compenſating for the effects of heat and cold in the balances of chronometers, by the unequal expanſion of different metals, a diſcovery which has been brought by our Engliſh artiſts to a ſtate of great perfection, although it had been thrown aſide by the inventor's ſon, Peter.

ROY, in *Geography*, a town of Sileſia, giving name to a lordſhip in the principality of Teſchen; 6 miles N. of Teſchen.

ROYA, EL, a town of Spain, in Old Caſtile; 10 miles N.N.W. of Soria.

ROYAL, *regal*, ſomething relating to a king.

The word is French, formed from the Latin *regalis*, of *rex*, *king*.

In this ſenſe we ſay, the royal family, the royal blood, royal line, &c.

In England, the prince and princeſs of Wales, the king's brothers, &c. are addreſſed under the title of *royal highneſs*.

ROYAL *Abbey*, denotes an abbey founded by a king, or by a prince who is ſucceeded by a king.

ROYAL *Academy of Arts*. See LONDON.

ROYAL *Academy of Sciences*, &c. See ACADEMY.

ROYAL *Academy of Muſic*. See OPERA.

ROYAL *Antler*, among *Hunters*, expreſſes the third branch of the horn of a hart or buck, that ſhoots out from the rear or main horn above the back-antler.

ROYAL *Army*. See ARMY.

ROYAL *Aſſent*, is that aſſent or approbation which the king gives to a thing done by others; as the election of a biſhop by dean and chapter, or to a bill paſſed in both houſes of parliament.

The royal aſſent in parliament being given, the bill is indorſed with theſe words, *Le roy le veut;* that is, *it pleaſes the king*. If he refuſes it, thus, *Le roy s'aviſera*, q. d. *the king will adviſe upon it*. See PARLIAMENT.

ROYAL *Boroughs*. See BOROUGH.

ROYAL *Crown*, is that worn by kings. See CROWN.

ROYAL *Charter*. See CHARTER.

ROYAL *African Company*. See COMPANY.

ROYAL *Exchange*, the burſe or meeting-place of the merchants in London.

It was firſt built in 1566, at the charge of ſir Thomas Greſham; and in a ſolemn manner, by herald with ſound of trumpet, in preſence of queen Elizabeth, proclaimed the Royal Exchange. Till that time the merchants met in Lombard-ſtreet.

It was built of brick, yet then eſteemed the moſt ſplendid burſe in Europe. A hundred years after its building, at the great fire, it was burnt down; but it was ſoon raiſed again in a ſtill more magnificent manner, the expence of it amounting to 50,000*l*.

One half of this ſum was diſburſed by the chamber of London, the other by the company of mercers; who, to reimburſe themſelves, let to hire a hundred and ninety ſhops above ſtairs, at twenty pounds each; which, with other ſhops, &c. on the ground, yielded a yearly rent of above four thouſand pounds; yet the ground it ſtands on does not exceed three-fourths of an acre; whence it is obſerved to be much the richeſt ſpot of ground in the world.

It is a quadrangular building, with walks around, in which the merchants of the reſpective countries aſſociate themſelves. In the middle of the area, or court, is a fine marble ſtatue of king Charles II., in the habit of a Roman Cæſar, erected by the ſociety of merchant-adventurers; the workmanſhip of Grinlin Gibbons. Around are ranged the ſtatues of the ſeveral kings ſince the Norman Conqueſt. See LONDON.

ROYAL *Fiſhes* are whales and ſturgeon, and ſome add porpoiſes too; which the king, by his prerogative, is to have, whenever caſt on ſhore, or wrecked, in all places of the realm; unleſs granted to ſubjects by expreſs words.

ROYAL *Foot*, *Fort*, *Franchiſe*, *Hoſpital*. See the ſubſtantives.

ROYAL *Oak*, was a fair-ſpreading tree at Boſcobel, in the pariſh of Donnington, in Staffordſhire, the boughs of which were all covered with ivy; in the thick of which king Charles II. ſat in the day-time with colonel Careleſs, and in the night lodged in Boſcobel-houſe; ſo that they are miſtaken who ſpeak of it as an old hollow oak; it being then a gay flouriſhing tree, ſurrounded with many more. The poor remains of it are now fenced in with a handſome wall, with this inſcription over the gate, in golden letters: FELICISSIMAM ARBOREM, QUAM IN ASYLUM POTENTISSIMI REGIS CAROLI II. DEUS OP. MAX. PER QUEM REGES REGNANT, HIC CRESCERE VOLUIT, &c. Phil. Tranſ. N° 310.

ROYAL *Oak*, *Robur Carolinum*, in *Aſtronomy*, one of the new ſouthern conſtellations, the ſtars of which, according to Sharp's Catalogue, annexed to the Britannic, are 12. See CONSTELLATION.

ROYAL *Officers*. See OFFICER.

ROYAL *Parapet*, or *Parapet of the Rampart*, in *Fortification*, is a bank about three fathoms broad, and ſix feet high, placed upon the brink of the rampart, towards the country; to cover thoſe who defend the rampart.

ROYAL *Poop*. See POOP.

ROYAL *Port*. See PORT *Royal*.

ROYAL *Society of England*, is an academy, or body, of perſons of eminent learning; inſtituted by king Charles II. for the promoting of natural knowledge.

This illuſtrious body had its original in an aſſembly of ingenious men, reſiding in London, who, being inquiſitive into natural, and the new and experimental philoſophy, agreed, about the year 1645, to meet weekly on a certain day, to diſcourſe upon ſuch ſubjects. Theſe meetings, it is ſaid, were ſuggeſted by Mr. Theodore Haak, a native of the Palatinate in Germany; and they were held ſometimes at Dr. Goddard's lodgings in Wood-ſtreet, ſometimes at a convenient place in Cheapſide, and ſometimes in or near

Greſham

Gresham College. This assembly seems to be that mentioned under the title of the "Invisible, or Philosophical College," by Mr. Boyle, in some letters written in 1646 and 1647. About the years 1648 and 1649, the company, which formed these meetings, began to be divided: those in London continued to meet there as before; and those who were removed to Oxford occasionally joined them. The latter, *viz.* Dr. Wilkins, Dr. Wallis, and Dr. Goddard, in connection with others, continuing their assemblies in Oxford, brought the study of natural and experimental philosophy into fashion there; meeting first in Dr. Petty's lodgings, afterwards at Dr. Wilkins's apartments in Wadham College, and, upon his removal, in the lodgings of the honourable Mr. Boyle. The greatest part of the Oxford society coming to London about the year 1659, they met once or twice a week in term-time, at Gresham College, till they were dispersed by the public distractions of that year, and the place of their meeting was made a quarter for soldiers. Upon the Restoration, in 1660, their meetings were revived, and attended with a larger concourse of persons, eminent for their character and learning.

They were at length taken notice of by the king, who was pleased to grant them an ample charter, dated the 22d of April 1663, by which they were erected into a corporation, "consisting of a president, council, and fellows, for promoting natural knowledge."

Their manner of electing fellows is by ballotting. Their council are in number twenty-one, including the president, vice-president, treasurer, two secretaries, and secretary for foreign correspondence; eleven of which are continued for the next year, and ten more added to them; all chosen on St. Andrew's day. Each member, at his admission, subscribes an engagement, that he will endeavour to promote the good of the society; from which he may be freed at any time, by signifying to the president, that he desires to withdraw.

The charges are five guineas paid to the treasurer at admission; and thirteen shillings *per* quarter, so long as the person continues a member; or, in lieu of the annual subscription, a composition of twenty-six guineas in one payment.

Their design is, to "make faithful records of all the works of nature or art, which come within their reach; so that the present, as well as after-ages, may be enabled to put a mark on errors which have been strengthened by long prescription; to restore truths that have been neglected; to push those already known to more various uses; to make the way more passable to what remains unrevealed," &c.

To this purpose they have made a great number of experiments and observations on most of the works of nature; eclipses, comets, meteors, mines, plants, earthquakes, inundations, springs, damps, subterraneous fires, tides, currents, the magnet, &c. Also numbers of short histories of nature; arts, manufactures, useful engines, contrivances, &c. The services they have been of to the public are very great. They have improved naval, civil, and military architecture; advanced the security and perfection of navigation; improved agriculture; and put not only this kingdom, but also Ireland, the plantations, &c. upon planting.

They have registered experiments, histories, relations, observations, &c. and reduced them into one common stock; and have, from time to time, published some of the most immediate use, under the title of Philosophical Transactions, &c. and laid the rest up in public registers, to be nakedly transmitted to posterity, as a solid ground-work for future systems. See TRANSACTIONS.

They have a library adapted to their institution; towards which Mr. Henry Howard, afterwards duke of Norfolk, contributed the Norfolcian library, and which is, at this time, greatly increased by a continual series of benefactions. The museum, or repository, of natural and artificial rarities, given them by Daniel Colwal, esq., and since enriched by many others, is now removed to the British Museum, and makes a part of that great repository. Their motto is, NULLIUS IN VERBA; and their place of assembling is Somerset-place, in the Strand. Sir Godfrey Copley, bart., left five guineas to be given annually to the person who should write the best paper in the year, under the head of experimental philosophy. This reward, which is now changed to a gold medal, is the highest honour the society can bestow. It is conferred on St. Andrew's day.

ROYAL *Society of Musicians.* See *Musical* FUND, and *Royal* SOCIETY *of Musicians.*

ROYAL *Spanish Academy.* See ACADEMY.

ROYAL *Sugar.* See SUGAR.

ROYAL, in *Sea Language*, is a name given to the highest sail which is extended in any ship. It is spread immediately above the top-gallant sail, to whose yard-arms the lower corners of it are attached. The sail is never used but in light and favourable breezes.

ROYAL *Stay.* See STAY.

ROYAL *Yard.* See YARD.

ROYALS, in *Artillery*, are a kind of small mortars, which carry a shell, whose diameter is five inches and a half. See MORTAR.

ROYAL *Bay*, in *Geography*, a bay on the N.E. of the island of Georgia, between Cape George and Cape Charlotte.—Also, a bay on the N. coast of Antigua, a little to the E. of Peyersan's Point.

ROYAL, or *Minong*, *Island*, an island about 35 miles long, and 12 wide, in the N.W. part of lake Superior. N. lat. 47° 52′. W. long. 89°.—Also, a small fertile island in the river St. Lawrence, 60 miles below lake Ontario. N. lat. 44° 46′. W. long. 75° 24′.

ROYAL *Reach*, a channel in the straits of Magellan, extending from Fortescue bay to Passage Point.

ROYAL *Sound*, a large bay on the coast of Kerguelen's land, between Cape George and the Prince of Wales's Foreland.

ROYAL'S *River*, a river of America, in Cumberland county, Maine, which runs into Casco bay, in the township of North Yarmouth.

ROYALSTON, a township of Worcester county, Massachusetts; 40 miles N.W. by N. of Worcester; incorporated in 1665, and containing 1415 inhabitants. Miller's river traverses this town from the east.

ROYALTIES, REGALITIES, the rights of the king; otherwise called the *king's prerogative*, and the *regalia*. See PREROGATIVE and REGALIA.

Of these, some the king may grant to common persons; others are inseparable from the crown.

ROYALTON, in *Geography*, a township of Windsor county, in the state of Vermont, N.W. of Hartford, on White river, containing 1748 inhabitants.

ROYAMUNGAL, a river of Bengal, which runs into the bay of Bengal, N. lat. 21° 35′. E. long. 89° 18′.

ROYAN, a town of France, in the department of the Lower Charente, on the Garonne; fortified by the Huguenots, and defended so vigorously against Louis XIII. in the year 1621, that he was compelled to withdraw his troops; but he afterwards avenged his disgrace, by demolishing it so entirely, that the present place is only the suburbs of the former; 12 miles S. of Marennes.

ROYAUMEIX, a town of France, in the department of the Meurte; 6 miles N. of Toul.

ROYBON, a town of France, in the department of the Isere, and chief place of a canton, in the district of St. Marcellin; 7 miles N.N.W. of St. Marcellin. The place contains 2412, and the canton 7373 inhabitants, on a territory of 190 kiliometres, in 11 communes.

ROYE, a town of France, in the department of the Somme, and chief place of a canton, in the district of Montdidier; 15 miles S.S.W. of Peronne. The place contains 3176, and the canton 14,027 inhabitants, on a territory of 195 kiliometres, in 39 communes. N. lat. 50° 8'. E. long. 2° 52'.

ROYENA, in *Botany*, named by Linnæus in honour of Adrian Van Royen, professor of Botany in the university of Leyden, who died in 1779, aged 74, and was succeeded by his nephew David, who died in 1799.—Linn. Gen. 221. Schreb. 299. Willd. Sp. Pl. v. 2. 631. Mart. Mill. Dict. v. 4. Ait. Hort. Kew. v. 3. 61. Thunb. Prodr. 80. Juss. Gen. 156. Lamarck Dict. v. 6. 320. Illustr. t. 370. Gærtn. t. 94.—Class and order, *Decandria Digynia*. Nat. Ord. *Bicornes*, Linn. *Guaiacanæ*, Juss.

Gen. Ch. *Cal.* Perianth inferior, of one leaf, urn-shaped, five-cleft, permanent. *Cor.* of one petal; tube the length of the calyx; limb spreading, revolute, deeply cloven into five, ovate segments. *Stam.* Filaments ten, very short, springing from the corolla; anthers oblong, acute, twin, erect, as long as the tube. *Pist.* Germen superior, ovate, terminating in two styles, a little longer than the stamens; stigmas simple. *Peric.* Berry invested with the coriaceous calyx, fleshy, of four cells, two of them often abortive. *Seed.* Nuts solitary, ovate, somewhat triangular.

Eff. Ch. Calyx urn-shaped. Corolla of one petal, with a revolute limb. Berry of four cells, two of them mostly abortive.

1. R. *lucida*. Shining-leaved African Bladder-nut. Linn. Sp. Pl. 568. (Staphylodendron africanum sempervirens, foliis splendentibus; Commel. Hort. v. 1. 187. t. 96.)—Leaves ovate, roughish with hairs.—Native of the Cape of Good Hope, as indeed are all the remaining species. It flowers in May and June.—The *stem* of this evergreen *shrub* is eight or ten feet high, branched in all directions. *Leaves* generally alternate, on short stalks, ovate, pointed. *Flowers* axillary, along the branches, very inconspicuous. *Berry* red, and fleshy like an apple.

2. R. *villosa*. Heart-leaved Royena. Willd. n. 2.—Leaves heart-shaped, oblong, downy beneath.—It flowers in June and July.—Very similar to the last in habit, but its *branches* are more villous. *Leaves* elliptic or oblong; heart-shaped at the base; on short, hairy stalks. *Flowers* axillary, nodding, solitary, on villous stalks. *Bracteas* two, opposite, ovate, pointed, downy, large, deciduous.

3. R. *pallens*. Pale Royena. Willd. n. 3.—"Leaves longish-obovate, obtuse, smooth."—It flowers in June and July.—We know not of any description or figure of this species which stands on the authority of Thunberg, Aiton, and Willdenow, who merely give its specific character.

4. R. *glabra*. Myrtle-leaved African Bladder-nut. Linn. Sp. Pl. 568. (Vitis idæa æthiopica, buxi minoris folio, floribus albis; Commel. Hort. v. 1. 125. t. 65.)—Leaves lanceolate, smooth.—Flowers in September.—*Stem* shrubby, five or six feet high, sending out numerous slender, leafy, evergreen *branches*, covered with a purplish *bark*. *Leaves* rather small, ovate, pointed, entire, bright green. *Flowers* axillary, along the branches, white. *Berry* roundish, purple, ripening in our greenhouses in the winter.

5. R. *hirsuta*. Hairy-leaved African Bladder-nut. Linn. Sp. Pl. 568. "Jacq. Collect. suppl. 110. t. 13. f. 1. fragm. t. 1. f. 2."—Leaves oblong-lanceolate, rather villous.—Flowers in July.—*Stem* strong and woody, seven or eight feet high, alternately branched, with a grey *bark*. *Leaves* an inch long, covered with soft hairs. *Flowers* on short stalks, axillary, small, of a faded purple colour.

6. R. *polyandra*. Oval-leaved Royena. Linn. Suppl. 240. Willd. n. 6.—Leaves elliptical. Flowers polyandrous, polygamous.—Time of flowering unknown.—The *stem* has knotty, irregular *branches*. *Leaves* somewhat obovate, coriaceous, finely downy on both sides. *Flowers* in short, axillary, downy clusters.

7. R. *angustifolia*. Willow-leaved Royena. Willd. n. 7.—Leaves lanceolate, acute, somewhat hairy beneath. It flowers in June and July.—This species is adopted on the authority of Willdenow, who observes, that it differs from all the foregoing ones, in having narrow, lanceolate *leaves*, sharp at both ends, and somewhat hairy underneath.

Royena is very nearly allied to Diospyros; the chief points of difference consisting in the latter genus having from six to twelve cells in the fruit, and sometimes five or six divisions in the calyx. Linnæus's description of the fruit of *Royena* is erroneous. See Diospyros.

Royena, in *Gardening*, contains plants of the shrubby evergreen exotic kind for the greenhouse, of which the species cultivated are; the shining-leaved royena, or African bladder-nut (R. lucida); the heart-leaved royena, or African bladder-nut (R. villosa); the myrtle-leaved royena, or African bladder-nut (R. glabra); the hairy-leaved royena, or African bladder-nut (R. hirsuta).

Method of Culture.—These plants are often rather troublesome in raising, but their culture may be attempted by cuttings and layers. The cuttings should be made from the young shoots, and be planted in the early spring in small pots filled with a loamy earth, plunging them in a very moderate hot-bed, covering them carefully with hand-glasses, refreshing them often with water in small proportions. When they have stricken roots, and are begun to shoot, inure them gradually to the open air, and when they are well rooted remove them into separate small pots, managing them afterwards as other rather tender greenhouse plants, such as the orange-tree, &c.

And the layers may be made from the young bottom shoots, laying them carefully down by slitting them as for carnations, watering them often in the warm season, but very moderately in the cold. When they are become well rooted, take them off and plant them in separate pots in the same manner as the cuttings, giving them the same sort of management afterwards.

The last sort often sends up suckers from the roots, and may sometimes be increased by planting in the same way as the cuttings. They afford variety among other greenhouse plants.

ROYERRE, in *Geography*, a town of France, in the department of the Creuse, and chief place of a canton, in the district of Bourganeuf; 9 miles S.E. of Bourganeuf. The place contains 1476, and the canton 6675 inhabitants, on a territory of 290 kiliometres, in 11 communes.

ROYMATLA, a river of Hindoostan, which is one of the mouths of the Ganges.

ROYMUNGUL, one of the mouths of the Ganges.

ROYOC, in *Botany*. See Roioc.

ROYON, in *Geography*, a town of France, in the department of the straits of Calais; 10 miles N.W. of St. Pol.

ROYPOUR, a town of Hindoostan, in Oude; 25 miles N.W. of Manickpour.—Also, a town of Bengal; 30 miles

miles N.N.W. of Midnapour.—Alſo, a town of Hindooſtan, in the circar of Boggilcund; 20 miles E. of Rewah.

ROYSTON, a town ſituated partly in Cambridgeſhire, and partly within that of Hertford, is ſeated at the bottom of a hill, among the chalk downs. The name appears to have been derived from a croſs, erected in the beginning of the twelfth century by a lady Roiſe, or Roiſia, and thence called "Roiſe's Croſs;" near to which a monaſtery for Auſtin canons was afterwards built: the canons being competently endowed, houſes and inns were erected, and in time formed a town, called Roiſe's Town, which was afterwards contracted to Royſton. At the time of the Domeſday Survey, the town was ſituated in five pariſhes, and ſo continued till the 32d year of king Henry VIII., when it was conſtituted a diſtinct pariſh: and the church of the diſſolved priory being made parochial, was, agreeably to the letter of the ſtatute, denominated "The Pariſh Church of St. John Baptiſt in Royſton." The eſtates granted to the priory by the founders appear to have included nearly all the land on which the town now ſtands. In the firſt year of Richard I. the canons obtained the liberty of holding a weekly market, and alſo an annual fair during the whole of Whitſun week. Henry III. inveſted them with many additional privileges: and under theſe grants the trade and population of the town rapidly increaſed. The greater part of the houſes were deſtroyed by fire in the reign of Henry IV.; but the convenient ſituation of the place as a corn-market contributed to its ſpeedy reſtoration: and in the time of Henry VI., according to Hollinſhed, wheat was ſo plentiful here as to be ſold for twelve-pence the quarter. Camden mentions this town as being famous for the great reſort of maltſters and other dealers in grain; and for the incredible quantity of corn to be ſeen every market day on the adjacent roads. It is ſtill celebrated for its corn trade, notwithſtanding the great alteration which has taken place in the modes of traffic. The ſcite of the priory with its appurtenances and liberties, and three annual fairs, were granted by Henry VIII., in conſideration of 1761*l.* 5*s.* 0*d.* to Robert Cheſter, eſq. whoſe poſterity continued to poſſeſs the ſame for ſeveral generations: but theſe are now the property of the honourable Thomas Brand. Only a few remains of the priory buildings are now left, excepting the church, which conſiſts of a nave, chancel, and aiſles, with a low tower. Beſides the priory, there were two other religious foundations in this town. One of them, an hoſpital dedicated to St. Nicholas, was founded ſo early as king John's reign; but no particulars of it are now known. The other, which was alſo an hoſpital or free chapel, was dedicated to St. John and St. James, and was in exiſtence in the twelfth year of Henry III., as Walter de Gray, archbiſhop of York, then granted indulgences to ſuch as ſhould contribute to the ſupport of its ſick and weak brethren. Some remains of this hoſpital are yet extant in a dwelling-houſe. King James I. built a manſion here, as an occaſional reſidence for enjoying the amuſements of hawking and hunting. At the commencement of the civil wars Charles I. removed from Hampton-Court to this houſe. It is ſtill called the king's houſe, but is fallen to decay. Beneath the market-place is a *Cave,* or ſubterranous crypt or oratory, which has been dug out of the ſolid chalk, and had originally a perpendicular aperture riſing to the ſtreet, and communicating with the upper part of the cavity. This was of a circular form, about two feet in diameter, and had been cloſed by a mill-ſtone, which was accidentally diſcovered in Auguſt 1742. This aperture, or deſcent, had holes for the feet cut into the chalk on each ſide; but as the lower part of the crypt was found to be filled with looſe earth and rubbiſh, this paſſage was quickly enlarged, the curioſity of the town's-people being ſtrongly excited by the hope of diſcovering ſome concealed treaſure. About two hundred loads of earth were drawn out; but the zeal of the labourers was only repaid by finding a ſkull, and other human bones, greatly decayed. The interior of this ſingular ſubterraneous apartment is completely circular, finiſhed in a kind of dome above, broken only by the original entrance. Round the lower part of the ſides is a ſeries of rude carving of the crucifixion, ſeveral ſaints, and various other ſubjects from ſacred and profane hiſtory. The bottom of this cell is ſurrounded by a raiſed ſeat about one foot high, and between two and three wide, but divided on the eaſt ſide by a hollow place, called the Grave. The preſent entrance is by a regular deſcent or paſſage, nearly one hundred yards in length, formed in the chalk from an adjacent houſe. The diameter of the crypt is about twenty-five feet; and the height is between thirty and forty. The Roman road, called Ichnield Way, paſſed by this town. According to the population returns of the year 1811, the number of houſes in this pariſh was 284, containing 1309 inhabitants. The market is held on Thurſdays; and here are five annual fairs. Royſton is ſituated 20 miles N.E. from Hertford, and 37 miles N. from London. Beauties of England and Wales, vol. vii. by E. W. Brayley and J. Britton. Lyſons's Magna Britannia, Cambridgeſhire. Stukeley's Palæographia Britannica.

ROYTON, a chapelry or townſhip in the pariſh of Preſtwich-cum-Oldham, and county of Lancaſter, England, is two miles N. of the town of Oldham. This place abounds with cotton manufactories, which appear to have been ſettled here in conſequence of the abundance of coal obtained. According to the population report of 1811, this townſhip contained 625 houſes, and 3910 inhabitants. Royton-hall is the ſeat of Joſeph Pickford, eſq. but formerly belonged to the Byron family, who poſſeſſed conſiderable landed property in the neighbourhood. The houſe is ſeated in a deep valley, ſurrounded by high hills. Beauties of England, &c. vol. ix. by J. Britton.

ROZANNA, a town of Lithuania, in the palatinate of Novogrodek; 48 miles S.W. of Novogrodek.

ROZANS, a town of France, in the department of the Higher Alps, and chief place of a canton, in the diſtrict of Gap; 10 miles W. of Serres. The place contains 900, and the canton 5024 inhabitants, on a territory of 195 kiliometres, in 11 communes.

ROZAS, Las, a town of Spain, in New Caſtile; 10 miles N.W. of Madrid.

ROZE, Nicolas, in *Biography,* muſic-maſter of the church of the Holy Innocents at Paris, was born at Bourgneuf, in the dioceſe of Chalons-ſur-Saône, in 1745. At ſeven years old he was received as a choriſter in the collegiate church of Beaune, in Burgundy. Soon after, he had inſtructions from the abbé Rouſſeau of Dijon, muſic-maſter of Tournay. He had the misfortune to loſe this amiable maſter in two years time, who had taught him to ſing ſeveral motets or anthems in that ſhort period. He was afterwards a conſiderable time totally without inſtructions. And what was ſtill worſe, he was under the authority of perſons who prevented him from attempting compoſition.

The abbé Hornet, nephew to the maitre de chapelle of Notre-Dame, gave him leſſons in ſinging, but he was abſolutely forbidden compoſition by this maſter, for fear his application ſhould injure the fine voice which nature had given him. At twelve years old he again found himſelf without an inſtructor, and going to the college of Beaune to to finish his classical studies, and afterwards to the seminary of Autun, where, during two years' residence, he composed the chief part of the chants which at present are adopted almost throughout the diocese.

At twenty-two years old he went into orders at Beaune. In 1669, as soon as he was admitted into priest's orders, he composed a mass, which he carried to Paris and presented to M. d'Auvergne, master of the king's band. This able professor encouraged him to pursue composition, and made him compose under his own eye a motet for the Concert Spirituel.

It was at this period that the abbé Roze began to make himself known; and this motet procured him the place of maitre de chapelle of the cathedral of Angers, which he retained five years.

In 1775 he was appointed to the Holy Innocents, and from that time he has continued to furnish the Concert Spirituel with motets; and though his style is modern, he has never deviated from the grandeur and solemnity befitting sacred music.

The abbé Roze is one of the best singing masters, in point of taste, at Paris.

He has published a system of harmony, or accompaniment, in which he modestly pretends to no more than to assist the students in harmony with methodical elementary principles, so clear, that children of eight years old shall find no difficulty in them. It often happens that able composers are unable to teach children the first elements of music for want of a well digested method. This the abbé Roze's system will be found, with respect to accompaniment. He has traced the chords from the fundamental base or key-note, through all the combinations of harmony allowable by ancient rules in one key. Laborde, 1788.

ROZESTVEN, in *Geography*, a town of Russia; 32 miles S. of Petersburg. N. lat. 52° 20'. E. long. 29° 50'.

ROZESTVENSKOI, a town of Russia, in the government of Tobolsk; 16 miles S.E. of Kemskoi.—Also, a town of Russia, in the government of Archangel, on the Pinega; 4 miles S.E. of Pineg.

ROZETT, Cape, a cape on the western coast of France. N. lat. 49° 28'. W. long. 2°.

ROZIER, Francis, in *Biography*, an eminent writer in economics, was born at Lyons in 1734. His father, who was engaged in commerce, dying while he was young, and without property, he entered into the ecclesiastical order, though his taste led him to agricultural and botanical pursuits. He obtained the place of director of the school of Lyons. In this situation he joined La Tourette in publishing, in 1766, "Elementary Demonstrations of Botany," a work that passed through many editions. In 1771 we find him at Paris, where he began to publish the "Journal de Physique et d'Histoire Naturelle," which was conducted a considerable time with great reputation. In this work he gave clear and interesting accounts of all new discoveries in physics, chemistry, and natural history. Through the recommendation of the king of Poland, he was presented to a valuable priory, when, being completely at his ease, he turned his attention to his favourite project of drawing up a complete body of rural economy. He now purchased a domain at Beziers, in the finest part of France, and engaged actively in country labours, and at the same time employed himself in the abridgment of the great works from which his compilation was to be formed. This was at length finished, under the title of "Cours d'Agriculture," in 10 vols. 4to., of which the last did not appear till after the author's death. In 1788 he went to Lyons, and was admitted a member of the academy, while the government gave him the direction of the nursery ground of the Generality. On the unfortunate revolution, Rozier was one of its earliest partizans, but without ever entering into its excesses. He was, however, one of its victims; in September 1793, during the siege of Lyons, a bomb falling upon his bed, buried his body in the ruins of his house. He was author, likewise, of several treatises on the method of making wines, and distilling brandy, on the culture of turnip and cole-seed, on oil-mills, and other machinery.

Rozier, *Cape*, in *Geography*, a cape on the coast of Canada, in the gulf of St. Lawrence; 9 miles W. of cape Gaspe.

ROZIERES. See Rosieres.

ROZOY, a town of France, in the department of the Seine and Marne, and chief place of a canton, in the district of Coulommiers. The place contains 1507, and the canton 13,199 inhabitants, on a territory of $312\frac{1}{2}$ kiliometres, in 28 communes.

Rozoy *en Thierache*, a town of France, in the department of the Aisne; 21 miles N.E. of Laon.

ROZVALINA, Totagai, a town of Russian Tartary, near lake Kargaldzin. N. lat. 52° 44'. E. long. 68° 54'.

RSESCHOW, a town of Austrian Poland, in Galicia; 70 miles W. of Lemberg.

RUA, La, a town of Spain, in Galicia; 25 miles N.E. of Orense.

RUAD, Rouad, or *Rou-Wadde*, an island of the Mediterranean, anciently celebrated under the name of Aradus or Arad. N. lat. 34° 42'. E. long. 35° 57'. See Arad.

RUADOK, or Rhiwaedog, a village of North Wales, in the county of Merioneth, where a battle was fought between the Welsh, under Llywarch Hen and the Saxons; 2 miles E. of Bala.

RUALGO, a town of Italy, in the Cadorin; 4 miles S. of Cadora.

RUANEL, a town of Ceylon; 38 miles S.S.W. of Candy.

RUARUS, Martin, in *Biography*, was born at Krempen, in Holstein, about the year 1587, and being designed for a Lutheran minister, he was educated in the principles professed by the disciples of Luther. But at Altdorf he became a convert to the Socinian doctrine, as taught in a private manner by professor Sonerus. When he was reproached and threatened by his family for deserting the principles of his forefathers, he justified his conduct, and defended the cause of free inquiry in matters of religion. Of his sincerity no doubt could be entertained, as he submitted to the loss of his patrimony rather than make a sacrifice of what he considered to be truth. He travelled over the greater part of Europe, and acquired respect and esteem wherever he went, by his great learning and excellent moral character. He was offered situations of trust and honour in England and Silesia, but declined them all. At length he became principal of the college of Racow in Poland; after which, about the year 1635, he became pastor to the Socinian church at Dantzic. In the year 1646, Calixtus used all his endeavours to bring him back to his original principles, but without effect. He died at Dantzic in 1657, at the age of 70. He wrote notes on the catechism of the Socinian churches in Poland, which were added to the addition of that work printed in 1665. Two volumes of his letters, each containing one hundred, were published after his death at Amsterdam. They are said to be curious and interesting, not only as they throw light on the history of Socinianism, but as they furnish the reader with valuable literary anecdotes. Among the author's correfpondents were father Merfenne, Hugo Grotius, and De Bergius.

RUATUN, or RATTAN, in *Geography*, an ifland in the bay of Honduras, about 30 miles in length and 12 in breadth, furrounded with rocks and fhoals; with a harbour capable of containing a large fleet of fhips. The Englifh, in the year 1742, formed a fettlement here for the purpofe of carrying on the logwood trade, but it was foon abandoned. N. lat. 16° 24′. W. long. 87° 10′.

RUBASS, a town of Hindooftan, in the fubah of Agra; 14 miles W. of Fattipour.

RUBBER, a large coarfe file.

RUBBER *of Pencil Strokes*. See CAOUTCHOUC.

RUBBER, in *Electricity*. See ELECTRICAL *Machine*.

RUBBERS, among *Shepherds*, a difeafe in fheep. See SCAB.

RUBBING-POST, a poft fet up for the purpofe of cattle, hogs, or other animals, rubbing themfelves upon. Mr. Marfhall, in his "Rural Economy of Norfolk," fays, it is an excellent cuftom of the Norfolk farmer to erect rubbing-pofts in the different parts of the inclofure he is feeding or teathing; they keep the ftock from the fences, and furnifh them, no doubt, with an agreeable, and perhaps a falutary, amufement. Some he faw draw the crown of a tree, with the lower part of the boughs left on, into the middle of the clofe: this is lefs trouble than putting down a poft, is eafily rolled out of the way of the plough, and feems to be ftill more agreeable to the cattle. They are alfo ufeful in hog-fties.

Thefe forts of pofts may probably be found of great fervice in the feeding pafture, for the purpofe of the fattening ftock rubbing themfelves upon, as they tend to keep them eafy and quiet, as well as to afford them that kind of agreeable feeling which may be of utility in promoting their progrefs towards a ftate of fatnefs.

RUBBIO, in *Commerce*, a meafure for corn in Italy, containing 8 lappa, which are equal to $7\frac{3}{4}$ Englifh bufhels.

RUBBLE STONE, *Grauwacke* of Werner, *Gres gris* of the French, is a particular kind of fand-ftone, containing not only grains of quartz, filiceous fchiftus, or horn-ftone, but alfo fcraps of blueifh argillite in a clayey cement, of which there is often no more than is barely fufficient to hold the grains together, fometimes with and fometimes without mica; commonly compact, fometimes flaty in the grofs. Its colour is yellowifh, or blueifh-grey, or dark reddifh-brown mixed with grey. Fracture, in the fmall, fine fplintery, or earthy; hardnefs from 7 to 9, rarely 10. Sp. grav. from 2.64 to 2.685, but when withered only 2.60. See *Tranfition* ROCKS.

RUBECULA, in *Ornithology*, a fpecies of *Motacilla*; which fee.

RUBEFACIENT, in *Medicine*, from *rubor*, *rednefs*, and *facio*, *I make*, or *produce*, a term which is ufed to denote thofe fubftances which, when applied externally, by friction or otherwife, excite the action of the fuperficial veffels, and, by filling them with red blood, occafion a fuffufion of rednefs in the part.

The operation of a rubefacient is, therefore, analogous to that of a blifter, but confiderably lefs efficient as a remedy; fince it produces, in fact, but a fmall degree of the incipient effect of a blifter, *viz.* a very flight and fuperficial diftenfion of the blood-veffels, fcarcely amounting to inflammation. Rubefacients are employed under the fame indications as blifters, and are intended, like them, to relieve fome internal pain or inflammation, by exciting a counter-irritation, or, as fome explain it, by revulfion; *i. e.* by drawing the fluids from the difeafed to the external parts. The friction, by means of which the rubefacient is ufually applied, contributes alfo to the fame effect.

The fubftances, by which this effect is produced, are of an acrid or ftimulating nature, fuch as ammonia, turpentine, camphor, vinegar, the effential oils, fpirits, &c.: and the difeafes, which they are ordinarily ufed to relieve, are the flighter degrees of local internal inflammation. Thus, for the relief of a flight fore-throat, or inflammation of the tonfils, it is cuftomary to rub the front of the neck with hot vinegar, or ammonia and oil; and the more external rednefs it produces, the more effectual is the internal relief. Slight pains in the cheft are often materially alleviated by the ufe of a warm liniment or plafter, or by the ufe of the ointment of tartarized antimony, which excites not only rednefs, but puftules. And rheumatic affections of the joints are often more effectually removed by friction with a rubefacient, than by any other means. See REVULSION.

RUBELLIO, in *Ichthyology*, a name given by fome authors to a fmall fea-fifh of a red colour, caught in the Mediterranean, and more ufually called by writers on thefe fubjects the *erythrinus*.

RUBELLITE, in *Mineralogy*, is confidered as a fubfpecies of tourmaline, of a reddifh-violet colour. It differs from tourmaline, being infufible under the blowpipe, but it lofes its colour and tranfparency. Its fpecific gravity is 3.1. It contains, according to Klaproth,

Silex	43.5
Alumine	42.25
Soda	9
Oxyd of iron and manganefe	1.5

A fpecimen analyfed by Vauquelin gave 7 parts in the 100 of oxyd of iron and manganefe. This ftone is fometimes ufed in jewellery. In the Greville collection of minerals in the Britifh Mufeum, there is a magnificent fpecimen of the red rubellite, originally prefented to Col. Symes by the king of Ava. It has been valued at 1000*l.*

RUBELLUS, in *Ichthyology*, a name given by fome authors to the common roach, and by others to the rudd or finfcale.

RUBENACH, in *Geography*, a town of France, in the department of the Rhine and Mofelle, and chief place of a canton, in the diftrict of Coblentz. The place contains 567, and the canton 6935 inhabitants, in 19 communes.

RUBENS, *Sir* PETER PAUL, in *Biography*. This moft fingularly accomplifhed man, and extraordinary painter, was the fon of John Rubens and Mary Pipelings, both defcendants of diftinguifhed families of the city of Antwerp. His father was one of the principal magiftrates of that place, when civil war defolated Flanders; and its calamities approaching the precincts of his abode, he left it for Cologne, in which city our artift was born in 1577. The day of his nativity was the feaft of St. Peter and St. Paul, and from thence he received, at the baptifmal font, the names of thefe apoftles. From his infancy he difcovered prompt and lively talents, which were cultivated by his parents with great care, in every branch of polite and claffical literature; and he amply repaid their care by the high degree of fuccefs he attained.

The views of his parents were otherwife directed than to the arts, and Rubens was placed, when his education was completed, as a page to the countefs of Lalain; a fituation too humble, and attended with occupation too trivial, to engage or detain long, in its obfequious frivolities, fuch a mind as he poffeffed: and on the death of his father, which happened foon after, he obtained permiffion of his mother to purfue the bent of his inclination, and became a painter.

To

To forward this view, he placed himſelf as a diſciple of Tobias Verhaecht, a landſcape painter of ſome note, but ſoon left him, to ſtudy hiſtory painting under Adam Van Oort. As the vulgar and brutal deportment of that artiſt were little congenial to the elevated and gentle mind and diſpoſition of Rubens, he ſoon quitted him alſo, and then entered the ſchool of Otho Venius, who poſſeſſed qualities, both as a man and an artiſt, far more ſuited to his taſte; and he became attached to this his laſt preceptor, in the warmeſt and moſt reſpectful degree.

When Rubens had attained his twenty-third year, Otho had the candour to tell him that he could no farther promote his progreſs; and adviſed him to travel to Italy, and gather the rich fruit of higher cultivation in art, at that rich ſtorehouſe and fertile nurſery of taſte and talent. This wiſe and parental advice of his maſter correſponded ſo entirely with his own inclination, that he immediately prepared for the journey; and having received ſtrong recommendatory letters from the archduke Albert, governor of the Netherlands, to Vincenzio Gonzaga, duke of Mantua, he ſet forth for Italy.

Devoting a ſhort time to the examination of the fine works at Venice, he proceeded to Mantua, where he received moſt marked attention from the duke, who was no leſs pleaſed with his polite accompliſhments, than with his ſkill as an artiſt, and ſoon after appointed him one of the gentlemen of his chamber. His reſidence with this prince afforded him every deſirable means of ſeeing and ſtudying the great works of Giulio Romano, in the palace del T, with which he is ſaid to have been peculiarly delighted; and he had continued with him two years, when he requeſted permiſſion to go to Venice, the empire of colouring, for the purpoſe of ſtudying ſtill farther the works of Titian and others, which had ſo much engaged his attention as he paſſed through that city. On his return to Mantua he evinced how much he had benefited by ſtudying the rich and brilliant productions of the Venetian ſchool, in the three magnificent pictures he painted for the church of the Jeſuits; which, in bravura of execution, and freedom of force in effect, rank nearly among his beſt productions. His patron afterwards gave him a commiſſion, which afforded him the means of purſuing his ſtudies at Rome, where he had not yet been, which was to make copies for him of ſome of the moſt celebrated pictures there, and he received it with gratitude and delight. During his reſidence there he executed ſeveral of theſe tranſcripts with uncommon ſucceſs, and they were eſteemed by the duke almoſt equal in value with the originals.

In 1605, Rubens was honoured by his friend with another commiſſion, which ſtill further aſſiſted to advance his knowledge of the art, whilſt it ſerved the views of the prince. He was ſent on an embaſſy from Mantua to the court of Spain, and went to Madrid, carrying with him magnificent preſents for the duke of Lerma, the favourite of Philip III. He executed his miſſion with the ſucceſs which attends ability and integrity; and while intent upon the political part of his employment, did not neglect to employ his pictorial talents with full power, gaining the eſteem and admiration of the king of Spain, whoſe portrait he painted, and from whom he received the moſt flattering marks of approbation.

Soon after his return to Mantua, he reviſited Rome, where he was engaged to adorn the tribune of Sta. Maria, in Valticella; there he painted three admirable pictures, in which he appears to have imitated the ſtyle of P. Veroneſe. From Rome he went to Genoa, where the reputation he had acquired greatly excited public curioſity, and he was engaged to paint many pictures. Among them he executed two for the church of the Jeſuits, the ſubjects of which were, the Crucifixion, and St. Ignatius performing a miracle, which gave univerſal ſatisfaction and delight.

Having been abſent from his native country eight years, he was ſummoned home by the reported illneſs of his mother; but though he haſtened with all ſpeed, he did not reach Antwerp in time to afford his beloved parent the conſolations of his preſence and affections. The loſs of her affected him deeply, and he intended, when he had arranged his private affairs, to go and reſide in Italy; but the archduke Albert, and the Infanta Iſabella, exerted their intereſt to retain him in Flanders, and in their ſervice. He conſequently eſtabliſhed himſelf at Antwerp, where he married his firſt wife, Elizabeth Brants, and built a magnificent houſe, with a ſaloon in form of a rotunda, which he enriched with antique ſtatues, buſts, vaſes, and pictures by the moſt celebrated painters: and here, ſurrounded by works of art, he carried into execution thoſe numberleſs productions of his prolific and rich invention, which once adorned his native country, but now are become the ſpoil of war, and the tokens of conqueſt and ambition, ſhining with equal luſtre among other ſuper-eminent productions of painting in the gallery of the Louvre.

The amazing ſucceſs of Rubens in his art, and the honours and wealth which were accumulated upon him, excited the envy and malignity of many among his rivals, who aſcribed the moſt meritorious parts of his works to the ability of his pupils, among whom were Jordaens, Van Uden, Snyders, Wilden, &c. and forgetting that ſuch men would not conſent to work for another whom they did not regard as pre-eminent to themſelves. Cornelius Schut abuſed him for lack of invention. Abraham Janſens had the audacity to defy him to a trial of ſtrength. Rubens anſwered, that he would contend with him when he had ſhewn himſelf to be a worthy competitor. A more friendly offer was rejected by him with equal wit. A chemiſt offered him a ſhare of his laboratory, and of his hopes of obtaining the philoſopher's ſtone. He carried the viſionary into his painting room, and told him his offer came twenty years too late, for ſo long, ſaid he, is it ſince I found the art of making gold with my palette and pencils. The abuſe of Schut and of Rombouts, who joined in it, he anſwered by relieving their neceſſities, and procuring them employment; and by engaging in thoſe varieties of art, landſcapes, lion and crocodile-hunting, and other miſcellaneous ſubjects, he decidedly eſtabliſhed his claim to the title of an univerſal painter, and covered his calumniators with ſhame and confuſion.

In 1620, when his talents had procured him univerſal renown, he received a commiſſion from Mary de Medici to adorn the gallery of the palace of the Luxembourg. There, in conſequence, he executed the works ſo well known; in which he repreſented, with the moſt rich and varied imagination, by very ingenious allegorical and emblematical deſigns, the principal events in the life of that princeſs. The whole were executed at Antwerp, except two pictures, which he painted at Paris in 1623, when he went there to arrange the whole in the gallery: and thus, in the ſhort ſpace of three years, amidſt innumerable other engagements, was this large ſeries of compoſitions, extenſive in their deſign, and rich in number of figures and in variety of colouring, completed: exhibiting an aſtoniſhing proof of the vivacity of his imagination, and the ſkill and dexterity with which he controlled the materials of his art. It was at this period that he became known to the duke of Buckingham, as that nobleman paſſed with his maſter, prince Charles, through France on his way to Madrid. He afterwards became the purchaſer of Rubens's rich museum of works of art, for which he is said to have given 10,000*l.* sterling.

On the return of Rubens to Antwerp, he was honoured with several conferences with the Infanta Isabella, and was by her dispatched on a political mission to the court of Madrid, where he arrived in 1628, and was most graciously received by Philip IV. He acquitted himself in his novel capacity to the satisfaction of that monarch, and his minister, the duke de Olivares, by both of whom he was highly esteemed; and while his talents as a diplomatist met with the success they merited, those of the painter were not neglected.

The duke de Olivares had just completed the foundation of a convent of Carmelites at the small town of Loeches, near Madrid, and the king, as a mark of his favour to the minister, commissioned Rubens to paint four pictures for their church, which he executed in his grandest style, and the richest glow of his colouring. The first is an allegorical design of the triumph of the new Law, which he has personified by a figure of Religion, seated on a superb triumphal car, drawn by four angels, with others bearing the cross, with characteristic symbols; four figures, expressive of Infidelity or Ignorance, over which Religion is supposed to triumph, follow the car like slaves or captives bound in chains. The group is crowned with beautiful cherubims, that hover in the air with chaplets in their hands, disposed with singular art and the most charming effect. The companion picture represents the interview of Abraham and Melchisedech, who offers him bread and the tenth of his spoils. The other two pictures, of equal excellence with the above, represent the four doctors of the church, and the four evangelists, with their distinctive emblems: they are all of very large dimensions, and in composition and expression are not excelled by any of his works. He also painted eight grand pictures for the great saloon of the palace at Madrid, which are regarded among the most brilliant of his productions. Their subjects were the Rape of the Sabines; the battle between the Romans and Sabines; the Bath of Diana, Perseus, and Andromeda; the Rape of Helen; the Judgment of Paris, Juno, Minerva, and Venus; and the Triumph of Bacchus. He also painted a large portrait of the king on horseback, with other figures; and a picture of the martyrdom of the apostle St. Andrew, which was in the church dedicated to that saint. For these extraordinary productions he was richly rewarded, received the honour of knighthood, and was presented with the golden key as gentleman of the chamber to the king. In 1629 he returned to Flanders, and thus, in the short space of little more than nine months, he designed and executed so extensive a series of pictures; a labour which, to any other artist not possessed of his extraordinary powers, must have required the exertion of many years. When he had rendered the account of his mission to the Infanta, she dispatched him to England, to sound the disposition of the government on the subject of a peace. There for a time he concealed the powers granted to him to negociate upon the subject. Charles, in the interim, honoured this great painter with his notice, and commissioned him to paint the ceiling of the banqueting-house at Whitehall, where he has represented the apotheosis of king James I.

During one of the frequent visits with which Charles honoured Rubens, whilst he was engaged in this great work, the latter, with infinite address, took a favourable opportunity of touching on the subject of peace with Spain; and finding that the monarch was no ways averse to it, at length produced the credentials with which he was furnished. The king appointed some members of the council to negociate with him; and the business was speedily brought to a conclusion. Charles, delighted both with the man and the artist, munificently rewarded Rubens, and on the 21st of February 1630, conferred upon him the honour of knighthood. Soon afterwards, the important object of his mission being happily effected, he returned to the Netherlands, where he was received with all the honours and distinctions due to exalted merit.

Rubens continued to enjoy his well-earned fame and honours, with uninterrupted success, till he arrived at his 58th year, when he was attacked with strong fits of gout, which debilitated his frame, and unfitted him for great exertions: he abandoned, therefore, all larger works, and confined himself to easel painting. Yet he continued to exercise his art until the year 1640, when he died, at the age of 63. He was buried, with extraordinary pomp, in the church of St. James at Antwerp, under the altar of his private chapel, which he had previously decorated with a very fine picture. A monument was erected to him by his wife and children, with an epitaph in Latin, eulogizing his talents and virtues, and displaying their success.

The victorious yet barbarous irruption of the French republicans into the Netherlands, robbed Flanders generally, and no place more than Antwerp, of the fine historical works of Rubens, of which at this period the gallery of the Louvre exhibits a most astonishing display; no less than fifty-two of his pictures, and among them several of the highest quality, being now exposed to view there. It is difficult to say which branch of the art most successfully employed his talents, in history, portraiture, animals, landscape, or still life: in all, his brilliancy of imagination, and wonderful skill in execution, are equally apparent. From his birth he had evinced a lively and uncommon portion of genius, which met the advantages furnished to him in his progress through life, with an ardour and success of which history scarcely affords a parallel. Both the number and merit of the works of Rubens are calculated to excite extraordinary attention. His fame is extended over a large part of the continent, and it may be truly said, that he has enriched his country, not only by the magnificent examples of art which he left, but also by what some may deem a more solid advantage, the wealth which continued till lately to be drawn into it, by the concourse of strangers from all parts of the world to view them.

Rubens is not one of those regular and timid composers, who escape censure and deserve no praise. He produced no faultless monsters; his works abound with defects as well as beauties, and are liable, by their daring excentricities, to provoke much criticism. But they have, nevertheless, that peculiar property, always the companion of true genius, that which seizes on the spectator, commands attention, and enforces admiration, in spite of all their faults. His productions seem to have flowed from his pencil with more than freedom—with prodigality: his mind appears to have been inexhaustible; his hand never wearied: the exuberant fertility of his imagination was, therefore, always accompanied by a correspondent spirit in the execution of his work.

"Led by some rule, which guides but not constrains,
He finished more through happiness than pains."

No man ever more completely laid the reins on the neck of his inclinations, no man ever more fearlessly abandoned himself to his own sensations, and depending on them, dared to attempt extraordinary things, than Rubens. To this, in a great measure, must be attributed that perfect originality of manner, by which the limits of the art may be said to have been extended. Endowed with a full comprehension

prehension of his own character, he waited not a moment for the acquisition of what he perhaps deemed incompatible excellence: his theory once formed, he seldom looked abroad for assistance; there is consequently in his works very little that appears to be taken from other masters, and if he has occasionally stolen any thing, he has so well digested and adapted it to the rest of his composition, that the theft is not discoverable. But though it must be allowed that he possessed, in many respects, the true art of imitation, though he looked at nature with a painter's eye, and saw at once the characteristic feature by which every object is distinguished, and rendered it on canvas with a vivacity of touch truly astonishing; though his powers of grouping and combining his objects into a whole, and forming his masses of light and shadow and colour have never been equalled; and though the general animation and energy of his attitudes, and the flowing liberty of his outline, all contribute to arrest the attention, and inspire a portion of that enthusiasm by which the painter was absorbed and carried away; yet the spectator will at last awake from his trance, his eyes will cease to be dazzled, and then he will not fail to lament, that such extraordinary powers were so often misapplied, if not entirely cast away: he will enquire, why Rubens was content to waste so many requisites to the perfection of the art? why he paid no greater attention to elegance and correctness of form, to grace, to beauty, dignity, and propriety of character? Why every subject, of whatever class, is equally adorned with the gay colours of spring, and every figure in his compositions indiscriminately *fed on roses*. Nor will he be satisfied with the ingenious, but surely unfounded apology, that these faults harmonize with his style, and were necessary to its complete uniformity, that his taste in design appears to correspond better with his colouring and composition, than if he had adopted a more correct and refined style of drawing; and that perhaps, in painting, as in personal attractions, there is a certain agreement and correspondence of parts in the whole together, which is often more captivating than more regular beauty.

The redemption of what he wanted, is found in the universality of his power as an executive painter. In the smallest sketch, the lightness and transparency of his touch and colour, are no less remarkable than the sweeping rapidity and force of his brush in his largest works: and in all kinds of subjects, he equally keeps up his wonted superiority. His animals, particularly his lions and horses, are so admirable, that it may be said they were never properly, at least poetically, painted, but by him; his portraits rank with the best works of those painters who have made that branch of art their sole study; and his landscapes remind us of the lustre of Claude Lorraine and the grandeur of Titian. In the latter class of his works, the picturesque forms of his rocks and trees, the deep tones in his shady glades and glooms, the watery sunshine, the dewy verdure, the airiness and facility of his touch, exhibit a charm, and shew a variety of invention, which fascinate the observer, and leave him no inclination to dwell on the defects, though they are often neither few nor small.

As a colourist, Rubens, in comparison with Titian, the great master of the Venetian school, will rise or fall, according to the taste of the amateur. If he is less chaste than the Venetian, he is more brilliant; and if not by the truth of his colours, yet he claims our applause by the lustre and splendour of his tints. The latter, in his execution, mingled his hues as they are found in nature, in such a manner as to make it impossible to say where they begin or terminate; Rubens, on the other hand, laid his colours in their places, one by the side of the other, and then very slightly mixed them by a touch of a soft pencil; not unfrequently leaving his prepared ground visible through parts of the colours, to produce an harmonizing tone. Of these different styles, the only correct mode of judging is by reference to the specific object of art, *the imitation of nature*, and then Titian's will be regarded as the most correct, though Rubens may be more alluring.

RUBENS, ALBERT, son of Peter Paul, was born at Antwerp in 1614, and succeeded his father in his post as secretary to the council, devoting his leisure to literary pursuits. He died in 1657, leaving behind him many works, as monuments of his great learning and sound judgment, of which the following may be mentioned. "Regum et Imperatorum Romanorum Numismata," which is a commentary on the medals of the duke of Arschot: "De Re Vestiaria Veterum:" "Dissertatio de Gemma Tiberiana et Augustea—de Urbibus Neocoris—de natali Die Cæsaris Augusti," which were published by Grævius in the Thesaurus Antiq. Roman.

RUBENTIA, in *Botany*, so called by Commerson, from the vernacular name of the tree in the Mauritius, *Bois Rouge;* see ELÆODENDRUM. See also RHAMNUS *pentaphyllus*, where we ought to have observed that the plant of Desfontaines and Boccone is very different from *Elæodendrum Argan*, to which the synonyms of Linnæus and Jacquin most probably belong, as cited in our vol. 12th.

RUBEOLA, the diminutive of *Rubia;* Tourn. Inst. 130. t. 50. See ASPERULA and CRUCIANELLA.

RUBETA, or TOAD, in *Zoology*, a species of *Rana;* which see.

RUBETRA, in *Ornithology*, a species of *Motacilla;* which see. It is also a name by which Gesner and some others have called that species of the œnanthe, commonly known by the names of the *stone-chatter*, *stone-smick*, or *moor-titling*. (See MOTACILLA *Rubicola*.) Other species of *Motacilla* are also called by the same name. See also MUSCICAPA and PIPRA.

RUBIA, in *Botany*, derived from *ruber*, red, on account of the fine scarlet colour afforded by its root; which is well known to dyers and tanners under the name of Madder.—Linn. Gen. 52. Schreb. 69. Willd. Sp. Pl. v. 1. 603. Mart. Mill. Dict. v. 4. Sm. Fl. Brit. 181. Prodr. Fl. Græc. Sibth. v. 1. 97. Ait. Hort. Kew. v. 1. 242. Juss. Gen. 197. Tournef. t. 38. Michaux Boreal-Amer. v. 1. 81. Pursh v. 1. 102. Lamarck Illustr. t. 60.—Class and order, *Tetrandria Monogynia*. Nat. Ord. *Stellatæ*, Linn. *Rubiaceæ*, Juss.

Gen. Ch. *Cal.* Perianth superior, of one leaf, four-toothed, very small, or none. *Cor.* of one petal, bell-shaped, four-toothed, or more frequently five-cleft, without a tube. *Stam.* Filaments four, awl-shaped, shorter than the corolla; anthers simple. *Pist.* Germen inferior, twin; style thread-shaped, cloven at the top; stigmas two, capitate. *Peric.* Two smooth berries united into one. *Seeds* solitary, roundish, umbilicated.

Ess. Ch. Corolla of one petal, bell-shaped, superior. Berries two, combined, each with a single seed.

1. R. *tinctorum*. Dyer's Madder. Linn. Sp. Pl. 158. Sm. Fl. Græc. Sibth. t. 141. Woodv. Med. Bot. t. 68. —Leaves elliptic-lanceolate, annual, about six in a whorl, rough at the keel. Stem prickly.—Native of the south of Europe, flowering in June. *Root* perennial, widely spreading, much divided and branched at the top, succulent, its bark principally affording a scarlet dye. *Stems* herbaceous, annual, decumbent, widely spreading, branched, leafy, obtusely quadrangular, prickly, with little hooks at the angles.

gles. *Leaves* ſpreading, acute, an inch and half long, roughiſh above, narrowed at the baſe into a ſhort, broad footſtalk; at the margin and back of the rib rough with ſpines, which for the moſt part point backwards, but in a contrary way towards the tip. *Flowers* yellowiſh-green, in axillary, terminal, trichotomous, leafy or bracteated, rough *panicles*, longer than the leaves. *Berries* dark-purple.

The cultivation of this uſeful plant in Great Britain by no means keeps pace with the demand for it. That grown in Holland is the moſt eſteemed by our dyers and calico-printers. Dr. Sibthorp tells us it is much cultivated in the neighbourhood of Athens.—Madder has the property of tinging, with its bright colour, not only the milk, but even the bones of ſuch animals as feed upon it.

2. R. *chilenſis*. Chili Madder. Willd. n. 2. "Molina Nat. Hiſt. Chili. 118." (Rubiaſtrum, Cruciatæ folio et facie, vulgo Relbun; Feuillée Peruv. 60. t. 45.)—Leaves annual, four in a whorl. Stalks axillary, ſolitary, ſingle-flowered. Stem ſmooth.—Native of Chili, on mountains. *Root* perennial, much divided and ſpreading, affording a dye like the laſt. *Stems* round, ſlender, ſomewhat creeping. *Leaves* ovate, four together, forming a croſs, rough and ſticking to the clothes. *Flowers* axillary, ſolitary, ſtalked, white. *Berries* roundiſh, red.

3. R. *peregrina*. Wild Engliſh Madder. Linn. Sp. Pl. 158. Fl. Brit. n. 1. Engl. Bot. t. 851.—Leaves about four in a whorl, elliptical; ſhining and ſmooth on their upper ſide. Flowers five-cleft. Not uncommon in the ſouth-weſt of England, among buſhes, on a rich loamy ſoil, flowering in July, and ripening its berries about October.—*Root* perennial, red, or orange-coloured. *Stems* branched, diffuſe, ſquare, rough at the angles, perennial. *Leaves* four, rarely ſix together, evergreen, pointed, rough, with teeth at the margin, and nerves on the under ſide. *Flowers* in forked panicles, terminal, yellowiſh, always five-cleft and pentandrous, without a calyx. *Berries* black, one of them generally abortive.

It is remarked in the Flora Britannica, that *Rubia*, n. 708 of Haller, which has been confounded with this ſpecies, is unqueſtionably *R. tinctorum* of Linnæus, having ovato-lanceolate *leaves*, rough on the upper ſide, and *flowers* which are moſtly four-cleft, deſtitute of a calyx.

4. R. *lucida*. Shining-leaved Madder. Linn. Syſt. Nat. ed. 12. v. 2. 732. Willd. n. 4. Sm. Fl. Græc. Sibth. t. 142.—Leaves elliptical, evergreen, ſix in a whorl, ſmooth at the keel. Stem without prickles. Native of Majorca, and the iſlands of Zante and Cyprus. It flowers in July. *Root* perennial, branched, much divided at the crown. *Stems* rather ſhrubby, a little ſpreading, much branched, unarmed, clothed with roughiſh down; jointed, roundiſh, leafleſs and grey in the lower part; leafy and ſquare in the upper. *Leaves* ſpreading, recurved, half an inch long, ſeſſile, pointed, ſmooth on both ſides, thickened at the margin, rough with ſpines pointing forwards. *Flowering* in axillary, numerous, trichotomous panicles, of a yellowiſh-green.

5. R. *fruticoſa*. Prickly-leaved Madder. Willd. n. 5. Jacq. Ic. Rar. t. 25.—Leaves evergreen, elliptical, carinated; prickly at the margin. Stem ſhrubby, rough.—Native of the Canary iſlands, and flowering at Kew in September.—*Stem* woody, round, much branched, of a greyiſh-brown colour; the younger *branches* angular, very rough, green. *Leaves* from three to ſeven together, ſmooth, except at the edges and back of the rib. *Flowers* on axillary, ſhort ſtalks, ſolitary or three together, pale yellow. *Berries* roundiſh, black, with purple pulp.

6. R. *anguſtifolia*. Narrow-leaved Madder. Linn. Mant. 39. Willd. n. 6.—Leaves evergreen, linear, ſmooth on the upper ſide.—Native of Minorca, and introduced at Kew, in 1772, by M. Richard, where it flowers in July and Auguſt.—*Stems* diffuſe, very rough, ſquare. *Leaves* four or ſix in a whorl, linear, acute, their keel and margin fringed with ſmall prickles, and rugged along the rib of the upper ſurface. *Flowers* yellow, flat, five-cleft.

7. R. *cordifolia*. Heart-leaved Madder. Linn. Mant. 197. "Pallas. It. v. 3. 715. t. L. f. 1." (R. cordata; Thunb. Japon. 60.)—Leaves perennial, four in a whorl, heart-ſhaped.—Native of the Cape of Good Hope, Siberia, China, and Japan; flowering at Kew in July.—Whole *herb* diffuſe, or ſlightly climbing. *Stem* ſquare, branched, with recurved prickles at the angles. *Leaves* four, rarely ſix, together, ovate, acute, revolute at the edge, rugged all over and dotted, on quadrangular ſtalks. *Flowers* white, in ſpreading, axillary, terminal panicles. Thunberg informs us that this ſpecies is uſed in Japan for dyeing.

8. R. *Brownei*. Brownean Madder. Michaux Boreal-Amer. v. 1. 81. Purſh 102. (R. peregrina; Walt. Fl. Carol. 86.—R. ſubhirſuta ſcandens vel reclinata, foliis cruciatis floribus ſingularibus ad alas; Brown Jam. 141.—Valantia hypocarpa; Linn. Sp. Pl. 1491.)—Leaves four in a whorl, oval. Flowers on ſtalks, ſolitary.—Found in ſhady woods from Carolina to Florida, and on the cool mountains of Jamaica. *Stem* herbaceous, from one to three feet high, looſe, branched, grooved, rugged. *Leaves* ſeſſile, ſmall, entire, convex, hiſpid with hairs, on ſhort downy ſtalks. *Flowers* axillary, ſmall, yellow, like thoſe of a *Galium*. *Berries* minute, tawny, or purpliſh, ſingle-ſeeded.

Rubia, in *Gardening*, contains plants of the hardy, herbaceous, perennial kind, of which the ſpecies moſtly cultivated is the dyer's madder (R. tinctorum).

It may be noticed, that madder is ſo eſſential to dyers and calico-printers, that theſe buſineſſes cannot be carried on without it.

Method of Culture.—The young plants of this kind are increaſed by off-ſets or ſuckers, from the roots of the old plants in the ſpring, as April or the following month; which ſhould be ſlipped off ſoon after they appear above ground, by opening the earth round the roots, and taking off the ſide ſuckers with as much root-part and fibres to each as poſſible, preſerving the tops entire; which ſhould be planted directly, in the manner directed below. The ground being well prepared by frequent deep ploughing, or trenching over, and the proper quantity of ſets or ſuckers provided, they ſhould, with a dibble, be planted in rows two feet aſunder, and one diſtant in the row, putting each plant low enough in proportion to the length of its root, leaving moſt of the green top out of the ground, and cloſing the earth well about each ſet, as the work proceeds. Some ſet theſe plants in beds, three rows length-ways, at two feet diſtance, with wide alleys between bed and bed, in order for landing up the crowns of the roots two or three inches deep in winter. They ſhoot up into ſtalks the ſame year in either mode, but the roots require two or three years' growth before they are large enough for uſe; during which period they ſhould be kept clean from weeds all the ſummer by broad-hoeing, in dry weather; and in autumn, when the ſtalks decay, cutting them down, and then ſlightly digging the ground between the rows, raiſing it ſomewhat ridge-ways along the rows of the plants, an inch or two thick over their crowns; or, if they are in beds, they may be landed up from the alleys to the ſame depth; the ſame culture being repeated till the autumn of the third year, when the roots will be fit for taking up for uſe. This is performed by trenching the ground the way of the rows, beginning at one end of it, and

and opening a two-feet-wide trench close along by the first row of plants, digging down to the depth of the roots to get them clean out to the bottom; then opening another trench close to the next row, turning the earth into the first; and so on, trench and trench, till the whole is taken up and removed.

It is found that, in the garden culture, these plants succeed best in a light rich deep soil; the roots are sometimes used fresh for dyeing, being prepared by washing and pounding; but commonly when designed for keeping, or to be sent to a distance, are dried in some covered airy shed; then all the mould being rubbed off, and the roots made sufficiently dry, are sold to those who manufacture them for use, if not performed by the cultivator; this consists in drying them in a kiln or some stove-house, &c. then thrashing them to beat off the outer skin, in order to separate it from the inner part of the root, as being of an inferior quality. The roots being then dried in a kiln about twenty-four hours, are removed to a mill or pounding-house, where they are pounded in a long hollow oaken block, with stampers kept in motion by the mill; and when thus reduced to powder, sifted, and put in casks, as may be more fully seen under the head MADDER, in *Agriculture*.

But these plants are sometimes employed for variety in the borders or other open parts of gardens or pleasure-grounds, when of large extent.

RUBIA, in the *Materia Medica*, &c. See MADDER.

RUBIA, in *Geography*, a town of Austria, in the county of Goritz, on the Vipao; four miles S.E. of Goritz.

RUBIACEÆ, in *Botany*, one of Jussieu's largest and most important natural orders of plants, which has grown out of the Linnæan *Stellatæ*, and is named from *Rubia*, a genus belonging to the latter. Linnæus, in subordinate sections of his *Stellatæ*, has indicated some genera, as akin to what more strictly appeared to him to constitute that order. But his ideas wandered between this tribe and the *Contortæ*, to which last he referred some genuine *Rubiaceæ*; as *Cinchona* and *Gardenia*. Jussieu, taking a more accurate and comprehensive view of the subject, has greatly extended the order, while he has, at the same time, better defined it than any preceding botanist. This order is the 57th of his series, the 2d of his 11th class. We refer the reader to DIPSACEÆ for the characters of that class. *Cotyledons* two. *Flowers* monopetalous, superior. *Anthers* distinct; &c. The order of *Rubiaceæ* is thus defined.

Calyx of one leaf, superior, simple; its limb divided, or occasionally undivided. *Corolla* regular, mostly tubular, with a divided limb. *Stamens* definite, four or five, seldom more, inserted into the tube of the corolla, alternate with its segments, and equal to them in number. *Germen* inferior; style one, very rarely double; stigma generally double. *Fruit* in some cases of two lobes, or grains, each lobe single-seeded, not bursting, but having the appearance of a naked seed; in others a simple capsular or pulpy fruit, often of two cells, in each of which the seeds are either solitary or numerous; in a few instances there is but one cell, in some others many; the fruit, of whatever description, is either crowned with the permanent limb of the calyx, or marked with a rim, or scar, where the latter had been. The *corculum* is oblong, slender, inclosed in a large, horny, lateral *albumen*. *Stem* herbaceous, shrubby, or arboreous. *Leaves* in a few instances whorled, in most opposite, their *footstalks* generally connected at the base, through the medium of a simple pair of *stipulas*, or sometimes a fringed kind of sheath, embracing the stem or branch. Plants of this order are readily known, even without flowers, by their *leaves* or *stipulas*. The shrubby and arborescent kinds are principally natives of tropical climates, where they greatly abound.

Section 1. *Fruit two-lobed, with two seeds. Stamens generally four.* Leaves mostly whorled; stem almost uniformly herbaceous.

Sherardia, *Asperula*, *Galium*, *Crucianella*, *Valantia*, *Rubia*, and *Anthospermum*.

Sect. 2. *Fruit two-lobed, with two seeds. Stamens four, rarely five or six.* Leaves mostly opposite, connected by a fringed sheath; stem in general herbaceous.

Houstonia, *Knoxia*, *Spermacoce*, *Diodia*, *Galopina*, *Richardia*, and *Phyllis*.

Sect. 3. *Fruit simple, with two cells, and many seeds. Stamens four.* Leaves opposite. Stem either herbaceous or shrubby. *Hedyotis; Oldenlandia* of Plumier and Linnæus, which is not distinct from *Hedyotis*, as we have shewn in its proper place; *Carphalea* of Jussieu, Lamarck Illustr. t. 59; *Coccocypselum* of Browne and Schreber; *Gomozia; Manettia* of Linnæus, for which Jussieu prefers Aublet's name *Nacibea; Tontanea* of Aublet, supposed to be Schreber's *Bellardia; Petesia* of Browne and Linnæus; *Fernelia* of Commerson, Lamarck Illustr. t. 67; and *Catesbæa*.

Sect. 4. *Fruit simple, with two cells, and many seeds. Stamens five.* Leaves opposite; stem often shrubby.

Randia, which is a *Gardenia; Bellonia; Virecta; Macrocnemum; Bertiera* of Aublet and Schreber; *Dentella* of Forster; *Mussænda; Cinchona; Tocoyena* of Aublet, Lamarck Illustr. t. 163; *Posoqueria* of the same authors, which is *Cyrtanthus* of Schreber; *Rondeletia; Genipa* of Plumier and Linnæus, which is a *Gardenia; Gardenia;* and *Portlandia*.

Sect. 5. *Fruit simple, with two cells, and many seeds. Stamens six, or more.* Leaves opposite; stem shrubby or arboreous.

Coutarea of Aublet, which is *Portlandia hexandra* of Linnæus; *Hillia;* and *Duroia*.

Sect. 6. *Fruit simple, with two cells and two seeds. Stamens four.* Leaves opposite; stem for the most part shrubby.

Chomelia of Jacquin; *Pavetta; Ixora; Coussarea* of Aublet; *Malanea* of the same, which is Schreber's *Cunninghamia;* and *Antirrhæa* of Commerson.

Sect. 7. *Fruit simple, with two cells and two seeds. Stamens five.* Leaves opposite; stem shrubby or arboreous.

Chimarrhis of Jacquin; *Chiococca; Psychotria; Coffea; Canthium* of Lamarck, which is a *Gardenia; Ronabea* of Aublet, Lamarck Illustr. t. 166; *Pæderia; Coprosma;* and Aublet's *Simira*.

Sect. 8. *Fruit simple, with many cells, each containing a solitary seed. Stamens four, five, or more.* Leaves opposite; stem often shrubby.

Nonatelia of Aublet, which is scarcely different from *Psychotria; Laugeria; Erithalis; Psathura* of Commerson, Lamarck Illustr. t. 260; *Myonima* of Commerson, ibid. t. 68; *Pyrostria*, ibid. t. 68; *Vangueria*, ibid. t. 159; *Matthiola* of Plum. and Linn.; and *Guettarda*.

Sect. 9. *Fruit simple, with many cells, each containing many seeds. Stamens five, or more.* Leaves generally opposite; stem either shrubby or herbaceous.

Hamellia; Patima of Aublet, Lamarck Illustr. t. 159; and *Sabicea* of Aublet, which is Schreber's *Schwenkfeldia*.

Sect. 10. *Flowers aggregate upon a common receptacle; the fruit sometimes, but rarely, confluent.* Leaves opposite; stem arboreous or shrubby, rarely herbaceous.

Mitchella; Canephora of Jussieu, Lamarck Illustr. t. 151; *Patabea* of Aublet; *Evea* of the same, also *Tapogomea*, both compre-

comprehended by Schreber under *Callicocca; Morinda; Nauclea;* and *Cephalanthus.*

Sect. 10. *Rubiaceous genera, with the nature of whose fruits Jussieu was not, as yet, sufficiently acquainted.*

Serissa of Commerson, Lamarck Illustr. t. 151, which L'Heritier named *Buchozia;* and found to have a berry with two seeds; *Pagamea* of Aublet, Lamarck Illustr. t. 88; *Faramea* of the same, ibid. t. 63; and *Hydrophylax* of Linn. Suppl.

RUBICAN, in the *Manege.* A horse is said to be of a rubican colour, that is a bay, sorrel, or black, with a light grey or white upon the flanks, but so that this grey or white is not predominant there.

RUBICILLA Americana, in *Ornithology,* a name given by Mr. Ray to the guiratirica, a Brasilian bird, of the bull-finch kind, very beautifully variegated with red, black, and grey.

RUBICOLA, a species of *Motacilla;* which see.

RUBICON, in *Geography,* a river of Italy, famous in Roman history, now a diminutive stream, and called by some Fiumesino, and by others *Pisatello* (which see), which enters the Adriatic about eight miles N. of Rimini.—Also, a department of Italy, composed of part of the Romagna. It contains about 105,000 inhabitants, who elect 12 deputies. The capital is Rimini.

RUBICULUS, in *Ichthyology,* a name given by Figulus and some others to that species of fish which we call the *roach.* It is of the cyprinus kind, and is distinguished by Artedi under the name of the red-eyed cyprinus, with the tail and belly-fins red. See Cyprinus.

RUBIELOS, in *Geography,* a town of Spain, in Aragon; 22 miles S.E. of Teruel.

RUBIERA, a town of Italy, in the department of the Panaro; five miles W. of Modena.

RUBIFYING, formed of *rubens, ruddy,* and *fio, I become,* in *Chemistry,* &c. the act of turning a thing red by force of fire, &c.

Red arsenic is common white arsenic rubified by a mixture of sulphur and copper.

RUBIGALIA, or Robigalia, in *Antiquity,* a feast celebrated by the Romans, in honour of the god Rubigus, or the goddess Rubigo; to engage those deities to preserve the corn from blasting and mildews.

The Rubigalia were instituted by Numa in the eleventh year of his reign; and were held on the seventh of the calends of May, which is our twenty-fifth of April; being about the time when the blight or mildew, called by the Latins *rubigo,* uses to attack the corn.

Varro fixes it to the time when the sun enters the 16th degree of Taurus. Indeed the true time seems rather to have been on the 18th day before the equinox, and the true reason, because then Canicula, or the Little Dog, sets; which is esteemed a malific constellation.

Hence they sacrificed a dog to Rubigo: Ovid says, the entrails of a dog, and those of a sheep; Columella, only a sucking puppy. Festus insinuates, that the victim must also be red.

RUBIGO, or Robigo, a disease incident to corn, popularly called *mildew.*

The rubigo is a species of blight. See Blight, and Rust *of corn.*

RUBIN *of Antimony,* in *Chemistry,* a kind of liver of antimony, made with equal parts of nitre and crude antimony detonated together, to which is afterwards added an equal quantity of common salt. It is also called *magnesia opalina.*

Rubin, or *Roboan,* in *Geography,* a small island near the coast of Arabia, at the entrance of the straits of Babelmandeb, near a projecting cape of the continent, and accessible by fording at low-water. Pilots are obtained here to navigate vessels through the straits, and to different ports in the Red sea.

RUBINELLI, Giovanni, in *Biography,* an Italian opera singer of the first class for voice, figure, action, and knowledge, arrived in England, from Florence, in April, 1786. His journey hither from Rome, where he sung during the carnival of this year, was not very propitious, as the weather was uncommonly inclement; and he was not only overturned in his chaise at Macon, in France, but after quitting the ship, in which he sailed from Calais to Dover, the boat that was to have landed him was overset near the shore, and he remained a considerable time up to his chin in water, to the great risk of his health, his voice, and even his life. The first time we meet with his name in the dramatis personæ of an opera is in "Caliroe," set by Sacchini, for Stutgard, in 1770, where he performed the part of second man. He seems to have continued at the court of Wirtemberg, in no higher station, several years, as Grassi and Muzio are named before him in the "Indice de' Spettacoli Theatrale." His name does not appear as first serious man in Italy till 1774, when he sung at Modena, in Paesiello's "Alessandro nell' Indie," and Anfossi's "Demofoonte." After this, he appeared as principal singer in all the great theatres of Italy, till his arrival in London. The first opera in which Rubinelli appeared in England was a pasticcio, called "Virginia," May the 4th. His own part, however, was chiefly composed by Angiolo Tarchi, a young Neapolitan, then advancing into eminence with great rapidity. Rubinelli is in figure tall and majestic, in countenance mild and benign. There is dignity in his appearance on the stage; and the instant the tone of hie voice is heard, there remains no doubt with the audience of his being the first singer. It is a true and full contralto from C, in the middle of the scale, to the octave above. He sometimes, however, goes down to G, and up to F; but neither the extra low notes nor the high are very full. All above C is falset, and so much more feeble and of a different register from the rest, that we were uneasy when he transcended the compass of his natural and real voice. His shake is not sufficiently open; but in other respects he is an admirable singer. His style is grand, and truly dramatic. His execution is neat and distinct. His taste and embellishments are new, select, and masterly. His articulation is so pure and well accented, in his recitatives, that no one who understands the Italian language can ever want to look at the book of the words, while he is singing. His chest is so strong, and his intonation so perfect, that we have very seldom heard him sing out of tune. His voice is more clear and certain in a theatre, where it has room to expand, than in a room. He had a greater variety of embellishments than any singer we had heard, except Pacchierotti, who not only surpasses him in richness of invention and fancy, but in the native pathos, and touching expression of his voice. Yet Rubinelli, from the fulness of his voice, and greater simplicity of style, pleases a more considerable number of his hearers than Pacchierotti, though none perhaps, so exquisitely, as that singer used to please his real admirers. Rubinelli finding himself censured on his first arrival in England for changing and embellishing his airs, sung "Return, O God of Hosts," at Westminster Abbey, in so plain and unadorned a manner, that those who venerate Handel the most, thought him bald and insipid. Indeed, we we paffed feveral appoggiaturas, which we remember Mrs. Cibber to have introduced, who learned to fing the air from the compofer himfelf; and who, though her voice was a thread, and her knowledge of mufic very inconfiderable, yet from her intelligence of the words and native feeling, fhe fung this admirable fupplication in a more touching manner, than the fineft opera finger we ever heard attempt it; and Monticelli, Guadagni, Guarducci, and Pacchierotti, were of the number.

He remained here only one feafon; for in 1787 we find him finging at Brefcia and Venice; and in 1788 he likewife performed in that city; in 1789, at Rome and at Milan; in 1790, at Genoa. He was fucceeded in England by Marchefi.

RUBINUS Verus, from *ruber*, a true carbuncle.

RUBIO, Cape, in *Geography*, a cape on the N.W. coaft of the ifland of Iviça. N. lat. 39° 5′. E. long. 1° 21′.

RUBIS, in *Ornithology*, guainumbi or humming-bird. See Trochilus *Colubris*.

RUBLACEDA, in *Geography*, a town of Spain, in Old Caftile; 18 miles S. of Frias.

RUBLE, in *Commerce*, a money of account in Ruffia, containing 100 copecks, or kopeeks. The ruble is alfo divided into 10 grievens, 33⅓ altins, or 50 grofchen; and the copeck is likewife divided into 2 denufhkas, or 4 polufhkas.

The gold coins are the imperial and half imperial, of 10 and 5 rubles; double and fingle ducats, formerly worth 4½ rubles and 2¾ rubles, but raifed in value, in 1764, the double ducat to 5 rubles 60 copecks, and the fingle to 2 rubles 80 copecks. The filver coins are rubles of 100 copecks; alfo poltins of 50 copecks; polpoltins of 25 copecks; double and fingle grieven of 20 and 10 copecks; and pieces of 5 altins or 15 copecks; and peyte-copecks, of 5 copecks each, now out of circulation.

Gold Coins.—The ruble, and alfo the double and half ruble, bear the fame impreffions as the ducat, *viz.* the head of the reigning emperor or emprefs, with the name and titles in Ruffian characters, thus tranflated: "Peter by the grace of God emperor, or Elizabeth by the grace of God emprefs, and fovereign of all the Ruffias;" but on the reverfe of the ruble the value is written, "New coin, 2 rubles or 1 ruble;" and the half piece bears on its reverfe the cypher of the emprefs Elizabeth, with the word "Poltina," which means half a ruble. Thefe coins, as well as the ducats, are now nearly out of circulation.

The imperial has the head of the reigning fovereign, with name and title as above; reverfe, a crofs formed by five efcutcheons, with the four figures of the year of coinage in the four angles; legend, "Imperial Ruffian coin, value 10 rubles;" and on the half imperial, "Value 5 rubles." But the half imperials of Paul I. have on one fide a fquare, with ornaments, containing the infcription, "Not unto us, not unto us, but unto thy name;" reverfe, a crofs and four crowns, with a capital I in the centre, and the figure 5 in the four angles of the crofs.

Silver Coins.—The ruble has the head of the reigning fovereign, with the name and title as on the gold coins; reverfe, a two-headed eagle crowned, with an efcutcheon on its breaft; legend, "New coin, value 1 ruble," or fimply "Coin 1 ruble," and the date. Some rubles of Peter I. and Catherine I. bear on the reverfe a crofs and four crowns, with four I's, or four double II's in the four angles, and the date within the crofs.

The ruble of Paul I. (1799, &c.) bears the fame impreffions as the half imperial of the fame period, except that the legend on the reverfe is "Coin, value 1 ruble." The

The ruble of Alexander (1802) bears on one ſide the eagle and legend, as above; on the reverſe, "Coin of the Ruſſian empire, ruble," encircled with a branch of laurel, and one of oak, having a ſmall crown at the top.

The poltina, or half ruble, bears the ſame impreſſions as the ruble, according to the period at which it was coined, except that the inſcription contains the word POLTINA, inſtead of RUBLE; and the quarter ruble is marked POLUPOLTINICK.

The 20-copeck piece has the head, name, and title of the reigning ſovereign, as above; reverſe, a two-headed eagle, with the number 20 on its breaſt, and no legend. The 15-copeck piece bears the ſame impreſſions, but it is marked 15.

The 10-copeck piece has the two-headed eagle; reverſe, the value of the piece, 10 COPECKS.

The 5-copeck piece has a Ruſſian P, with a crown over it, and under which is an I; reverſe, 5 COPECKS, and two laurel branches. Kelly's Univerſal Cambiſt.

RUBRIC, RUBRICA, in the *Canon Law*, denotes a title, or article, in certain ancient law-books; thus called, becauſe written, as the titles of the chapters in our ancient Bibles are, in red letters.

RUBRICS alſo denote the rules and directions given in the Liturgy; for the order and manner in which the ſeveral parts of the office are to be performed.

They are called *rubrics* from the Latin *ruber, red;* becauſe formerly printed in red ink, to diſtinguiſh them from the reſt of the office, which was in black; as they ſtill are in the Roman miſſals, &c.

The great rubric for the celebration of Eaſter, preſcribed by the Nicene council, is to this purpoſe: Eaſter-day to be the Sunday which falls upon, or next after, the firſt full moon which immediately ſucceeds the vernal equinox. Dr. Wallis has a particular diſcourſe on the ancient rubrics for the feaſt of Eaſter, in the Philoſophical Tranſactions.

RUBRICA. See REDDLE.

RUBUS, in *Botany*, an ancient Latin word, certainly of the ſame origin as *ruber*, which appears to be the Celtic *rub*, red. (See RHUS, ROSA, and RUBIA.) The red hue, more or leſs prevalent, in various parts of the different kinds of Bramble, of which the preſent genus conſiſts, readily accounts for the application of the above name.—Linn. Gen. 254. Schreb. 342. Willd. Sp. Pl. v. 2. 1080. Mart. Mill. Dict. v. 4. Sm. Fl. Brit. 541. Prodr. Fl. Græc. Sibth. v. 1. 349. Ait. Hort. Kew. v. 3. 267. Purſh 346. Juſſ. 338. Tourn. t. 385. Lamarck Illuſtr. t. 441. Gærtn. t. 73.—Claſs and order, *Icoſandria Polygynia*. Nat. Ord. *Senticoſæ*, Linn. *Roſaceæ*, Juſſ.

Gen. Ch. *Cal.* Perianth inferior, of one leaf, flattiſh, in five oblong, ſpreading, ſimple, permanent ſegments. *Cor.* Petals five, roundiſh or oblong, ſomewhat ſpreading, inſerted into the calyx, and uſually about the length of its ſegments. *Stam.* Filaments numerous, ſhorter than the corolla, inſerted into the calyx; anthers roundiſh, compreſſed. *Piſt.* Germens numerous, altogether ſuperior; ſtyles ſmall, capillary, one ſpringing from the ſide of each germen; ſtigmas ſimple, permanent. *Peric.* Berry compound, conſiſting of ſeveral roundiſh pulpy grains, each of one cell, collected into a convex head, hollow underneath, inſerted upon a conical ſpongy permanent receptacle, and at length deciduous. *Seeds* ſolitary, oblong, compreſſed.

Obſ. The ſeparate juicy grains, which compoſe the general berry, are uſually ſo attached to each other, that they cannot be diſunited without tearing. In *R. ſaxatilis* they are diſtinct. *R. Chamæmorus* is not, as Linnæus firſt thought, dioecious, but monoecious; Dr. Solander having obſerved that the male and female flowers grow from one root, though on ſeparate ſtems. Each flower of this ſpecies has indeed both ſtamens and piſtils, though, in one or other flower, one part is imperfect.

Eſſ. Ch. Calyx in five ſimple ſegments. Petals five. Berry ſuperior, compoſed of ſingle-ſeeded grains, deciduous. Receptacle permanent.

This numerous genus partakes conſiderably of the beauty and elegance prevalent throughout the whole order of *Roſaceæ*, and is beſides valuable, in many inſtances, for its wholeſome and highly grateful fruit. The *ſtem* is moſt generally ſhrubby; ſometimes herbaceous; more frequently trailing than erect; in ſome of the ſhrubby kinds biennial only, not perennial. Both *ſtem, ſtalks*, and even the ribs of the *leaflets*, in many of the ſhrubby ſpecies, are prickly. *Leaves* either lobed, digitate, pedate, or pinnate. *Flowers* either ſolitary, racemoſe, or panicled, red or white. *Fruit* black, blueiſh, red, or yellowiſh, often highly fragrant. Moſt of the ſpecies grow in cool climates, or mountainous ſituations. We have ſeveral to add to Willdenow's, which amount to 31 in number.

Section 1. *Stem woody.*

1. R. *roſæfolius*. Roſe-leaved Bramble.—Leaves pinnate, of five, or three, doubly ſerrated leaflets; green, and ſlightly downy, on both ſides. Stem and footſtalks prickly. Flowers ſolitary.—Sm. Plant. Ic. faſc. 3. t. 60. Willd. n. 1. Gathered by Commerſon in the iſle of Mauritius, and communicated by Thouin to the younger Linnæus. We have alſo a fine ſpecimen from ſir Joſeph Banks, without any account of its native country. The *ſtem* is ſhrubby, round, finely downy like the whole of the herbage, but no part is hoary or white. *Prickles* ſomewhat hooked, yellowiſh, rather ſmall, copiouſly ſcattered over the ſtem and leaf-ſtalks. *Leaflets* uſually five, ovato-lanceolate, taper-pointed, deeply, ſharply, and doubly ſerrated; beſprinkled with minute reſinous particles, and of the ſame colour, on both ſides. *Stipulas* in pairs on the baſe of each footſtalk, linear-lanceolate, narrow and acute. *Flowers* ſolitary, ſtalked, either axillary, or oppoſite to the leaves, one of them terminal. Segments of the *calyx* ovate, taper-pointed, longer than the *petals*, denſely downy, eſpecially on the inner ſide. We know nothing of the *fruit*. The minute globular reſinous particles, ſcattered, more or leſs copiouſly, over both ſides of the *leaves*, ſeem peculiar to this ſpecies.

2. R. *fraxinifolius*. Aſh-leaved Indian Bramble. Poiret in Lamarck Dict. v. 6. 242. (R. moluccus parvifolius; Rumph. Amboin. v. 5. 88. t. 47. f. 1.)—Leaves pinnate, of ſeven, or five, doubly ſerrated, parallel-veined leaflets; quite ſmooth on both ſides. Footſtalks prickly. Panicles terminal, ſmooth, widely ſpreading.—Gathered by Commerſon in Java. If we are right in the ſynonym of Rumphius, about which there ſeems little doubt, and which is certainly miſapplied by Linnæus to his *R. parvifolius*, this ſpecies is common in Amboyna, growing in low ſituations near rivers. He ſays the *fruit* is red, but watery and inſipid. The whole plant in our ſpecimen is, except the downy inſide of the *calyx*, quite ſmooth, and of ſo ſtriking an appearance with its large aſh-like *leaves*, marked with numerous, ſtraight, parallel veins, that we cannot but wonder at its having ſo generally eſcaped the notice of Indian botaniſts. The *ſtem* is round, ſlightly, or not at all, prickly; though the *footſtalks*, and now and then the rib of a leaflet, bear ſmall hooked prickles. *Stipulas* almoſt ſetaceous. *Panicles* terminal, many-flowered, repeatedly compound, widely ſpreading; their ſtalks ſlender, unarmed, with ſeveral, ſcattered, oblong, ſmooth *bracteas*, toothed at the end. Segments of the *calyx* broadly ovate, with a long ſlender

ſlender point; partly downy on the outſide, and denſely ſo within. *Petals* not obſerved. *Fruit* of very numerous ſmall grains. *Seeds* curiouſly reticulated or corrugated. Rumphius's figure is about half the ſize of nature.

3. R. *pinnatus*. Wing-leaved Cape Bramble. Willd. n. 2. Ait. n. 10.—"Leaves pinnate, of five or three rugoſe leaflets; ſmooth on both ſides. Stem, footſtalks, and flower-ſtalks prickly. Cluſter terminal."—Native country unknown. *Willd.* Cape of Good Hope, and iſland of St. Helena; from whence it was introduced by ſir Joſeph Banks in 1789. *Aiton.* A ſhrubby green-houſe plant, flowering in June and July. *Branches* villous, green, with hooked prickles. *Leaflets* ovato-lanceolate, green, ſharply and doubly ſerrated; their mid-ribs, like the *footſtalk*, prickly beneath. *Cluſter* ſimple. *Flower-ſtalks* villous, very prickly. *Calyx* villous, longer than the *petals*. *Willd.* We preſume the above authors both mean the ſame plant, though Willdenow is not cited by Aiton, and we have no ſpecimens from either. We ſhould ſuſpect that the above-mentioned ſpecimen of *roſæfolius*, communicated by ſir Joſeph Banks, might be Mr. Aiton's *pinnatus*, were not the latter, as well as Willdenow's, ſaid to have ſmooth leaves.

4. R. *auſtralis*. New Zealand Bramble. Forſt. Prodr. 40. Willd. n. 3.—"Shrubby. Flowers dioecious. Leaves pinnate, of five, or three, leaflets. Stem and footſtalks prickly. Cluſters ſimple, axillary."—Native of New Zealand. *Forſter.*

5. R. *rigidus*. Rigid Cape Bramble.—Leaves pinnate, of five, or three, partial-ſtalked leaflets; ſmooth above; very downy beneath. Stem downy, minutely prickly. Cluſter terminal, twice compound.—Native of the Cape of Good Hope. We know it only by an unnamed ſpecimen, from thence, in the Linnæan herbarium. The *ſtem*, *footſtalks*, *flower-ſtalks*, *calyx*, and under ſide of the *leaves*, are all very denſely clothed with fine, ſhort, velvet-like down. *Leaflets* uſually five, ovate, doubly and unequally ſerrated near an inch and a half long, each on a ſhort, thick, partial ſtalk; the upper ſide green, ſmooth, ſtriated with ſunk ribs and veins, which project on the downy under ſide. *Stipulas* lanceolate, downy. *Flowers* numerous, rather ſmall. *Calyx* with ſhort thick points. The *petals* ſeem to be awl-ſhaped, and very ſmall. We are unacquainted with the *fruit*.

6. R. *laſiocarpus*. Woolly-berried Bramble.—Leaves pinnate, of ſeven, or five, leaflets; ſmooth above; white and very downy beneath. Stem nearly ſmooth, with curved prickles. Cluſter terminal, ſimple. Fruit downy.—Native of Myſore and the neighbouring hills. Sent by the Rev. Dr. Rottler, under the name of *Rubus indicus*. It appears to be no where deſcribed. At firſt ſight the plant reſembles our Raſpberry, but the *leaflets* are generally ſeven, the odd one large, often three-lobed; their upper ſurface ſtrongly ſtriated with veins, which are occaſionally hairy; the under very white and woolly, with yellowiſh, hairy ribs and veins. *Stipulas* awl-ſhaped, hairy. *Prickles* of the ſtem numerous, ſtrong, a little curved. *Cluſter* of few *flowers*, downy and prickly. *Fruit* clothed with denſe, white, woolly down. *Seeds* reticulated. Poſſibly *R. apetalus* of Poiret, Lamarck Dict. v. 6. 242, may be allied to this.

7. R. *idæus*. Raſpberry. Linn. Sp. Pl. 706. Willd. n. 4. Ait. n. 1. Purſh n. 1. Fl. Brit. n. 1. Engl. Bot. t. 2442. Woodv. Med. Bot. t. 158. Fl. Dan. t. 788. Ger. Em. 1272. Math. Valgr. v. 2. 357.—Leaves pinnate, of five, or three, ovate, rather angular leaflets, very downy beneath. Footſtalks channelled. Stem with briſtly prickles. Cluſters terminal, lax, ſomewhat compound. Native of mountainous or ſtony woods and thickets throughout Europe. Mr. Purſh ſays it occurs alſo in hedge-rows, from Canada to Pennſylvania; and Dr. Buchanan gathered what we cannot conſider as a diſtinct ſpecies, in the woods of Nepaul. It flowers every where in April, May, or June, ripening fruit about ſix weeks after. The *ſtems* are erect, ſhrubby, though only biennial, with creeping perennial *roots*. They are pale brown, uſually rough with ſmall briſtles rather than thorns; ſometimes they are quite ſmooth. Lower *leaves* pinnate, with two pair of leaflets and an odd one; upper ternate only; leaflets broad-ovate, partly rhomboid, unequally and ſharply ſerrated and cut, more or leſs pointed; greyiſh-green, and nearly ſmooth, above; white with denſe cottony down beneath, like the *calyx* and *flower-ſtalks*. *Footſtalks* rather downy, with a ſtrong furrow along their upper ſide, prickly, like the *flower-ſtalks*. *Stipulas* ſetaceous. *Cluſters* terminal, for the moſt part ſimple, lax, rather drooping. *Flowers* pendulous. *Calyx* with taper points, variable in length. *Petals* erect, obovate, white, ſmall. *Fruit* crimſon, of numerous pulpy grains, beſet with the permanent ſtyles. Its rich ſweetneſs, and highly perfumed flavour, render this fruit generally agreeable, both recent and preſerved. Raſpberry jam is an acceptable preſent, even in India. There are ſeveral cultivated varieties, differing in ſize and luxuriance, as well as the colour of the berries, which are ſometimes of an amber hue. Mr. Purſh ſays there are a number of wild varieties in America; a circumſtance which we have not much remarked in Europe. There is uſually a ſecond crop of the fruit in gardens. The flavour of the wild kind is thought ſuperior to the cultivated; at leaſt in Wales.

8. R. *ſuberectus*. Red-fruited Bramble. Engl. Bot. t. 2572. Ait. Epit. Hort. Kew. 373. (R. neſſenſis; Hall in Tr. of R. Soc. Edinb. v. 3. 20.)—Leaves pinnate, of ſeven, five, or three ovate leaflets; hairy beneath. Footſtalks channelled. Stems aſcending. Prickles minute, nearly ſtraight. Flowers axillary and terminal, ſomewhat panicled.—This ſpecies, firſt obſerved in Scotland near Loch Neſs, has ſince been found in other parts of that kingdom by Mr. George Anderſon, F.L.S. as well as in Wales and Yorkſhire. It is often intermixed with *corylifolius*, hereafter deſcribed, which it reſembles in habit, eſpecially in the pubeſcence, ſize, and hue of the foliage, though more naturally allied to *R. idæus*. The *ſtems* are biennial, not quite upright, brittle, reddiſh, nearly round, with ſpreading branches. *Prickles* ſcattered, ſmall. *Leaves* light green on both ſides; ſmooth above. *Panicles* racemoſe, rather lax, terminal and axillary. *Petals* larger and more ſpreading than in the laſt. *Calyx* finally reflexed. *Fruit* deep red, agreeable in flavour, later than the Raſpberry, and perhaps for that reaſon, as Mr. Anderſon ſuggeſts, not unworthy of cultivation.

9. R. *biflorus*. Two-flowered Bramble. Buch. MSS.—Leaves pinnate, of five or three acute jagged leaflets; hairy above; white and downy beneath: the odd one three-lobed. Stem and footſtalks prickly. Flower-ſtalks downy, terminal, in pairs, ſingle-flowered.—Native of wet ſituations, about banks of rivers in Upper Nepaul. Gathered by Dr. Buchanan at Chitlong, April 13, 1802. The *ſtems* are partly procumbent, branched, angular, a little zigzag, armed with ſcattered, ſtraight prickles. *Leaves* on long, hairy, prickly ſtalks; their leaflets deeply ſerrated and jagged, uſually five, the terminal one nearly ſeſſile, more or leſs diſtinctly three-lobed, or even pinnatifid, though ſometimes confluent with the two next, ſo as to make with them one deeply three-cleft leaflet; they are all very hairy, though green above; ſnow-white, with greeniſh hairy veins,

 beneath.

beneath. *Stipulas* linear. *Flowers* in pairs at the end of each branch, drooping. Segments of the *calyx* broad-ovate, very downy, with ſhort naked tips. *Petals* broad and roundiſh, as long as the calyx. Of the *fruit* we are ignorant.

10. R. *ſtrigoſus*. Rough-ſtalked American Bramble. Michaux Boreali-Amer. v. 1. 297. Purſh n. 3. (R. penſylvanicus; Lamarck Dict. v. 6. 246.)—"Leaves pinnate, of five, or three, oval, pointed leaflets; downy and white beneath. Stem erect, very briſtly, without thorns. Flowers axillary, ſolitary; their ſtalks and calyx hiſpid."—Native of the mountains from Canada to Virginia, flowering in June and July; berries very agreeably flavoured. *Purſh.* The *branches*, *ſtalks*, and ribs of the *leaves*, *flower-ſtalks* and *calyx*, are all very hiſpid, but not prickly. *Michaux.*

11. R. *Commerſonii*. Commerſonian Bramble. Poiret in Lamarck Dict. v. 6. 240.—"Leaves pinnate, of ſeven, or five, leaflets, ſmooth on both ſides. Stem prickly. Flowers terminal or axillary, nearly ſolitary. Calyx with long points."—Found by Commerſon in ſhady mountainous parts of the iſland of Java. Poiret ſays it has ſome relationſhip to *R. idæus*, but the *leaflets* are ſmaller, ſmooth on both ſides, and the *flowers* larger. *Prickles* nearly ſtraight, ſcattered. *Leaflets* narrow, cut and ſerrated; the odd one ſometimes lobed. *Footſtalks* cylindrical, prickly. *Petals* white, roundiſh, ſcarcely longer than the calyx. *Fruit* reddiſh, the ſize of raſpberries, but with a much leſs agreeable taſte and ſmell. We have ſeen no ſpecimen.

12. R. *occidentalis*. Virginian Raſpberry. Linn. Sp. Pl. 706. Willd. n. 5. Ait. n. 2. Purſh n. 6. (R. idæus, fructu nigro, virginianus; Dill. Elth. 327. t. 247.)—Leaves ternate, taper-pointed, doubly ſerrated; downy and white beneath. Footſtalks nearly cylindrical; prickly and glaucous, like the ſtem. Prickles hooked. Cluſters terminal, very prickly.—Native of rocky mountainous ſituations, from Canada to Carolina, flowering in May and June. Cultivated in Chelſea garden, before the year 1696, according to Plukenet. The *ſtem* is round, conſpicuous for its peculiarly fine glaucous bloom, even in a dried ſtate. *Leaves* all ternate, the ſide leaflets often furniſhed with a lateral notch, or lobe. *Prickles* on the *flower-ſtalks* remarkably numerous, and hooked. *Petals* ſmall, white, commonly emarginate. *Fruit* black, ſometimes red, ſweetiſh, but not highly flavoured. *Seeds* wrinkled.

13. R. *triphyllus*. Three-leaved Japaneſe Bramble. Thunb. Jap. 215. Willd. n. 6.—Leaves ternate, rounded, cut and coarſely ſerrated; entire at the baſe; downy and white beneath. Branches, footſtalks, and flower-ſtalks hairy and prickly. Flowers ſomewhat racemoſe.—Gathered by Thunberg in Japan. *Stem* round, ſmooth, purpliſh, with ſlender, ſpreading, wavy *branches*, which are hairy and minutely prickly. *Leaflets* rounded, broad and abrupt, nearly ſmooth above, of a thin and pliant ſubſtance. *Flower-ſtalks* very ſhaggy juſt under the *calyx*, which is downy and white, with long taper points. *Petals* erect, obovate, crenate, with long claws. This ſpecies is in reality more akin to our Raſpberry than any other, though perhaps ſufficiently diſtinct. We have no knowledge of the fruit.

14. R. *tomentoſus*. Velvet-leaved Bramble. Willd. n. 7. Sm. Prodr. Fl. Græc. Sibth. v. 1. 349. (R. etneus, trifolius rectus candicans ac piloſus; Cupan. Panphyt. v. 1. t. 149.)—Leaves ternate, or quinate, obovate, unequally ſerrated, all over hoary, very ſoft and downy; paler beneath. Stem and footſtalks with hooked prickles. Panicle downy, many-flowered. Bracteas linear-lanceolate, ſometimes thr e-cleft.—Native of Germany, Switzerland, the neighbourhood of Conſtantinople, and the country about mount Etna. We know no figure of this ſpecies, except in the very rare old work of Cupani, where it is extremely well repreſented, nor does any ſyſtematic author but Willdenow deſcribe it. Botaniſts have moſt unaccountably confounded it with the common *R. fruticoſus*, from which, and every other known ſpecies, it is diſtinguiſhed by the peculiar and uniform ſoft pubeſcence of its *leaves*, equalling that of the Marſh Mallow. The *leaflets* vary in ſhape, but are always contracted towards their baſe. They are uſually three, the lateral ones ſometimes lobed at the lower edge. We have a ſpecimen with five diſtinct leaflets, the lowermoſt pair ſmalleſt, growing out of the partial footſtalks of the next. The *ſtem* is angular, downy, with many uniform, rather ſmall, ſtrongly hooked prickles, ſuch as occur alſo on the footſtalks. *Flowers* large and abundant, with obovate, white, ſpreading *petals*, twice as long as the *calyx*; whoſe ſegments are ovate, finely downy, with ſmall points. The *bracteas* are more pale and membranous than in *fruticoſus*. *Stipulas* linear, very narrow, hairy. This ſpecies is unknown in England, either wild or cultivated.

15. R. *cuneifolius*. Wedge-leaved American Bramble. Purſh n. 5. (R. parvifolius; Walt. Carol. 149.)—"Leaves digitate, of three or five obovate-wedge-ſhaped leaflets; unequally toothed upwards, plaited, entire at the margin, revolute; downy beneath. Stem, footſtalks, and flower-ſtalks downy, with ſcattered recurved prickles. Cluſters terminal, panicled; the partial flower-ſtalks divaricated, and almoſt naked."—In ſandy fields and woods, from New Jerſey to Carolina, flowering in June and July. A ſtraggling briar, of a grey aſpect; the *berries* hard and dry. *Purſh.* Not having ſeen this plant, we have given, as nearly as poſſible, a tranſlation of Mr. Purſh's ſpecific character, though we do not quite underſtand what regards the *leaves*.

16. R. *ellipticus*. Oval-leaved Indian Bramble.—Leaves ternate, elliptical, finely ſerrated; downy and hoary beneath: the lower ones ſimple, ſomewhat three-lobed. Stem and footſtalks hiſpid, downy, and prickly. Panicle denſe, hairy.—Gathered by Dr. Buchanan, in January and April 1802, about the ſtony banks of rivulets in Nepaul. This *ſhrub* is ten or twelve feet high, with long, climbing, angular, zigzag, leafy *branches*, not only clothed with ſoft down, and copious rigid prominent briſtles, but alſo bearing ſcattered, hooked, ſtrong, though not large, prickles. The *footſtalks* are ſimilarly furniſhed. *Leaflets* much reſembling thoſe of a common Provins Roſe in ſhape and ſerratures, but rather larger, and only three to each leaf; ſmooth above; their under ſurface grey or whitiſh with fine down; the veins parallel, ſtraight, ſtrongly marked. *Stipulas* ſetaceous. The lower *leaves*, and ſmall axillary ones, are ſimple, occaſionally three-lobed. *Panicle* terminal, denſe, ſhorter than the *leaves*, compound. *Flowers* not very numerous. *Calyx* downy. *Petals* white, longer than the calyx. *Berries* yellow, pleaſantly flavoured. *Seeds* wrinkled, numerous.

17. R. *hiſpidus*. Briſtly American Bramble. Linn. Sp. Pl. 706. Willd. n. 8. Ait. n. 3. Purſh n. 7.—Leaves ternate, ſtrongly ſerrated, ſmooth on both ſides. Stems trailing, round, hiſpid as well as the footſtalks. Cluſters terminal, ſlender, ſomewhat hiſpid, of few flowers.—Gathered in Canada by Kalm, whoſe ſpecimen is before us. The *ſtems* are very long and trailing, clothed with copious, brown, reflexed briſtles, without prickles, as are alſo the *footſtalks*. *Leaflets* of a ſhining green; the middle one obovate; the others dilated, and often lobed at the outer edge; all acute, unequally ſerrated. *Flowers* few, with linear,

linear, sometimes three-cleft, *bracteas*. *Berries* of few grains, with large wrinkled *seeds*. Perhaps this ought to be arranged among the herbaceous species, near *saxatilis* hereafter described.

18. R. *trivialis*. Common American Dewberry. Michaux Boreali-Amer. v. 1. 296. Pursh n. 8.—"Leaves ternate, or quinate, oblong-oval, acute, unequally serrated, rather downy. Stems trailing. Flower-stalks solitary, elongated, rough, like the footstalks, with recurved prickly bristles. Stipulas awl-shaped. Petals obovate, thrice the length of the calyx."—Common in old fields, from New England to Carolina, blossoming in May and June. *Flowers* large. *Berries* black, large, very agreeably flavoured, known by the name of Dewberries. *Pursh.*

19. R. *flagellaris*. Long Trailing American Bramble. "Willd. Enum. 549." Pursh n. 9. (R. trivialis; Ait. n. 7. *Pursh.*)—Leaves ternate, unequally serrated, smooth on both sides. Stems trailing, round, beset, like the footstalks, with recurved prickles. Clusters terminal, lax, slender, downy, of few flowers.—Native of fields and sandy woods, from Virginia to Carolina, flowering in June and July. *Pursh.* Very nearly akin to *R. hispidus*, n. 17, but the *leaves* are smaller, and the *stem* is rather prickly than bristly. The hooked prickles on the *footstalks* are few, and widely scattered. *Petals* more orbicular than in the last; whether they accord with those of *hispidus*, we have not materials to determine; but we are greatly inclined to think the present is but a variety of that species.

20. R. *inermis*. Smooth American Bramble. "Willd. Enum. 548." Pursh n. 10. ("R. hispidus; Walt. Carol. 149?")—"Leaves ternate, ovate, acute, unequally serrated; downy beneath; the lateral leaflets somewhat cut. Stem, footstalks, and flower-stalks unarmed. Stipulas narrow-awl-shaped."—Native of Pennsylvania. We have seen no specimen of this species, nor did Mr. Pursh himself meet with it in America.

21. R. *parvifolius*. Small-leaved Indian Bramble. Linn. Sp. Pl. 707. Willd. n. 9; excluding the synonym of Rumphius, which has no affinity to this species, but rather belongs to our *fraxinifolius*, n. 2.—Leaves ternate, wrinkled, rounded, cut, and crenate; somewhat hairy above; downy and snow-white beneath. Branches and footstalks downy, with short hooked prickles. Stem round. Panicles downy and hairy, of few flowers.—Gathered by Osbeck in China. A miserable specimen from him, without flowers, exists in the Linnæan herbarium; but we have very complete ones collected by Dr. Buchanan, at Chitlong in Nepaul, April 10, 1802. Their first appearance accords very much indeed with our Common Raspberry, but the *leaflets* are all ternate, rounded, not pointed, crenate rather than serrated, as well as more wrinkled; and their upper surface, though green, is clothed with extremely soft hairs, feeling like velvet. The *flowers*, though few together, are panicled rather than simply racemose; their very woolly *calyx* is destitute of long points; and their *stalks* are hairy as well as woolly. We have no account of the *fruit*. The short, but strong and hooked, *prickles* moreover afford an essential distinction between this species and *R. idæus*.

22. R. *sanctus*. Bramble of the Holy Land. Schreb. Dec. 15. t. 8. Willd. n. 10. (R. creticus triphyllus, flore parvo; Tourn. Cor. 43. Pococke's Trav. v. 2. pt. 2. 190.)—Leaves ternate, or simple, downy and white beneath. Branches and footstalks downy, with hooked prickles. Stem angular. Panicles downy, many-flowered. Native of Crete and Palestine. This has a general resemblance to our British *R. fruticosus*, but has smaller, more rounded, and fewer *leaflets*. The *flowers*, and whole plant, are also of smaller dimensions. We do not however profess to be well acquainted with the limits of these two species, nor has the present one been properly investigated.

23. R. *jamaicensis*. Jamaica Bramble. Linn. Mant. 75. Willd. n. 11. Swartz Obs. 205. (R. n. 1; Browne Jam. 242. R. foliis longioribus, subtùs molli lanugine obductis et incanis, flore et fructu minoribus; Sloane Jam. v. 2. 109. t. 213. f. 1.)—Leaves ternate, or pedato-quinate, pointed, sharply serrated; white and finely downy beneath. Branches, footstalks, and flower-stalks downy, with hooked prickles. Panicles lax.—Native of Jamaica; frequent in the mountains of St. Mary's, and those beyond mount *Diable*, towards St. Ann's, but seldom seen in any other part of the island. *Browne.* Sloane justly remarks, that any arguments in favour of the coldness of the air in parts of Jamaica, or Hispaniola, where this bramble occurs, prove nothing, because it is a different species from our European one. Possibly however they may be more nearly related than he was aware. The pubescence of the back of the *leaves*, though very fine, soft, and white, is often approached in those particulars by that of our *fruticosus*, even on the same stem, with leaves that are almost green underneath. The insertion of the stalks of the fourth and fifth *leaflets*, when present, upon those of the next pair, making a pedate leaf, is characteristic of the Jamaica Bramble, but even this is occasionally to be detected in our's. The *flower* and *fruit* are said to be smaller than in *fruticosus*. In the Linnæan specimen the *flowers* are double, quite as large as those of the latter. The ribs of the *leaflets* are prickly in both; nor are the serratures at all more deep in one than the other.

24. R. *roseus*. Red-flowered Peruvian Bramble. Poiret in Lamarck Dict. v. 6. 245.—Leaves ternate, or simple, smooth. Stipulas oval, obtuse. Flowers axillary, nearly solitary. Calyx smooth, slightly fringed. Stem, flower-stalks, footstalks, and ribs of the leaves very prickly.—Gathered by Dombey in Peru. The *branches*, according to Poiret, are woody, striated, smooth, zigzag, prickly. *Leaves* very large, mostly ternate, oval or lanceolate, unequal, smooth on both sides; a little paler beneath. The terminal *leaflet* is four or five inches long, and three broad. *Stipulas* large, almost half embracing the stem. *Flower-stalks* long, plentifully furnished with strong, reddish, recurved prickles. *Calyx* large, with bluntly-pointed segments, a little fringed at the margin. *Petals* rose-coloured, roundish, shorter than the calyx, furnished with claws. We have seen no specimen, but the above description leaves no doubt of this being a most distinct species.

25. R. *urticæfolius*. Nettle-leaved Peruvian Bramble. Poiret in Lamarck Dict. v. 6. 246.—Leaves ternate, or simple, ovate, sharply serrated; silky beneath. Stem, flower-stalks, footstalks, and ribs of the leaves densely hispid and somewhat prickly. Panicles compound, many-flowered. Calyx silky.—Gathered at Lima by Dombey, from whom we have a specimen. This is said to be of very lofty growth. The *branches* are angular, remarkable, like all the *stalks*, for a dense rusty coating, resembling coarse plush, among which some few short hooked prickles are interspersed. The *leaflets* are large, densely, sharply, and rather unequally serrated; in form ovate, or somewhat elliptical; their upper side green, minutely downy; the under very densely covered with shining silky pubescence, which is said by Dombey to be of a silvery whiteness when fresh, though rather tawny in our specimen. *Stipulas* almost setaceous. *Panicle* large, dense, many-flowered. *Bracteas* ovate, silky externally, as well as the *calyx*. *Petals* minute, white.

white. *Fruit* black, of numerous grains, with reticulated *ſeeds*.

Mutis ſent Linnæus a ſpecimen from Santa Fé, which agrees in every eſſential particular with that of Dombey, except the *leaflets* being ſmaller, and in ſome inſtances five in number.—The ſpecific name does not appear to us very appropriate; *holoſericeus* would have been better, for we have met with nothing of ſo ſilky an aſpect in the genus beſides.

26. R. *cæſius*. Common Dew-berry. Linn. Sp. Pl. 706. Willd. n. 12. Ait. n. 4. Fl. Brit. n. 2. Engl. Bot. t. 826. Bulliard t. 381. (R. minor, fructu cæruleo; Bauh. Hiſt. v. 2. 59.)—Leaves ternate, hairy beneath; the lateral leaflets lobed externally. Stem prickly, proſtrate, glaucous. Calyx embracing the fruit.—Native of Europe, in groves and buſhy places; not rare in England; about ſhady hedges and the borders of fields, flowering in June and July, bearing fruit throughout Auguſt and September. The ſtems are round, weak and trailing, beſet with ſlender ſlightly curved prickles, and conſpicuous for a vivid glaucous bloom, eaſily rubbed off. Though woody, they are only annual, or at moſt biennial. *Leaflets* three, of a broad, rounded, ovate figure, acute, ſharply and doubly ſerrated, light green; downy and a little paler, but not hoary, beneath; the lateral ones ſeſſile, generally lobed on the outſide. *Footſtalks* prickly and downy. *Stipulas* lanceolate. *Flowers* few together, in ſlender, terminal or axillary, prickly panicles. Segments of the *calyx* ovate, or obovate, long-pointed, downy, ſpreading the *flower*, cloſed about the *fruit*, which laſt character is neglected in Bulliard's, otherwiſe characteriſtic, plate. *Petals* obovate, longer than the calyx, ſpreading, waved and crumpled, white, rarely reddiſh. *Fruit* of few and rather large grains, black with a bright blue tinge, like a plum; its flavour very agreeably acid, though not perfumed, and deſtitute of the mawkiſh flavour of the common Black-berry.

27. R. *corylifolius*. Hazel-leaved Bramble. Fl. Brit. n. 3. Engl. Bot. t. 827. Ait. n. 5. (R. major, fructu nigro; Schmidel Ic. t. 2. R. montanus repens, ſarmentis longiſſimis et rotundis, ſpinis tenuiſſimis exaſperatis, amplo coryli folio, flore albo, fructu nigro craſſiore; Mich. Hort. Florent. 82. Till. Pis. 149?)—Leaves quinate, or ternate, rounded, hairy beneath; the lateral leaflets ſeſſile. Prickles ſtraightiſh. Calyx of the fruit reflexed.—Native of England, Germany, and probably of Italy. We cannot diſcover that Dr. Sibthorp met with this ſpecies in Greece. Dillenius ſeems to hint at it in his edition of Ray's *Synopſis*, 467, as differing from the common bramble, in having "earlier, larger, and white bloſſoms," which is correctly true. Mr. Crowe, ever attentive to the uſeful parts of botany, was led to diſtinguiſh our *corylifolius*, by obſerving that thatchers rejected the *ſtems*, on account of brittleneſs, and ſelected the true *fruticoſus* to bind down their thatch, that ſpecies being truly ſhrubby and perennial; while the *ſtems* of the preſent are, like thoſe of the Raſpberry, biennial, and far more brittle than *fruticoſus*. They are moreover roundiſh, all the prickles nearly ſtraight, not hooked. The *leaflets* are large, pliant, doubly ſerrated, always of a bright green on both ſides; hairy, but never white or cottony, beneath. Some of them ſo exactly reſemble the leaves of a hazel, that we have puzzled good botaniſts to diſtinguiſh one from the other. The *flowers* appear early in July, and are white, forming an oblong cylindrical *panicle*. *Fruit* earlier, of a browner black, of rather fewer grains, and more gratefully acid than in *fruticoſus*, being intermediate, as it were, between the Dew-berry and Common Black-berry. Its reflexed *calyx* diſtinguiſhes it readily from the former. Our *corylifolius* is ſuppoſed to be the *fruticoſus* of Hoffmann's German Flora, and perhaps of many other botaniſts. Willdenow has it not.

28. R. *fruticoſus*. Common Bramble, or Black-berry. Linn. Sp. Pl. 707. Willd. n. 13. Ait. n. 6. Fl. Brit. n. 4. Engl. Bot. t. 715. Mill. Illuſtr. t. 45. (R. major, fructu nigro; Bauh. Hiſt. v. 2. 57. Rubus; Ger. Em. 1272. Camer. Epit. 751.)—Leaves moſtly quinate, downy beneath; leaflets ſtalked. Stem angular, beſet, like the footſtalks and flower-ſtalks, with hooked prickles. Calyx of the fruit reflexed.—Common in hedges and thickets throughout Europe; flowering with us in July and Auguſt, and ripening fruit in September and October. Dr. Sibthorp found this ſpecies extremely abundant in Greece, and conceived it to be, as generally ſuppoſed, the true Βατος, or Bramble, of Dioſcorides, the ſame name being given to it by the modern Greeks. The *ſtem* is truly ſhrubby and perennial, long and arching, purpliſh, ſtrongly angular, armed with very powerful hooked prickles, ſuch as occur, of a ſmaller ſize, on the ſtalks and ribs of the *leaves*, as well as on the *flower-ſtalks*. The *leaflets*, uſually five, are of a narrower, more oblong, and pointed form than the laſt; dark green above; very white and cottony beneath; though ſpecimens may occaſionally be found which have, on one and the ſame branch, ſuch white-backed leaves, with others that are pale green, or barely hoary. All the *leaflets* have commonly very conſiderable partial footſtalks, the outermoſt more or leſs combined with the next. The *flowers* in long, cylindrical, compound, denſe, and rigid panicles, are of an elegant bluſh or roſe-colour, ſeldom white. *Calyx* downy, moderately pointed, always reflexed both in flower and fruit. *Berry* of very numerous crowded grains, of a violet black when ripe, with a ſweet but mawkiſh taſte, acceptable only to children, whoſe

> "Pretty lips with black-berries,
> Are oft beſmeared and dyed."

There is a ſuppoſed variety of *R. fruticoſus* with jagged *leaves*, green beneath, and double white *flowers*.

29. R. *villoſus*. Hairy American Black-berry. Ait. n. 8. Willd. n. 14. Purſh n. 2.—Leaves quinate, or ternate, ovate-oblong, taper-pointed, ſharply ſerrated, finely hairy on both ſides. Stem and footſtalks hiſpid, and ſomewhat prickly. Cluſters ſimple, lax, hairy, and glandular; ſometimes leafy.—In old fields and commons, from New England to Carolina, frequent, flowering in June and July, and known by the name of Black-berries. *Purſh*. It appears to have been introduced into the gardens of England and France about the ſame time, near 40 years ago. In the latter it was called *R. vulpinus*. The *leaves* are rather large, properly conſiſting of five leaflets, green on both ſides, of which the terminal one has a very long partial ſtalk, and the two hindmoſt very ſhort ones, all the partial ſtalks radiating from one point. In ſome of the upper leaves the lateral leaflets are combined for almoſt their whole length; the next leaf to theſe is ternate; and the uppermoſt of all ſimple, diminiſhing into a leafy *bractea* under each *flower-ſtalk*, but ſtill accompanied by *ſtipulas*. The *flowers* are rather ſmall, and ſeem to be white.

30. R. *canadenſis*. Purple-ſtalked Canada Bramble. Linn. Sp. Pl. 707. Willd. n. 15. Purſh n. 4.—Leaves digitate, of from ten to five, or three, lanceolate, taper-pointed, ſharply ſerrated, partial-ſtalked leaflets, ſmooth on both ſides. Stem without prickles.—In rocky barren woods of Canada and New England, flowering in June and July.

 The

The *stem* and old branches are purple. *Pursh.* This is very unlike all the rest, having so many *leaflets*, all smooth on both sides; paler beneath, where they are marked by strong, prominent, parallel veins. *Footstalks* channelled, purplish, nearly or quite smooth. *Stipulas* setaceous. *Flowers* in simple, dense, terminal, downy *clusters*, with ovate, pointed, smooth *bracteas*. *Calyx* of the fruit reflexed, slightly downy. *Berries* of a few large grains, with wrinkled *seeds*. Linnæus by mistake cites the very same figure of Miller, which a few lines below, he properly refers to *R. odoratus*. This error Willdenow implicitly copies, without doubt or remark.

31. R. *spectabilis*. Elegant American Bramble. Pursh n. 11. t. 16.—Leaves ternate, ovate, acute, doubly serrated; downy beneath. Stem smooth and unarmed. Stalks single-flowered, solitary. Petals ovate.—Gathered by Mr. Menzies on the north-west coast of America, and by governor Lewis on the banks of the Columbia; flowering in April and May. *Pursh.* An elegant *shrub*, four or five feet high. *Stem* smooth, destitute of prickles; the *branches* slender, round, very smooth. *Leaves* large, on downy, channelled, occasionally somewhat prickly *stalks*, ternate; the lateral leaflets sessile, oblique at the base, and lobed at the outer side. *Stipulas* awl-shaped. *Flowers* as large as in the following species, of a full and rich crimson. Segments of the *calyx* downy, oblong, with short points. *Petals* full twice as long as the calyx.

32. R. *odoratus*. Flowering Raspberry. Linn. Sp. Pl. 707. Willd. n. 16. Ait. n. 9. Pursh n. 12. Curt. Mag. t. 323. Mill. Ic. t. 223. Cornut. Canad. 149. t. 150.—Leaves simple, with three or five acute lobes. Stem erect, hispid, unarmed. Corymbs terminal, spreading, hispid and glutinous. Petals nearly orbicular. Calyx with linear leafy points.—This, according to Mr. Pursh, is found in the woods of Canada, and on the Allegany mountains, from New York to Carolina, blossoming in June and July. In the gardens of Europe it has been cultivated for above a century, being, though a greenhouse plant in Sweden, perfectly hardy with us, and generally admired in shrubberies for the beauty of its copious, large, crimson *flowers*, with singularly white *stamens*; as well as for the cedar-like fragrance of its glutinous, rough, brown *flower-stalks* and *calyx*. The *stems* are a yard high, or more, biennial like *R. idæus*. *Leaves* ample, serrated, roughish, of a fine green. The *fruit* is scarcely ever formed in England. Miller describes it as reddish, insipid, of numerous small grains. Mr. Pursh says "the *berries* are yellow, of a very fine flavour and large size, but scarcely ever produced in the gardens."

33. R. *alcææfolius*. Hollyhock-leaved Bramble. Poiret in Lamarck Dict. v. 6. 247.—Leaves simple, somewhat palmate, sharply serrated, rugose; downy beneath. Clusters axillary and terminal, prickly. Bracteas in many capillary segments. Calyx very hairy, inflated. Branches angular. Gathered by Commerson in Java. The *stems* are about as tall as *R. idæus*, divided into very hairy, almost quadrangular, *branches*, furnished with reddish prickles. *Leaves* lobed, almost palmate, sharply toothed, very broad; rough and wrinkled, but not hairy, on their upper surface; downy beneath, with yellowish reticulated veins. *Footstalks*, as well as the principal ribs of each leaf, prickly. *Clusters* short, prickly, very hairy. *Bracteas* hairy, divided into numerous capillary segments. *Calyx* inflated, almost globular, divided half way down into five oval segments; white within; clothed externally with dense, tawny, woolly hairs. *Petals* roundish, white, soon falling. We know nothing of this species but from Poiret's description, which is very clear and well marked. We have altered his specific character by that description, for the purpose of contrasting its essential particulars with the following.

34. R. *rugosus*. Rugged-leaved Bramble.—Leaves simple, heart-shaped, roundly lobed, crenate, rugose; downy beneath. Clusters axillary and terminal. Bracteas ovate, cut. Calyx very hairy, branches round, prickly.—Gathered by Dr. Buchanan, July 18, 1802, at Sembu, in Upper Nepaul, where it is called, in the Parbuttic language, *Jogi Ayshalu*, and by the Nawars *Cumbatashi*. The *stem* is climbing, with round, downy *branches*, armed with small, scattered, hooked prickles. *Leaves* as broad as the palm of the hand, heart-shaped, acute, with about five or seven rounded, sharply crenate, rather shallow lobes; the upper side green, tessellated with numerous wrinkles, rather hairy; the under white and downy, reticulated with innumerable veins. *Footstalks* round, downy and prickly, as well as the principal ribs. *Stipulas* oblong, ovate, toothed, downy. *Clusters* short and dense, chiefly axillary, not so long as the footstalks, of few flowers; the terminal one larger. *Bracteas* broader than the stipulas, hairy, slightly cut or toothed. *Flowers* large. *Calyx* densely covered with long silky hairs; its segments ovate, acute, recurved, downy within. *Petals* white, erect, almost as long as the calyx, ovate, obtuse, finely toothed, furnished with claws. *Fruit* red. The round *branches*, less divided *leaves*, and more entire *bracteas*, seem to render this essentially distinct from Poiret's *alcææfolius*, to which it is evidently next akin.

35. R. *tiliaceus*. Lime-leaved Bramble.—Leaves heart-shaped, rounded, acute, sharply crenate, very obscurely lobed; white and downy beneath. Clusters axillary. Segments of the calyx lanceolate, downy. Stem and footstalks round, downy, slightly prickly. Gathered by Dr. Buchanan at the same place as the last, June 2, 1802. The *leaves* somewhat resemble those of the American *Tilia alba*. They are sometimes nearly orbicular, but generally have indications of a slight lobe at each side; the upper surface is green, naked, and tolerably even; the under clothed with very soft fine white down. All the stalks, like the *calyx*, are more cottony than silky. The latter is deeply divided, spreading, or in some degree recurved. *Petals* small, spatulate. *Seeds* wrinkled. The *clusters* are more lax, and the *flowers* very much smaller than in *R. rugosus*. Small dispersed prickles may be felt, rather than seen, here and there on the downy *branches* and *footstalks*. The *bracteas* are small, woolly, deeply jagged.

36. R. *moluccanus*. Molucca Bramble. Linn. Sp. Pl. 707. Willd. 17. (R. moluccus latifolius; Rumph. Amboin. v. 5. 88. t. 47. f. 2.)—Leaves simple, heart-shaped, somewhat lobed, crenate; white and downy beneath. Clusters axillary and terminal, aggregate. Bracteas deeply palmate. Calyx silky. Stem and footstalks round, downy, prickly.—Native of Amboyna and the Molucca islands. Very nearly allied to the three preceding species, but the *leaves* are more elongated and acute than in any of them, with a pair of rounded, more or less distinct, lateral lobes towards the base. The deeply palmate, or digitate silky *bracteas* seem nearly to agree with those of the *alcææfolius*. The *flowers* are plentiful. *Calyx* silky, with deep, lanceolate, taper-pointed segments. *Petals* obovate, crenate. *Fruit* red, eatable, but rather insipid.

37. R. *microphyllus*. Small-leaved Japan Bramble. Linn. Suppl. 263. (R. palmatus; Thunb. Jap. 217. Ki Itzigo; Kæmpf. Amœn. Exot. 787.)—Leaves simple, heart-shaped, obtuse, three-lobed, smooth. Stem and footstalks prickly. Flowers solitary. Outside of the calyx naked. Gathered by Thunberg, in hilly places, between Miaco and Quana in Japan,

Japan, flowering in April. The *ftem* is fhrubby, erect, two or three feet high. *Branches* round, wavy, fmooth, purplifh, befet with prominent, rather afcending, fcattered prickles. *Leaves* feveral together from each lateral bud, on fhortifh, channelled, rather prickly *ftalks*, heart-fhaped, rounded, fharply crenate, more or lefs three-lobed, ftrongly veined and fomewhat plaited, fmooth on both fides; paler beneath; their length about an inch. *Flowers* folitary from each bud, ftalked. *Calyx* fmooth and angular at the outfide; downy within; its fegments lanceolate, acute. *Petals* twice as long as the calyx, obovate, white, wrinkled, with long claws. *Fruit* yellow, very well flavoured.

38. R. *incifus*. Cut-leaved Japan Bramble. Thunb. Jap. 217. Willd. n. 19.—Leaves fimple, heart-fhaped, obtufe, cut, fmooth. Footftalks with hooked prickles. Stem prickly. Flowers folitary. Outfide of the calyx naked.—Native of Japan. We have feen no fpecimen. This fpecies feems, from Thunberg's defcription, very near the laft, differing chiefly in the divifions of the *leaves*.

We here find in Willdenow the *R. japonicus*, Linn. Mant. 245. Suppl. 263. This the Linnæan herbarium fhews to be no other than *Corchorus japonicus* of Thunberg, a beautiful fhrub, now becoming common in our gardens, where it is quite hardy. The double yellow *flowers* are much admired. Linnæus, by his fpecimen, fuppofed the *petals* to be white. He knew nothing of the *fruit*, and judging by the habit, was not inexcufable in referring the plant to *Rubus*. See Corchorus, n. 12.

39. R. *corchorifolius*. Corchorus-leaved Bramble. Linn. Suppl. 263. Willd. n. 21. (R. villofus; Thunb, Jap. 218.)—Leaves fimple, oblong-heart-fhaped, pointed, ferrated, fomewhat hairy. Stem round, downy, prickly. Flowers folitary. Outfide of the calyx hairy. Native of Japan, between Miaco and Jedo, flowering in April. The *ftem* is fhrubby and upright, finely downy, with a few diftant, flightly recurved, prickles. *Footftalks* hairy and prickly. *Leaves* longer, and much more pointed, than in *microphyllus* or *incifus*, with finer more copious ferratures; their ribs and veins efpecially hairy. *Flowers* on the young branches, ftalked, folitary, much like the two laft fpecies, but the calyx is both downy and hairy on the outfide. Nothing is faid of the *fruit*. The *leaves* are defcribed by Thunberg as elegantly plaited before they fully expand.

40. R. *elongatus*. Long-cluftered Bramble. Sm. Plant. Ic. t. 62. Willd. n. 22.—Leaves fimple, heart-fhaped, pointed, doubly crenate; white and downy beneath. Panicle elongated, racemofe. Segments of the calyx rounded, obtufe. Gathered by Commerfon in Java. The *branches* are round, downy, with minute difperfed prickles. *Leaves* very fmooth and even on the upper fide; their margin furnifhed with a row of broad fhallow notches, or ferratures, with fmall, rather acute, intermediate ones. *Panicle* terminal, long, lax, zigzag, finely downy or filky, in every part, as well as the *calyx*. *Bracteas* oblong, jagged at the end, deciduous. *Flower-ftalks* fhort and thick, aggregate, cluftered, or fomewhat umbellate. Segments of the *calyx* remarkably rounded. *Petals* orbicular, white. *Fruit* red.

41. R. *paniculatus*. Spreading Panicled Bramble.—Leaves fimple, heart-fhaped, pointed, flightly lobed, fharply and finely crenate: white and downy beneath. Panicle twice compound, fpreading. Segments of the calyx ovate, taper-pointed. Gathered by Dr. Buchanan, at Narain hetty, in Nepaul, Nov. 18, 1802. The round, downy *branches*, with fmall fcattered prickles, agree with the laft, as well as with *moluccanus*, *rugofus*, &c. The woolly *footftalks* alfo bear very fmall hooked prickles. The *leaves* are as broad as the hand, more finely and fharply crenate than thofe of *R. elongatus*, with fome irregular, fhallow, obfolete, acute lobes. *Panicle* very large, lax and fpreading, twice, or even thrice compound, downy, its ultimate ftalks partly umbellate, but all much more long and flender than in the foregoing. The *calyx* alfo differs effentially in its tapering fegments, downy, not filky on both fides. *Petals* fmall, obovate. *Fruit* black.

42. R. *pyrifolius*. Pear-leaved Bramble. Sm. Plant. Ic. t. 61. Willd. n. 23.—Leaves fimple, elliptical, pointed, ferrated, fmooth. Panicle corymbofe, downy. Calyx partly jagged. Petals minute.—Found in Java, by Commerfon. The *branches* are flender, round, flightly zigzag, minutely hairy, armed with fmall recurved prickles. *Leaves* on fhortifh hairy *ftalks*, coriaceous, three inches long, and one broad, coarfely ferrated; the ribs and veins only hairy on both fides. *Panicle* terminal, large, twice compound; its branches corymbofe and downy. *Bracteas* linear, deeply jagged, deciduous. Segments of the *calyx* ovate, taper-pointed, downy on both fides; the points of two or three of them deeply divided into three or four parts, while the reft are entire. *Petals* very fmall, abrupt and jagged, fcarcely a quarter the length of the calyx. *Fruit* of a few large grains, with wrinkled *feeds*.

43. R. *acuminatus*. Pointed-leaved Bramble.—Leaves fimple, ovate, taper-pointed, ferrated, fmooth. Panicle racemofe, not downy. Petals as long as the calyx.—Found by Dr. Buchanan, in the woods at Sembu in Upper Nepaul, flowering early in July, 1802. This fpecies is related to the laft, but very diftinct. The *ftem* is climbing, unarmed. The *branches* are minutely prickly, but not hairy. *Leaves* four or five inches in length, fcarcely coriaceous, fmooth and fhining on both fides, paler beneath, fimply or doubly ferrated, remarkable for their long taper points. *Footftalks* channelled, prickly, as well as the midrib, hardly pubefcent. *Stipulas* awl-fhaped, toothed, fmooth, deciduous. Panicle terminal, elongated, zigzag, compound, accompanied by fome leaves; its ultimate branches often three-flowered. *Flower-ftalks* warty, but not downy. *Bracteas* awl-fhaped, fimple or divided, fmooth. *Calyx* warty and downy, with a fhort fimple point to each fegment. *Petals* ovate, acute, the length of the calyx, white. *Fruit* of a very bright red, larger than the calyx.

Sect. 2. *Stem herbaceous.*

44. R. *pedatus*. Pedate Bramble. Sm. Plant. Ic. t. 63. Willd. n. 24. Purfh n. 17.—Leaves pedate, of five bluntifh, nearly fmooth, cut and ferrated leaflets. Flower-ftalks capillary, fimple, bracteated in the middle. Calyx fmoothifh, partly cut, reflexed.—Gathered on the north-weft coaft of America, by Mr. Menzies, to whom we are obliged for fpecimens. This is an elegant, delicate, herbaceous plant, with creeping *roots*, throwing up, at intervals, fhort fimple *ftems*, with one or two *leaves*, on long, flender, channelled *footftalks*, and one, rarely two, *flower-ftalks*, nearly the fame length, but more flender, bearing a pair of little roundifh *bracteas*, about half way up. *Stipulas* in pairs, roundifh, fringed, larger than the *bracteas*. *Flowers* folitary, fmall. *Calyx* deeply divided; its fegments oblong, fome of them three-cleft. *Petals* the fame length, elliptical, rather abrupt or jagged; whether white or yellow we are doubtful. If the latter, it would greatly confirm Mr. Purfh's fufpicion of this plant being a fpecies of *Dalibarda*, provided that genus fhould be eftablifhed, a point on which we fhall touch at the conclufion of this article. We know nothing of the *fruit* of our *R. pedatus*.

45. R. *faxatilis*. Stone Bramble. Linn. Sp. Pl. 708. Willd. n. 25. Ait. n. 11. Purfh n. 13? Fl. Brit. n. 5.

n. 5. Engl. Bot. t. 2233. Fl. Dan. t. 134. Ger. Em. 1273.—Leaves ternate, acute, ſlightly downy, doubly and unequally notched. Runners creeping, herbaceous. Panicle of few flowers. Stipulas ovate.—Native of ſtony, rather mountainous, dry woods and thickets, in the north of Europe, chiefly confined with us to Scotland, Wales, and the moſt northern and hilly part of England, flowering in June. The whole herb is of a ſlender delicate habit, light green, ſlightly downy, not at all white or hoary. It ſpreads extenſively by means of long trailing ſhoots, either naked or leafy, which do not bloſſom till their extremities have taken root. The flowering *ſtems* are ſolitary, erect, ſimple, a ſpan high, ſlightly angular, leafy, hairy, beſides a few occaſional, very tender, horizontal prickles, often preſent alſo on the *footſtalks*. The *leaflets* are in ſome meaſure rhomboid, ſharply and coarſely crenate; the ſide ones now and then lobed at the lower margin, and very rarely two at each ſide. *Cluſter* terminal, downy, of from three to five ſmall inconſpicuous *flowers*. Segments of the *calyx* lanceolate, downy, acute. *Petals* erect, lanceolate, bluntiſh, cream-coloured or greeniſh. *Berries* of a very few large, crimſon, globular grains, pleaſantly acid. *Seeds* compreſſed, wrinkled.

Mr. Purſh, following Michaux, conſiders as a variety of this a plant found in Canada, and on the mountains from New York to Virginia, which has ſmall black *berries*. The *flowers* are about three, on long partial ſtalks. Its runners accord with our *ſaxatilis*, but we ſhould preſume that an accurate compariſon of theſe two plants might prove them to be diſtinct ſpecies.

46. R. *obovalis*. Moſs American Black-berry. Michaux Boreali-Amer. v. 1. 298. Purſh n. 14.—Leaves ternate, oval, rounded, ſerrated, naked. Stem hiſpid. Cluſters ſomewhat corymboſe, of few flowers. Stipulas ſetaceous.—Found in ſwamps, among bog-moſs, on the mountains from New York to Carolina, flowering from May to July. The *ſtem* is deſcribed as rather ſhrubby, hiſpid with rigid hairs. *Flower-ſtalks* elongated. *Bracteas* ovate. *Berries* with only a few large grains, black and ſweet. The name, and definition of the *leaves*, *foliolis obovalibus*, are incorrect. An oval is of the ſame breadth at each end. We preſume Michaux meant *obovate*.

47. R. *arcticus*. Dwarf Crimſon Bramble. Linn. Sp. Pl. 708. Fl. Lapp. ed. 2. 170. t. 5. f. 2. Willd. n. 26. Ait. n. 13. Purſh n. 15. Fl. Brit. n. 6. Engl. Bot. t. 1585. Curt. Mag. t. 132. Fl. Dan. t. 488.—Leaves ternate, ſmooth, bluntly ſerrated. Stem moſtly ſingle-flowered, without prickles. Petals roundiſh, notched.—Native of Lapland, alſo of Labradore, and about Hudſon's Bay; as well as of the iſle of Mull, and the mountains of Ben-y-glo, in Scotland, flowering in May and June. The *root* is perennial and creeping, but without ſcyons. *Stems* unarmed, erect, leafy, from four to eight inches high, almoſt invariably ſimple and ſingle-flowered, though ſometimes from luxuriance an axillary bloſſom occurs at the ſecond leaf, as drawn in Engl. Bot. *Leaflets* always three, ovate or rhomboid, bluntiſh, with broad roundiſh ſerratures. *Stipulas* ovate, entire. *Flower* terminal, ſtalked, of a beautiful crimſon. *Calyx* downy, often with ſix or ſeven ſegments, with which the *petals* agree in number. The latter are moſtly emarginate, ſometimes much jagged. *Berry* of a few large grains, amber-coloured, with a purpliſh tinge, about as big as a raſpberry, but far ſuperior in flavour, partaking of that fruit and the ſtrawberry, with a luſcious ſweetneſs. Linnæus juſtly extols this fruit, and acknowledges his obligation to it, when fatigued with the labours of his Lapland tour. Syrup, jelly, and wine are made of it in Sweden, which are eſteemed highly. Theſe berries are often ripened in our gardens, provided the plant be allowed to grow with luxuriance. The *ſeeds* are ſcarcely perceptibly wrinkled.

48. R. *piſtillatus*. Cloſe-ſtyled Bramble. Sm. Exot. Bot. v. 2. 53. t. 86. Ait. n. 12. Purſh n. 16. (R. acaulis; Michaux Boreali-Amer. v. 1. 298.)—Leaves ternate, ſmooth, ſharply ſerrated. Stem ſingle-flowered, without prickles. Petals oblong, entire. Styles cluſtered together.—Native of Labradore; and, according to Mr. Purſh, of the bogs of Canada, as well as the north-weſt coaſt of America, flowering in June and July. It was firſt cultivated in England by Mr Dickſon, in the garden of the late Rt. Hon. Charles Greville at Paddington, about the year 1802. This moſt reſembles the *arcticus* in habit, but is of more humble ſtature, though by no means deſtitute of a ſtem. The *leaves* are more acutely ſerrated, and riſe above the *flower*, which is crimſon, large, and handſome, on a terminal, downy, ſimple *ſtalk*. *Calyx* with ſix, or more, lanceolate, narrow ſegments, rather downy. *Petals* as numerous, and twice as long, elliptic-oblong, with taper claws. *Stamens* club-ſhaped and obtuſe, which is likewiſe the caſe in the *arcticus*, but in the preſent there is more of a capillary ſtalk to the *anther*. *Germen* depreſſed. *Styles* few, crowded together, looking like a ſimple one. We know nothing of the *fruit*.

49. R. *geoides*. Avens-leaved Bramble. Sm. Plant. Ic. t. 19. Willd. n. 29.—Leaves ſimple or ternate, obtuſe, ſerrated, ſmooth; the odd leaflet very large. Stems depreſſed, ſingle-flowered. Petals roundiſh.—Gathered by Commerſon at the ſtraits of Magellan. This is a humble depreſſed herb, with very ſhort *ſtems*. *Footſtalks* long, channelled, ſlightly hairy, each bearing two awl-ſhaped *ſtipulas*, a good way above the baſe. *Leaves* moſtly compoſed of one large, heart-ſhaped, rounded, abrupt, unequally ſerrated, ſmooth, terminal leaflet, and a pair of, much ſmaller, ſtalked ones, which laſt are ſometimes wanting. *Flower* terminal, ſolitary, on a thick downy ſtalk. Segments of the *calyx* oblong. *Petals* nearly orbicular. *Fruit* unknown. Commerſon obſerved the *ſtamens* and *piſtils* to be always preſent together in each flower, in which this plant differs from *R. Dalibarda* and *Chamæmorus*, hereafter deſcribed.

50. R. *trifidus*. Three-cleft Japan Bramble. Thunb. Jap. 217. Willd. n. 27.—Leaves ſimple, three-cleft, cut and ſerrated, ſmooth. Stem without prickles, nearly ſimple, erect. Flowers ſtalked, ſolitary. Calyx white and downy.—Found by Thunberg, near Quana in Japan, flowering in April. The *ſtem* is ſaid to be rather zigzag, round, moſtly ſimple, purple, and ſmooth. *Leaves* ſtalked, heart-ſhaped, roundiſh, nearly as broad as the palm of the hand; their lobes cut, and unequally ſerrated. *Flowers* from the ſame bud with the leaves, ſolitary, on a ſimple, rarely divided, *ſtalk*, which is like the *footſtalks*, about a finger's length, and villous. *Fruit* red, eatable, agreeably flavoured. By the above deſcription, taken from Thunberg, it ſhould ſeem that there are more *flowers* than one on each ſtem; but we have ſeen no ſpecimen.

51. R. *ſtellatus*. Starry-flowered Bramble. Sm. Plant. Ic. t. 64. Willd. n. 28. Purſh n. 18.—Leaves ſimple, three-lobed, rugoſe. Stem ſingle-flowered. Segments of the calyx awl-ſhaped. Petals lanceolate.—Gathered by Mr. Menzies, near Foggy Harbour, on the north-weſt coaſt of America. The *roots* are perennial and creeping. *Stems* annual, ſolitary, erect, ſimple, leafy, downy, without prickles, about two inches high. *Leaves* two or three, alternate, on long downy ſtalks, heart-ſhaped, broader than they are long, more

more or lefs deeply three-lobed, rather acute, fharply ferrated, rugofe, veiny, flightly hairy; paler beneath. *Stipulas* roundifh, or ovate, fomewhat notched. *Flower* large, terminal, folitary, much overtopped by the foliage, crimfon, on a fhort downy ftalk. *Calyx* hairy, with from five to ten long, taper fegments; its bafe angular and ribbed. *Petals* as many, lanceolate or obovate, with taper claws. *Berry* compofed of feveral grains. The *calyx* fometimes remains through the winter, elevated on the elongated dried *ftem*, as in the plate above cited.

52. R. *Chamæmorus.* Mountain Bramble, or Cloudberry. Linn. Sp. Pl. 708. Fl. Lapp. ed. 2. 173. t. 5. f. 1. Willd. n. 30. Ait. n. 14. Purfh n. 19. Fl. Brit. n. 7. Engl. Bot. t. 716. Lightf. Scot. 266. t. 13. f. 2. Fl. Dan. t. 1. (Chamæmorus; Ger. Em. 1273. Vaccinia nubis; ibid. 1420, very bad.)—Leaves fimple, lobed, rugofe. Stem fingle-flowered. Segments of the calyx ovate. Petals roundifh.—Native of alpine turfy bogs in the north of Europe, frequent in Lapland, Denmark, Siberia, &c., as well as on the higheft mountains of Scotland, Wales, and the north of England, flowering in June. It occurs alfo in Canada and New England. The *roots* are long and creeping, throwing up here and there folitary *ftems*, about a fpan high, fome bearing folitary male *flowers*, others female ones. *Leaves* fhaped like thofe of a mallow, or currant, heart-fhaped at the bafe, ftrongly veined, plaited, fmooth, unequally ferrated, one or two on each ftem. *Footftalks* flightly hairy. *Stipulas* ovate, obtufe. *Flower* on a long downy *ftalk*, rifing above the leaves, white, elegant. *Calyx* tawny, downy, with five broad ovate fegments. *Petals* about twice as long as the calyx. *Berry* of many large grains, amber-coloured, with a pleafant acid flavour refembling that of tamarinds, though rather mucilaginous. Lightfoot fays, thefe berries are brought to table in the highlands. Linnæus fpeaks of them as much efteemed by the Laplanders, who preferve them through the winter, buried under the fnow.

53. R. *coriaceus.* Coriaceous Peruvian Bramble. Poiret in Lamarck Dict. v. 6. 237.—Leaves fimple, ovate-oblong, undivided, fmooth, ferrated. Stem and footftalks fomewhat prickly. Flowers axillary, folitary. Segments of the calyx lanceolate. Petals roundifh.—Found by Dombey in Peru. Defcribed by Poiret, from Juffieu's herbarium. The *ftems* are erect, nearly fimple, herbaceous, reddifh, compreffed, very fmooth, except a few fmall fcattered prickles on their upper part. *Leaves* alternate, diftinct, thick, and coriaceous, rather obtufe; fhining on the upper fide; their *footftalks* furnifhed with fome fmall prickles. *Stipulas* oval, toothed. *Flowers* axillary, towards the top of the ftem, on fimple, thickifh *ftalks*, armed with very fine prickles. *Calyx* large, broad at the bafe, with five fmooth, lanceolate, pointed, greenifh fegments. *Petals* rounded, fhorter than the calyx, crenate at the extremity, appearing yellow when dry.

54. R. *Dalibarda.* Violet-leaved Dwarf Bramble. Linn. Sp. Pl. 708. Willd. n. 31. Sm. Plant. Ic. t. 20. Lamarck Illuftr. t. 441. f. 3. (Dalibarda repens; Linn. Sp. Pl. ed. 1. 491. Poiret in Lamarck Dict. v. 6. 250. Purfh v. 1. 350. D. violæoides; Michaux Boreali-Amer. v. 1. 299. t. 27. Ait. v. 3. 271.)—Leaves fimple, heart-fhaped, undivided, crenate, hairy. Stems creeping. Stalks fingle-flowered. Petals ovate. Gathered by Kalm in Canada. Mr. Purfh fays it is found in the fhady woods and bogs of that country, and on the high mountains of New England and Pennfylvania, flowering in May and June. The *herbage* much refembles that of fome fpecies of violet. The *root* is perennial and creeping, fending forth feveral depreffed, creeping, round, leafy, downy *ftems*. *Leaves* rounded, about an inch in diameter, finely hairy on both fides, on long, flender, hairy *footftalks*. *Stipulas* oblong, with feveral terminal awl-fhaped fegments. *Flower-ftalks* nearly radical, about as long as the footftalks, but more flender, fimple, hairy, each bearing a fmall white *flower*, not unlike a fingle *hepatica*, but about half the fize. Segments of the *calyx* lanceolate, acute, downy, fometimes partly notched, nearly equal to the *petals*. *Stamens* capillary. *Styles* five, above half as long as the ftamens. They are erroneoufly defcribed "very fhort" in the Plant. Ic. *Fruit* of five, or not fo many, pale, dry, ovate, obtufe grains, minutely downy, and flightly wrinkled.

The want of pulp in the *fruit* firft induced Linnæus to feparate this plant, as a genus, from *Rubus*; but he afterwards altered his opinion. His original determination has been followed by Michaux, Purfh, and Aiton. The queftion is difficult, but there are many different degrees of pulpinefs in the feveral fruits of acknowledged *Rubi*, and Mr. Purfh himfelf defcribes his *cuneifolius*, fee n. 15, with "hard and dry *berries*," though no perfon furely would think of placing that fpecies any where elfe. Till, therefore, we can judge for ourfelves, by tracing the growth of the *fruit* in queftion, and comparing it with others, we had rather follow Linnæus. Michaux fays *Dalibarda* differs from *Rubus*, nearly in the fame manner as *Potentilla* from *Fragaria*; but this is incorrect. Thefe latter are diftinguifhed by the deciduous flefhy receptacle of *Fragaria*; the others merely by more or lefs pulp in the berry; for *Dalibarda* has not naked feeds, or "*femina exfucca*," but poffibly *bacca exfucca*, a very different matter. We fhall recur to the fubject again under the following fpecies.

55. R? *fragarioides.* Strawberry-leaved Bramble. (Dalibarda fragarioides; Michaux Boreali-Amer. v. 1. 300. t. 28. Curt. Mag. t. 1567. Purfh v. 1. 350. Ait. v. 3. 271. Poiret in Lamarck Dict. v. 6. 250.)—Leaves ternate; leaflets all feffile, wedge-fhaped, notched and ferrated, fringed. Stalks radical, many-flowered. Calyx tubular at the bafe.—Native of fhady beech woods in Canada, and of the Allegany mountains, flowering in May and June. We have feen no fpecimen, but by the above plate, the *root* appears to be fimple, oblong, woody and perennial. *Leaves* all radical, on longifh flender ftalks; the middle *leaflet* feffile like the reft, and very little larger. *Flower-ftalks* longer than the leaves, fomewhat panicled, bearing about five *flowers*, the fize of the laft. *Calyx* remarkably elongated, and inverfely conical, at the bafe, with ovate, finally reflexed, fegments. *Petals* ovate, faid to be yellow. *Stamens* numerous; their filaments permanent, erect. Of the particular ftructure of the *fruit* we find no account. This fpecies, with its yellow *flowers*, and tubular *calyx*, to fay nothing of the *herbage*, is fo unlike the other *Dalibarda*, that it weakens, inftead of confirming, that fuppofed genus. We prefume not to fay, without actual examination, what it moft refembles. Pallas, it feems, made this plant a *Dryas*. We place it here merely for further enquiry. Dr. Sims in Curtis's Magazine remarks that the *calyx* fometimes betrays an inclination to have intermediate fegments, a very curious, though puzzling, circumftance.

56. R. *radicans.* Creeping Peruvian Bramble. Cavan. Ic. v. 5. 7. t. 413. Poiret in Lamarck Dict. v. 6. 249. —Leaves ternate; leaflets all ftalked, heart-fhaped, villous, ferrated. Stem creeping, prickly. Stalks radical, fingle-flowered. Calyx notched. Gathered by Lewis Née, in the woods of Chili, growing at the roots, or on the rotten trunks, of trees, bearing flowers and fruit in February. The *ftem* is quite proftrate, armed with fhort prickles, fpreading

ing to a great extent, and fixing itfelf here and there, as it runs, by fibrous *roots*. *Leaves* feveral from each part where the roots are produced, forming a tuft, accompanied by a folitary, long-ftalked, pale red *flower*, rifing above the leaves, and fucceeded by an ovate greenifh *berry*, compofed of numerous grains, all together the fize of a currant, and faid to be very agreeably flavoured. The *calyx* is reflexed when in fruit, its fegments oblong, acute, with many deep notches. *Petals* roundifh, obtufe.

Rubus, in *Gardening*, contains plants of the under-fhrubby and herbaceous perennial kind, of which the fpecies cultivated are, the rafpberry (R. idæus); the Virginian rafpberry (R. occidentalis); the flowering rafpberry (R. odoratus); the common bramble (R. fruticofus); the briftly bramble (R. hifpidus); the dewberry bramble (R. cæfius); the dwarf crimfon bramble (R. arcticus); and the mountain bramble, or cloud-berry (R. chamæmorus).

In the firft fpecies the varieties are, the red-fruited, the white-fruited, the twice-bearing, of which the firft crop ripens in July, and the fecond in October, thofe of the latter feafon having feldom much flavour; the fmooth rafpberry, and the large Antwerp. But the forts moftly cultivated, according to Mr. Forfyth, are, the early white, the double-bearing white, the large common white, the large red, the red Antwerp, the large white Antwerp, the fmooth cane double-bearing, and the Woodward's new rafpberry.

In the fourth fort there are feveral varieties; but that which is chiefly introduced as a garden fhrub, is the double-flowered bramble.

Method of Culture.—In the firft fort and varieties of thefe plants it may be effected by fuckers and layers. The plants fhould always have a portion of ground to themfelves, being planted at the diftance of about fix feet from row to row, and four in the rows, with the exception of the early white fort, which may be fet out clofer. And according to Mr. Forfyth, the ground fhould firft be well trenched over and dunged; then, making choice of the ftrongeft and fineft plants that come out from the fides of the ftools, where they have been ftanding for fome years, or encouraging the ftrongeft plants that come out betwixt the rows after digging, which fhould be done annually, they may be planted out as above. In digging the ground, it frequently happens that the roots are cut with the fpade, which occafions a great number of fmall plants to come up; of thefe the ftrongeft and fineft fhould be felected, hoeing up all the fuperfluous ones. But he prefers laying down fome of the ftrongeft outfide fhoots in the month of March; as, by the following autumn, they will make fine roots, and may be planted out in a quarter, or piece of ground, where they are intended to remain. Thefe will not be fo liable, he thinks, to throw out fuckers as thofe which are produced from fuckers. The frefh pieces of ground fhould always be planted in moift weather, as the roots are very delicate, and liable to hurt, when expofed to a dry air. If, however, they are planted in dry weather, he advifes that care be taken to moiften the roots with water, and cover them well with wet litter, or leaves, during the time in which they are planting out. In performing the work, a trench fhould be opened with a fpade, along the line where the fuckers or layers are to be planted, cutting off all the fmall fibry roots with a knife, leaving only the ftronger roots; putting them into the trench, and covering them with fome earth; then watering them well, and throwing the remainder of the earth over them, letting them remain till you have finifhed planting the piece; then, where you firft began to plant, beginning to tread the ground with the foot as hard as poffible along each of the trenches, and in the fame direction as planted; then with a fpade levelling all the ground fmooth, and running it over with a rake, taking off any ftones and rubbifh that may be left on the furface, fo as to render it perfectly even. The plants fhould be watered two or three times a week, when the feafon is dry, till they have taken root; and it will be neceffary to ftake the Antwerp, and other ftrong growing forts, with ftout ftakes, running a couple of fmall rails at top to tie the branches to, which will prevent their being broken by the wind, or beaten down by the rain. The early white, and fmaller forts, may be plaited together at top, tying them round with the fmall yellow willow, which will keep them together. Some of the early rafpberries may be planted between the trees on a weft afpect, to produce early fruit before thofe in the quarters come in. The Antwerps thrive exceedingly well againft north walls or palings, and produce late crops. Such as are planted againft walls or palings fhould be tacked to them, to keep them in their places.

And it is advifed that where any of the fmall red and white forts are found, they fhould be deftroyed, planting the large red, the fmooth cane double-bearing, the large red and white Antwerps, the large common white, the double-bearing white, and Woodward's new rafpberry in their ftead. In refpect to the cutting or pruning of thefe plants, fome, Mr. Forfyth remarks, prefer pruning them in autumn, a practice of which he by no means approves. As they bear the fruit on the wood of the preceding year, they are, he thinks, very liable to be killed by the froft in fevere winters; but, by deferring the pruning till the month of February, there will be a great choice of fine wood for bearing the following fummer, being careful to root out or cut down all the wood that bore fruit the preceding year, which generally dies, felecting only from five to feven of the moft vigorous and ftrong fhoots from the laft year's wood to bear fruit the enfuing feafon. Thefe fhoots may be pruned to the length of three or four feet, according to their ftrength, when they are of the fmooth cane double-bearing fort (which generally bears a fecond crop in autumn, and will, in fine feafons, continue bearing from June to November); but, if the large Antwerp, the fhoots fhould be left five or fix feet long in thefe prunings.

But in regard to the early white, which never grows fo ftrong as the above forts, it fhould be fhortened to two feet and a half, or three feet. Thefe fhould be planted in rows about three feet diftant from each other, and two feet from plant to plant in the rows; always remembering to keep them clear of fuckers, and to cut out the dead or laft year's wood, as above; making choice of the ftrongeft fhoots for bearing wood. Great care fhould, however, be taken not to cut off the little fpurs on the fides, which bear the fruit in this kind. Plants of this fort continue in bearing five or fix years; by which time a frefh plantation fhould be in readinefs to fucceed them. The young plants often bear fome fruit the firft year, and come into full bearing in the fecond after planting. If they be fuffered to remain more than five or fix years on the fame ground, they degenerate, and bear fmall fruit. And much care fhould be taken not to leave above eight or ten of the ftrongeft fhoots, rubbing off or pulling up all the fuperfluous ones; and keeping the ground well hoed and cleared of weeds between the rows, as well as in other places.

Alfo in the other forts the increafe may be effected by fuckers, layers, cuttings, and dividing the roots, and in the two laft, or herbaceous kinds, by feed. The fuckers fhould be taken up in autumn, winter, or fpring, with roots; and the ftrongeft be planted at once into the fhrubbery, and the others in nurfery-rows for a year or two, or till wanted for

 planting.

planting. The layers ſhould be made from the ſhoots, which may be done almoſt any time, as they readily emit roots at every joint, and become fit to plant out in the autumn following. And the cuttings ſhould be taken off from ſome of the younger ſhoots, and divided into lengths a foot long, and planted in a ſhady border, either in the ſpring or ſummer ſeaſon. The roots in any of the raſpberry and herbaceous ſorts, when increaſed into large bunches, may be divided or ſlipped into ſeveral diſtinct ſets, and planted out ſeparately.

The laſt two ſorts may likewiſe be raiſed from ſeeds, which ſhould be taken from the ripened fruit, and ſown in a moiſt ſituation where the plants are to remain, keeping the young plants clean afterwards.

Both the firſt ſpecies, and all the varieties, are highly uſeful for their fruit; for the table, preſerving, and other culinary purpoſes.

And moſt of the other ſorts afford variety in the borders, clumps, and other parts of pleaſure-grounds, among other hardy plants.

Rubus, in *Ichthyology*, a name given by Joannes Cuba, Albertus, and ſome other writers, to the ſpecies of *ray*, uſually called the *ſkate*, or *ſlaire*. See Raia (Batis and Rubus).

RUBY, *Spinelle*, Fr., in *Mineralogy*, a precious ſtone, much valued by jewellers; but under this name a variety of minerals have not unfrequently been ſold, which differ eſſentially in their characters. Mineralogiſts have alſo diſagreed much in the claſſification of ſubſtances to which they have given the name of ruby. The oriental ruby is, in fact, a red variety of the ſapphire, and is deſcribed under the article Gems. It poſſeſſes greater hardneſs than the common ruby, and differs from it in its cryſtallization. The primitive form of the cryſtals of the common ruby is the regular octahedron, from which the ſecondary forms vary but little. Two cryſtals are ſometimes united, and form a macle. The colour is red, varying from ſcarlet to violet and yellowiſh-red, and ſometimes a dark red. It is infuſible by the blowpipe, nor does it loſe its colour by the heat. The fracture is flatly conchoidal; it has a ſplendent vitreous luſtre. The ruby poſſeſſes a conſiderable degree of hardneſs, though its principal conſtituent ingredient is alumine. According to Vauquelin, it contains

Alumine - - -	84.47
Magneſia - - -	8.78
Chromic acid - - -	6.18

To the chromic acid the common ruby owes its colouring matter. A variety of ruby has received from Haüy the name of Pleonaſte; it differs from the above in containing iron in place of chromic acid, and the colours vary from a purple to blue and green. Another gem nearly reſembling the ruby, the ſpinelle zinſifere of Haüy, called alſo automalite, has been claſſed as a ſub-ſpecies of ruby, but it differs from it greatly in its conſtituent parts.

Automalite, like the common ruby, has the octahedral cryſtallization, with laminæ parallel to the faces of the cryſtal; its colour is a dark blueiſh-green, nearly opaque. The conſtituent parts, according to Vauquelin, are,

Alumine - - - -	42
Silex - - - -	4
Oxyd of zinc - - -	28
Oxyd of iron - - -	5
Sulphur - - -	17

The ruby, in its moſt perfect ſtate, is a gem of very great beauty and value. It is often found perfectly pure, and free from all ſpots or blemiſhes; but it is much more frequently debaſed by them, and greatly brought down in its value, eſpecially in the larger ſpecimens. It is of very great hardneſs, equal to that of the ſapphire, and ſecond only to the diamond. It is various in ſize, but is leſs ſubject to variations in its ſhape than moſt of the other gems. It is moſt frequently found very ſmall; its common ſize being that of the heads of the larger ſort of pins; and when of this ſize it is very cheap; but it is alſo found of four, ſix, or ten carats; and ſometimes, though but very rarely, up to twenty, thirty, or forty; nay, we have accounts of ſome of more than a hundred. It is never found of an angular or cryſtalliform ſhape, but always of a pebble-like figure, often roundiſh, ſometimes oblong, and much larger at one end than the other, and in ſome ſorts reſembling a pear, and is uſually more or leſs flattened on one ſide.

It is commonly ſo naturally bright and pure on the ſurface as to need no poliſhing: it is worn in rings, and in the crowns of princes, in its rough or native ſtate. Its colour is red in very different degrees, from the deepeſt garnet colour to that of the paleſt red diamond, but it ever has with the red more or leſs of a purpliſh tinge. This is very plainly diſtinguiſhed in the deeper coloured ſpecimens, but in the pale ones is gradually leſs and leſs to be diſtinguiſhed in proportion to their degree of colour. Theſe are the diſtinguiſhing characters of the ruby, and by theſe it is eaſily known from the garnet, carbuncle, and other red gems.

Our jewellers are very nice, though not perfectly determinate in their diſtinctions; knowing this gem, in its different degrees of colour, under three names; the firſt is ſimply the *ruby:* this is the name they give to it in its moſt perfect and ſtrongeſt coloured ſtate.

The ſecond is the *ſpinel* ruby. Under this name they know thoſe rubies which are of a ſomewhat leſs deep and much leſs vivid colour than what they call the true ruby, or ſimply the ruby.

The third is the *balaſs* ruby, a name derived from Balakeia, the name of a country where the paler rubies are principally found. Under this name they expreſs a pale, yet a very bright ruby, with a ſmaller admixture of the purple tinge than in the deeper coloured one, and ſomething reſembling the colour of the damaſk roſe. This is of a conſiderable value, but leſs than the deeper, or, as they call it, the true ruby.

Beſides theſe, they know alſo two other ſtones under the general name rubies, calling them the *rock ruby*, and the *rubacelle*. But theſe are not truly of the ruby kind; the firſt being a very beautiful ſpecies of garnet, and having a tinge of blue with its red; and the other a hyacinth, having a manifeſt caſt of yellow. See Gems.

There are but two places in the Eaſt where the ruby is found; the kingdom of Pegu, and the iſle of Ceylon. The mine in Pegu, where it is found in greateſt plenty, is in the mountain Capelan, twelve days' journey from Siren, the reſidence of the king of that country. The fineſt rubies brought hence do not exceed three or four carats; the king reſerving all the larger to himſelf.

In Ceylon the rubies are found in a river which deſcends from the mountains towards the middle of the iſland: ſome few are alſo found in the ground. The rubies of Ceylon are uſually brighter and more beautiful than thoſe of Pegu, but they are rare; the king of Ceylon prohibiting his people to gather them, or traffic with them. There are, as ſome ſay, rubies alſo found in Europe, particularly in Bohemia and Hungary, eſpecially the former, in which is a mine of flints of divers ſizes; which, upon breaking, are ſometimes found to contain rubies, pretended to be as fine and hard as any of the Eaſtern ones.

The

The Greeks call the ruby ἀπύρωτος, *q. d.* refifting the fire. The ancients, out of their credulity and fuperftition, attributed many virtues to the ruby; as that it expels poifons, cures the plague, abates luxury and incontinence, banifhes forrow, &c.

It is faid the inhabitants of Pegu have the art of heightening the rednefs and brilliancy of rubies, by laying them in the fire, and giving them a proper degree of heat; but this feems a very erroneous account.

The ruby is formed in a ftony fubftance, or bed, of a rofe-colour, called *mother of ruby;* it has not all its colour and luftre at once, but comes to it by degrees. At firft it is whitifh; and, as it approaches to maturity, becomes red. Hence we have white rubies, others half-white, half-red, and others blue and red, called *fapphire* rubies. When a ruby exceeds twenty carats, it may be called a *carbuncle;* the name of an imaginary ftone, of which the ancients and moderns have given us fo many defcriptions.

They have feveral modes of counterfeiting rubies; and fome have carried the imitation to that length, that the moft able lapidaries, till they come to try the hardnefs, are fometimes deceived.

Frutiere affures us very pofitively, that there have been rubies in France of two hundred and forty carats. Tavernier tells us he faw one in the Indies of fifty carats, which he had a mind to have bought. He adds, that the king of France has finer and larger rubies than any in the poffeffion of the great Mogul.

The largeft ruby that is known to be in the wörld was brought from China to prince Gargarin, governor of Siberia. It came afterwards into the hands of prince Mentchikof, and is at prefent one of the ornaments of the imperial crown of Ruffia.

Ruby, *Sapphire.* See Sapphire and Gems.

Ruby, *Counterfeit.* See Gems, *Ruby* Glass, and *Ruby* Paste.

Ruby, in *Chemiftry,* is a name given to feveral preparations of natural bodies, becaufe of their red colour: as,

Ruby *of Arfenic,* &c. See Realgar.

Ruby, in *Heraldry,* denotes the red colour with which the arms of noblemen are blazoned; being the fame which, in the arms of others, not noble, is called *gules.*

Ruby-*Throat,* Latham, in *Ornithology.* See Motacilla *Calliope.*

RUCCELLA, La, in *Geography,* a town of Sicily, in the valley of Demona; 7 miles S.W. of Cefalu.

RUCELLAI, Bernardo, in *Biography,* was born of a noble family at Florence in 1449. At the age of feventeen he married Nannina, daughter of Piero, and fifter of the illuftrious Lorenzo de Medici, which gave him great influence, and raifed him to the higheft pofts in the republic. In 1480 he was appointed to the office of gonfalonier of juftice; and four years afterwards he went as ambaffador to the ftate of Genoa. In 1494 he was deputed, in the fame quality, to Ferdinand, king of Naples, and afterwards to Charles VII. king of France. With his public employments he joined that cultivation of polite literature, which was frequent among the Florentines in the age of the Medici. He was intimately acquainted with Marfiglio Ficino, of whofe academy he was at firft one of the chief ornaments, and afterwards the firmeft fupport. After the death of Lorenzo he was the munificent patron and protector of the Platonic academy, for the ufe of which he erected a fumptuous edifice, with fine gardens and groves, furnifhed with monuments of antiquity, ferving as well for ornament as inftruction. In the revolutions which followed the fubverfion of the Medici intereft, Rucellai incurred the charges of ambition and inconftancy, by favouring fometimes one party and fometimes another: but, according to Mr. Rofcoe, his crime, in the eyes of the Florentine hiftorians of the fucceeding century, was "an ardent love of liberty, which he preferred to the claims of kindred, and the expectations of perfonal aggrandizement." On the acceffion of Leo X. he declined the office which his countrymen would have conferred upon him of going as public orator to congratulate the pontiff, forefeeing, probably, in his elevation, the ruin of the liberties of Florence. He died in 1514, and was buried in the church of St. Maria Novella, the front of which, begun by his father, was finifhed by him with great magnificence. The following are the works of this patron of literature: "De Urbe Roma," which is a commentary on the defcription of Rome by Publio Vittore, in which he collected from all the ancient writers whatever would ferve to convey a juft idea of the grandeur of that capital; "De Magiftratibus Romanis;" "De Bello Italico;" and "De Bello Pifano:" thefe have been compared with the hiftory of Salluft. Bernardo was a poet in his own tongue; and a piece of his, entitled "Trionfo della Calumnia," was printed among the "Canti Carnafcialefchi," at Florence in 1759. Rofcoe's Lorenzi de Medici.

Rucellai, Giovanni, fon of the preceding, a diftinguifhed Italian poet, was born in 1475. Improving the advantages which he naturally enjoyed under his father's roof, he became a diftinguifhed fcholar, and in 1505 the republic of Florence nominated him ambaffador to the Venetian ftate. He took a very active part in the tumult raifed by the younger citizens in the year 1512, to promote the return of the Medici to Florence. Upon the elevation of pope Leo X., who was his relation, Giovanni, in hopes of preferment, repaired to Rome, and entered into the ecclefiaftical order: and in 1515 he attended Leo on his vifit to Florence, on which occafion the pontiff was entertained in the Rucellai gardens with the reprefentation of the tragedy of "Rofmonda," written by Giovanni. Leo fhewed the greateft attachment to his relation, and fent him, at a very critical period, as nuncio to the court of Francis I., where he was at the death of Leo X. On that event he returned to Florence, and was fent to Rome to congratulate the new pope Adrian VI. on his acceffion. In this, as well as in the pontificate of Leo X., and alfo in the fucceeding one of Clement VII., to whom he was related, he had the moft fanguine hope of promotion to a cardinalate. He died in 1526, without attaining to the object of his ambition. As an author, Giovanni is known by "Le Api," The Bees, which is a didactic poem in unrhymed verfe, and bears a high rank among Italian compofitions in that clafs. His tragedy Rofmonda, already noticed, and his Oreftes, are imitations, the former of the Hecuba of Euripides, the latter of the Iphigenia in Tauris. Rofcoe's Leo X.

RUCHENWALDE, in *Geography,* a town of Brandenburg, on the Ucker Mark; 2 miles N.E. of Storkow.

RUCHT, a river of France, which runs into the Roer, near Hermbach.

RUCK, in *Rural Economy,* a provincial term, fignifying a rude heap or bundle of any thing.

RUCKENSTEIN, in *Geography,* a town of the duchy of Carniola; 6 miles W. of Gurkfeld.

RUCKERSDORF, a town of Bavaria, in the territory of Nuremberg; 8 miles W. of Lauf.

RUCKERSWALDE, a town of Silefia, in the principality of Neiffe; 5 miles E.S.E. of Neiffe.

RUCKINGEN, a town of Germany, in the county of Ifenburg, on the Kinzig; 5 miles N.E. of Hanau.

RUCTATION, Ructus, in *Medicine*, belching, an involuntary difcharge of flatus from the ftomach, fometimes accompanied with a portion of the folid or liquid contents of that organ.

This is ufually one of the fymptoms of indigeftion, whether arifing from a morbid condition of the ftomach, or from a temporary overloading of it with too much food, or with food of an acrid, heavy, or indigeftible quality, or fuch as is difpofed to pafs into fermentation. There is a natural tendency in the food, efpecially the vegetable portion of it, to the procefs of fermentation, and the confequent evolution of air; but by the influence of the gaftric juice, when it is fufficient to accomplifh the digeftive procefs, this tendency is counteracted, and no air is evolved. Whence the beft remedy for eructation is the improvement of the digeftive power, and the avoiding of fermentative food. See Indigestion.

RUD, in *Ichthyology*. See Cyprinus *Caraffius*, and Cyprinus *Erythrophthalmus*.

Rud, in *Rural Economy*, a term provincially fignifying a fort of red ochre.

RUDAW, in *Geography*, a town of Pruffia, in the province of Natangen; 12 miles S.W. of Lick.—Alfo, a town of Pruffia, in the province of Samland, formerly fortified with a caftle, now in ruins. Some monuments of Pagan idolatry ftill remain in the vicinity of Rudaw; and alfo a ftone pillar in a field near Tranzou, erected in commemoration of a victory obtained by the knights of the Teutonic order in 1370, over Kinftud, great duke of Lithuania; 12 miles N.N.W. of Königfberg.

RUDBECK, John, in *Biography*, a learned Swedifh bifhop, was born about the year 1581. After having obtained the elementary parts of education, he was entered at the univerfity of Upfal, where he made fuch progrefs in the higher branches of learning, that before he had completed his twenty-third year he was appointed profeffor of mathematics, which, in 1610, he exchanged for his profefforfhip of Hebrew. On the coronation of Guftavus Adolphus, he took his degree in theology, and in 1619 he was nominated to the bifhopric of Vefteras. In confequence of fome ftrong expreffions which he made ufe of in a public oration, a violent difpute took place between him and profeffor Meffenius, which was carried fo far, that the king was obliged to interfere, and to allay the angry paffions of the difputants, his majefty appointed Meffenius affeffor in one of the courts of juftice; and in 1613 he made Rudbeck one of his own chaplains. It was owing, in a great meafure, to the zeal and exertions of this prelate, that the Swedifh bible, known among the learned as the Bible of Guftavus Adolphus, was publifhed in 1618. He is alfo known and highly efteemed in his own country for the confiderable donations which he made to the gymnafium of Vefteras, and for his aid in the improvement of other ufeful inftitutions; he died in 1646. He was author of feveral theological works, of which the titles are given in the General Biography. Among thefe was one, entitled "Privilegia quædam Doctorum, Magiftrorum, Pracalaureorum, Studioforum, et Scholarum omnium, &c." This work, which excited great attention, had nearly proved the author's ruin, and was, very foon after the publication, prohibited by a decree of the fenate. Upon this occafion, one of the members of the fenate afferted, that a more dangerous book had fcarcely ever appeared, and that it was neceffary the publifher fhould make oath that he had not retained a fingle copy. It prevented the promotion of the prelate, who would otherwife probably have been raifed to the rank of archbifhop.

Rudbeck, Olof, or Olaus, a man of very extenfive learning and accomplifhments, who if not, ftrictly fpeaking, the father of natural fcience in Sweden, muft be reckoned among its earlieft and moft diftinguifhed patrons and cultivators, was the fon of John Rudbeck, bifhop of Vefteras; an honeft and uncourtly bifhop, who fpoke truth, and was never promoted. The fon had a great and vigorous mind, fomewhat over-luxuriant in fpeculation and hypothefis, but fagacious in difcovery, and indefatigable in application. He was born in 1630, and educated at Upfal. Anatomy was his earlieft ftudy, and he profecuted it with fuch fuccefs, that at the age of nineteen or twenty he made the important difcovery of the lymphatic veffels in the liver, and, foon afterwards, of thofe of other parts of the body. His inaugural differtation, in 1652, treated of the circulation of the blood. Bartholine contended with Rudbeck for the originality of the difcovery of the lymphatic fyftem, and they appear to have made it independent of each other; though Haller gives the priority, in point of time, to Rudbeck. See Bartholine, Thomas.

The univerfity of Upfal was, at this time, advancing rapidly towards that celebrity which it has now fo long maintained. Enriched with the patrimonial eftates of the great Guftavus Vafa, its funds have ever been ample, and the good fenfe of its directors has generally led them to a right application of thefe refources. Rudbeck, however, having made Botany a part of his purfuits, contributed, out of his own means, to the advancement of that fcience. He founded a garden, which he afterwards gave to the univerfity. He vifited Holland in 1653, but returning home next year, devoted himfelf to the ftudy, and, we prefume, to the practice of medicine, as well as to the inftruction of his pupils in anatomy. In 1658 he was appointed profeffor of medicine, and was fixed at Upfal for the remainder of his life. It appears that he married before the age of thirty, his fon, the fubject of our next article, having been born in 1660, but we have no particular account of Rudbeck's domeftic hiftory. Befides the attention which he gave to the above-mentioned purfuits, he very early addicted himfelf to the ftudy of languages, hiftory, antiquities, architecture, and mufic, as well as the practical art of drawing. He fo far took the lead in matters of tafte, that the public feftivals and decorations, at the coronation of the young king Charles XI., in 1660, were put entirely under his direction.

The firft botanical publication of Rudbeck feems to have been his Catalogue of the Upfal Garden, printed in 1658, the year after the eftablifhment of that collection. To this little volume a preface in Latin and Swedifh is prefixed, treating of practical horticulture, and recommending botany for its agreeablenefs and utility. The lift is, of courfe, not very ample, but contains feveral exotic fpecies and varieties; and when the author complains of a fharp froft on the 24th of July, we cannot but allow the protection of ftoves and greenhoufes to have been of the moft imperious neceffity, fo that he could fcarcely, in one year, have fufficiently provided them. An Appendix to this catalogue was printed in 1666, the garden having been, by that time, confiderably enriched. The fame year, 1666, not, as Linnæus has it, 1664, another fimilar work appeared, *Deliciæ Vallis Jacobææ;* a catalogue, alphabetical like the former, of a garden at Jacob's Dahl, near Stockholm, belonging to count Magnus Gabriel de la Gardie, chancellor of the kingdom of Sweden, as well as of the univerfity of Upfal. This, though anonymous, is attributed by Linnæus, to to Rudbeck. It is a little book of extreme rarity, insomuch that Haller speaks of it by report only. A Latin poem is prefixed to the work, describing the beauty of this villa, its orangery, aviary, plantations, and fountains.

We know not at what period of his life Rudbeck first conceived the vast project of his *Campi Elysii*, in which all the plants in the world, as far as they had been discovered, were to be represented by wooden cuts, in twelve folio volumes, disposed according to Bauhin's *Pinax*. For this stupendous work he is said to have prepared ten or eleven thousand figures. The first and second volumes were already printed, when a dreadful fire reduced almost the whole town of Upsal to ashes, in the year 1702. Three copies only of the first volume escaped the fire, two of which remain in Sweden, and the third is preserved in the Sherardian library at Oxford. A few leaves of this last copy, having been deficient, are supplied in manuscript. A number of the blocks of this very volume, which consists of grasses and their allies, came into England with the Linnæan collection; and having been compared with the Oxford copy, an impression of them was given to the public in 1789, under the title of *Reliquiæ Rudbeckianæ*, the appropriate letterpress of each figure, and the Linnæan names, being subjoined. An historical preface is prefixed to this edition, as well as a dedication to Dr. John Gustavus Acrel, Professor of Medicine at Upsal, who was entrusted with the sale of the Linnæan museum and library. (See Linnæus.) The object of the dedication is to bear testimony to the honourable conduct of this gentleman, who, because he would not act unjustly, was accused of having received a bribe of 100 pounds, so moderate is the standard of bribery in Sweden, to betray the interest of the proprietors. Perhaps this report arose from his rejecting, for them, the offer of the same sum, from another quarter, to forfeit their engagement to the person with whom they had treated, and to whom he indignantly communicated the proposal.

The second volume of the *Campi Elysii* came from the press a little before the former; so that several copies, having got abroad, escaped the destruction of the rest. Even this, however, is a very rare book, the price of which can hardly be estimated. A copy was bought by professor Jacquin in Germany, many years ago, for about 30 guineas. This volume is in the Linnæan, Banksian, and Sherardian libraries. Containing liliaceous plants, and the Orchis tribe, it is much more splendid than the first. The figures are copied from all quarters, though several are original, and amount to about 600 in all, many of them executed with great correctness and elegance, more especially after the fine engravings of the Hortus Malabaricus. There are, of course, several repetitions of the same species, and abundance of garden varieties of Tulips, &c. The *Orchideæ* are numerous, but inferior, as to the correctness of their flowers, to some other plants, a defect arising from their singularity or minuteness. The preface attributes the anticipated publication of this volume to the greater popularity and attraction of its contents; and speaks of many of the intended figures of the whole work, as to be executed from drawings made by the author himself, after original specimens, either preserved in Burser's fine Swiss herbarium, or obtained from other quarters. The author speaks of his son and nephew, each of the same name with himself, as his coadjutors, and the destined continuators of this laborious undertaking. The destruction of his materials is extremely to be regretted; for such a repository of the botanical knowledge of the time, would have been highly valuable to succeeding writers; particularly as illustrating the plants of Bauhin, so many of which are to be determined from Burser's herbarium only. The volume in question stands alone, like the single unrivalled column of the temple of peace at Rome, a perpetual cause of regret, and a monument of irrevocable destruction.

Another great work of our author, on which, most of all perhaps, his literary celebrity depends, is entitled *Atlantica*, and ought to consist of four volumes in folio; but of these the fourth, at least, if we mistake not, is to be met with in manuscript only. The others are extremely rare, probably from the accident of the fire above-mentioned. One alone, composed of wooden cuts, is in our possession. The aim of this singular, but profoundly learned, performance, was to prove that Sweden had been the terrestrial paradise of our first parents, the *Atlantis* of Plato, and the source of all learning, ancient mythology, arts, and sciences. By a passage in Linnæus's Lapland Tour, v. 1. 19, it should seem that Rudbeck had fixed the scene of the Trojan war at a village in Gestrickland, which bears the name of Troye. The reader will no longer wonder at this, when, in one of our author's illustrative maps, he finds Helicon stationed in Lapland; the Fortunate Islands at the Orkneys; and Acheron at the Maelstrom, off the coast of Norway. The church of old Upsal, certainly a hyperborean temple of the simplest form, and the most remote antiquity, is supposed to have been a fane of Apollo. It is square, with two round-arched door-ways at each side, but no windows. Rudbeck compares it with the temple of Janus at Rome, and shews how the present cathedral of Upsal originated from the plan of a similar edifice. In these points his remarks are well worthy of attention. Those who cannot help smiling at the wildness of some of his hypotheses, must respect his learning and ingenuity, and his work is said to have excited much attention when it first appeared. At present it ranks chiefly among the baubles of mere collectors, for the sake of its rarity.

This great man did not long survive the wreck of all his hopes and labours, in the fire at Upsal. He died in 1702, aged 72, having, nine years before, resigned the Professorships of Botany and Anatomy to his son. In the frontispiece of his *Atlantica* he is represented, with rather an agreeable and sensible countenance, of a plump and sleek habit of body, with long straight hair, and the habiliments of our professors and divines in the time of the Commonwealth. He is demonstrating his peculiar opinions to a circle of ancient philosophers and poets, and Plato is lending the delighted Hesiod a pair of spectacles. Rudbeck is said to have been a man of a mild and amiable character, much esteemed for his personal qualities, as well as for his boundless erudition. We can scarcely call him the founder of Botanical Science in Sweden, because he was preceded by Chesnecopherus, under whose presidency at Upsal, in 1621, a physical dissertation on plants was published and defended by Starbeck, a native of Smoland, which evinces the deep attention this branch of philosophy had even then excited, in that famous school. The curious reader may trace, in this dissertation, many ideas, supposed to have a more modern origin. Rudbeck's Works. Haller's Bibl. Bot. and Anat. Aikin's Gen. Biog. S.

Rudbeck, Olof, junior, son of the preceding, was born at Upsal in 1660. Having been directed by his father to his own favourite studies of medicine, botany, and antiquities, he proved worthy of such a parent, friend, and preceptor. He excelled likewise in the art of delineating natural objects, and found great advantage from this talent in his subsequent pursuits. Having travelled to Holland, he took his degree of doctor of physic, at Utrecht, in 1690, publishing on that occasion an able dissertation, *de Fundamentali*

RUCKINGEN, a town of Germany, in the county of Isenburg, on the Kinzig; 5 miles N.E. of Hanau.

RUCTATION, Ructus, in *Medicine*, belching, an involuntary discharge of flatus from the stomach, sometimes accompanied with a portion of the solid or liquid contents of that organ.

This is usually one of the symptoms of indigestion, whether arising from a morbid condition of the stomach, or from a temporary overloading of it with too much food, or with food of an acrid, heavy, or indigestible quality, or such as is disposed to pass into fermentation. There is a natural tendency in the food, especially the vegetable portion of it, to the process of fermentation, and the consequent evolution of air; but by the influence of the gastric juice, when it is sufficient to accomplish the digestive process, this tendency is counteracted, and no air is evolved. Whence the best remedy for eructation is the improvement of the digestive power, and the avoiding of fermentative food. See Indigestion.

RUD, in *Ichthyology*. See Cyprinus *Carassius*, and Cyprinus *Erythrophthalmus*.

Rud, in *Rural Economy*, a term provincially signifying a sort of red ochre.

RUDAW, in *Geography*, a town of Prussia, in the province of Natangen; 12 miles S.W. of Lick.—Also, a town of Prussia, in the province of Samland, formerly fortified with a castle, now in ruins. Some monuments of Pagan idolatry still remain in the vicinity of Rudaw; and also a stone pillar in a field near Tranzou, erected in commemoration of a victory obtained by the knights of the Teutonic order in 1370, over Kinstud, great duke of Lithuania; 12 miles N.N.W. of Königsberg.

RUDBECK, John, in *Biography*, a learned Swedish bishop, was born about the year 1581. After having obtained the elementary parts of education, he was entered at the university of Upsal, where he made such progress in the higher branches of learning, that before he had completed his twenty-third year he was appointed professor of mathematics, which, in 1610, he exchanged for his professorship of Hebrew. On the coronation of Gustavus Adolphus, he took his degree in theology, and in 1619 he was nominated to the bishopric of Vesteras. In consequence of some strong expressions which he made use of in a public oration, a violent dispute took place between him and professor Messenius, which was carried so far, that the king was obliged to interfere, and to allay the angry passions of the disputants, his majesty appointed Messenius assessor in one of the courts of justice; and in 1613 he made Rudbeck one of his own chaplains. It was owing, in a great measure, to the zeal and exertions of this prelate, that the Swedish bible, known among the learned as the Bible of Gustavus Adolphus, was published in 1618. He is also known and highly esteemed in his own country for the considerable donations which he made to the gymnasium of Vesteras, and for his aid in the improvement of other useful institutions; he died in 1646. He was author of several theological works, of which the titles are given in the General Biography. Among these was one, entitled "Privilegia quædam Doctorum, Magistrorum, Pracalaureorum, Studiosorum, et Scholarum omnium, &c." This work, which excited great attention, had nearly proved the author's ruin, and was, very soon after the publication, prohibited by a decree of the senate. Upon this occasion, one of the members of the senate asserted, that a more dangerous book had scarcely ever appeared, and that it was necessary the publisher should make oath that he had not retained a single copy. It prevented the promotion of the prelate, who would otherwise probably have been raised to the rank of archbishop.

Rudbeck, Olof, or Olaus, a man of very extensive learning and accomplishments, who if not, strictly speaking, the father of natural science in Sweden, must be reckoned among its earliest and most distinguished patrons and cultivators, was the son of John Rudbeck, bishop of Vesteras; an honest and uncourtly bishop, who spoke truth, and was never promoted. The son had a great and vigorous mind, somewhat over-luxuriant in speculation and hypothesis, but sagacious in discovery, and indefatigable in application. He was born in 1630, and educated at Upsal. Anatomy was his earliest study, and he prosecuted it with such success, that at the age of nineteen or twenty he made the important discovery of the lymphatic vessels in the liver, and, soon afterwards, of those of other parts of the body. His inaugural dissertation, in 1652, treated of the circulation of the blood. Bartholine contended with Rudbeck for the originality of the discovery of the lymphatic system, and they appear to have made it independent of each other; though Haller gives the priority, in point of time, to Rudbeck. See Bartholine, Thomas.

The university of Upsal was, at this time, advancing rapidly towards that celebrity which it has now so long maintained. Enriched with the patrimonial estates of the great Gustavus Vasa, its funds have ever been ample, and the good sense of its directors has generally led them to a right application of these resources. Rudbeck, however, having made Botany a part of his pursuits, contributed, out of his own means, to the advancement of that science. He founded a garden, which he afterwards gave to the university. He visited Holland in 1653, but returning home next year, devoted himself to the study, and, we presume, to the practice of medicine, as well as to the instruction of his pupils in anatomy. In 1658 he was appointed professor of medicine, and was fixed at Upsal for the remainder of his life. It appears that he married before the age of thirty, his son, the subject of our next article, having been born in 1660, but we have no particular account of Rudbeck's domestic history. Besides the attention which he gave to the above-mentioned pursuits, he very early addicted himself to the study of languages, history, antiquities, architecture, and music, as well as the practical art of drawing. He so far took the lead in matters of taste, that the public festivals and decorations, at the coronation of the young king Charles XI., in 1660, were put entirely under his direction.

The first botanical publication of Rudbeck seems to have been his Catalogue of the Upsal Garden, printed in 1658, the year after the establishment of that collection. To this little volume a preface in Latin and Swedish is prefixed, treating of practical horticulture, and recommending botany for its agreeableness and utility. The list is, of course, not very ample, but contains several exotic species and varieties; and when the author complains of a sharp frost on the 24th of July, we cannot but allow the protection of stoves and greenhouses to have been of the most imperious necessity, so that he could scarcely, in one year, have sufficiently provided them. An Appendix to this catalogue was printed in 1666, the garden having been, by that time, considerably enriched. The same year, 1666, not, as Linnæus has it, 1664, another similar work appeared, *Deliciæ Vallis Jacobææ;* a catalogue, alphabetical like the former, of a garden at Jacob's Dahl, near Stockholm, belonging to count Magnus Gabriel de la Gardie, chancellor of the kingdom of Sweden, as well as of the university of Upsal. This, though anonymous, is attributed by Linnæus, to to Rudbeck. It is a little book of extreme rarity, infomuch that Haller fpeaks of it by report only. A Latin poem is prefixed to the work, defcribing the beauty of this villa, its orangery, aviary, plantations, and fountains.

We know not at what period of his life Rudbeck firft conceived the vaft project of his *Campi Elyfii*, in which all the plants in the world, as far as they had been difcovered, were to be reprefented by wooden cuts, in twelve folio volumes, difpofed according to Bauhin's *Pinax*. For this ftupendous work he is faid to have prepared ten or eleven thoufand figures. The firft and fecond volumes were already printed, when a dreadful fire reduced almoft the whole town of Upfal to afhes, in the year 1702. Three copies only of the firft volume efcaped the fire, two of which remain in Sweden, and the third is preferved in the Sherardian library at Oxford. A few leaves of this laft copy, having been deficient, are fupplied in manufcript. A number of the blocks of this very volume, which confifts of graffes and their allies, came into England with the Linnæan collection; and having been compared with the Oxford copy, an impreffion of them was given to the public in 1789, under the title of *Reliquiæ Rudbeckianæ*, the appropriate letterprefs of each figure, and the Linnæan names, being fubjoined. An hiftorical preface is prefixed to this edition, as well as a dedication to Dr. John Guftavus Acrel, Profeffor of Medicine at Upfal, who was entrufted with the fale of the Linnæan mufeum and library. (See LINNÆUS.) The object of the dedication is to bear teftimony to the honourable conduct of this gentleman, who, becaufe he would not act unjuftly, was accufed of having received a bribe of 100 pounds, fo moderate is the ftandard of bribery in Sweden, to betray the intereft of the proprietors. Perhaps this report arofe from his rejecting, for them, the offer of the fame fum, from another quarter, to forfeit their engagement to the perfon with whom they had treated, and to whom he indignantly communicated the propofal.

The fecond volume of the *Campi Elyfii* came from the prefs a little before the former; fo that feveral copies, having got abroad, efcaped the deftruction of the reft. Even this, however, is a very rare book, the price of which can hardly be eftimated. A copy was bought by profeffor Jacquin in Germany, many years ago, for about 30 guineas. This volume is in the Linnæan, Bankfian, and Sherardian libraries. Containing liliaceous plants, and the Orchis tribe, it is much more fplendid than the firft. The figures are copied from all quarters, though feveral are original, and amount to about 600 in all, many of them executed with great correctnefs and elegance, more efpecially after the fine engravings of the Hortus Malabaricus. There are, of courfe, feveral repetitions of the fame fpecies, and abundance of garden varieties of Tulips, &c. The *Orchideæ* are numerous, but inferior, as to the correctnefs of their flowers, to fome other plants, a defect arifing from their fingularity or minutenefs. The preface attributes the anticipated publication of this volume to the greater popularity and attraction of its contents; and fpeaks of many of the intended figures of the whole work, as to be executed from drawings made by the author himfelf, after original fpecimens, either preferved in Burfer's fine Swifs herbarium, or obtained from other quarters. The author fpeaks of his fon and nephew, each of the fame name with himfelf, as his coadjutors, and the deftined continuators of this laborious undertaking. The deftruction of his materials is extremely to be regretted; for fuch a repofitory of the botanical knowledge of the time, would have been highly valuable to fucceeding writers; particularly as illuftrating the plants of Bauhin, fo many of which are to be determined from Burfer's herbarium only. The volume in queftion ftands alone, like the fingle unrivalled column of the temple of peace at Rome, a perpetual caufe of regret, and a monument of irrevocable deftruction.

Another great work of our author, on which, moft of all perhaps, his literary celebrity depends, is entitled *Atlantica*, and ought to confift of four volumes in folio; but of thefe the fourth, at leaft, if we miftake not, is to be met with in manufcript only. The others are extremely rare, probably from the accident of the fire above-mentioned. One alone, compofed of wooden cuts, is in our poffeffion. The aim of this fingular, but profoundly learned, performance, was to prove that Sweden had been the terreftrial paradife of our firft parents, the *Atlantis* of Plato, and the fource of all learning, ancient mythology, arts, and fciences. By a paffage in Linnæus's Lapland Tour, v. 1. 19, it fhould feem that Rudbeck had fixed the fcene of the Trojan war at a village in Geftrickland, which bears the name of Troye. The reader will no longer wonder at this, when, in one of our author's illuftrative maps, he finds Helicon ftationed in Lapland; the Fortunate Iflands at the Orkneys; and Acheron at the Maelftrom, off the coaft of Norway. The church of old Upfal, certainly a hyperborean temple of the fimpleft form, and the moft remote antiquity, is fuppofed to have been a fane of Apollo. It is fquare, with two round-arched door-ways at each fide, but no windows. Rudbeck compares it with the temple of Janus at Rome, and fhews how the prefent cathedral of Upfal originated from the plan of a fimilar edifice. In thefe points his remarks are well worthy of attention. Thofe who cannot help fmiling at the wildnefs of fome of his hypothefes, muft refpect his learning and ingenuity, and his work is faid to have excited much attention when it firft appeared. At prefent it ranks chiefly among the baubles of mere collectors, for the fake of its rarity.

This great man did not long furvive the wreck of all his hopes and labours, in the fire at Upfal. He died in 1702, aged 72, having, nine years before, refigned the Profefforfhips of Botany and Anatomy to his fon. In the frontifpiece of his *Atlantica* he is reprefented, with rather an agreeable and fenfible countenance, of a plump and fleek habit of body, with long ftraight hair, and the habiliments of our profeffors and divines in the time of the Commonwealth. He is demonftrating his peculiar opinions to a circle of ancient philofophers and poets, and Plato is lending the delighted Hefiod a pair of fpectacles. Rudbeck is faid to have been a man of a mild and amiable character, much efteemed for his perfonal qualities, as well as for his boundlefs erudition. We can fcarcely call him the founder of Botanical Science in Sweden, becaufe he was preceded by Chefnecopherus, under whofe prefidency at Upfal, in 1621, a phyfical differtation on plants was publifhed and defended by Starbeck, a native of Smoland, which evinces the deep attention this branch of philofophy had even then excited, in that famous fchool. The curious reader may trace, in this differtation, many ideas, fuppofed to have a more modern origin. Rudbeck's Works. Haller's Bibl. Bot. and Anat. Aikin's Gen. Biog. S.

RUDBECK, OLOF, junior, fon of the preceding, was born at Upfal in 1660. Having been directed by his father to his own favourite ftudies of medicine, botany, and antiquities, he proved worthy of fuch a parent, friend, and preceptor. He excelled likewife in the art of delineating natural objects, and found great advantage from this talent in his fubfequent purfuits. Having travelled to Holland, he took his degree of doctor of phyfic, at Utrecht, in 1690, publifhing on that occafion an able differtation, *de Fundamentali*

mentali Plantarum Notitiâ ritè acquirendâ. In this he aſſerts the neceſſity of arranging and diſtinguiſhing the genera of plants by their fructification alone, and prefers ſuch leading principles as are derived from the fruit, rather than from the corolla. He rejects habit, colour, ſenſible qualities, time of flowering, &c. on which ſo much ſtreſs has been laid by ſuperficial obſervers; while, on the other hand, he declines being implicitly led by the more abſtruſe principles of certain more philoſophical botaniſts. Some unfortunate errors of the preſs occur in pages 12, 13, &c. the terms *gymno-* and *angio-ſpermæ* being often tranſpoſed. Rudbeck extends his remarks to nomenclature, and very much to the purpoſe. He had previouſly, at Upſal, in 1686, defended a theſis, *de Propagatione Plantarum*, which is leſs original, though highly creditable as a ſchool exerciſe. The Upſal garden was founded immediately on his return, and enriched with ſeeds obtained from the collections in Holland.

On the 21ſt of May 1695, profeſſor Rudbeck, junior, ſet out from Upſal on a tour to Lapland, accompanied by two young men, the ſons of Count Gyllenborg. After his return he prepared a very ample account of his journey, having made a number of drawings for the purpoſe. The firſt part, publiſhed in 1701, in Latin and Swediſh, is dedicated to king Charles XII. in a Latin, as well as Swediſh, poem, and ornamented with a magnificent wood cut of the *Pedicularis Sceptrum-Carolinum.* But this volume, a thin quarto, goes no further than the province of Upland. The reſt of the materials, except a collection of drawings of plants, which ſtill exiſt, and perhaps rather belong to the *Campi Elyſii*, ſeem to have periſhed in the fire of Upſal. Such indeed was the fate of moſt of the copies of the work juſt mentioned, entitled *Laponia illuſtrata*, which is therefore an extremely ſcarce book.

In 1720 Rudbeck, in conjunction with Benzelius, afterwards archbiſhop of Upſal, founded the Swediſh Academy of Sciences, as it was then called, though ſubſequently, when other ſimilar eſtabliſhments aroſe at Stockholm, Lund, &c. the original one was entitled the Royal Academy of Upſal. This inſtitution ſtill flouriſhes, and has produced ſeveral volumes of Tranſactions in Latin. In the firſt, printed in 1720, is a catalogue of plants, obſerved by Rudbeck in Lapland, with cuts of *Lobelia Dortmanna*, and *Linnæa borealis.*

Several curious diſſertations came forth, from time to time, from this learned man, which evince his deep erudition, though he betrays, like his father, ſomewhat of a paradoxical turn. He was particularly ſkilled in oriental literature, and was hence led to undertake the explanation of ſome of the moſt obſcure ſubjects of natural hiſtory in the ſacred ſcriptures. He contends that *Borith*, mentioned by ſome of the prophets, is neither an herb, nor any kind of ſoap, but a purple dye. He alſo undertook to demonſtrate that the *Dudaim* were Raſpberries. (See DUDAIM.) The peruſal of theſe erudite ſpeculations, inſtead of affording inſtruction on the ſubject diſcuſſed, rather leads us to the conviction, that a man who has ſo many tools at command, can turn and mould any ſubject as he pleaſes. The two diſſertations in queſtion appeared in 1733, in quarto. The author had previouſly given to the world three others, the inaugural eſſays of ſome of his pupils. Theſe were on *Hedera*, in 1707, in 4to.; on *Mandragora*, in 1702; and on the *Rubus arcticus* of Linnæus, in 1716, both in 8vo., with good cuts. His moſt elaborate and eccentric performance of all, perhaps, is a diſſertation on the bird *Selav*, which our tranſlation of the bible renders a quail. Some have thought it a locuſt, but Rudbeck will have it a flying-fiſh; and as Johnſon maliciouſly ſays of Milton, he is never at a loſs for a reaſon. Abundance of profound remarks are interſperſed in this treatiſe. Amongſt other things, the affinity of the Hebrew, Chineſe, and Gothic languages is diſcuſſed. The younger Rudbeck died in 1740, highly reſpected. He left in manuſcript a ſort of univerſal lexicon, which has never been printed. Rudbeck, jun.'s Works. Haller Bibl. Bot. Aikin's Gen. Biog. Dryand. Bibl. Banks. S.

RUDBECKIA, in *Botany*, was dedicated by Linnæus to the memory of his great countrymen, Olof Rudbeck, father and ſon, his predeceſſors in the botanical chair at Upſal. (See RUDBECK.) A genus allied to *Helianthus* was well choſen for this purpoſe, a Sun-flower having been the emblem, or, ſome ſay, a part of the coat of arms, of the perſons commemorated.—Linn. Gen. 440. Schreb. 574. Willd. Sp. Pl. v. 3. 2246. Mart. Mill. Dict. v. 4. Ait. Hort. Kew. v. 5. 130. Purſh v. 2. 573. Juſſ. 189. Lamarck Illuſtr. t. 705. Gærtn. t. 172.—Claſs and order, *Syngeneſia Polygamia-fruſtranea.* Nat. Ord. *Compoſitæ oppoſitifoliæ*, Linn. *Corymbiferæ*, Juſſ.

Gen. Ch. *Common Calyx* a double row of flat, broadiſh, ſhort ſcales, ſix in each row. *Cor.* compound, radiated. Florets of the conical diſk numerous, perfect, tubular-funnel-ſhaped, five-cleft in the border; thoſe of the radius about twelve, female, ligulate, very long, lanceolate, flat, pendulous, with two or three terminal teeth. *Stam.* in the perfect florets five, capillary, very ſhort; anthers united into a cylindrical tube. *Piſt.* in the perfect florets, germen ſquare; ſtyle thread-ſhaped, the length of the partial corolla; ſtigma deeply divided, revolute: in the female florets, germen minute; ſtyle and ſtigma wanting. *Peric.* none, except the unchanged calyx. *Seeds* in the perfect florets only, ſolitary, oblong, each crowned with a membranous four-toothed border. *Recept.* chaffy, conical, longer than the common calyx. Scales the length of the ſeeds, erect, of a concave or channel-like form, deciduous.

Eſſ. Ch. Receptacle chaffy, conical. Seed crowned with a four-toothed border. Calyx of a double row of ſcales.

1. R. *laciniata.* Broad Jagged Rudbeckia. Linn. Sp. Pl. 1279. Willd. n. 1. Ait. n. 1. Purſh n. 12. (Aconitum helianthemum canadenſe; Cornut. Canad. 178. t. 179.)—Lower leaves pinnate; leaflets ovate, unequal at the baſe, toothed, ſomewhat three-lobed: upper ones undivided or three-cleft, ovate-oblong. Crown of the ſeeds four-toothed.—Native of North America. On the edges of ſwamps and ditches, from Canada to Virginia, flowering from Auguſt to October. *Purſh.* A hardy perennial in our gardens, where it has been known for nearly two centuries, flowering in autumn. The *ſtems* are from five to eight or ten feet high, erect, branched, furrowed, ſmooth. *Leaves* alternate, deep green, minutely rough, like a file, to the touch, pointed, variouſly divided. *Flowers* large, terminal, on long ſolitary *ſtalks*, erect; their radius of a full yellow; diſk ovate, brown.

2. R. *columnaris.* High-crowned Rudbeckia. Purſh n. 11. Curt. Mag. t. 1601.—Stem ſimple, ſtraight, with a few flowers, on long ſtalks, at the top. Leaves pinnatifid, cut, with linear ſegments. Calyx ſimple, five-leaved. Diſk cylindrical, elongated.—Found on the banks of the Miſſouri, by Mr. Fraſer, who has brought it to England. The ſingular appearance of the *receptacle*, which is quite cylindrical, flat at the top, diſtinguiſhes this from all other known ſpecies. The *rays* are from five to eight, lax, elliptical, jagged at the end. *Leaves* narrow, roughiſh.

3. R. *digitata.* Narrow Jagged Rudbeckia. Mill. Dict. n. 6. Ait. n. 2. Purſh n. 13. (Chryſanthemum americanum

canum majus, foliis magis diffectis; Morif. v. 3. 22. fect. 6. t. 6. f. 54.)—Lower leaves pinnate; leaflets pinnatifid: upper ones deeply three-cleft, lanceolate, partly cut. Crown of the feeds crenate. Stem fmooth.—Found on the mountains of Virginia and Carolina, flowering from Auguft to October. *Purfh.* This refembles the firft fpecies, but has fmaller *flowers*, and much narrower, rather fmoother, *leaves*. The crown of each *feed*, befides having four teeth, is finely jagged, or crenate.

4. R. *pinnata*. Fragrant Pinnated Rudbeckia. Venten. Hort. Cels. t. 71. Sm. Exot. Bot. v. 1. 73. t. 38. Ait. n. 3. Purfh n. 14. Michaux Boreali-Amer. v. 2. 144. (R. digitata; Willd. n. 2.)—Leaves pinnate, fomewhat fubdivided. Crown of the feed entire at the edge. Stem rough.—Native of the weftern parts of Carolina and Georgia, where it flowers from July to October. *Purfh.* With us it is a hardy perennial, having been introduced, from the garden at Madrid, by feeds fent to the late lady Amelia Hume. Every part of the *herbage* is minutely rough. *Flowers* large and handfome, with the fcent of anife; their rays deep yellow; numerous, broad, downy, pointing downwards; difk ovate, dark purple, almoft black. Ventenat miftook this for the *digitata* of Miller and Aiton.

5. R. *triloba*. Three-lobed Rudbeckia. Linn. Sp. Pl. 1280. Willd. n. 3. Ait. n. 4. Purfh n. 9. (Chryfanthemum cannabinum virginianum hirfutum, difco nigro, petalis aureis radiato; Pluk. Almag. 100. Phyt. t. 22. f. 2.)—Leaves fpatulate; the lower ones three-lobed; the upper undivided. Stem hairy, much branched. Calyx leafy. Scales of the receptacle with prominent points.—An inhabitant of the mountains of Virginia and Carolina, flowering in Auguft and September. *Purfh.* *Stem* four or five feet high, much branched and fpreading, leafy, ftriated, rough with pale, rigid, deflexed hairs, which are more erect on the branches. *Leaves* more or lefs fhaggy with fimilar hairs. *Flowers* not much above an inch in diameter, pale yellow according to Mr. Purfh, but partly orange, or tawny, in our dried fpecimens. Outer fcales of the *calyx* leafy, as long as the radiant florets. *Difk* convex, hardly conical, remarkable for the projecting needle-like points of the fcales, between the florets. This has long been cultivated in France as well as England, where it is biennial, though fometimes perennial in Carolina.

6. R. *fubtomentofa*. Downy Rudbeckia. Purfh n. 10. (R. triloba β; Michaux Boreali-Amer. v. 2. 144.)—"Downy, with fhort pubefcence. Branches erect, many-flowered. Leaves oblong-lanceolate, acute, fomewhat ferrated; the lower ones three-lobed. Scales of the calyx clofe-preffed, fhorter than the rays."—Native of mountain meadows, in Virginia and the country of the Illinois, flowering in Auguft and September. Perennial, not near fo tall as the preceding, from which it is very diftinct. *Purfh.*

7. R. *Radula*. File Rudbeckia. Purfh n. 8.—"Stem hifpid below; fmooth, and nearly naked, above. Stalks very long, fingle-flowered. Leaves ovate, tapering, tuberculated, hifpid. Calyx imbricated; with ovate, pointed, fringed fcales.—Gathered by Bartram in Georgia. Mr. Purfh defcribed it from the Bankfian herbarium. The *root* is marked as biennial. We have examined no fpecimen.

8. R. *hirta*. Great Hairy Rudbeckia. Linn. Sp. Pl. 1280. Willd. n. 4. Ait. n. 5. Purfh n. 7. (R. foliis lanceolato-ovatis, alternis, indivifis, petalis radii bifidis; Mill. Ic. t. 224. f. 1. Obelifcotheca integrifolia, radio aureo, umbone atro-rubente; Dill. Elth. 295. t. 218.)—Rough with briftly hairs. Stem flightly branched, fingle-flowered. Flower-ftalk elongated, naked. Leaves undivided, ovate, fomewhat fpatulate, triply ribbed, ferrated. Calyx leafy. Scales of the receptacle lanceolate, hairy.—Found on the mountains from Virginia to Florida, flowering from July to September. *Purfh.* *Root* biennial. *Herb* about two feet high, rough and hairy. *Flower* rather large, with a dark brown difk, and long yellow rays.

9. R. *fulgida*. Small Hairy Rudbeckia. Ait. n. 6. Willd. n. 5. Purfh n. 6.—Stem hifpid. Branches ftraight, fingle-flowered. Leaves oblong-lanceolate, triply ribbed, toothed, rough; contracted, and fomewhat heart-fhaped, at the bafe. Calyx leafy. Scales of the receptacle lanceolate, fringed.—In mountain meadows and woods, from Penfylvania to Carolina, flowering from July to October. *Purfh.* Said in Hort. Kew. to have been introduced into England, by the late Meffrs. Kennedy and Lee, in 1760. This differs from the laft in having a perennial *root;* branched *ftem;* and fmaller *flowers*, whofe rays are of a deep orange-colour, and the difk dark purple. The fcales of the *calyx* are fhorter, broader, and more ovate.

10. R. *denfifolia*. Crowded-leaved Rudbeckia.—Stem rough. Branches fingle-flowered. Leaves oppofite, ftalked, elliptic-lanceolate, rough, fomewhat toothed. Calyx clofe-preffed, not half the length of the rays.—Gathered by Commerfon, on rocks at Monte Video. The *ftem* feems rather fhrubby, branched, round, clothed with numerous leaves, and very rough with minute depreffed prickles, fuch as cover every part of the herbage. *Leaves* about an inch and half long, more or lefs acute, fometimes diftantly toothed; the upper ones partly fcattered. *Flowers* large, on long, rough, nearly leaflefs *ftalks*. Scales of the *calyx* ovate, rough and fringed. *Rays* numerous, broad, yellow, afcending, almoft thrice as long as the *calyx*. *Difk* brown, or purplifh.

11. R. *decumbens*. Decumbent Rudbeckia.—Stem decumbent, creeping. Leaves oppofite, ftalked, linear-fpatulate, nearly fmooth. Flower-ftalks erect, folitary, angular, very long and flender, flightly hairy.—Found by Commerfon on the rocks of Monte Video. The *ftems* are woody, creeping by means of numerous radicles, afcending at the extremity only, but producing, as they go, a denfe affemblage of fhort leafy fhoots or branches. *Leaves* very various in fize and breadth, obtufe, triply ribbed, rather flefhy, very flightly and occafionally hairy, nearly entire. *Flower-ftalks* terminal, folitary, fimple, fingle-flowered, erect and ftraight, naked, near a fpan long, being ten times the length of the leaves, of equal thicknefs throughout. *Flowers* about an inch in diameter, yellow in the *difk* as well as *radius*. Scales of the *calyx* ovate, acute, clofe-preffed, fringed with briftles, and about half the length of the rays. We have no means of inveftigating the *receptacle*, or *feed-crown*, but we prefume, from the habit of every part, the genus can fcarcely be doubtful.

12. R. *bellidioides*. Daify-like Rudbeckia.—Stem decumbent. Leaves oppofite, ftalked, ovate, rough-edged. Flower-ftalks erect, folitary, very long; fwelling and very downy at the top.—This likewife was gathered by Commerfon, at Monte Video. *Roots* creeping, with thick flefhy fibres. *Stems* trailing, with fhort leafy branches, forming a fort of tuft, much as in the foregoing, but the leafy part does not appear to take root. *Leaves* tolerably uniform, from one and half to two inches long, and half an inch wide, obtufe, triply ribbed, entire; very rough on the ribs and margin; tapering down at the bafe into a broad fringed *footftalk*. *Flower-ftalks* four or five inches long, fituated as in the laft fpecies, but ftouter, efpecially towards the flower, where they are denfely covered with fhort, rigid, clofe-preffed hairs. *Flowers* entirely yellow, the fize of the laft,

laſt. Scales of the *calyx* cloſe-preſſed, ovate, half the length of the *radius*, ſmooth, except a ſlight marginal fringe; ſtrongly ribbed, or furrowed, at the baſe. The younger Linnæus, as well as Commerſon, thought this a *Rudbeckia*, nor have we ſufficient doubts on the ſubject to ſpoil a flower by diſſection.

13. R. *ariſtata.* Awn-ſcaled Rudbeckia. Purſh n. 5.—"Stem hiſpid. Branches elongated, corymboſe, ſingle-flowered. Leaves lanceolate-oblong, ſerrated, hiſpid. Diſk of the flower nearly hemiſpherical. Scales of the ſeed-crown awl-ſhaped, awned."—Native of South Carolina; deſcribed by Mr. Purſh from the Bankſian herbarium. The *flowers* are ſmall, deep yellow. If there be no error in the above definition, and the *ſeed* be really crowned with ſeparate awl-ſhaped ſcales, this ſpecies does not well anſwer to the character, or idea, of a *Rudbeckia.* The analogy of other ſpecies would lead us to ſuppoſe the ſcales of the *receptacle* were meant, had not the words "*paleis pappi*" been ſo preciſe.

14. R. *ſpatulata.* Spatulate-leaved Rudbeckia. Michaux Boreali-Amer. v. 2. 144. Willd. n. 6. Purſh n. 4.*—"Slender, finely downy. Stems ſingle-flowered. Leaves obovato-ſpatulate, entire. Calyx ſpreading, imbricated. Radiant florets three-toothed."—Gathered by Michaux on the mountains of Carolina; by Bartram in Florida. It is biennial, flowering in July and Auguſt. *Purſh.*

15. R. *diſcolor.* Two-coloured Rudbeckia. Purſh n. 4.—"Branches corymboſe, ſingle-flowered. Flower-ſtalks naked, elongated. Leaves lanceolate, nearly entire, rough with rigid hairs. Calyx-ſcales ovate, acute. Petals lanceolate, entire, of two colours, as long as the calyx."—Gathered in Florida, by Bartram. Perennial. *Flowers* ſmall; their rays yellow above, deep orange or purple underneath. *Purſh.* We have not examined a ſpecimen of either of the two laſt, both which Mr. Purſh deſcribed from ſir Joſeph Banks's herbarium.

16. R. *lævigata.* Smooth Rudbeckia. Purſh n. 3.—"Quite ſmooth all over. Stem poliſhed, panicled. Branches corymboſe. Stalks elongated, ſingle-flowered. Leaves ovato-lanceolate, pointed at each end, triply ribbed, poliſhed, nearly entire. Scales of the calyx lanceolate, the length of the rays."—Found by Mr. Lyon, in Georgia. Perennial. The *leaves* have occaſionally one or two teeth. *Rays* pale yellow, ſhort. In Mr. Lambert's herbarium. *Purſh.*

16. R. *amplexifolia.* Stem-claſping Rudbeckia. Jacq. Coll. v. 5. 155. Ic. Rar. t. 592. Willd. n. 7. Ait. n. 7. Purſh n. 2. (R. perfoliata; Cavan. Ic. v. 3. 27. t. 252.)—Leaves elliptic-oblong, heart-ſhaped at the baſe, naked, rough-edged; the lower ones ſerrated. Stem ſmooth, ſtriated. Diſk nearly cylindrical.—Native of Lower Louiſiana, on the banks of the Miſſiſippi, flowering in July and Auguſt. We had a ſpecimen, in 1793, from the garden of Mr. Saliſbury, who received ſeeds the preceding year, ſaid to have been collected by Michaux, in New Orleans. The *root* is annual. *Stem* erect, branched, round, leafy, about two feet high. *Leaves* of a pale glaucous green, acute, alternate, reticulated with veins, very ſmooth, except at the edge, which is beſet with minute cloſe prickles. *Flowers* ſolitary, at the ſummit of each branch, erect, with broad, dependent, deep yellow *rays*, each terminating in two or three blunt teeth; and an elongated, obtuſe, dark green or blackiſh *diſk*.

17. R. *purpurea.* Purple Rudbeckia. Linn. Sp. Pl. 1280. Willd. n. 8. Ait. n. 8. Purſh n. 1. Curt. Mag. t. 2. Chryſanthemum americanum, doronici folio, &c.; Pluk. Phyt. t. 21. f. 1. Cateſb. Carol. v. 2. t. 59.)—Leaves rough, ovate, tapering at the baſe, undivided, toothed; the upper ones lanceolate, entire. Rays very long, pendulous, cloven.—On the mountains from Virginia to Florida, flowering from Auguſt to October. *Purſh.* This elegant and hardy perennial plant has been more than a century in our gardens. It thrives beſt in a rich moiſt ſoil, and is propagated by parting the roots. The *ſtems* are three or four feet high, erect, round, ſtriated, ſmooth, moſtly purpliſh. *Leaves* triply ribbed, near a ſpan long, rough and harſh to the touch; the lower ones on long ſtalks. *Flowers* terminal, ſolitary, very large, and of a beautiful, as well as ſingular, aſpect; the *diſk* obtuſely conical, brown, beſet with the long, prominent, rigid, ſpinous ſcales of the *receptacle*; *radius* of numerous, linear-lanceolate, pink or light crimſon *florets*, each three inches long, pendulous, acute and cloven at the extremity. Mr. Curtis obſerves that the *ſeeds* are rarely perfected here, nor do the *roots* increaſe very faſt. Linnæus has ſtrangely erred, in referring to this ſpecies, Miller's yellow-flowered figure, which belongs to *R. hirta*; ſee n. 8.

R. *anguſtifolia*, Linn. Sp. Pl. 1281. Willd. n. 9, proves the very ſame plant with *Helianthus anguſtifolius* of the ſame authors.

R. *oppoſitifolia*, Linn. Sp. Pl. 1280, is, according to Mr. Purſh, the ſame as *Helianthus lævis*, Linn. Sp. Pl. 1278, and *Silphium ſolidaginoides*, ibid. 1302. Perſoon has eſtabliſhed it as a new genus, by the name of *Heliopſis lævis*, and he is followed by Purſh, p. 563. The *leaves* do not anſwer to the ſpecific name, being rough with briſtly warts.

R. *alata*, Jacq. Ic. Rar. t. 593, is *Helenium quadridentatum*, Willd. Sp. Pl. v. 3. 2121. Purſh 560. See HELENIUM.

RUDBECKIA, in *Gardening*, contains plants of the herbaceous, biennial, and perennial kinds, of which the ſpecies cultivated are, the broad jagged-leaved rudbeckia (R. laciniata); the narrow jagged-leaved rudbeckia (R. digitata); the hairy rudbeckia (R. hirta); the purple rudbeckia (R. purpurea); the narrow ſimple-leaved rudbeckia (R. anguſtifolia); and the three-lobed rudbeckia (R. triloba).

Method of Culture.—All the ſorts of theſe plants may be increaſed by off-ſets, parting the roots and ſeeds. The off-ſets in the perennial ſorts ſhould be taken off, and planted out in the early autumn: when the ſtems decay, the roots may alſo be divided, and planted out at the ſame time, or in the early ſpring months. And as theſe plants are often liable to go off ſoon, ſome ſhould be frequently raiſed to keep up the ſtock; and others have a tendency to become biennial, and decay without increaſing the root: they ſhould have the flower-ſtems cut down in the early ſummer, to encourage the growth of the root off-ſets, for ſlipping in the following autumn.

However, all the ſorts may be raiſed from ſeed, and the biennial ſorts muſt always be raiſed annually in that way; likewiſe ſuch of the perennial kind as are biennially inclined, ſowing the ſeeds in April, in a border of light earth, raking them in; and when the plants are two or three inches high, pricking them out in nurſery-rows till autumn, then planting them out where they are to remain. They ſhould have a light dry ſoil, and rather warm ſituation. They all afford much ornament and variety in the borders and clumps, among other flowering plants.

RUDDER, in *Navigation*, a piece of timber turning on hinges in the ſtern of a ſhip; and which oppoſing ſometimes one ſide to the water, and ſometimes another, turns or directs the veſſel this way or that.

The rudder becomes gradually broader, in proportion to its

its diſtance from the top, or to its depth under water. The back, or inner part of it, which joins to the ſtern-poſt, is diminiſhed into the form of a wedge through its whole length, ſo as that the rudder may be the more eaſily turned from one ſide to the other, where it makes an obtuſe angle with the keel. The hinges, which are bolted round the ſtern-poſt to the after-extremity of the ſhip, are called *googings*, and are furniſhed with a large hole on the after-part of the ſtern-poſt. The other parts of the hinges, which are bolted to the back of the rudder, are called *pintles*, being ſtrong cylindrical pins, which enter into the googings, and reſt upon them. The length and thickneſs of the rudder are nearly equal to thoſe of the ſtern-poſt. The rudder is turned upon its hinges, by means of a long bar of timber, called the *tiller*, which enters nearly in an horizontal direction into the ſhip, paſſing under the upper or middle deck tranſom; and its operation is directed by the tiller-rope, which in large veſſels is wound about a wheel. (See Tiller.) The power of the rudder is reducible to that of the lever, and the oblique action of the water upon it is to be determined by the reſolution of forces.

In order to explain the action of the rudder on the ſhip, it ſhould be conſidered that if, inſtead of leaving the rudder exactly in a right line with the keel, ſo as to be a kind of prolongation of it, it be turned to one ſide or the other, as B D (*Plate* IV. *Navigation*, *fig*. 4.), it receives an immediate impulſe from the water, which glides along the ſhip's bottom, in running aft from A to B; and this fluid impels it towards the oppoſite ſide, while it continues in that ſituation, ſo that the ſtern, to which the rudder is confined, receives the ſame movement; and the ſhip receiving an impulſe ſideways, her ſtern turns accordingly from B to *b*, on any point whatever C, while her head paſſes from A to *a*. It muſt be obſerved, that the water ſtrikes the rudder obliquely, and only with that part of its motion which acts according to the ſine of incidence, in impelling it in the direction N P, with a force which depends not only on the rapidity of ſailing, but alſo on the greatneſs of the ſine of incidence; a force which is conſequently in the compound ratio of the ſquare of the greater or leſs velocity of the ſhip's motion, and of the ſquare of the larger or ſmaller ſine of incidence, which depends upon various circumſtances. So that, if the veſſel runs three or four times more ſwiftly, the abſolute ſhock of the water upon the rudder will be nine or ſixteen times ſtronger under the ſame angle of incidence, and will be augmented in a greater proportion, if the ſine of incidence be increaſed. This impulſion, or, what is the ſame, the power of the helm, is always very feeble, when it is compared with the whole weight of the veſſel; but it acts with a very long arm of a lever, which occaſions it to work very advantageouſly in turning the ſhip; for the helm is fixed at a very great diſtance from the centre of gravity G, as well as from the point C, upon which the ſhip is ſuppoſed to turn, with reſpect to the point of percuſſion B: and if the direction P N of the impreſſion of the water upon the rudder be prolonged, it is evident that it will paſs perpendicularly at the point R, widely diſtant from the centre of gravity G; therefore the abſolute effort of the water is very powerful. It is not therefore ſurpriſing, that this machine impreſſes the ſhip with a conſiderable circular movement, by forcing the ſtern from B to *b*, and the head from A to *a*, and even much farther, when the velocity of the ſhip is preſerved; becauſe the effect of the helm always keeps pace with the rapidity of the ſhip's way.

Amongſt all the obliquities which may be given to the rudder, there is one ſituation which is more favourable than any of the others, to make it produce with more rapidity the effect of turning the ſhip, in order to change her courſe. To be convinced of this, we have only to conſider that, if the obtuſe angle A B D (*fig*. 4.) were to be leſſened, the impulſe of the water on the rudder would augment, at the ſame time that it would more oppoſe the ſailing of the ſhip, ſince the angle of incidence would be more open, and would preſent a greater ſurface to the ſhock of the water, by oppoſing its paſſage more perpendicularly: but then the direction N P of the effort of the helm upon the ſhip would paſs at a ſmaller diſtance from the centre of gravity G towards R, and would leſs approach the perpendicular N L; according to which, it is abſolutely neceſſary that the power ſhould act with greater effect to turn the ſhip. Therefore, it is evident, that, if the obtuſe angle A B D were too much leſſened, the greater ſhock of the water could not counterbalance the loſs occaſioned by the diſtance between the direction N P and N L, or by the great obliquity which would be given to the ſame direction N P of the abſolute effort of the helm with the keel A B. If, on the other hand, the angle A B D were made more obtuſe, the direction N P of the effort of the rudder would become more advantageous to turn the ſhip, ſince it would approach more the perpendicular N L, and ſince the prolongation of N P would augment G R, by paſſing at a greater diſtance from the centre of gravity G. But the rudder would then be ſtruck too obliquely; for the angle of incidence would be more acute; ſo that it would only preſent a ſmall part of its breadth to the ſhock of the water, and would of courſe receive but a faint impulſion. All this proves that the greateſt diſtance G R from the centre of gravity G will not counterbalance the too great obliquity of the ſhock of the water. Whence it muſt be concluded, that when the water ſtrikes the rudder too obliquely, or too perpendicularly, a great deal of the impulſion, or of the effect it ſhould produce, is loſt. Therefore, between theſe two extremes, there is a middle poſition, which muſt be the moſt favourable.

The diagonal N P of the rectangle I L (*fig*. 4.) repreſents the abſolute direction of the effort of the water upon the rudder: N I expreſſes the portion of this effort which oppoſes the ſhip's head-way, or which forces her a-ſtern in the direction of the keel. It is eaſy to perceive that this portion N I of the whole power of the helm contributes little to turn the veſſel; for, if I N were prolonged, it would be ſeen that its direction paſſes at a very ſmall diſtance G V from the centre of gravity G, and that the arm of the lever B N = G V, to which the force is as it were affixed, is at moſt equal only to one half of the breadth of the rudder. But it is not ſo with reſpect to the relative force N L, which acts perpendicularly to the keel. If the firſt force, N I, is almoſt uſeleſs, and even hurtful, by retarding the velocity; the ſecond, N L, is capable of a very great effect, ſince it is applied at a great diſtance from the centre of gravity G of the ſhip, and acts on the arm of a lever G E, which is very long. Thus it appears, that, between the two effects N L and N I, which reſult from the abſolute effort N P, there is one which is always oppoſing the ſhip's head-way, contributing but little, therefore, to the motion of her turning; whilſt the other alone produces that movement of evolution, without retarding her velocity.

As to the moſt advantageous angle made by the helm, with the line prolonged from the keel, geometricians have fixed it at 54° 44′ (See Dynamics, Mechanics, and Windmill.) But it has been ſaid, that, in determining this

this angle, they have presumed that the ſhip is as narrow at her floating line, or at the line deſcribed by the ſurface of the water round her bottom, as at the keel; whereas all veſſels increaſe in breadth from the keel upward to the extreme breadth, where the floating line, or the higheſt water-line, is terminated; and, therefore, the angle above ſtated is too large. For the rudder is impreſſed by the water, at the height of the floating line, more directly than at the keel, becauſe the fluid exactly follows the horizontal outlines of the bottom; ſo that a particular poſition of the helm might be ſuppoſed neceſſary for each different incidence which it encounters from the keel upwards. But as a middle poſition may be taken between all theſe points, it will be ſufficient to conſider the angle formed by the ſides of the ſhip, and her axis, or the middle line of her length, at the ſurface of the water, in order to determine afterwards the mean point, and the mean angle of incidence. The angle 54° 44′, it is ſaid, is too open, and very unfavourable to the ſhip's head-way, becauſe the water acts upon the rudder there with too great a ſine of incidence, as being equal to that of the angle which it makes with the line prolonged from the keel below; but above, the ſhock of the water is almoſt perpendicular to the rudder, becauſe of the breadth of the bottom, or that of the ſhip's ſides. If then the rudder is only oppoſed to the fluid, by making an angle of 45°, or 45° 1′, with the line prolonged from the keel, the impreſſion, by becoming weaker, will be leſs oppoſed to the ſhip's head-way, and the direction N P (*fig.* 4.) of the abſolute effort of the water upon the rudder, approaching nearer to the lateral perpendicular N L, will be placed more advantageouſly, ſince the prolongation of the abſolute effort paſſes at a greater diſtance G R from the centre of gravity of the ſhip. To which it is added, that experience daily teſtifies, that a ſhip ſteers well, when the rudder makes the angle D B E no more than 35°. If this angle be made 45°, and the abſolute effort N P be diſcompoſed, we ſhall have N I equal to the other ſide N L of the ſame ſquare; ſo that the part of the whole power which oppoſes the head-way of the ſhip would be only equal to that which produces the movement of rotation; inſtead of which, if D B E were 54° 44′, N I would become much greater than N L, in proportion to the ſines of the angles which are oppoſed to them in the triangles P I N or P L N, and the ſhip would loſe much more of her velocity than in the firſt ſituation of the rudder, which is thought to be beſt adapted to veſſels in general, ſubject, however, to occaſional alteration, as they ſhall make an angle more or leſs open with their ſides a-ſtern. Hence it has been concluded, as a general poſition, that the moſt advantageous angle will always be found between 35° and 45°. From Bouguer's treatiſe (ubi infra), it appears, that, in moſt ſhips, the angle of the rudder with the prolonged line of the keel ſhould be 46° 40′. L. Euler recommends an obliquity ſomewhat leſs than 54° 44′, for the greateſt action of the rudder; and eſtabliſhes this rule, that an obliquity of about 48° will, in general, produce the beſt effort.

Thoſe who duly conſider the action of the *helm* and *tiller* (for an account of which, ſee thoſe articles) will eaſily conceive, that the greater the ſhip's velocity is, the more powerful is the action of the rudder, ſince it acts againſt the water with a force which increaſes as the ſquare of the velocity of the fluid, whether the ſhip has head-way, or ſtern-way; obſerving always, that in theſe two circumſtances the effects are contrary; for, if the ſhip goes a-ſtern, the rudder will be ſtruck from I to N (*fig.* 4.); and, inſtead of being puſhed from N to P, it will be ſo from N to R; ſo that the ſtern being moved in the ſame direction, the head will take a contrary one, and move towards the ſame ſide as the tiller B F.

It ſhould be obſerved, in the uſe of the rudder, that there is one part of its effort which impedes the ſhip's ſailing, when it is ſtruck by the water which runs rapidly along the ſhip's bottom. If it makes an angle of 45° with the keel prolonged, it receives only half the impulſion it would, if acted upon perpendicularly; becauſe the abſolute impulſe diminiſhes from two cauſes. The ſurface which oppoſes the ſhock of the water is reduced to a leſs extent than it was at firſt, and the angle of incidence diminiſhes likewiſe; ſo that by this, the impulſe has diminiſhed one half. Conſidering next the impulſion N P, which remains (*fig.* 4.), it will appear that there is only one part N I which is oppoſed to the ſailing, and which is leſs than N P, in the proportion as the ſine total is to the ſine of 45°, the meaſure of the angle of incidence V N B equal to N P I; for the angle V N L is right, as well as the angle P N B; ſo that, if you take away the common angle L N B, the two angles P N L and V N B will remain equal between themſelves; but, as the angle I P N is equal to its alternate angle P N L, it follows that I P N is always equal to V N B, whether the angle made by the rudder be more or leſs open with the keel prolonged. So that, if the ſurface of the rudder which receives the ſhock be 80 feet ſquare ſuperficies, it will firſt be reduced, by its being expoſed to the courſe of the fluid, to an effort of 40 feet ſurface, then to 28 or 29; becauſe, in the firſt place, there is only one part of the velocity of the water which contributes to the ſhock, and that is proportional to the relation of the ſquare of the ſine total to that of the ſine of incidence; and, ſecondly, becauſe out of the abſolute impulſe N P, which reſults from this laſt oblique ſhock, there is only a part N I which oppoſes the velocity of the ſhip proportional to the abſolute force N P, in the ſame relation as there is between the ſine total and the ſine of incidence; that is to ſay, that when the rudder makes, in the largeſt ſhips, an angle of 45°, it impedes the ſhip's rapidity of ſailing, in the direction of the keel, with an effort N I, equivalent to the impulſion which a ſurface of 28 or 29 feet ſquare might receive, if it were expoſed perpendicularly to the ſhock of the water. So that, if the ſhip ſails 12 knots an hour, or 19 feet a ſecond, the effort of the rudder N I, which oppoſes the ſhip's way, will be 12,499 or 12,945 pounds; ſalt water weighing $\frac{1}{35}$th more than freſh.

It follows, from all that has been ſaid of the rudder, that it ought to be employed as little as poſſible; that is to ſay, the ſhip and her ſails ought to be ſo diſpoſed, that the ſmalleſt motion of this machine may bring her to her courſe, if ſhe deviates from it, or make her perform any evolution which may be thought proper.

The ingenious writer of the article *Seamanſhip* in the Enc. Brit. ſuggeſts, that the theory of M. Bouguer and ſome other French mathematicians is founded on principles that are erroneous. They aſſume, as we have above ſuppoſed, that the impulſe of a fluid is in the proportion of the ſquare of the ſine of the angle of incidence; and alſo that its action on any ſmall portion, ſuch as a ſquare foot of the ſails or hull, is the ſame as if that portion were detached from the reſt, and were expoſed, ſingle and alone, to the wind or water in the ſame angle. Both theſe principles, it is affirmed, are erroneous; and the error is very conſiderable in caſes which moſt frequently occur in practice, that is, in the ſmall angles of inclination. The error of this theory, eſpecially in caſes of great obliquity, may be ſeen in the following

following table: in which the first column exhibits the angle of incidence; the second, the impulsions really observed; the third, the impulses, if they had followed the duplicate ratio of the sines; and the fourth, the impulses according to the simple ratio of the sines.

Angle of Incidence.	Impulsions observed.	Impulses in dupl. Ratio of Sines.	Impulses in simple Ratio of Sines.
90	1000	1000	1000
84	989	989	995
78	958	957	978
72	908	905	951

30	440	250	500
24	424	165	407
18	414	96	309
12	406	43	208
6	400	11	105

The error in the second principle of the theory is still greater, and the action on one part of the sail or hull is so greatly modified by its action on another adjoining part, that a stay-sail is often seen hanging like a loose rag, although there is nothing between it and the wind; and this merely because a great sail in its neighbourhood sends off a lateral stream of wind, which completely hinders the wind from getting at it. Till the theory of the action of fluids be established, therefore, we cannot tell what are the forces which are acting on every point of the sail and hull: therefore we cannot tell either the mean intensity or direction of the whole force which acts on any particular sail, nor the intensity and mean direction of the resistance to the hull; circumstances absolutely necessary for enabling us to say what will be their energy in producing a rotation round any particular axis. In like manner, we cannot, by such a computation, find the spontaneous axis of conversion (see ROTATION), or the velocity of such conversion. In short, we cannot pronounce with tolerable confidence *à priori* what will be the motions in any case, or what dispositions of the sails will produce the movement we wish to perform. The experienced seaman learns by habit the general effects of every disposition of the sails; and though his knowledge is far from being accurate, it seldom leads him into any very blundering operation. Perhaps he seldom makes the best adjustment possible, but seldomer still does he deviate very far from it; and in the most general and important problems, such as working to windward, the result of much experience and many corrections has settled a trim of the sails, which is certainly not far from truth, but (it must be acknowledged) deviates widely and uniformly from the theories of the mathematician's closet. The honest tar, therefore, must be indulged in his joke on the useless labours of the mathematician, who can neither hand, reef, nor steer.

Bouguer Traité de la Manœuvre des Vaisseaux. Falconer's Marine Dict. art. *Helm*; and Euler's Complete Theory of the Construction and Properties of Vessels, translated by Mr. Watson, 1776, book ii. chap. vii. viii. ix.

A narrow rudder is best for a ship's sailing, provided she can feel it, that is, be guided and turned by it; for a broad rudder will hold much water when the helm is put over to any side; but if a ship have a fat quarter, so that the water cannot come quick and strong to her rudder, she will require a broad rudder.

The aftmost part of the rudder is called the *rake* of the rudder.

Large canal boats have *clasp-rudders*, about half their length being moveable on hinges, so as to fold and shorten them before the entering of a lock.

RUDDER-*Coats*, are coverings made of well-tarred canvas, to prevent the water from running in at the rudder-hole.

RUDDER-*Irons*, in a *Ship*, are the cheeks of that iron of which the pintle is part, which is fastened and nailed down about the rake of the rudder.

RUDDER-*Pendants*. See PENDANTS.

RUDDER-*Rope*. See ROPE.

RUDDER-*Tackle*. See TACKLE.

RUDDIMAN, THOMAS, in *Biography*, was born in the parish of Boyndie, Banffshire, in the year 1674, where he received the first rudiments of his education, and in 1690 he was sent to King's college, Aberdeen, where he obtained a bursary. He took the degree of M. A. in 1694, and in the following year he was elected master of the public school of Laurence-Kirk. In 1700 he removed to Edinburgh, and two years afterwards he was appointed librarian to the faculty of advocates. In 1709 he published Johnson's metrical paraphrase of Solomon's Song, and soon after he added a very accurate glossary to the folio edition of Gawin Douglas's translation of the Eneid. His situation at the advocates' library was so favourable to his literary pursuits, that he declined an invitation from the magistrates of Dundee, to the office of rector of the grammar-school in that town. In 1714 he published his "Rudiments of the Latin Tongue," which became a very popular book in Scotland, and was used in many schools in South Britain. In 1725 he edited "Buchanani Opera omnia," in two vols. folio, to which he added notes critical and explanatory. About the same time he commenced the business of printer, in conjunction with his brother Walter. In 1720 he published the first part of his "Grammaticæ Latinæ Institutiones," which was very soon followed by his "Grammatical Exercises." Of the various works which issued from the press of the Ruddimans, the most important were the "Greek Testament," and an edition of the works of Livy: the last is reckoned an extremely correct edition. He also edited Anderson's "Diplomata et Numismata Scotiæ," to which he prefixed a learned preface. He exhibited great critical acumen in his vindication of "Buchanan's Version of the Psalms," against the objections of Mr. Mann, and by "Critical Observations on Burrman's Commentary on Lucan's Pharsalia." Some treatises on disputed points of Scottish history involved him in controversies, in which he met with much abuse, but he did not lose his own temper, though he was a warm advocate for the national independence of Scotland, and much attached to the house of Stuart. At an advanced age his eye-sight began to fail him, and he resigned the office of librarian to the faculty of advocates in 1752. He died in January 1757, at the age of 83. Chalmer's Life of Ruddiman.

RUDDOCK, in *Ornithology*, an English name for the *rubecula*, more commonly known by the name of the *red-breast*, or *robin-red-breast*.

RUDELSHOFEN, in *Geography*, a town of Germany, in the margraviate of Anspach; four miles E. of Uffenheim.

RUDELSTADT, a town of Silesia, in the principality of Schweidnitz; 16 miles W. of Schweidnitz. N. lat. 50° 42′. E. long. 15° 59′.

RUDEN,

RUDEN, a ſmall iſland in the Baltic, near the coaſt of Pomerania, amidſt ſhoals and ſand-banks, which render it probable that it was formerly much larger; and this conjecture is confirmed by another circumſtance, *viz.* that in the year 1264 it had two church-villages, called "Ruden" and "Carven." On this iſland is a caſtle; and between it and the little iſland of Die is a ſand eight miles long and two broad. N. lat. 53° 40′. E. long. 13° 48′.

RUDEN, or *Tydal*, a mountain which ſeparates the province of Jamptland in Sweden, from the province of Drontheim in Norway.

RUDENHAUSEN, a town of Germany, in the county of Caſtel; 28 miles W.S.W. of Bamberg.

RUDENTURE, in *Architecture*, the figure of a rope, or ſtaff, ſometimes plain, ſometimes carved; with which a third part of the fluting of columns is frequently filled up.

It is thus called from the Latins *rudens*, *cable*, whence ſome call it a cabling; and the columns, whoſe flutings are thus filled, they call *rudented*, or *cable columns*.

There are alſo rudentures in relievo, laid on the naked of pilaſters, not fluted; an inſtance of which we have in the church of St. Sapienza at Rome.

RUDERATION, RUDERATIO, in *Building*, a term uſed by Vitruvius for the laying a pavement with pebbles, or little ſtones.

To perform the ruderation, it is neceſſary the ground be firſt well beaten, to make it firm, and to prevent its cracking. Then a ſtratum of little ſtones is laid, to be afterwards bound together with mortar, made of lime and ſand, called by Vitruvius *ſtatumen*.

If the ſand be new, its proportion to the lime may be as three to one; but if dug out of old pavements, or walls, as five to two.

RUDERATION, Daviler obſerves, is uſed by Vitruvius, lib. vii. cap. 1. for the coarſeſt and moſt artleſs kind of maſonry; where a wall is, as it were, cobbled up.

RUDGELEY, in *Geography*, a market-town in the pariſh of Rudgeley, eaſt diviſion of the hundred of Cuttleſtone, county of Stafford, England, is ſituated on the ſouth bank of the river Trent, at the diſtance of 9½ miles E.S.E. from the town of Stafford, and 131½ miles N.W. by N. from London. It has been long celebrated on account of its great annual fairs for horſes, particularly thoſe of the coach breed. The market day is Tueſday, weekly; and the fairs are held on the 6th of June and 20th of October. The church, which ſtands on the north ſide of the town, is not remarkable as a building, but it contains ſeveral handſome monuments to the memory of the Chetwynd and Weſton families. The living is a vicarage in the patronage of the dean and chapter of Lichfield.

The ancient owners of Rudgeley were of the ſame name with the town, and ſeem to have continued in poſſeſſion till the reign of Henry VI. In the time of Edward III. ſome of the family were ſheriffs of the county; and one was a knight of the ſhire during the ſame period. Erdeſwick ſtates that this manor ſubſequently belonged to the biſhops of Lichfield, and was alienated by biſhop Sampſon to the crown in 1547.

On the oppoſite bank of the Trent from Rudgeley, are ſeveral villages named Ridwane, and diſtinguiſhed from each other by the adjunct Hamſtall, Pipe, and Maveſyn or Malveyſin. Of theſe, the laſt is the moſt important; and its church is intereſting to the antiquary, on account of the numerous ancient monuments it contains in memory of the Maveſyns, lords of the manor, ſeveral of whom were military characters of conſiderable eminence. Hugo Maveſyn, the founder of the church, is repreſented by a ſtone figure in chain armour, armed and equipped for battle, lying under a pointed arch in the north wall of the church. Adjoining, under another ſimilar arch, is the recumbent figure of ſir Henry Maveſyn, a knight croiſader. Like his predeceſſor, he appears completely armed, and dreſſed in chain mail; but differs from him in having his legs croſſed, and his ſhield charged with croſs bars. The other tombs are altar-ſhaped, and are ſituated in the middle of the church. That of ſir Robert Maveſyn recalls to memory a melancholy ſtory, thus related by Mr. Pennant: "In the beginning of the reign of the uſurping Henry, when the kingdom was divided againſt itſelf, two neighbouring knights, ſir Robert Maveſton, and ſir William Handſacre, of Handſacre, took arms in ſupport of different parties: the firſt to aſſert the cauſe of Bolingbroke; the laſt that of the depoſed Richard. They aſſembled their vaſſals, and began their march to join the armies, then about to commence battle near Shrewſbury. The two neighbours, with their reſpective followers, unfortunately met not far from the ſeats. Actuated by violent party rage a ſkirmiſh enſued: ſir William was ſlain on the ſpot. What a picture is this of the miſery of civil diſſention? What a tale the following of the ſudden viciſſitude of hatred to love, between contending families? Margaret, one of the daughters, and coheireſs, of ſir Robert Maveſton, gave her hand to ſir William, ſon of the knight ſlain by her father, and with her perſon and fortune compenſated the injury done by her houſe to that of Handſacre."

About two miles to the north-weſt of Rudgeley, cloſe to the river Trent, ſtand the church and village of Colwich. The firſt is very ancient, and is prebendal to the cathedral of Lichfield. Here are ſeveral tombs in memory of the Anſons, anceſtors of the preſent lord Anſon; alſo of the Wolſelys, proprietors of Wolſely park, which is ſituated on the ſouthern bank of the Trent, and diſplays much fine and pictureſque ſcenery. Cannock chace, which extends to the ſouthward, and contains an area of nearly forty miles ſquare, was formerly a foreſt, but has been long ſtripped of its foliage, and is now a heathy waſte, only remarkable for the extenſive proſpects it affords, and for its richneſs in coal-mines. On its eaſtern boundary is Beaudeſert park, the princely ſeat of the earl of Uxbridge, which is placed on the declivity of a lofty ſloping eminence, ſheltered on all ſides by "beautiful riſing grounds, emboſomed with trees, and commanding in front, over the tops of far ſubjacent woods, a moſt extenſive and diverſified view; ſo that it well vindicates the propriety of its name." The houſe was erected in the reign of queen Elizabeth, by Thomas, ſecond lord Paget. It is a handſome ſtructure of ſtone, built in the form of a half H, and has been of late years greatly improved by its noble owner. On the ſummit of the hill on which it is ſituated, may be ſeen the remains of an ancient Britiſh poſt, called Caſtle-hill. It is formed by two deep ditches, and an immenſe rampart, and has one entrance on the eaſt and another on the weſt. Near the baſe of the hill on its eaſt ſide, ſtands the village of Fairwell, the church of which was formerly attached to a priory of Benedictine nuns. Originally it was the property of canons regular, or hermits, but at the requeſt of ſeveral of the brethren it was beſtowed on the nunnery in 1140, by Roger de Clinton, biſhop of Lichfield, who further endowed it with conſiderable poſſeſſions. King Henry II. was likewiſe a great benefactor to this ſociety. Pennant's Journey from Cheſter to London, 4to. Lond. 1782. The Hiſtory and Antiquities of Staffordſhire, &c. by the Rev. Stebbing Shaw, B. D. F. S. A. vol. i. fol. Lond. 1798.

RUDHAN, a town of Perſia, in the province of Kerman; 60 miles N.W. of Sirgian.

RUDIARIUS, in *Antiquity*, a veteran gladiator, who had got a difcharge from the fervice.

He was thus called, becaufe, as a mark of difmiffion, a rod was put into his hands, called *rudis;* which fee.

The *rudiarii* were alfo called *fpectatores*.

RUDIMENTS, Rudimenta, the firft principles, or grounds, of any art or fcience, called alfo the elements thereof.

RUDIS, a knotty, rugged ftick, which the prætor, among the Romans, gave the gladiators, as a mark of their freedom and difmiffion.

The rudis feems to have been beftowed both on flaves and freedmen; with this difference, that it procured for the former no more than a difcharge from any farther performance in public, upon which they commonly turned *laniftæ*, fpending their time in training up young fencers; but the latter, who had hired themfelves out for thefe fhows, were reftored to a full enjoyment of their liberty. Kennet, Rom. Ant. p. 280.

Hence the Latin phrafe, *rude donare*, to make a gladiator free, to difcharge him from fighting any more. They were hence called *rudiarii*, and had a cuftom of hanging up their arms in the temple of Hercules, the patron of their profeffion, and were never called out again without their confent.

RUDISHEIM, in *Geography*, a town of Germany, in the Rhingau, celebrated for its wine; 19 miles W. of Mentz.

RUDKIOPING, a fea-port town of Denmark, on the W. coaft of the ifland of Langeland, and the only town in the ifland; the inhabitants carry on a confiderable trade in corn and provifions. N. lat. 54° 37′. E. long. 10° 45′.

RUDMAS Day, in our *Old Writers*, the feaft of the Holy Crofs. There are two of thofe feafts, one on the third of May, being the Invention of the Crofs; and the other the fourteenth of September, called *Holy Rood-day*, and is the Exaltation of the Crofs.

The word is compounded of the Saxon *rode*, *i. e. crux*, and *mafs-day*, *i. e. feaft-day*.

RUDNA, in *Geography*, a town of Hungary; 12 miles N.N.W. of Kemnitz.

RUDNIK, a town of Servia; 40 miles N.N.E. of Jenibafar.

RUDNIKI, a town of Lithuania, in the palatinate of Wilna; 15 miles S.S.W. of Wilna.

RUDNIKZA, a town of European Turkey, in Servia; 46 miles S. of Belgrade.

RUDOLFSOWITZ, a town of Silefia, in the lordfhip of Plefz, on the Biela; three miles S.E. of Plefz.

RUDOLFSTEIN, a town of Germany, in the principality of Culmbach; five miles N.W. of Hof.

RUDOLFWERTH, Neustadtein, or *Novomefto*, a town of Auftria, in the duchy of Carniola, fituated on the Gurk, and founded in the year 1365, by the Auftrian archduke Rodolph IV. privileged, and called after his own name. It has a provoftfhip or collegiate church, erected in the year 1509, four other churches, and two convents. By incurfions of the Turks in the fifteenth and fixteenth centuries, fucceffive fires, and the plague, this town has been very much reduced from its former flourifhing condition; 44 miles S.S.W. of Pettau. N. lat. 45° 52′. E. long. 15° 41′.

RUDOLPHIA, in *Botany*, a genus eftablifhed by Willdenow, in the Tranfactions of the Society *Naturæ Scrutatorum* at Berlin, v. 3. 151, is named in honour of Charles Afmund Rudolph, a German phyfician, the author of fome botanical obfervations. Such at leaft is the account of De Theis, taken probably from the above publication, which we have not feen. The genus may alfo ferve as a memorial of John Henry Rudolph, author of an inaugural differtation on fuch plants of the *Flora Jenenfis*, as belong to the *Polyandria Monogynia* of Linnæus; fee *Dryandr. Bibl. Banks.* v. 3. 161.—Willd. Sp. Pl. v. 3. 918. Poiret in Lamarck Dict. v. 6. 331.—Clafs and order, *Diadelphia Decandria*. Nat. Ord. *Papilionaceæ*, Linn. *Leguminofæ*, Juff.

Eff. Ch. Calyx two-lipped. Standard of the corolla very long, lanceolate. Stamens all connected. Legume flat, with many feeds.

1. R. *volubilis*. Twining Rudolphia. Willd. n. 1.—"Leaves ovate, pointed; heart-fhaped at the bafe, and fomewhat peltate."—Native of very lofty mountains, in the Weft Indian ifland of Porto Rico. The *ftem* is fhrubby, without prickles, twining up the trunks of trees; its bark black and warty; the young branches downy. *Leaves* fimple, alternate, ftalked, rigid, entire; fhining on the upper fide; downy when young. *Footftalks* with two joints, channelled between them, on the upper fide. *Clufters* fcattered, thrice the length of the leaves. *Flower-ftalks* three together. *Flowers* fcarlet. *Willdenow*.

2. R. *peltata*. Peltate Rudolphia. Willd. n. 2. (Erythrina planifiliqua; Linn. Sp. Pl. 993. Corallodendron folio fingulari oblongo, filiquâ planâ; Plum. Ic. 92. t. 102. f. 1.)—Leaves oblong-lanceolate, fomewhat heart-fhaped, peltate.—Native of Hifpaniola. Willdenow afferts this to be diftinct from the foregoing. The common *flower-ftalk*, as reprefented by Plumier, is a foot and half long, racemofe at the extremity.

M. Poiret reduces to this genus the *Butea* of Koenig, and we heartily wifh we could follow him, in order to get rid of a name fo abfurd and reprehenfible in its original application; fee Plaso and Butea. We fear however that neither the character of the legumes, nor the habits of the plants, will fupport fuch a meafure.

RUDOLPHINE Tables. See Catalogue *of the Stars*.

RUDOLSTADT, or Rudelstadt, in *Geography*, a town of Germany, in the county of Schwartzburg Rudolftadt, from which a branch of the houfe of Schwartzburg derives its title, fituated on the Saal; 24 miles S.E. of Erfurt. N. lat. 51° 40′. E. long. 11° 19′.

RUDRA, in *Mythology*, a name of the Hindoo deity Siva. In fome of their theogonical books, Siva, in the form of Rudra, is made to fpring from a wrinkle in the forehead of Brahma, with five heads and ten arms, as he is reprefented in the plates of the Hindoo Pantheon. When five-headed, he is named Pancha-muki. (See that article.) Rudra is faid to have thus fprung into a new form, to enable Brahma to people the world with fuitable inhabitants; his earlier efforts having been productive of a refractory race. (See Muni.) The name of Rudra is generally applicable to Siva, in his character of Fate and Deftiny, and of Time. Under the article Mahakala he is called Kal-Agni-Rudra, interpreted Time, Fire, Fate, and defignative of his deftructive energies. (See Kal-agni-rudra.) In the Inftitutes of Menu, (fee Menu,) the "eleven Rudras" are mentioned, but it has not been explained what that number efpecially adverts to. Rudra is underftood to be the deity of pregnant women, as is his confort, known as fuch in her character of Rudri, or Rudrani. (See Rudrani.) He is alfo called the god of tears and lamentation: being, as time or fate, the lord of punifhment, and thereby caufing thefe refults. Sometimes he is called Maha Rudra, or the great Rudra. This occurs in an extract in the article Kama.

RUDRANI, or Rudri, is a name and form of the goddefs

goddefs Parvati, confidered then as the fakti or energy of her lord Siva, in his form of Rudra. (See thofe feveral articles; alfo RAUDRI.) In this character fhe is fometimes called the patronefs of pregnant women. (See IDITA, ILITA, and ILITHYA.) She is invoked under the appellation of "Rudrani the beloved of Siva," in the article LAKSHMI of this work.

RUDSTAKES, in *Agriculture*, a provincial term applied to the ftakes to which cattle are tied in the ftall.

RUDTSDORF, in *Geography*, a town of Bohemia, in the circle of Chrudim; nine miles E. of Leutmifchl.

RUE, PIERRE DE LA, in *Biography*, an ecclefiaftical compofer in the firft ftage of correct counterpoint. He was contemporary with Jofquin, and one of the compofers for the papal chapel during the pontificate of Sixtus IV. who reigned from 1471 to 1484. De la Rue, or as he is called by writers in Latin, Petrus Platenfis, was one of the moft voluminous compofers of this early period. What country gave him birth, is now difficult to afcertain; Walther calls him a Netherlander; Glareanus, a Frenchman; others fuppofe him to have been a Spaniard. It is, however, certain that he was in high favour with prince Albert, and princefs Ifabella, of the Low Countries; that a work under his name was publifhed at Antwerp, with this title: "El Parnaffo Efpanol de Madrigales y Villancicos à quatro, cinco y feis voces;" befides maffes and motets to Latin words; and that he was a very learned contrapuntift.

Many of his compofitions for the church are ftill extant in the mufeum collection of maffes and motets, fome of which were publifhed as early as the year 1503, immediately after the invention of mufical types.

RUE, CHARLES DE LA, a learned French Benedictine monk, was born at Corbie, in Picardy, in the year 1684. He took the vows at the age of 19, in the abbey of Meaux, having already given evidence that he poffeffed a ftudious difpofition, by the progrefs which he had made in the languages, and in the belles lettres. In 1712 the learned Montfaucon admitted him into his friendfhip, became the guide of his ftudies, and freely communicated to him the ftores of knowledge which he poffeffed. So well did the pupil avail himfelf of thefe advantages, that he foon became a very ufeful affiftant to his mafter in his learned labours. In 1713, Montfaucon had publifhed the remains of Origen's "Hexapla," and de la Rue was fixed on to give a complete edition of that learned father's works, with the exception of the Hexapla. In 1733 he publifhed the two firft volumes, with proper prolegomena, and many ufeful as well as very learned notes. The other volumes were publifhed by his nephew Vincent, whom he had affociciated with himfelf in his work, after the death of Charles, which happened in 1739. The manner in which the third and fourth volumes of this great work were executed, fhews that the nephew was fully adequate to the tafk confided to him. This edition is entitled "Origenis Opera omnia, quæ Græcè vel Latinè extant, et ejus nomine circumferentur, ex variis Editionibus et Codicibus Collecta, recenfita, Latinè verfa at Annotationibus illuftrata." Vincent de la Rue died in the year 1762. Moreri.

RUE, in *Botany*. See RUTA.

RUE, in the *Materia Medica*, the ruta graveolens, or common rue, has a ftrong, ungrateful odour, and a bitter, hot, penetrating tafte; the leaves are fo acrid as to irritate and inflame the fkin, if they be much handled; and in its natural and uncultivated ftate, it is faid to poffefs thefe qualities more powerfully. Its virtues are extracted both by water and rectified fpirit, but more powerfully by the latter. On infpiffating the fpirituous tincture, very little of its flavour rifes with the menftruum; moft of the active parts of the rue being concentrated in the extract. In diftillation with water, an effential oil feparates, which is of a yellowifh or brownifh colour, a moderately acrid tafte, and penetrating fmell; the decoction, infpiffated, yields a moderately warm, pungent, and bitterifh extract. The feeds and capfules contain more oil than the leaves. From the experiments of Beaumé it appears, that the recent plant contains but a very fmall portion of effential oil: thus, from 21 lbs. of the leaves he fcarcely obtained a drachm, while 10 lbs. of the feeds yielded two ounces.

Rue was much ufed by the ancients, who afcribed to it many excellent qualities. Hippocrates commends it as a refolvent and diuretic, and attributes to it the power of refifting contagion, and the action of other kinds of poifons; fo that it was employed with this intention by Mithridates (fee Plin. N. Hift. l. 28. c. 8.): this quality, though allowed by Boerhaave, is now generally difcredited. (Cullen's Mat. Med. vol. ii. p. 365.) According to Bergius, it is "alexiteria, pellens, emmenagoga, fudorifera, rubefaciens." It is, however, acknowledged to be a powerful aftringent, and, like other medicines of the fetid kind, to poffefs attenuating, deobftruent, and antifpafmodic powers, and to be peculiarly adapted to phlegmatic habits, or weak and hyfterical conftitutions, fuffering from retarded or obftructed fecretions. A ftrong infufion of it, exhibited per anum, has been found of great fervice in relieving the convulfions of infants, arifing from flatulence and other inteftinal irritations. It is employed by fome as a tea, and alfo externally in difcutient and antifeptic fomentations. Among the common people, the leaves are fometimes taken with treacle, on an empty ftomach, as anthelmintic. A conferve, made by beating the frefh leaves with thrice their weight of fine fugar, is the moft commodious form for ufing the herb in fubftance. The dofe of the powdered leaves may be from grs. xv to ℈jj, given twice or thrice a day.

The officinal preparations are *oleum rutæ*, and *extractum rutæ graveolentis*. The "oleum herbæ florefcentis rutæ" of the Dublin pharmacopeia, or oil of rue, is procured in the quantity of 59 grains of oil from 21 pounds of rue, which oil has the ftrong ungrateful odour and tafte of the plant. When recently drawn the colour is yellow, but by age it deepens to a brown, and depofits a brownifh refinous fediment. It congeals at 40° Fahrenheit. This oil is ftimulant, and antifpafmodic: it is fometimes given in hyfteria, and the convulfive affections of infants attendant on dentition, and is fometimes ufed as a rubefacient in palfy. The dofe is from ♏ ij to ♏ v, triturated with fugar or mucilage. The "extractum foliorum rutæ graveolentis," Edin. "extractum foliorum rutæ," Dub., or extract of rue, is prepared by the former difpenfatory in the fame manner as the extract, and by the latter, like other fimple extracts: and by whichever procefs it is prepared, it is inodorous, but has a bitter acrid tafte. The medicinal properties are different from thofe of the plant, the ftimulant and narcotic powers of which depend on the volatile oil it contains, which is diffipated during the infpiffation of the extract. The dofe is from grs. x to ℈j, in pills. Lewis. Woodville. Thompfon.

RUE, *Dog's*. See SCROPHULARIA.

RUE, *Goat's*. See GALEGA.

RUE, *Meadow*. See THALICTRUM.

The leaves of meadow-rue, mixed with other greens, are fomewhat laxative, according to Dodonæus; but a decoction of the root is more fo, and may be well fubftituted for rhubarb.

Rue, *Wall*, or *White maidenhair, ruta muraria*, a fpecies of *afplenium*; which fee.

This plant is found growing out of the joints of old walls in various parts of England, where it is gathered for medicinal ufe; but as it cannot be cultivated in gardens fo as to grow to advantage, it is needlefs to fay more of it.

This is one of the five capillary herbs mentioned in the Difpenfatory, and has the fame virtues with the reft of the maiden-hairs; it is fometimes ufed in pectoral decoctions and diuretic apozems.

Rue, *Wild Affyrian.* See Peganum.

Its virtues agree with the garden rue, but it is more acrimonious.

Rue, in *Geography*, a town of France, in the department of the Somme, and chief place of a canton, in the diftrict of Abbeville; 12 miles N.W. of Abbeville. The place contains 1346, and the canton 9736 inhabitants, on a territory of $332\frac{1}{2}$ kiliometres, in 16 communes. The chief trade of this town is in fifh, fheep, wool, horfes, and cattle.

Rue, a river of Wales, in the county of Montgomery, which runs into the Severn, three miles S. of Welfhpool.—Alfo, a river of France, which runs into the Dordogue, near Bort.

Rue *Ruw*, a town of Switzerland, in the canton of Friburg, capital of a bailiwick; 10 miles W. of Gruyeres.

RUEBLAND, a town of the duchy of Carinthia; fix miles S.S.E. of Spital.

RUECCO, a river which rifes in Carniola, and runs into the fea a little to the N.E. of Trieste, paffing during its fhort courfe through immenfe rocks.

RUEDA, a town of Spain, in the province of Leon; 11 miles E.S.E. of Leon.—Alfo, a town of Spain, in the province of Leon; 16 miles S.W. of Valladolid.

RUEDOCK. See Ruadock.

RUELLE, a French term, formerly introduced into our language, is a diminutive of *rue, ftreet*, and fignifies, literally, *little ftreet*.

Its ufe, among us, was for an alcove, or other genteel apartment, where the ladies receive vifits either in bed or up. The poets go reading their works from ruelle to ruelle, to befpeak the approbation and intereft of the ladies. The term, however, is now difufed.

RUELLIA, in *Botany*, a genus of Plumier's, named in honour of a French phyfician and botanift, Dr. John Ruelle, who publifhed, in 1536, a treatife "De Naturâ Stirpium," chiefly a tranflation of Diofcorides, which is celebrated by Plumier for the excellence of its latinity. Ruelle, though phyfician to Francis I., quitted the profeffion of phyfic, and entered into the church. He died a canon of Paris, in 1537.—Plum. Gen. 12. t. 2. Linn. Gen. 324. Schreb. 423. Willd. Sp. Pl. v. 3. 362. Mart. Mill. Dict. v. 4. Ait. Hort. Kew. v. 4. 56. Purfh 420. Brown. Prodr. 477. Dill. Elth. t. 248 and 249. Juff. 103. Lamarck Dict. v. 6. 337. Illuftr. t. 550. Gærtn. t. 54.—Clafs and order, *Didynamia Angiofpermia.* Nat. Ord. *Perfonatæ*, Linn. *Acanthi*, Juff.

Gen. Ch. *Cal.* Perianth inferior, of one leaf, permanent, divided, more or lefs deeply, into five linear, acute, ftraight, equal, permanent fegments. *Cor.* of one petal, fomewhat irregular; the upper part of the tube dilated and inclining; limb five-cleft, fpreading, obtufe; the two upper fegments moft reflexed. *Stam.* Filaments four, fhorter than the corolla, fituated in the dilated part of the tube, approaching each other, and connected, in pairs; anthers fcarcely projecting beyond the tube, each with two parallel, fimple cells. *Pift.* Germen fuperior, roundifh; ftyle thread-fhaped, the length of the ftamens; ftigma in two acute fegments, the lowermoft involute. *Peric.* Capfule nearly cylindrical, pointed at each end, almoft feffile, of two cells, and two valves, feparating by the elafticity of their taper bafe. Partition contrary to the valves, and combined with them. *Seeds* feveral, roundifh, compreffed, each fubtended by an awl-fhaped, afcending prop.

Eff. Ch. Calyx in five deep, equal fegments. Corolla fomewhat bell-fhaped, flightly irregular. Stamens approximated in pairs. Anthers of two parallel cells. Capfule of two elaftic valves, and two cells; partition from the centre of each valve. Seeds feveral, with awl-fhaped props.

This genus has generally been fuppofed, by botanifts of the Linnæan fchool, to differ from *Jufticia*, merely in having four ftamens inftead of two. The elaftic bivalve capfule, with props to the feeds, was confidered as common to both, and very juftly; though a few fpecies have been admitted, in which thefe characters are altogether wanting, as *R. balfamea* and *uliginofa*.

Mr. Brown has inveftigated *Ruellia* with no lefs care than Justicia, fee that article; for indeed a ftudent of tropical plants could not fail foon to difcover, that he was able to proceed but a very little way, without underftanding thefe genera, and the family to which they belong. The able botanift juft mentioned feparates from *Ruellia* all fpecies that have only two feeds in each cell, fuch as *R. intrufa* of Vahl, and the Linnæan *Jufticia gangetica*; and even thefe, he thinks, require fubdivifion. Others are to be removed on account of their feparate partition, unconnected with the valves of the capfule, like *R. Blechum*, &c. *R. depreffa* belongs, it feems, to a different natural order.

The number of fpecies, which in Willdenow is 46, becomes thus greatly reduced. In the new edition of Hort. Kew. eleven are, under Mr. Brown's infpection, enumerated, two of them not among Willdenow's. Four more are defcribed in his own Prodromus, from New Holland. To all thefe *reptans* of Forfter, and probably *fecunda* of Vahl, are to be affociated, nor is it fuppofed that feveral more fpecies may not be found. We fhall exhibit thefe acknowledged ones (only omitting *ringens*; fee Hygrophila,) as a fpecimen of the genus, feveral of them being much recommended by their beauty. Unfortunately they moftly require the heat of a ftove, a few only will fucceed with the protection of a green-houfe, in this country. They are generally perennial herbs; fometimes fhrubby.

1. R. *ovata.* Ovate-leaved Ruellia. Cavan. Ic. v. 3. 28. t. 254. Willd. n. 4. Ait. n. 1.—Leaves feffile, elliptic-oblong, acute at each end, entire, villous. Flowers axillary, ternate, nearly feffile. Stem decumbent.—Native of Mexico, from whence it was tranfmitted to the botanic garden at Madrid. The late marchionefs of Bute fent it to Kew in 1800. This is a perennial, herbaceous, ftove-plant, flowering in July and Auguft. The *root* is fibrous. *Stems* fcarcely a fpan long, obfcurely quadrangular, leafy, hairy; proftrate at the bafe; afcending at the extremity. *Leaves* oppofite, near two inches long, foft, downy and fringed. *Flowers* about the top of the ftem, large, longer than the upper leaves, deep blue with a white tube. *Stigma*, according to Cavanilles, fpatulate, undivided.

2. R. *ftrepens.* Whorled Ruellia. Linn. Sp. Pl. 885. Mant. 422. Willd. n. 5. Ait. n. 2. Purfh n. 1. (R. ftrepens, capitulis comofis; Dill. Elth. 330. t. 249.)—Leaves ftalked, ovate, acute, entire. Stalks three-flowered, very fhort. Stem erect.—Native of North America. On dry hills, in fhady woods, from Virginia to Carolina, flowering in June and July. *Purfh.* *Stem* fquare, with a few fhort branches. *Leaves* two inches long, roughifh with fhort fcattered hairs. *Flowers* large, pale blue, making two or three

three apparent whorls, from the upper leaves. *Bracteas* lanceolate, fringed, rising above the *calyx*, whose segments are awl-shaped, very narrow, and hairy, rather longer than the ripe *capsule*.

3. R. *patula*. Spreading Ruellia. Jacq. Misc. 2. 358. t. 119. Willd. n. 6. Ait. n. 3.—Leaves stalked, ovate, entire, very obtuse, downy. Flowers ternate, nearly sessile. Stem much branched, spreading. Capsule above twice the length of the calyx.—Native of the East Indies; imported by sir J. Banks, in 1777. This is a shrubby species, flowering copiously in the stove, in July and August. The *leaves* are shorter and broader than in the foregoing, rounded, and somewhat heart-shaped. *Flowers* light blue. *Calyx* small. The whole plant is finely downy.

4. R. *lactea*. White Mexican Ruellia. Cavan. Ic. v. 3. 28. t. 255. Willd. n. 9. Ait. n. 4.—Leaves stalked, ovate, fringed, slightly toothed. Stalks about three-flowered, very short. Stem woolly, erect. Capsule shorter than the calyx.—Native of Mexico. It has been dispersed from the garden of Madrid, to different parts of Europe, and proves a tolerably hardy green-house plant, flowering in summer. The *stem* is herbaceous, erect, a foot high, square, covered with long, dense, woolly hairs. *Leaves* three or four inches long, and two broad. *Flowers* of a pale blueish-white, the central one without *bracteas*. Segments of the *calyx* hairy, very long and slender.

5. R. *clandestina*. Covert-flowering Ruellia. Linn. Sp. Pl. 885. Willd. n. 10. Ait. n. 5. (R. capsulis teretibus; Dill. Elth. 328. t. 248.)—Leaves stalked, oblong, obtuse, somewhat toothed; tapering at the base. Stalks three-flowered, rather shorter than the leaves. Capsule nearly cylindrical, longer than the calyx.—Native of Barbadoes and Santa Cruz. A perennial stove plant, flowering in July and August, but seldom cultivated. The *root* consists of many long, thick, fleshy fibres. *Stem* a span high, clothed with numerous, large, undulating *leaves*. *Flowers* large, blue, on slender elongated stalks. *Calyx* linear and very narrow, scarcely above half the length of the *capsule*, which is obscurely quadrangular when ripe, containing a great number of flat, downy *seeds*, bordered with a white membrane. The *corolla* of the earliest flowers is said to be small and imperfect.

6. R. *paniculata*. Panicled Ruellia. Linn. Sp. Pl. 885. Willd. n. 18. Ait. n. 6. (Speculum veneris majus, impatiens; Sloane Jam. v. 1. 158. t. 100. f. 2.)—Leaves ovate, pointed, rough, entire. Stalks many-flowered, forked, divaricated, longer than the leaves. Upper segment of the calyx rather the broadest. Native of the West Indies. Sloane speaks of it as common about Kingston in Jamaica, growing among bushes. Miller and Linnæus cultivated this plant, and it may be met with sometimes in stoves, flowering in summer. The habit is somewhat shrubby, and the herbage hoary. *Leaves* copious, from two to four inches long, on stalks about half their length. *Flower-stalks* axillary, chiefly about the upper part of the stem, and extending beyond the leaves, so as to give the whole plant a panicled appearance. *Bracteas* oblong, obtuse. Each *flower* is nearly sessile, of a bright light blue, with a long slender tube. Segments of the *calyx* hispid, linear, very narrow, one of them twice as broad as the rest. Sloane says the *capsule* throws out the *seeds* with violence, when it is either touched or wetted at the end.

7. R. *tuberosa*. Tuberous-rooted Ruellia. Linn. Sp. Pl. 885. Willd. n. 19. Ait. n. 7. (Gentianella flore cæruleo, integro vasculo seminali ex humidi contactu impatiente; Sloane Jam. v. 1. 149. t. 95. f. 1.)—Leaves ovate-wedge-shaped, crenate. Flower-stalks deeply-three-cleft. Stem simple.—Native of Jamaica, in bushy places near Kingston, flowering after the rainy season. The perennial *root* consists of many long fleshy knobs. *Stem* erect, herbaceous, a foot high, a little hairy. *Leaves* spreading, minutely and sparingly hairy, each tapering down into a long *footstalk*. *Flower-stalks* slender, axillary, solitary, shorter than the leaves. *Calyx* very long and slender, rough with close bristles. *Corolla* large, of a fine blue. *Capsule* the length of the calyx; we do not perceive it to be more angular than that of *R. clandestina*, though Dillenius indicates the contrary. *Seeds* numerous.

8. R. *biflora*. Two-flowered Ruellia. Linn. Sp. Pl. 886. Willd. n. 21. Ait. n. 8. (R. oblongifolia; Michaux Boreali-Amer. v. 2. 23? Pursh n. 2?)—"Flowers in pairs, sessile.—Native of Carolina, from whence it was sent to Kew, in 1765, by Mr. John Cree. It is kept in the greenhouse, being an herbaceous perennial, flowering in July. We have seen no authentic specimen, nor have we any further knowledge of this species than what occurs in Linnæus. *R. oblongifolia* of Michaux, suspected by Mr. Pursh to be the same plant, is described as "ascending, all over minutely and densely downy, with erect, nearly sessile, obovate-oblong *leaves*, and mostly solitary *flowers*." Pursh adds that "the *bracteas* are the length of the *calyx*, whose thread-shaped segments are the length of the tube of the *corolla*." He adds that it grows "in sandy pine woods of Georgia, flowering in June and July," and that "the *flowers* are a yellowish-blue," a colour not very intelligible to us; but the author only saw them dried.

9. R. *ocymoides*. Brasil-leaved Ruellia. Cavan. Ic. v. 5. 9. t. 416. Ait. Hort. Kew. Epit. 373.—Stem branched, erect. Leaves ovate, obtuse, entire; glaucous beneath. Flowers axillary, ternate. Bracteas ovate. Calyx tubular at the base.—Native of Mexico; cultivated in the garden of Madrid, and introduced at Kew in 1798. It is biennial, flowering in the stove from July to September, and may perhaps be perennial in its native country. The *stem* is about six inches high, branched from the bottom, somewhat downy like the rest of the plant. *Leaves* opposite, on long stalks, concave; dark green above; glaucous beneath. *Flowers* sessile, with an ovate stalked *bractea* at the base of each. *Calyx* with a perceptible tube, though much shorter than the last; its segments awl-shaped, rather unequal. *Corolla* pale blue, with a white tube.

10. R. *formosa*. Large Scarlet Ruellia. Ait. n. 10. Andr. Repos. t. 610. Curt. Mag. t. 1400.—Leaves stalked, ovate, entire, downy on both sides. Stalks axillary, alternate, very long, with few flowers. Corolla somewhat ringent. Native of Brasil. Said to have been introduced into England by sir Charles Cotton, in 1808. It proves a great ornament to our stoves, which are decorated all summer long with its very large and splendid scarlet *flowers*. The *stem* is in some degree shrubby, erect, three or four feet high, square, finely hairy, as well as the rest of the herbage, whose colour is a greyish-green. *Flower-stalks* twice or thrice as long as the leaves. Segments of the *calyx* deep and linear. Lobes of the *corolla* emarginate. *Capsule* obovate, the length of the calyx. *Seeds* numerous, lenticular, rough. Very different from the *macrophylla* of Vahl's Symbolæ, v. 2. 72. t. 39, which, according to Mr. Brown, is no *Ruellia*, having but two seeds in each cell, and still generically different, as he thinks from *R. intrusa*, &c. mentioned in our introductory part of this article.

11. R. *fulgida*. Lesser Scarlet Ruellia. Ait. n. 11. Andr. Repos. t. 527.—Leaves stalked, ovate, pointed, crenate, hairy. Tufts many-flowered, on long axillary stalks. Corolla somewhat ringent, with a nearly cylindrical tube.

tube.—Native of the Weft Indies. It made a part of a fine collection of ftove plants, brought over by the late much-lamented earl of Seaforth, and given by his lordfhip to A. B. Lambert, efq. This plant firft flowered in Mr. Lambert's ftove, in June, 1807. Its habit is fhrubby. *Leaves* different from the laft, in being crenate and wavy. *Flowers* remarkably abundant, their ftalks affembled in a corymbofe manner. *Corolla* of a rich orange-fcarlet, but fcarcely one-third the fize of the *R. formofa*. *Seeds* with a white border.

12. R. *fecunda*. Yellow Ruellia. "Vahl. Symb. v. 3. 84." Willd. n. 36.—"Leaves ovate, fomewhat heart-fhaped, entire, villous. Clufters axillary, turned one way." —Native of the Eaft Indies. *Herbage* downy. *Leaves* ftalked, an inch long, obtufe; the younger ones hoary, rather pointed. *Footftalks* widely fpreading, fcarcely fhorter than the leaves. *Clufters* almoft a fpan long; the partial flower-ftalks fhort and diftant. *Bracteas* fetaceous, ftill fhorter. *Calyx* hairy. *Corolla* fmooth, yellow, an inch long. *Germen* villous and hoary. *Vahl.* Mr. Brown, not having perhaps inveftigated the fruit of this fpecies, has marked its genus as doubtful.

13. R. *reptans*. Creeping Ruellia. Forft. Prodr. 44. Willd. n. 37.—"Leaves ftalked, ovate, obtufe, bluntly ferrated. Flower-ftalks terminal, fomewhat fpiked."—Native of the ifland of Tanna. We have feen no fpecimen, but Mr. Brown has afcertained this to be a true *Ruellia*.

14. R. *auftralis*. Southern Ruellia. Cavan. Ic. v. 6. 62. t. 586. f. 1. Brown n. 1.—Flowers axillary, nearly feffile, folitary or ternate. Segments of the calyx awl-fhaped, rough, feparate to the bafe. Leaves ftalked, elliptic-oblong, entire, fmooth. Stem diffufe.—Native of New South Wales, from whence we received fpecimens from Dr. White in 1792. Mr. Brown has alfo obferved it in the tropical part of New Holland. The *ftem* is of humble growth, rather fhrubby, more or lefs diffufe, branched, flender, quadrangular, fmooth. *Leaves* moft crowded towards the tops of the branches, fmall, hardly an inch long; paler beneath. Tube of the *corolla* not much longer than the calyx; its limb dilated and fpreading, with rounded, entire, nearly uniform fegments. We know nothing of the colour. The figure in Cavanilles is not characteriftic. Its *flowers* are much too fmall in the limb. The name too is faulty.

15. R. *pumilio*. Dwarf Ruellia. Brown n. 2.—"Flowers axillary, folitary, nearly feffile. Bracteas minute. Calyx fmooth, tubular at the bafe. Leaves narrow-oblong, obtufe. Stem diffufe."—Gathered by Mr. Brown at Port Jackfon, New South Wales.

16. R. *acaulis*. Humble Ruellia. Brown n. 3.—"Stem fhort. Leaves oblong-wedge-fhaped, obtufe. Stalks axillary, fingle-flowered, feveral times longer than the capfule. Calyx nearly fmooth, without bracteas."—Gathered by fir Jofeph Banks and Dr. Solander, in the tropical region of New Holland.

17. R. *bracteata*. Bracteated Ruellia. Brown n. 4.—"Flowers axillary. Bracteas leafy, large, deciduous. Tube of the corolla elongated; its limb nearly equal. Capfule with a taper bafe. Leaves oblong or elliptical. Stem erect."—Gathered by Mr. Brown, in the tropical part of New Holland.

By a miftake, as we prefume, *R. ringens* of Linnæus is retained as fuch in Hort. Kew. without any remark, and even with the erroneous fynonym, which is directed to be ftruck out in Mr Brown's Prodromus, 479, where the plant in queftion makes a new genus. See HYGROPHILA.

Mr. Purfh has three North American fpecies, befides thofe to which we have adverted above, called *hybrida*, *ciliofa*, and the *humiftrata* of Michaux. Thefe we dare not admit, becaufe it does not appear that their generic characters have been critically examined by any body; at leaft not with a reference to the above limitations of *Ruellia*.

RUEMANNSFELDEN, in *Geography*, a town of Bavaria; 36 miles E. of Ratifbon.

RUENGAS, a country of Africa, S. of Monoemugi, about S. lat. 7°.

RUERLOO, a town of Holland, in the county of Zutphen; 4 miles W. of Borckeloe.

RUESCAR, a town of Spain, in the province of Grenada; 15 miles E. of Almeria.

RUESTA, a town of Spain, in Aragon, on the Aragon; 24 miles W. of Jaca.

RVEUTZENDORFF, a town of Auftria; 4 miles E.N.E. of Entzerltorff.

RUFF, or RUFFLE, in *Military Language*, a beat on the drum. Lieutenant-generals have three ruffles, major-generals two, brigadiers and governors one, as they pafs by the regiment, guard, &c. See DRUM.

RUFF-*trees*. See ROOF-*trees*.

RUFFACH, in *Geography*, a town of France, in the department of the Upper Rhine; 8 miles S. of Colmar.

RUFFE, in *Ichthyology*, the Englifh name of the *cernua*, or fmall gilded pearch, a fifh common in our rivers, and much refembling the pearch in figure, though of a more flender form.

The ruffe is called by the generality of authors *cernua fluviatilis*; and by fome *charus acerina* and *afpredo*. It is called by Johnfon and Charleton alfo *fcrollus*. Willughby, as well as thefe authors, has mentioned the fcrollus as another fpecies of fifh; but it is proved, by obfervation, that they are evidently the fame fpecies. Artedi makes this fifh a pearch, or *perca*; and accurately diftinguifhes it from the other fifh of that genus by the name of the pearch with only one fin on the back, and with a cavernous head. In the Linnæan fyftem it is the PERCA *Cernua*; which fee.

This fifh may be preferved in glafs jars with frefh water, and be made very tame. It muft be fed, for it cannot fubfift on the animalcula of river-water, as fmall dace can.

No fifh fhews the circulation of the blood in a finer manner than ruffes, whofe fins are exceedingly tranfparent. Befides, it is a creature vaftly tenacious of life, and will live twenty or thirty minutes out of water, without receiving much damage. Phil. Tranf. N° 478. p. 26.

RUFFE, in *Ornithology*, the name of a male fpecies of bird, the female of which is called *reeve*, and the Latin name for which is *avis pugnax*, or the fighting bird.

This fpecies is the TRINGA *pugnax* of Linnæus; which fee.

The feathers of the male affume in feveral parts a variety of colours; but they are diftinguifhed by a very remarkable circle of long feathers, furrounding their necks; whence their name: on the back of their necks they have a tuft of feathers, which fpread wide on both fides; thefe feathers around the neck are black in fome birds; and in others white, yellow, or ferruginous; and they frequently differ in colour, even in the fame bird; the coverts of the wings are brown or afh-coloured; the feathers on the breaft black or dufky; the four exterior feathers of the tail of a cinereous brown, and the four middle barred with black and brown; the bill is black towards the end, and red at the bafe; the legs are yellow. In moulting they lofe the neck-feathers, nor do they recover them till after their return in the following fpring, when a fet of fmall pear-fhaped yellow

 pimples

pimples break out on the face above the bill. The male birds of the firſt year want theſe marks: and the older they are, the more numerous are the pimples, and the fuller and longer the ruffs. The length of the male to the tip of the tail is one foot, the breadth two; of the reeve ten inches, the breadth nineteen: the weight of the former, when juſt taken, is ſeven ounces and a half, and of the latter only four. The reeves never change their colour, which is pale brown; the back ſpotted with black, ſlightly edged with white; the tail brown; the middle feathers ſpotted with black; the breaſt and belly white; and the legs of a pale dull yellow. They come over to us in vaſt numbers early in the ſpring, and diſappear about Michaelmas, building in ſome parts of Lincolnſhire, particularly in the fenny country about Croyland. They are found alſo in the iſle of Ely, and in the Eaſt Riding of Yorkſhire, and for about three weeks at Martin-mere, in Lancaſhire. The reeves lay four eggs, which are white, marked with large ruſty ſpots, in a tuft of graſs, the firſt week in May, and ſit about a month. Soon after their arrival, the males begin to *hill*, *i. e.* to collect on ſome dry bank, near a pool of water, in expectation of the females, who reſort to them. Each male keeps poſſeſſion of a ſmall piece of ground, which it runs round till the graſs is worn quite away, and nothing but a naked circle left; and when a female lights, the ruffs immediately fall to fighting. When a fowler diſcovers one of thoſe hills, he places his net at night, and at day-break reſorts to his ſtand; and at the firſt pull takes thoſe birds that are within reach; he then places his ſtales, or ſtuft birds, to entice thoſe that are traverſing the fen. In this way a fowler will take forty or fifty dozen in a ſeaſon. When they firſt come over, there are many more males than females among them; but theſe are ſo continually fighting, that their numbers ſoon decreaſe below an equality. They are fed after they are taken with bread and milk, hemp-ſeed, and ſometimes boiled wheat; to which, if expedition is required, they add ſugar, and thus they become very fat. They are killed by cutting off the head with a pair of ſciſſars; and they diſcharge a great quantity of blood, conſidering their ſize. They are dreſſed like woodcocks, with their inteſtines; and when killed at the proper time, they are reckoned by the epicures very delicious. Ray and Pennant.

Ruffe is alſo the name of a particular ſpecies of pigeon, called by Moore the *columba cucullata rudis*.

It is in ſhape very like that ſpecies of pigeon called the *jacobine*, but is larger, and has a longer beak. The iris of the eye is ſometimes red, ſometimes pearl-coloured; the feathers of the hood and chain are much longer than the jacobine, though they do not come down ſo low to the ſhoulders of the wings, nor are they ſo compact and cloſe, but are apt to blow about with every little blaſt of wind, and fall more backward off the head, and lie in a rough confuſed manner.

It is a common thing to match the jacobine pigeon with this ſpecies, with intent to improve its chain by the length of the ruffe's feathers; but the event is, that the pigeon is always worſe inſtead of better, being longer beaked, and looſer in its head and chain, without any real advantage.

RUFFEC, in *Geography*, a town of France, and principal place of a diſtrict, in the department of the Charente; 34 miles S. of Poitiers. The place contains 2110, and the canton 12,668 inhabitants, on a territory of 250 kiliometres, in 20 communes. N. lat. 46° 2′. E. long. 0° 17′.

RUFFI, Antony de, in *Biography*, a lawyer and hiſtorian, was born at Marſeilles in 1607, and in proceſs of time he became a counſellor in the ſeneſchalcy of Marſeilles, an office of conſiderable importance, and which he diſcharged with diligence and great integrity. He was made counſellor of ſtate in 1654, and died in 1689, at the age of 82. His leiſure time, he had, during his long life, employed in learned enquiries, of which the fruits were, 1. An elaborate "Hiſtory of Marſeilles," fol. 2. "The Life of Gaſpard de Sinicane, known by the name of the Chevalier de Coſte." 3. "The Hiſtory of the Counts of Provence:" and he left in MS. "A Hiſtory of the Generals of the Gallies." He had a ſon, Louis Antony, who purſued a ſimilar line of ſtudy, and added to his father's Hiſtory of Marſeilles a ſecond volume, in an edition publiſhed in 1696. He was author, likewiſe, of "Diſſertations Hiſtoriques et Critiques ſur l'Origine des Comtes des Provence, de Venaiſſin, de Forcalquier, et des Vicomtes de Marſeille;" and in 1716 he publiſhed "Une Diſſertation Hiſtorique, Chronologique, et Critique ſur les Evêques de Marſeille." He died in 1724, at the age of 66.

RUFFIEUX, in *Geography*, a town of France, in the department of Mont Blanc, and chief place of a canton, in the diſtrict of Chambéry. The place contains 1048, and the canton 5110 inhabitants, on a territory of 100 kiliometres, in 8 communes.

RUFFINUS, in *Biography*, ſurnamed by ſome authors *Toranius*, a celebrated eccleſiaſtical writer and ſcripture commentator, who flouriſhed in the fourth and fifth centuries, was probably a native of Aquileia, but the time of his birth is unknown. Having made choice of the eccleſiaſtical profeſſion, he was baptized in the year 369, and became a preſbyter of the church in that city. Here he contracted a moſt intimate friendſhip with St. Jerome, who, in his letters to his friends, extolled in the higheſt terms the virtues and ſanctity of Ruffinus, though at a later period he proved his moſt bitter enemy. In or about the year 371 Ruffinus quitted Aquileia, with the determination of devoting himſelf to the auſterities of the monaſtic life, under the monks in the deſerts of Egypt. Coming to Rome in his way to Africa, his deſign recommended him to the confidence of Melania, a Roman widow of noble family and vaſt opulence, who reſolved to accompany him to that country, and to expend her riches in the eſtabliſhment of monaſtic and charitable inſtitutions. In Egypt, Ruffinus ſpent ſeveral months in converſing with the monks, whoſe ſolitary cells were ſcattered throughout the deſerts of Nitria, and in attending the lectures of Didymus, maſter of the catechetical ſchool in Alexandria. By the Arians, who at this time were protected by the emperor Valens, Ruffinus was perſecuted, thrown into priſon, cruelly treated, and at length baniſhed to a diſtant deſert. His female friend, Melania, however, found means to purchaſe his redemption, and removed with him from Egypt into Paleſtine, where they viſited the holy place, and took up their reſidence at Jeruſalem. In this city, Ruffinus, ſupported by the munificence of his patroneſs, built a convent for upwards of fifty females, who renounced the world and devoted themſelves to a religious life, over whom Melania preſided. Connected with this convent were apartments for the accommodation of the pilgrims who came to viſit the holy city, and who were received, and hoſpitably entertained, at the expence of the foundreſs. Here Ruffinus ſpent all his leiſure time in ſtudy and compoſition. About the year 390, a violent quarrel aroſe between Epiphanius, and John, patriarch of Jeruſalem, concerning the opinions of Origen, in which Ruffinus took ſuch a part as to give great offence to his friend Jerome. Their friendſhip was now broken off, but was in a few years renewed through the mediation of Theophilus, patriarch of Alexandria. In the year 397, Ruffinus and Melania took their leave of Jeruſalem, and embarked for Italy.

Italy. Having arrived at Rome, Ruffinus almoſt immediately publiſhed a Latin verſion of the firſt book of the "Apology for Origen," which was followed by another piece, intended to prove that the works of Origen had been corrupted and interpolated, and a defence of him drawn up from his own letters. At this period our author publiſhed his tranſlation of Origen's "Book of Principles," with a preface, in which he applauded the high opinion which, in the earlier part of his life, Jerome had entertained of that author and his writings. This conduct was warmly reſented by Jerome, who publiſhed "An Apology" for himſelf, in which he attacked Ruffinus in the moſt acrimonious terms, treating him as a heretic. About the year 400 he publiſhed an eloquent and indignant reply to the accuſations in his "Two Books of Invectives." Ruffinus, whatever might be the nature of his arguments, was in other reſpects the leaſt powerful, and he thought it adviſeable to retire to Aquileia. He was ſummoned to Rome by Anaſtaſius, to vindicate himſelf againſt the accuſations of Jerome, but he did not think it fit to obey the ſummons, contenting himſelf with ſending a declaration of the conformity of his faith with that of the Catholic church, and ſtating that, with reſpect to his tranſlation of Origen's work, he had neither approved nor diſapproved, but barely refuted the ſentiments of that writer. Not ſatisfied with this declaration, Anaſtaſius condemned him as a heretic; but the papal anathema ſeems to have produced little effect on Ruffinus, ſince it did not prevent him from continuing his controverſy with Jerome, or interrupt his tranquillity or his ſtudies. In the year 410, the ravages of the Viſigoths in Italy, under Alaric, compelled him to fly from Aquileia, when he took refuge in the iſland of Sicily, where he appears to have died, either in the ſame or the ſucceeding year. Various characters have been given of this father. Moſheim obſerves, that "he would have obtained a very honourable place among the Latin writers of this century, had it not been his misfortune to have had the powerful and foul-mouthed Jerome for his adverſary:" and Dupin acknowledges, "that though very ill uſed by St. Jerome, he was one of the ableſt men in his time: perhaps he had not ſo much learning as that father, but his temper was better and leſs violent." His ſtyle is neat, and ſufficiently pure in point of latinity. In his commentaries on divers parts of the ſcriptures, he explains the text in an elegant and natural way, chiefly adhering to the literal ſenſe, without entangling himſelf in allegories. In his character of a tranſlator from the Greek to the Latin, he takes conſiderable liberties, but he honeſtly acknowledges them. His original works, beſides the pieces in controverſy with Jerome, already noticed, comprize commentaries on different parts of the Old Teſtament; two books of Eccleſiaſtical Hiſtory, added by him to his verſion of Euſebius, and continuing the hiſtory of the church to the death of the emperor Theodoſius. Other works have been aſcribed to him. The whole of what belongs to Ruffinus, excepting his apologies for Origen and declaration to Anaſtaſius, were publiſhed in a folio volume at Paris, in 1580. He tranſlated the works of Joſephus, the Eccleſiaſtical Hiſtory of Euſebius, and many other works from the Greek to the Latin. Moreri. Dupin. Moſheim.

RUFINUS, miniſter of ſtate to the emperors Theodoſius and Arcadius, was a native of Eluzzo, now named Eauſe, a town of France, in the department of Gers, according to the modern diviſions of that kingdom, which in the time of Rufinus was a celebrated city, and paſſing from the Romans to the Goths, was taken from them by Clovis. Rufinus was brought up to the profeſſion of the law, and being poſſeſſed of a bold and ready elocution, with much addreſs, and an advantageous perſon, he attracted ſome conſiderable ſhare of notice at the court of Conſtantinople, and about 390 was raiſed by Theodoſius to the poſt of maſter of the offices. In 392 he was nominated to the conſulſhip, with Arcadius for a colleague; and during the ſame year he was entruſted with the important poſt of prefect of the Eaſt. He diſguiſed his ambition and other vices under the maſk of piety, by which he ſecured the confidence of the emperor, and obtained the friendſhip of Ambroſe, and other dignified eccleſiaſtics. Having built a ſumptuous palace and church at Chalcedon, he aſſembled the moſt illuſtrious biſhops of the Eaſt to aſſiſt at the dedication, taking occaſion, at the ſame time, to receive the rite of baptiſm, which in that age was often deferred to a late period. By nature he was cruel and vindictive, and committed many atrocious acts: he ſtimulated his maſter to order the dreadful maſſacre of Theſſalonica: he procured the diſgrace and exile of the brave general Promotus, who had chaſtiſed his inſolence by a blow: and he effected the ruin of the prefect Tatianus, and the execution of his ſon Proculus, in order to make way for his own prefecture of the Eaſt. "The puniſhment of the two prefects," ſays Gibbon, "might, perhaps, be excuſed by the exceptionable parts of their own conduct: the enmity of Rufinus might be palliated by the jealous and unſociable nature of ambition. But he indulged a ſpirit of revenge, equally repugnant to prudence and to juſtice, when he degraded their native country of Lycia, from the rank of Roman provinces; ſtigmatized people with a mark of ignominy; and declared that the countrymen of Tatianus and Proculus ſhould ever remain incapable of holding any employment of honour or advantage, under the imperial government."

After the death of Theodoſius, in 395, Rufinus ſucceeded to abſolute authority over the Eaſtern empire, in the name of Arcadius, and he made uſe of his power for the gratification of his paſſions, eſpecially that of avarice. He exhibited a very remarkable inſtance of his arbitrary and violent conduct in the treatment of Lucian, who had purchaſed his favour, and the office of count of the Eaſt. This unfortunate perſon, whoſe adminiſtration is ſaid to have been exemplary, affronted the emperor's uncle by the refuſal of an unjuſt requeſt. On the complaint of Arcadius to Rufinus, the latter, without acquainting any one with his deſign, ſet off for Antioch, and performing the journey with great celerity, entered that capital in the dead of the night, and commanded the prefect to be brought before him. Without pretending to hear any thing in proof of his innocence, he cauſed Lucian to be ſcourged to death. In the mean time his own fall was rapidly approaching. To ſecure his authority, and with a view of raiſing himſelf to a partnerſhip in the empire, he had planned the marriage of his daughter to the emperor. But the chamberlain, Eutropius, contrived to place in his view Eudoxia, the beautiful daughter of Frank Bauto. He became enamoured at the ſight, and Rufinus, after his return, was mortified by the emperor's marriage with his daughter's rival. This diſappointment, and the fear of loſing the power which he poſſeſſed, inſpired him, it is ſaid, with plotting the deſtruction of his ſovereign, and with inviting the Huns and Goths to invade the empire, in order to create a general confuſion. The famous Stilicho was at this time omnipotent in the Weſtern empire as miniſter of the young Honorius, brother to Arcadius; and claiming from the appointment of Theodoſius the guardianſhip of both his ſons, he prepared to march into the Eaſt, in order to aſſert his authority there. At the head of the armies of both parts of the empire he had croſſed the Alps, and was near Theſſalonica, when Rufinus,

finus, dreading his approach, procured an order from Arcadius for the Eaftern forces to feparate from Stilicho and march to Conftantinople. The general did not venture to difobey, and placed them under the command of Gainas, the Goth, with whom he had concerted his plan. The army arrived before the capital of the Eaft, in November 395, and the emperor, with Rufinus, went out to meet it. At the diftance of a mile from the capital, in the field of Mars, the troops halted. Arcadius and his minifter advanced, according to an ancient cuftom, refpectfully to falute the power that fupported the throne. Rufinus expected that his partizans would take that opportunity of proclaiming him emperor, and had actually prepared the purple robe, diadem, and royal donative for the occafion. By the direction of Gainas, however, the wings wheeled round and inclofed their victim, and upon a fignal given, a foldier plunged his fword into his breaft. Rufinus fell, groaned, and expired at the feet of the affrighted emperor. His mangled body was abandoned to the brutal fury of the populace of both fexes, who haftened in crowds, from every quarter of the city, to trample on the remains of the haughty minifter, at whofe frown they had fo lately trembled. His right hand was cut off and carried through the ftreets of Conftantinople, in mockery, to extort the contributions for the avaricious tyrant, whofe head was publicly expofed, borne aloft on the point of a long lance. According to the favage maxims of the Greek republics, his innocent family would have fhared the punifhment of his crimes; but they fortunately took refuge in a fanctuary, which protected them from the raging madnefs of the people, and they were permitted to fpend the remainder of their lives in the exercifes of Chriftian devotions, as they were called, in the peaceful retirement of Jerufalem.

Rufinus is faid to have been well verfed in elegant literature, yet a poet has been the bittereft foe to his memory. Claudian has made him the fubject of two books of invectives, probably for the purpofe of ingratiating himfelf with Stilicho, the avowed enemy of Rufinus. Univer. Hift. Gibbon, vol. v.

RUFISCO, in *Geography*, a town of Africa, in the kingdom of Kayor, fituated on the fea-coaft. Its name is a corruption of "Rio-frefco," its Portuguefe appellation. It contains about 300 houfes, and the inhabitants carry on a confiderable trade with Europeans in flaves, fkins, gum, ivory, oftrich feathers, cotton, indigo, &c.; 60 miles W.N.W. of Amboul.

RUFS, a town of Pruffian Lithuania; 20 miles N.W. of Tilfit.

RUFTER-HOOD, among *Falconers*, a plain leathern hood, large and open behind, to be worn by a hawk when fhe is firft drawn.

RUFUMBA, in *Geography*, a town of Mombique, on the Suabo. S. lat. 6° 25′. E. long. 35° 30′.

RUFUS, the Ephefian, in *Biography*, a phyfician and anatomift of confiderable eminence, in the reign of the emperor Trajan, was apparently entitled to the reputation which he obtained by his extenfive knowledge and experience. Galen efteemed him one of the moft able of the phyficians who had preceded him. Rufus appears to have cultivated anatomy, by diffecting brutes, with great zeal and fuccefs. He traced the origin of the nerves in the brain, and confidered fome of them as contributing to motion, and others to fenfation. He even obferved the capfule of the cryftalline lens in the eye. He confidered the heart as the feat of life, and of the animal heat, and as the origin of the pulfe, which he afcribed to the *fpirit* of its left ventricle and of the arteries; and he remarked the difference in the capacity and thicknefs of the two ventricles. He deemed the fpleen to be a very ufelefs vifcus, and his fucceffors have never difcovered its ufe. He examined very fully the organs of generation, and the kidnies and bladder; he has left, indeed, a very refpectable treatife on the difeafes of the urinary organs, and the methods of cure. He alfo wrote a good work on purgative medicines, mentioning their different qualities, the countries from which they were obtained; and a little treatife on the names given by the Greeks to the different parts of the body. Galen affirms alfo that Rufus was the author of an effay on the *materia medica*, written in verfe; and Suidas mentions a treatife of his on the *atra bilis*, with fome other effays; but thefe are loft. See Sprengel, Gefchichte der Arzneikunde, 2 theil, p. 63; and Le Clerc, Hiftoire de la Médecine, part iii. p. 104.

RUFUVEILLE, in *Geography*, a town of France, in the department of the Channel; nine miles W. of Mortain.

RUGBY, a fmall market-town and parifh in the hundred of Knightlow, and county of Warwick, England, is fituated at the diftance of 19 miles E.N.E. from Warwick, 12 miles E. from Coventry, and $84\frac{1}{2}$ miles N.W. by N. from London. This place is called Rocheberie in Domefday-book, as Dugdale conjectures, from the word Roche, fignifying a rock, or quarry of ftone, and Berie, a court, or habitation of note. Hence it has been fuppofed to have been a town of importance in early Saxon times, but the records of its remote hiftory have entirely perifhed. After the Conqueft it formed part of the poffeffions of Turchil de Warwick, from whom it was held by one Eddulfus, whofe pofterity continued to enjoy it till the reign of Edward I., when it was conveyed, by marriage, to the family of Goband, from whom it paffed to the barons of Stafford. The fituation of Rugby is lofty, and commands an extenfive view over the adjacent country. The houfes are difpofed in the moft irregular manner, and are, in general, conftructed of wood. Here is a charity fchool, founded and endowed for the education of thirty boys, by Richard Elborow, efq.; alfo a grammar-fchool, which was founded by Laurence Sheriff, efq., in the ninth year of the reign of queen Elizabeth. The latter is a very important eftablifhment, and is under the direction of twelve truftees, who are appointed from among the nobility and principal gentry of the county. By judicious management the property of this fchool, though originally trifling, has become extremely valuable, yielding a rent of 2000*l.* *per annum*, and when the prefent leafes fhall expire, the rent will doubtlefs be confiderably increafed. The truftees hold regular meetings for the tranfaction of bufinefs; and in Auguft an annual examination of the pupils takes place before them. There are fourteen exhibitioners fent from this fchool to the univerfities, each of whom is allowed 40*l.* a-year. When vacancies occur, they are filled up at the annual examinations, which are attended by a member from both univerfities, appointed for the purpofe by the vice-chancellor. The fcholars at prefent amount to about 330 in number, of whom 50 are on the foundation. The old buildings of this fchool having been found unfuitable to its extended condition from the period of their erection, a new ftructure has been raifed nearly on the fame fcite, fince the year 1808. This edifice is built in the ftyle of architecture prevalent in the reign of queen Elizabeth, when the fchool was founded, and is admirably adapted to the purpofes for which it was erected. It is compofed of white brick, but the angles, cornices, and dreffings to the windows and entrances, are of ftone. The principal front extends 220 feet in length, and has a tower gateway in the centre, which leads into the principal court, a fine area 90 feet long, by 75 wide, with a plain cloifter on three fides.

On the south side of the court are, the dining-hall for the boys in the head-master's house, and three schools for different classes; the west side is occupied by the great school, and that on the north by the French and writing schools. The head-master's house is placed at the eastern end of the south front; and between it and the schools is a range of building, divided into small apartments, appropriated to the use of the students. About sixty boys are thus accommodated; the remainder lodge with the other master, or at boarding-houses in the town. This building was designed and erected by Henry Hakewill, esq., architect.

The church of Rugby is not worthy of notice, but the church-yard is remarkable for various eccentric inscriptions. The market-day here is Saturday, weekly; and fairs are held on the 17th February, 31st March, 15th May, 7th July, 21st August, Monday before the 29th of September, 22d November, and 10th December. No manufacture of any importance is carried on in this town, but it has acquired a small trade for the supply of the adjacent country, since the formation of the Oxford canal, which passes about a mile to the northward, and forms a branch of the system of inland navigation, which connects all the principal rivers and towns in England.

Adjoining to Rugby, on its north-eastern side, is an eminence called Castle mount, from the circumstance of its having been formerly the scite of a castle. Dugdale is of opinion that this fortress was one of those erected in king Stephen's time, when he was threatened with invasion by the empress Maud, whose crown he had usurped. It was most probably demolished by order of king Henry II. in the third year of his reign. The only vestiges of it now visible are parts of the moat and some embankments.

According to the parliamentary returns for 1811, Rugby parish contains 335 houses, and 1805 inhabitants, of whom nearly 1000 reside in the town. The Antiquities of Warwickshire, &c. by William Dugdale, fol. London, 1657. Beauties of England and Wales, vol. xv. 1814, by I. N. Brewer.

RUGEL, a town of Baden, near the Rhine; 10 miles N.N.W. of Friburg.

RUGEN, an island in the Baltic, separated from the coast of Pomerania, by a strait not above a mile wide; about 60 miles in circumference, without including the indentations of the coast. Its name is said to be derived from the Rugi, who first inhabited the Pomeranian coast beyond the Oder, but afterwards removed on this side of that river, taking up their chief residence in the country called after their name. On the decease of the last prince of Rugen, duke Wartislav XI., in 1478, Rugen became united with Pomerania. In 1168 it was subdued by Waldemar I., king of Denmark, its temple was demolished, the pagan worship suppressed, and Christianity established. There the divines of Rugen became vassals to the crown of Denmark. At the treaty of Westphalia, Rugen was added to Sweden, as a particular principality. At the peace of Roschild in 1658, and also at that of Copenhagen in 1660, Denmark ceded to Sweden the whole jurisdiction, civil and ecclesiastical, which it had previously exercised over certain lands in the principality of Rugen. This island is not only encompassed by the sea, but so penetrated by it, that several other islands and peninsulas are thus formed. The soil is fruitful, particularly in all kinds of grain, so that some thousands of lasts are annually shipped off for Stralsund. It breeds likewise large stocks of cattle, and yields a large quantity of fish; but Pomerania supplies it with fuel. The nobility are numerous, and invested with considerable privileges. The president of the provincial tribunal, who must be a native, and a nobleman, is the prefect or governor, and he is assisted in the administration by a secretary and purveyor. Rugen contains 27 parishes, and 21,240 inhabitants. Its capital is Bergen. N. lat. 54° 30′. E. long. 13° 30′.

RUGENWALDE, a town of Hinder Pomerania; 20 miles N.E. of Cosslin. N. lat. 54° 33′. E. long. 16° 7′.

RUGGA, a town of Africa, in Tunis, anciently called "Carago;" 40 miles S. of Cairoan.

RUGGARD, a town of Denmark, in the island of Funen; 10 miles W. of Odensee.

RUGGED Isle, a small island near the S. coast of Ireland, and county of Cork. N. lat. 51° 30′. W. long. 9° 2′.

Rugged *Point*, a cape on the N. coast of Cumbava. S. lat. 8° 9′. E. long. 118° 58′.

RUGGIOLA, a sort of Spanish slate, serving in many places in the room of tiles and brick. It is a flaky stone of the nature of some of our grey slates, and is cut out of a mountain near Cordova; a plate of this being well heated on both sides, will retain its warmth for twenty-four hours.

The people of Cornwall and some parts of Yorkshire use a stone, which is of a talcky nature, to warm themselves when in bed, applying it at the feet of the bed. This they call the warming stone, from its use, and it will retain a sensible heat six or eight hours, after once moderately warming. Plot's Oxfordshire, p. 258.

RUGLERSREUT, in *Geography*, a town of Saxony, in the principality of Culmbach; three miles N. of Gefrees.

RUGLES, a town of France, in the department of the Eure, and chief place of a canton, in the district of Evreux; 21 miles S. of Evreux. The place contains 1564, and the canton 12,105 inhabitants, on a territory of 240 kiliometres, in 26 communes.

RUGLEN. See Rutherglen.

RUGMAN, Jonas John, in *Biography*, a learned Icelander, was born in 1636, and received his early education at the school of Hulum. He afterwards set out for Copenhagen, in order that he might enter himself at the university, but Denmark and Sweden being, at that time, engaged in war, he was made prisoner on the way, in 1658, and carried to Gottenburg, where he was patronized by a person named Brahe, who placed him at Wissenborg school, whence he was sent to the academy of Upsal, with a pension from the king. He became acquainted with Olof Verelius, the Swedish historian and antiquary, who, immediately after the peace, sent him to Copenhagen, and thence to Iceland, for the purpose of collecting ancient manuscripts, a great number of which he brought to Sweden. He went again to Copenhagen in 1665, and brought back with him a transcript of Oluf Trygvessen's History, "Ex Codice Wormiano Membranaceo." When the college of antiquities was established at Upsal in 1667, he was one of the earliest members, but died in two years afterwards, at the age of 43. He was author of many learned works, the titles of which are given in the General Biography. Among them may be mentioned "Fragmenta quædam Legum veterum collecta ex diversis Scriptoribus et Historiis, Lingua eadem;" "Versio Svetica Historiæ Veteris Islandica Lingua scriptæ de Regibus Norvagorum, quæ vulgo Konuriga-Sagur nuncupantur." Gen. Biog.

RUGOSUM, Folium, in *Botany*. See Leaf.

RUGUPORUM, in *Geography*, a town of Hindoostan, in Golconda; 25 miles S.W. of Warangole.

RUHELAND, a town of Germany, in the principality of Blankenburg; five miles S.S.W. of Blankenburg.

RUHLA,

RUHLA, a town of Saxony, in the principality of Eifenach, celebrated for its manufacture of knives; four miles S. of Eifenach.

RUHLAND, or RULAND, a town of Upper Lufatia, on the river Elfter; 27 miles N. of Drefden. N. lat. 51° 27'. E. long. 13° 50'.

RUHNKEN, DAVID, in *Biography*, an eminent critic, was born in 1723, at Salop, in Pomerania, of parents in a reputable fituation of life. He received the early part of his education at his native place, after which he went to the Frederician college at Konigfberg, from whence, at 18, he proceeded to the univerfity of Wittemberg, where he paid particular attention to the lectures of Ritter on jurifprudence and hiftory, and thofe of Berger on Roman eloquence and antiquities; he did not, however, neglect other important branches of ftudy, *viz.* the mathematics and philofophy. He was intended, by his parents, for the church, and they were defirous that he fhould conclude his ftudies with a courfe of theology; but the ardour which he had imbibed for philological enquiries induced him to repair to Leyden, where the learned Hemfterhuys was then in the height of his reputation. To this profeffor he particularly attached him-felf, who, in return, recommended him feveral private pupils. Ruhnken refolved to fettle in that country, as well on account of the felect fociety, as of the philofophical liberty for which Holland was, at that period, peculiarly diftinguifhed. In the year 1749, being the fixth year of his refidence at Leyden, he firft made himfelf known as a critic by a Latin epiftle to the celebrated Valckenaer on Homer's hymns, and Hefiod, which was followed, in 1751, by another to Ernefti, on Callimachus and Apollonius Rhodius. Both of thefe difplayed confummate fkill in the Greek language, with great compafs of erudition and elegance of tafte. At this time, by the advice of Hemfterhuys, he renewed his ftudy of jurifprudence, in order to qualify himfelf for a profefforfhip, thofe of polite literature being pre-occupied; and in 1752 he edited fome Greek commentaries upon a part of the Code and Digeft with a Latin verfion and learned notes. He next edited "Timæi Lexicon Vocum Platonicarum," a piece which gave full fcope to that grammatical criticifm in which he particularly excelled. "This," according to the learned Brunk, "in the whole circle of Greek literature, is both the fhorteft and moft learned work." In the year 1755, Ruhnken vifited Paris, where he remained a year moft affiduoufly occupied in copying and collating MSS. in the public libraries. After his return, in 1757, he was appointed reader of the Greek in the univerfity, and upon this occafion he pronounced an oration "De Græcis Artium et Doctrinarum Inventrice." In four years after this, he fucceeded to the chair of hiftory and eloquence, delivering for his inaugural fpeech an oration "De Doctore Umbratico." By this appellation, fays his biographer, he meant to characterize the man of letters who confines himfelf to the *fhade* of his own fchool, furrounded by admiring fcholars, and fhunning the commerce of the world at large; and the picture which he drew was fo well delineated, that it gave offence to certain perfons who fuppofed it to be defigned as a portraiture of themfelves. About this period he refufed a profefforfhip at Gottingen, recommending Heyne to fill the office. In his forty-firft year he married a beautiful young woman of eighteen, by whom he had two daughters, but the comfort of this alliance was, in a few years, deftroyed by an apoplectic attack, which deprived his wife of fight and fpeech. He feems hitherto to have lived in a focial unfhackled manner, enjoying the company of his friends, and participating in all common amufements. He was remarkably fond of hunting, or rather courfing, a fport of which he was a great mafter, few furpaffing him in the breed of his greyhounds, or in agility in leaping over the water-ditches, fo frequent about Leyden. This paftime, apparently fo very uncongenial to a literary mind, he continued almoft to the laft year of his life, and he thought it enabled him to refume his ftudies with peculiar fpirit and effect. In the year 1767 he was Rector Academiæ, and on quitting his office he pronounced a very elegant eulogy on Hemfterhuys, who had died in the preceding year. In 1774 he was made librarian to the univerfity, in which ftation he took great pains in making additions to the ftock of valuable books. He preferved his health to an advanced age, till at length he became fubject to catarrhal and dropfical complaints, under which he funk in May 1798, in the 76th year of his age. He was the editor of many learned works, among which are the following: "Rutilius Lupus," with "Aquila Romanus," and "Julius Rufianus;" "De Figuris fententiarum;" "De Vita et Scriptis Longini;" "Velleius Paterculus;" "Homer's Hymns;" a very much enlarged edition of "Timæi Lexicon;" an edition of the "Works of Muretus:" the two laft were publifhed in the year 1789. He afterwards employed himfelf in an edition of the Scholiafta of Plato; and an improved edition of Scheller's Latin dictionary. This learned man placed all his glory in philological acquirements, which he feemed to regard as the higheft fpecies of knowledge. He not only made very light of theological ftudies himfelf, but difcouraged them in all young men who poffeffed ftrong natural talents and promifing abilities. A very tenacious memory had ftored his mind with a vaft mafs of critical matter, efpecially of every thing that related to grammar, which he applied with much clearnefs and fagacity. He was one of the moft correct Grecians of his age, and was furpaffed by none in the purity and elegance of his latinity, both in fpeaking and writing. He left very little property behind him, excepting a library, rich in valuable printed books and manufcripts, which were purchafed by the ftates of Holland for the univerfity of Leyden, upon the condition of annuities for life to his widow and daughters.

RUHR, in *Geography*. See ROER.

RUHRORT. See ROERORT.

RUHTE, a town of Weftphalia, in the bifhopric of Hildefcheim, at the conflux of the rivers Innerfee and Leine; feven miles N.W. of Peine.

RUJAMPET, a town of Hindooftan, in Tellingana; 22 miles S. of Ramgur.

RUIB, a fmall ifland in the Pacific ocean, near the coaft of Waygoo. N. lat. 0° 4'. E. long. 130° 20'.

RUIJUEAH, a town of Hindooftan, in Lahore; 36 miles W. of Lahore.

RUINART, THIERRY, in *Biography*, a learned French writer, who flourifhed at the clofe of the 17th and at the beginning of the 18th centuries, was born at Rheims in the year 1657. When very young he took the habit among the Benedictine monks of the congregation of St. Maur, and, after going through the ufual courfe of philofophy and divinity in the abbey of St. Peter at Meaux, devoted his chief attention to the ftudy of the facred fcriptures, the fathers, and the ancient ecclefiaftical writers. Thefe branches of learning he cultivated with fo much ardour and fuccefs, that he was foon felected by father Mabillon to be his affiftant in his learned labours. In 1689 he fhewed his talents as an author, by publifhing at Paris "Acta primorum Martyrum fincera et felecta, collecta et edita cum notis," with a learned preface, in which

which he undertakes to refute the hypothefis of Dodwell, "De paucitate Martyrum." This work was feveral times reprinted with confiderable additions. The next publication was an improved edition, in 1694, of "Victoris Vitenfis Hiftoria Perfecutionis Vandalicæ." In 1699 he publifhed a new and greatly efteemed edition of "S. Gregorii Turgonenfis Epifcopi, Opera Omnia, necnon Fredegarii Scholaftici Epitome et Chronicon cum fuis continuatoribus et aliis antiquis Monumentis:" he was the author and editor of many other works, and in 1709 he publifhed a fketch of the "Life of Father Mabillon," and he died in the fame year at the age of 52. His works afford abundant evidence that he was a man of deep refearch and profound learning: they recommend themfelves by their accuracy, perfpicuity, and neatnefs of ftyle. The author, however, was not more refpected for his learning, than he was efteemed for his humility, modefty, and piety.

RUINES, in *Geography*, a town of France, in the department of the Cantal, and chief place of a canton, in the diftrict of St. Flour; fix miles E.S.E. of St. Flour. The town contains 649, and the canton 7994 inhabitants, on a territory of 275 kiliometres, in 15 communes.

RUININE OIL, a name given by fome authors to the oil of the palma Chrifti, which is very common in the Weft Indies, and is ufed by the common people in lamps. It is a delicate, fweet, and tranfparent oil, and has no peculiar operation in phyfic. They often give it in glyfters from one fpoonful to three at a time, and it has only the effect of common oil; but the leaves of the plant are one of the grand medicines of the Negroes; bruifed and applied to the head, they are thought to be an almoft infallible remedy for the head-ache, of whatever kind, or from whatever caufe. See CASTOR-*Oil*.

RUINS, a term particularly ufed for magnificent buildings fallen to decay by length of time, and of which there only remains a confufed heap of materials.

Such are the ruins of the tower of Babel, of the tower of Belus, two days journey from Bagdat, in Syria, on the banks of the Euphrates; which are now no more than a heap of bricks, cemented by bitumen; and of which we only perceive the plan to have been fquare.

Such alfo are the ruins of a famous temple, or palace, near Schiras, in Perfia, which the antiquaries will have to have been built by Ahafuerus; and which the Perfians now call Tchelminar, or Chelminar; *q. d.* the forty columns; becaufe there are fo many columns remaining pretty entire, with the traces of others; a great quantity of baffo relievos, and unknown characters, fufficient to fhew the magnificence of the antique architecture. The ruins of Palmyra may alfo be reckoned in the clafs of famous ruins.

RUISCH, RACHEL, in *Biography*, was born at Amfterdam in 1664, the daughter of Frederick Ruifch, or Ruyfch, the celebrated profeffor of anatomy. The very early difpofition fhe exhibited for drawing flowers, and the extreme accuracy and minutenefs with which fhe had copied prints without affiftance, induced her father to place her under the tuition of William Van Aelft, an eminent flower-painter.

In a few years fhe became the rival of her mafter, and at length furpaffed him; and indeed, as far as a neat and correct imitation of a fingle flower, a leaf, or an infect goes, fhe has been equalled by few. The great defect in her productions is a want of combination, the parts being feparated, and the maffes weak; which is the more to be lamented, as her choice of objects was remarkably elegant, and her manner of treating them perfection itfelf, even to illufion.

Her extraordinary talents recommended her to the peculiar patronage of the elector palatine, who in 1708 appointed her his paintrefs; and he was fo great an admirer of her works, that he poffeffed a confiderable portion of them, and rewarded their author munificently. She continued to exercife her talents, with almoft unimpaired fuccefs, to a very advanced period of her exiftence, and died at Amfterdam in 1750, at the age of 86.

RUISSEAU, GRAND, in *Geography*, a fettlement in the Indiana territory, on the left bank of the Miffifippi.

RUISSKAR, a fmall ifland on the eaft fide of the gulf of Bothnia. N. lat. 61° 24′. E. long. 21° 8′.

RUIVAINS, a town of Portugal, in the province of Tras os Montes; nine miles S. of Montalegre.

RUIZIA, in *Botany*, named by Cavanilles in honour of Don Hippolito Ruiz, a Spanifh botanift, who ftudied under the celebrated Mutis in South America, and who in conjunction with Pavon, another pupil of Mutis, publifhed the fplendid *Flora Peruviana*.—Cavan. Diff. 3. 117. Schreb. 466. Willd. Sp. Pl. v. 3. 798. Ait. Hort. Kew. v. 4. 221. Juff. 275.—Clafs and order, *Monadelphia Polyandria*. Nat. Ord. *Columniferæ*, Linn. *Malvaceæ*, Juff.

Gen. Ch. *Cal.* Perianth inferior, double; outer of three, ovate, concave, acute, deciduous leaves; inner of one leaf, permanent, cloven into five, lanceolate fegments. *Cor.* Petals five, obliquely fickle-fhaped, rounded at the tip, undivided, flat, fpreading, faftened to the bundle of ftamens. *Stam.* Filaments numerous, generally from thirty to forty, fhorter than the corolla, united at their bafe into the form of a pitcher, inclofing the germen; anthers oblong, incumbent. *Pift.* Germen fuperior, globofe, ten-furrowed; ftyles ten, fhort; ftigmas fimple. *Peric.* Capfules ten, compreffed, membranaceous, woody on the back, boat-fhaped, of one cell, united into a globular, umbilical whorl. *Seeds* two, roundifh, or flightly triangular, pointed.

Obf. This genus is nearly akin to ASSONIA; fee that article.

Eff. Ch. Calyx double; outer of three leaves. Styles ten. Capfules ten, of one cell, with two feeds, and difpofed in a circle.

1. R. *cordata*. Heart-leaved Ruizia. Willd. n. 1. Cavan. Diff. t. 36. f. 2.—Leaves heart-fhaped, lanceolate, wavy.—Native of the Ifle of Bourbon, where it flowers in March and April. *Stem* fhrubby, branched. *Leaves* alternate, ftalked, numerous, ovate, pointed, notched. *Stipulas* awl-fhaped, whitifh, powdery, deciduous. *Flowers* in umbel-like terminal corymbs, fulphur-coloured, each on a fhort ftalk.

2. R. *lobata*. Lobed Ruizia. Willd. n. 2. Cavan. Diff. t. 36. f. 1.—Leaves heart-fhaped, five-lobed, notched.—Found alfo in the Ifle of Bourbon, flowering in February and March. A handfome *fhrub*, five or fix feet high, much branched, with a greyifh-white *bark*. *Leaves* crowded together at the extremities of the branches, alternate, ftalked, fmooth above, white and dufty beneath, the older divided into five, rarely into feven, lobes. *Stipulas* awl-fhaped, erect, downy or powdery, deciduous. *Flowers* like thofe of the above fpecies in form and colour.

3. R. *variabilis*. Various-leaved Ruizia. Willd. n. 3. Jacq. Hort. Schoenbr. v. 3. 24. t. 295. (R. palmata and R. laciniata; Cavan. Diff. t. 37. f. 1, and 2.)—Leaves of the flowering branches palmate; thofe of the barren ones digitate.—Native of the Ifle of Bourbon, and introduced at Kew, in 1792, where it flowers in May. A very handfome *fhrub* of rather humble, but diffufe, growth. *Stems* wavy, furrowed, brown. *Leaves* alternate, ftalked, dark green above, whitifh underneath, extremely curious for the variety

variety of their ſhape, expreſſed in the ſpecific character, and which is admirably ſhewn in Jacquin's figure. *Flowers* in umbel-like corymbs, of a pale red or crimſon colour, with deep red claws. The name of this is by miſtake engraved *R. diverſifolia,* inſtead of *variabilis* in Jacquin's plate.

In Commerſon's MSS. this genus was called *Kænigia.*

RUKHADORFF, in *Geography*, a town of Auſtria; four miles N.N.E. of Sonneberg.

RUKI, a town of Mingrelia, in which the palace of the prince is ſurrounded with a thick wall, ſeated on a river which runs into the Black ſea; 200 miles W. of Teflis.

RUKKIA, in *Zoology*, a name given by ſome to a peculiar kind of ſquirrel, found in the iſland of Ceylon.

RUKMENI, in *Hindoo Mythology*, is the name of one of the wives of Kriſhna, who being an incarnation of Viſhnu, his heavenly conſort Lakſhmi, is repreſented to have alſo deſcended in this form of Rukmeni to accompany him. In many authorities ſhe appears to be the ſame perſon as Radha, Kriſhna's favourite wife: but others make a difference, ſtating that Rukmeni was his legal worldly wife, and that Radha is a perſonification of religion. Others again ſay, that Rukmeni was the ſpiritual ſpouſe. If, however, it be admitted, that ſuch a perſon as Kriſhna ever exiſted, we may farther admit, that he had a plurality of wives, and that the two women in queſtion were among them. A liſt of his wives, eight in number, will be found under KRISHNA. Rukmeni is uſually the firſt on the liſt. She is ſaid to have been the daughter of a Raja Bhiſhmaka; and another of her names is Kantamati. On the death of Kriſhna, Rukmeni, with ſeveral others of his wives, burnt themſelves, in view to an immediate reunion with their lord in Vaikontha, the paradiſe of Viſhnu. This ſelf-immolation is called *Sati*; and under that article ſome account is given of it. Rukmeni is related to have borne a ſon to Kriſhna, of whom very frequent mention is made in Hindoo writings, being no other indeed than Kama, the god of love, incarnated in the perſon of their ſon Pradyamna. As the mother of the Hindoo Cupid, we here find Lakſhmi (recollecting that Rukmeni is that goddeſs in another form) correſponding, as in many other inſtances, with the Venus of Weſtern mythologiſts. See KAMA, LAKSHMI, PRADYAMNA, and RETI, for farther notice of theſe fables. Under KRISHNA, RADHA, and VAIKONTHA, will alſo be found ſome particulars connected with the ſubjects of this article. It may be farther noticed, that in temples dedicated to the worſhip of Kriſhna, ſtatues of Rukmeni are commonly ſeen. Caſts, ſaid to be of her, are alſo common. In other *avataras*, or *deſcents* of Viſhnu, his conſort is ſaid to have accompanied him under the name of Rukmeni. See hereon under WITTOBA.

RULE, or RULER, *Regula*, a very ſimple inſtrument, ordinarily of hard wood, thin, narrow, and ſtraight, ſerving to direct the drawing of right lines.

The rule is of principal uſe in all the mechanical arts.

To prove whether or no it be juſt, draw a line by it on paper; then turn the rule about, the right end to the left, and apply the ſame edge this way to the line; if the edge now agree exactly with the line, the ruler is true.

Deſmarets has a fine poem on the amours of the rule and compaſs. The ſtone-cutters' rule is uſually four feet long, and divided into feet and inches.

The maſons' rule is twelve or fifteen feet long, and is applied under the level to regulate the courſes, to make the piedroits equal, &c.

RULE, *Parallel*, or *Ruler*. See PARALLEL.

RULE is alſo applied to certain inſtruments which have other conſiderable uſes beſides that of drawing lines. Such are the carpenters' joint-rule, Everard's and Coggeſhall's ſliding-rules, &c.

RULE, *Carpenters' joint*, is an inſtrument uſually of box, 24 inches long, and $1\frac{1}{2}$ broad, each inch being ſubdivided into eight parts. On the ſame ſide with theſe diviſions is uſually added Gunter's line of numbers.

On the other ſide are the lines of timber and board-meaſure, the firſt beginning at $8\frac{1}{2}$, and continued to 36, near the other end; the latter is numbered from 7 to 36, 4 inches from the other end. (*Plate* VI. *Surveying*, *fig.* 14.) The diviſion of the timber-line is formed from a conſideration, that 1728 inches make a ſolid foot, in the following manner: thus, 9 is ſo placed againſt one of the diviſions of inches, or parts on the other ſide of the rule, beginning from the right hand, that its ſquare, which is 81 inches, multiplied by that number of inches and parts, muſt make 1728 inches; which, dividing 1728 by 81, muſt be placed againſt $21\frac{1}{3}$ from the right hand; and 10 muſt be placed againſt $17\frac{28}{100}$ inches; becauſe 1728 divided by the ſquare of 10 or 100, gives $17\frac{28}{100}$, &c. But becauſe a ſquare whoſe ſide is 1, 2, &c. to 8 inches, requires more than 24 inches in length, as a multiplier, in order to produce 1728 inches; and ſince the length of the rule is only 24 inches, there is a table upon the left end of it, which ſupplies its defect of length. In this table the upper row of figures, *viz.* 1, 2, 3, 4, 5, 6, 7, 8, denotes inches, or the lengths of the ſides of ſquares; and the ſecond and third rows are the correſpondent feet and inches to make up a ſolid foot. It is made by dividing 144 inches by the ſquares of 1, 2, 3, 4, 5, 6, 7, 8.

The line of board-meaſure is thus divided: ſuppoſe the diviſion 7 to be marked; divide 144, the number of inches in a ſquare foot, by 7, and the quotient will be $20\frac{4}{7}$ inches; whence the diviſion 7 muſt be againſt $20\frac{4}{7}$ inches on the other ſide of the rule. To mark the diviſion 8, divide 144 by 8, and the quotient, which is 18 inches, muſt be placed on the line of board-meaſure againſt 18 inches on the other ſide, &c. But becauſe the ſide of a long ſquare, that is, 1, 2, 3, 4, 5 inches, requires the other ſide to be more than 24 inches, the whole length of the rule; there is a table annexed, formed by dividing 144 inches by each of the numbers in the upper row, and then each of the quotients by 12, to reduce them into feet.

RULE, *uſe of the carpenters' joint.* The application of the inches in meaſuring lengths, breadths, &c. is obvious. That of the Gunter's line, ſee under GUNTER's *Line.* The uſe of the other ſide is all we need here illuſtrate.

1. *The breadth of any ſurface, as board, glaſs, &c. being given, to find how much in length makes a ſquare foot.*—Find the number of inches the ſurface is broad, in the line of board-meaſure, and right againſt it, on the inches ſide, is the number of inches required. Thus, if the ſurface were 8 inches broad, 18 inches will be found to make a ſuperficial foot.

Or, more readily, thus. Apply the rule to the breadth of the board or glaſs, that end marked 36 being even with the edge; the other edge of the ſurface will ſhew the inches and quarters of inches which go to a ſquare foot.

To find the content of a given ſurface. Find the breadth, and how much makes one foot; then turn that over as many times as you can upon the length of the ſurface, and ſo many feet does the ſurface contain.

2. *Uſe of the table at the end of the board-meaſure.* If a ſurface be one inch broad, how many inches long will make a ſuperficial foot? Look in the upper row of figures for

1 inch, and under it, in the second row, is 12 inches, the answer to the question.

3. *Use of the line of timber-measure.* This resembles the former; for, having learnt how much the piece is square, look for that number on the line of timber-measure; the space thence to the end of the rule is the length, which, at that breadth, makes a foot of timber. Thus, if the piece be 9 inches square, the length necessary to make a solid foot of timber is $21\frac{1}{3}$ inches. If the timber be small, and under 9 inches square, seek the square in the upper rank of the table, and immediately under it are the feet and inches that make a solid foot. Thus, if it be 7 inches square, 2 feet 11 inches will be found to make a solid foot.

If the piece be not exactly square, but broader at one end than another, the method is, to add the two together, and take half the sum for the side of the square. For round timber, the method is, to girt it round with a string, and to allow the fourth part for the side of the square. But this method is erroneous; for hereby you lose above $\frac{1}{5}$th of the true solidity. See Sliding *Rule* and Timber.

Rule, *Caliber.* See Caliber.

Rule, *Everard's sliding.* } See Sliding *Rule.*
Rule, *Coggeshall's sliding.* }

Rule, *Regula,* also denotes a certain maxim, canon, or precept to be observed in any art or science. Thus we say, the rules of grammar, of logic, of philosophizing, &c.

School philosophers distinguish two kinds of rules; *viz. theoretical,* or *rules of knowing,* which relate to the understanding, being of use in the discovery of truth; and *practical,* or *rules of acting,* which relate to the will, and serve to direct it to what is good and right.

For the management and application of these two sorts of rules, there are two distinct arts; *viz. logic* and *ethics:* see each respectively.

Rules *of knowing, regulæ sciendi,* are such as direct and assist the mind, in perceiving, judging, and reasoning.

Rules *of acting, regulæ agendi,* are those by which the mind is guided in her desires, pursuits, &c.

Authors are extremely divided about the regard to be had to the rules of poetry fixed by the ancients, Aristotle, Horace, Longinus, &c. and admitted by the modern critics, as Bossu, &c. some contending, that they must be inviolably observed; others pleading for liberty to set them aside on occasion. Rules, it is complained, are fetters; rank enemies to genius; and never religiously observed by any, but those who have nothing in themselves to depend on. Voiture frequently neglected all the rules of poetry, as a master who scorned to be confined by them.

The theatre has its particular rules, as the rule of twenty-four hours, the unities of action, time, and place, &c. If it be true, says Moliere, that plays conducted according to the rules do not please, but those which are not, do, the rules must be naught. For myself, when a thing hits and diverts me, I do not enquire whether I have done amiss, nor whether Aristotle's rules forbid me to laugh.

Rules *of philosophizing.* See Philosophizing.

Rule, in *Arithmetic,* denotes a certain method of performing particular arithmetical operations, as the rules of addition, subtraction, multiplication, and division; which four are called the fundamental rules of arithmetic, all other operations being dependant on one or more of these. See Addition, Subtraction, &c.

From the combination of these rules various others are derived, and, we must add, many more than ought to be distinctly characterized. Thus, our writers on arithmetic give us the rules of barter, simple interest, brokerage, factorage, rebate and discount, exchange, tare and tret, and a vast variety of others, which are, in fact, only so many examples in the rule of proportion (or, as it is commonly called, the rule of three), and ought, therefore, to be included under that general term.

At a time when arithmetic and geometry formed almost the only subjects of a mathematical education, long spun-out treatises of arithmetic, and extensive elementary works on geometry, were at least excusable; but since the improvements that have been made in analysis, the two former subjects form but a very small part of what is necessary to be known, for a person to have any pretensions to the character of a mathematician; and it is, therefore, astonishing that writers on those subjects, particularly those on arithmetic, have not thought of contracting their works, by condensing under one head a number of different rules, now given under distinct titles, and transforming others, such as position, alligation, &c. to introductory treatises on algebra, to which branch they more properly belong. By a judicious arrangement of this kind, the two subjects of arithmetic and elementary algebra might be very well condensed into the usual size of an arithmetic, and a boy be made to acquire a competent knowledge of both subjects, in less time than is usually employed in taking him through arithmetic only.

Rule *of Three,* or *Rule of Proportion,* by some former writers called also the *Golden Rule,* is one of the most extensive and useful rules in arithmetic, teaching how to find a fourth proportional to three given numbers.

The rule of three has commonly been divided into two cases, *direct* and *inverse,* a distinction, however, which is totally useless, and which has been avoided by some of our best modern writers; it may not, however, be amiss to explain, in this place, the difference that was formerly understood between the direct and the inverse rule of three.

The *rule of three direct,* is when more requires more, or less requires less, as in this example. If 3 men will perform a piece of work, as, for instance, dig a trench 48 yards long in a certain time, how many yards will 12 men dig in the same time? Here it is obvious, that the *more* men there are employed, the *more* work will they perform; and therefore, in this instance, more requires more. Again; if 6 men dig 48 yards in a given time, how much will 3 men dig in the same time? Here less requires less; for the *less* men there are employed, the *less* will be the work done in the same time. And all questions falling under either of these cases are said to be in the rule of three direct.

The *rule of three inverse,* is when more requires less, or less requires more, as in this example. If 6 men dig a certain quantity of trench in 14 hours, how many hours will it require for 12 men to dig the same quantity? Or thus: If 6 men perform a piece of work in 7 days, how long will 3 men be in performing the same work? These examples are both in the inverse rule; for in the first, more requires less, that is, 12 men being *more* than 6, they will require *less* time to perform the same work; and in the latter, the number of men being *less,* they will require a *longer* time. All questions of this class are said to be in the rule of three inverse. These two cases, however, as we before observed, may be included under one general rule, as follows.

Rule.—Of the three given terms, set down that which is of the same kind with the answer towards the right hand; and then consider, from the nature of the question, whether the answer will be more, or less, than this term. If the answer is to be greater, place the less of the other two terms on the left, and the remaining term in the middle; but if it is to be less, place the greater of the two given quantities on the left, and the less in the middle; and in either case, multiply the second and third terms together, and divide by the first term for the answer, which will always be of the same denomination as the third term.

 Not

Note 1.—If the firſt and ſecond terms contain different denominations, they muſt both be reduced to the ſame denominations; and if the third term be a compound number, it is generally moſt convenient to reduce it to the loweſt denomination contained in it.

Note 2.—The ſame rule is applicable, whether the given quantities be integral, fractional, or decimal.

Examples.

If an acre of land be worth 73*l.* 1*s.*, how much land may be bought for 250*l.* 10*s.*?

Integral.

£ s. : £ s. :: Acre.
As 73 1 : 250 10 :: 1
20 20

1461 : 5010 :: 1

In many caſes of commerce and accompts, we have more compendious ways of working queſtions that come under the rule of three than by the rule itſelf; which, by reaſon of their expediting practice, are called *practice*, and conſtitute a particular rule of themſelves.

According to the above rule, it will be obſerved, that the third term is of the ſame kind or name as the fourth term or anſwer, and the ſecond of the ſame name with the firſt; ſo that the analogy in both pair of terms is between quantities of the ſame kind; which is, in fact, neceſſary to conſtitute a proportion, according to Euclid's definition: whereas, by ſome ſtrange overſight, it will be found that moſt of our writers on arithmetic, by making the middle term like the anſwer, have neceſſarily to conſider the ratio of incongruous quantities, or at leaſt the ratio between the abſtract numbers by which they are expreſſed.

Rule *of Compound Proportion*, or *Double Rule of Three*, or, as it is otherwiſe called, the *Rule of Five*, is the method of ſolving, at one operation, ſuch queſtions as would require two or more ſtatings by the common or ſimple rule of three.

Rule.—1. Set down the terms expreſſing the condition of the queſtion, in one line. 2. Under each conditional term ſet its correſponding one in another line. 3. Multiply the producing terms of one line, and the produced term of the other line continually, and take the reſult for a dividend. 4. Multiply the remaining terms continually, and let the product of them be a diviſor. 5. The quotient of this diviſion will be the term required.

By producing terms here, are meant whatever neceſſarily and jointly produce any effect; as the cauſe and the time; length, breadth, and depth; buyer and his money; ſeller and his goods; all neceſſarily inſeparable in producing their ſeveral effects.

In a queſtion where a term is underſtood, and not expreſſed, that term may be expreſſed by unity.

Example.—If 250*l.* ſerve ſix perſons for nine months; how long will 1000*l.* ſerve four perſons at the ſame rate?

Here the terms which exprefs the condition are,

	£	Per.	Mon.
	250 :	6 :	9
correfponding terms	1000 :	4 :	Q

where Q is put to reprefent the term required.

Among the conditional terms, fix perfons and nine months are producing, and 250*l.* is produced: among their correfponding terms, four perfons and Q are producing, and 1000*l.* is produced.

But it being impoffible to multiply the producing terms in the fecond line, and the produced in the firft, becaufe Q is unknown; therefore, multiply the producing terms of the firft line by the produced in the fecond, and divide by the product of the reft.

Then will $Q = \frac{6 \times 9 \times 1000}{4 \times 250} = 6 \times 9 = 54$. See Mr. Dodfon's Anti-Logarithmic Canon, p. 38, et feq.

But if the notion of producing and produced terms fhould feem obfcure, thofe who have a knowledge of the doctrine of compound ratios will eafily perceive that, in the foregoing queftion, Q is to 9 months in the compound ratio of four perfons to fix perfons inverfely, and of 1000*l.* to 250*l.* directly, that is, $\frac{Q}{9} = \frac{6}{4} \times \frac{1000}{250}$, therefore $Q = \frac{6 \times 9 \times 1000}{4 \times 250} = 54$, as before. And in like manner may other queftions, relating to the compound rule of proportion, be ftated and folved, however complex.

The above rule may be expreffed fomewhat fimpler, as follow:

Rule 2.—Set that term, which is of the fame kind with the anfwer, on the right, and take any two of the other given terms which are of the fame name, and confider, from the nature of the queftion, whether, if thefe three were the only given terms, the anfwer ought to be more or lefs than the above-mentioned right-hand term, and arrange thefe two terms accordingly, as in the rule of three.

Confidering ftill the fame right-hand term as common to every ftating, take two other terms which are of the fame kind, and arrange them as above, according as, in this cafe, the anfwer ought to be more or lefs than the right-hand term; and proceed in the fame manner with every pair of terms that are of the fame name. Then multiply all the firft terms together for a divifor, and all the other terms together for a dividend, and the quotient thence arifing will be the anfwer fought.

Example.—If 248 men, in 5 days of 11 hours each, can dig a trench 230 yards long, 3 wide, and 2 deep; in how many days, of 9 hours each, will 24 men dig a trench 420 yards long, 5 wide, and 3 deep?

$$\left.\begin{array}{lrcr} \text{Men} & 24 & : & 248 \\ \text{Hours} & 9 & : & 11 \\ \text{Length} & 230 & : & 420 \\ \text{Width} & 3 & : & 5 \\ \text{Depth} & 2 & : & 3 \end{array}\right\} :: 5 \text{ days, } \textit{common term.}$$

Then $\frac{248 \times 11 \times 420 \times 5 \times 3}{24 \times 9 \times 230 \times 3 \times 2} = 288\frac{32}{207}$ days, the term required.

Rule, *Central.* See Central.

Rule, in a monaftic fenfe, is a fyftem of laws, or conftitutions, by which religious houfes are eftablifhed and regulated; and which the religious make a vow to obferve at their entrance.

The monaftic rules are all to be approved of by the pope, in order to make them valid. The rule of St. Benedict is, by fome authors, called the *holy* rule.

Thofe of St. Bruno and St. Francis are, of all others, the moft auftere. See Carthusians.

When a religious cannot fupport the aufterities of his rule, he fues for a difpenfation.

Rule, in the *Canon Law.* The rule *de verifimili notitia, of probable notice*, in the Romifh church, renders all provifions to a benefice, vacant by death, null, if it appear, that, from the day of the deceafe to the day of the date of the provifions, or to the day when the courier arrives from Rome, there has not been time fufficient for regular notice of the perfon's deceafe to be conveyed to the pope.

Provifions are even null, if it be proved the courier fet out before the perfon was deceafed. This rule was, according to the old conftitution, ftrictly obferved in France; in other countries the pope finds frequent occafions to difpenfe with it. See Provisions.

Rule *of twenty Days, Regula viginti Dierum.* By this rule, if an ecclefiaftic refign his benefice, to make the refignation valid, the refigner muft furvive its admiffion in the court of Rome twenty days. If he die before the expiration of the twenty days, the refignation is void, and the benefice becomes vacant by death.

This rule does not hold of the provifions of ordinary collators; nor of fimple and pure refignations into the hands of the ordinary; but only in cafe of provifions of the pope, difpatched on refignations *in favorem.*

This rule anciently extended to fuch as refigned in time of health, as well as of ficknefs. Pope Boniface reftrained it to the latter; whence it is commonly called *regula de infirmis refignantibus.*

Rule *de Publicandis.* By this rule, the refignee of a benefice, if he have a provifion from the court of Rome, is obliged to publifh the refignation, and take poffeffion within fix months; or, if he have it from the ordinary collator, within one month. Otherwife, if the refigner die, the refignation becomes null.

Rules *of Court*, in *Law*, are certain orders made, from time to time, in the courts of law, which attornies are bound to obferve, in order to avoid confufion; and both the plaintiff and defendant are at their peril alfo bound to pay obedience to rules made in court relating to the caufe depending between them. It is to be obferved, that no court will make a rule for any thing that may be done in the ordinary courfe; and that if a rule be made, grounded upon an affidavit, the other fide may move the court againft it, in order to vacate the fame, and thereupon fhall bring into court a copy of the affidavit and rule. On the breach and contempt of a rule of court an attachment lies; but it is not granted for difobedience to a rule, when the party has not been perfonally ferved; nor for difobeying a rule made by a judge in his chamber, which is not of force to ground a motion upon, unlefs the fame be entered. A rule of court is granted every day, whilft the courts of Weftminfter fit, to prifoners of the king's bench, or Fleet prifon, to go at large about their private affairs.

Rules, *Clerk of the.* See Clerk.

Rule *Water*, in *Geography*, a river of Scotland, which runs into the Teviot, 4 miles S.W. of Jedburgh.

RULER, Parallel. See Parallel *Ruler.*

RULLE, in *Geography*, a town of Weftphalia, in the bifhopric of Ofnabruck; 7 miles N.E. of Ofnabruck.

RUM, a fpecies of vinous fpirit, drawn by diftillation from fugar-canes.

The word rum is the name it bears among the native Americans.

Rum

Rum is very hot and inflammable, and is in the fame ufe among the natives of the fugar-countries, as brandy among the French.

Rum differs from what we fimply call fugar-fpirit, in that it contains more of the natural flavour or effential oil of the fugar-cane; a great deal of raw juice, and parts of the cane itfelf, being often fermented in the liquor, or folution of which the rum is prepared.

The unctuous or oily flavour of rum is often fuppofed to proceed from the large quantity of fat ufed in boiling the fugar; which fat, indeed, of courfe, will ufually give a ftinking flavour to the fpirit in our diftillation of the fugar liquor, or wafh, from our refining fugar-houfes; but this is nothing like the flavour of the rum, which is really the effect of the natural flavour of the cane. The method of making rum is this:

When a fufficient ftock of the materials is got together, they add water to them, and ferment them in the common method, though the fermentation is always carried on very flowly at firft; becaufe at the beginning of the feafon for making rum in the iflands, they want yeaft, or fome other ferment, to make it work; but by degrees, after this, they procure a fufficient quantity of the ferment, which rifes up as a head to the liquor in the operation, and thus they are able afterwards to ferment and make their rum with a great deal of expedition, and in large quantities.

When the wafh is fully fermented, or to a due degree of acidity, the diftillation is carried on in the common way, and the fpirit is made up proof; though fometimes it is reduced to a much greater ftrength, nearly approaching to that of alcohol or fpirit of wine, and is then called double-diftilled rum. It might be eafy to rectify the fpirit, and bring it to much greater purity than we ufually find it to be of; for it brings over in the diftillation a very large quantity of the oil; and this is often fo difagreeable, that the rum muft be fuffered to lie by a long time to mellow before it can be ufed; whereas, if well rectified, it would grow mellow much fooner, and would have a much lefs potent flavour.

The beft ftate to keep rum in, both for exportation and other ufes, is doubtlefs that of alcohol, or rectified fpirit. In this manner it would be tranfparent in one-half the bulk it ufually is, and might be let down to the common proof ftrength with water when neceffary. For the common ufe of making punch, it would likewife ferve much better in the ftate of alcohol; as the tafte would be cleaner, and the ftrength might always be regulated to a much greater exactnefs than in the ordinary way.

The only ufe to which it would not ferve fo well in this ftate, would be the common practice of adulteration among our diftillers; for when they want to mix a large portion of cheaper fpirit with the rum, their bufinefs is to have it of the proof ftrength, and as full of the flavouring-oil as they can, that it may drown the flavour of the fpirits they mix with it, and extend its own. If the bufinefs of rectifying rum was more nicely managed, it feems a very practicable fcheme to throw out fo much of the oil, as to have it in the fine light ftate of a clear fpirit, but lightly impregnated with it; in this cafe it would very nearly refemble arrac, as is proved by the mixing a very fmall quantity of it with the taftelefs fpirit, in which cafe the whole bears a very near refemblance to arrac in flavour.

Rum is ufually very much adulterated in England; fome are fo barefaced as to do it with malt-fpirit; but when it is done with melaffes-fpirit, the taftes of both are fo nearly allied, that it is not eafily difcovered. The beft method of judging of it is by fetting fire to a little of it; and, when it has burnt away all the inflammable part, examining the phlegm both by the tafte and fmell. Shaw's Effay on Diftillery.

Mr. B. Edwards, in his "Hiftory of the Weft Indies," vol. ii. has given the following account of the procefs for extracting rum from the fugar-cane, or from the very dregs and feculencies of the plant, by fermentation and diftillation. He commences his account with obferving, that the ftill-houfes on the fugar-plantations in the Britifh Weft Indies, vary greatly in point of fize and expence, according to the fancy of the proprietor, or the magnitude of the property. In general, however, they are built in a fubftantial manner of ftone, and are commonly equal to the boiling and curing-houfes together. (See Sugar.) For a plantation making, *communibus annis*, 200 hogfheads of fugar of 1600 weight, our author conceives, that two copper ftills, the one of 1200, and the other of 600 gallons, wine meafure, with proportionate pewter worms, are fufficient. The fize of the tanks (or tubs) for containing the cold water in which the worms are immerfed, muft depend upon circumftances; if the advantage can be obtained of a running ftream, the water may be kept abundantly cool in a veffel barely large enough to contain the worm. If the plantation has no other dependance than pond-water, a ftone tank is much fuperior to a tub, as being longer in heating, and if it can be made to contain from twenty to thirty-thoufand gallons, the worms of both the ftills may be placed in the fame body of water, and kept cool enough for condenfing the fpirit, by occafional fupplies of frefh water.

For working thefe ftills and worms, it is neceffary to provide, firft, a dunder-ciftern, of at leaft three thoufand gallons; fecondly, a ciftern for the fcummings; and laftly, twelve fermenting vats, or cifterns, each of them of the contents of the largeft ftill, *viz.* 1200 gallons. In Jamaica, cifterns are made of plank, fixed in clay; and are univerfally preferred to vats or moveable veffels, for the purpofe of fermenting. They are not fo eafily affected by the changes of the weather, nor fo liable to leak as vats, and they laft much longer. But in the Britifh diftilleries, fermenting cifterns, it is faid, are unknown. To complete the apparatus, it is neceffary to add two or more copper pumps for conveying the liquor from the cifterns, and pumping up the dunder, and alfo butts or other veffels for fecuring the fpirit when obtained; and it is ufual to build a rum-ftore adjoining the ftill-houfe.

The ingredients or materials for the procefs confift of melaffes, or treacle drained from the fugar; fcummings of the hot cane-juice, from the boiling-houfe, or fometimes raw-cane liquor, from canes expreffed for the purpofe: lees, or, as it is called in Jamaica, "dunder," from the Spanifh *redunder*, the fame as *redundans* in Latin; and water. Dunder, in the making of rum, ferves the purpofe of yeaft in the fermentation of flour. It is the lees or feculencies of former diftillations; and fome planters preferve it for ufe from one crop to another; but this is faid to be a bad practice. Some fermented liquor, compofed of fweets and water alone, ought to be diftilled in the firft inftance, that frefh dunder may be obtained. This is a diffolvent menftruum, and occafions the fweets with which it is combined, whether melaffes or fcummings, to yield a far greater proportion of fpirit than can be obtained without its affiftance. The water which is added acts in fome degree in the fame manner by dilution.

In the Windward iflands, the procefs, we are told, is conducted as follows: the ingredients, *viz.* fcummings, one-third; lees or dunder, one-third, and one-third of water, are well mixed in the fermenting cifterns, and when they are pretty cool, the fermentation will rife, in twenty-four hours,

to

to a proper height for admitting the firſt charge of melaſſes, of which ſix gallons for every hundred gallons of the fermenting liquor, is the general proportion to be given at twice; *viz.* three *per cent.* at the firſt charge, and the other ſeven *per cent.* a day or two afterwards, when the liquor is in a high ſtate of fermentation; the heat of which, however, ſhould not, in general, be ſuffered to exceed from 90° to 94° Fahrenheit. The infuſion of hot water will raiſe, and of cold water abate the fermentation. The quantity of melaſſes above-mentioned, added to a third of ſcummings, gives $11\frac{1}{2}$ *per cent.* of ſweets, ſix gallons of ſcummings being reckoned equal to one gallon of melaſſes. When the fermentation falls by eaſy degrees from the fifth to the ſeventh or eighth day, ſo as then to become fine, and throw up ſlowly a few clear beads or air-globules, it is ripe for diſtillation; though when the liquor is firſt ſet at the beginning of the crop (the houſe being cold, and the ciſterns not ſaturated) it will not be fit for diſtillation under ten or twelve days. When this is the caſe, at a longer or ſhorter period, the liquor or waſh being conveyed into the largeſt ſtill, which muſt not be filled higher than within eight or ten inches of the brim, leſt the head ſhould fly, a ſteady and regular fire muſt be kept up until it boils, after which a little fuel will ſerve. In about two hours the vapour or ſpirit, being condenſed by the ambient fluid, will force its way through the worm in the ſhape of a ſtream, as clear and tranſparent as cryſtal, and it is ſuffered to run until it is no longer inflammable. The ſpirit thus obtained is known by the appellation of "low wines." To make it rum of the Jamaica proof, it undergoes a ſecond diſtillation. Between the practice of the Jamaica diſtillers, and that of thoſe of the Windward iſlands, there is ſome little variation in the firſt proceſs. This conſiſts chiefly in the more copious uſe of dunder. As dunder ſerves to diſſolve the tenacity of the ſaccharine matter, it ſhould be proportioned, not only to the *quantity*, but alſo to the *nature* of the ſweets. If the ſweets in the fermenting ciſtern conſiſt of melaſſes alone, which is generally the caſe after the buſineſs of ſugar-boiling is finiſhed, when no ſcummings are to be had, a greater proportion of dunder is neceſſary; becauſe melaſſes are a body of greater tenacity than cane-liquor, and are rendered ſo viſcous and indurated by the action of fire, as to be unfit for fermentation without the moſt powerful ſaline and acid ſtimulators. For the ſame reaſon, at the beginning of the crop, when no melaſſes can be had, and the ſweets conſiſt of cane-juice or ſcummings alone, very little dunder is neceſſary. In ſuch caſe twenty *per cent.* at the utmoſt will be ſufficient. Dunder, in a large quantity, injures the *flavour*, though it may increaſe the *quantity* of the ſpirit. Dr. Shaw ſays, that the Engliſh diſtillers add many things to the fermenting liquor or waſh, in order to augment the vinoſity of the ſpirit, or to give it a particular flavour. He obſerves, that a little tartar, nitre, or common ſalt, is ſometimes thrown in at the beginning of the operation, or in their ſtead a little of the vegetable or finer mineral acid. Theſe are thought to be of great uſe in the fermenting of ſolutions of treacle, honey, and ſimilar ſweet and rich vegetable juices, which contain a ſmall proportion of acid. A ſimilar practice is ſaid to prevail among the diſtillers in St. Chriſtopher's, ſome of which conſider an addition of ſea-water to the fermenting liquor as a real and great improvement. Shaw recommends the juice of Seville oranges, lemons, and tamarinds, or other very acid fruits, and, above all other things, an aqueous ſolution of tartar; but Mr. Edwards is of opinion, that dunder alone anſwers every purpoſe. Dr. Shaw alſo recommends to the diſtiller to introduce into the fermenting ciſtern a few gallons of the rectified ſpirit, which, he ſays, will revert, with a large addition, to the quantity of ſpirit that would otherwiſe have ariſen from the diſtillation. It is ſuggeſted by Mr. Edwards, that a ſmall quantity of vegetable aſhes, thrown into the rum-ſtill, will be found ſerviceable. The alkaline ſalts are ſuppoſed to attenuate the ſpirit, and keep back the groſs and fetid oil, which the diſtillers call the "faints," but if too freely uſed, they will alſo keep back a proportion of the fine eſſential oil, on which the flavour of the rum wholly depends. After all, the moſt important object of attention in making good rum is probably "cleanlineſs;" for all adventitious or foreign ſubſtances deſtroy or change the peculiar flavour of the ſpirit. It ſhould, indeed, be an invariable practice with the manager or diſtiller to take care that the ciſterns are ſcalded, and even cleanſed with ſtrong lime-water, every time when they are uſed; not merely on account of the rum, but becauſe it has often happened that the vapour of a foul ciſtern has inſtantly killed the firſt perſon that has entered it without due precaution.

The following improved method of conducting the proceſs, or of compounding the ſeveral ingredients, is very general in Jamaica, *viz.*

Dunder one half, or		50 gallons	
Sweets 12 *per cent.*	Melaſſes	6 gallons	42 gallons.
	Scummings	36 gallons (equal to ſix gallons more of melaſſes)	
Water		8 gallons	
		100	

Of this mixture, or "waſh," as it is ſometimes called, 1200 gallons ought to produce 300 gallons of low-wines; and the ſtill may be twice charged or drawn off in one day. The method of adding all the melaſſes at once, which is done ſoon after the fermentation commences, renders the proceſs ſafe and expeditious; whereas by charging the melaſſes at different times, the fermentation is checked, and the proceſs delayed.

The low-wines obtained in the manner above deſcribed, are drawn off into a butt or veſſel, and, as opportunity ſerves, are conveyed into the ſecond ſtill of 600 gallons, to undergo a further diſtillation. The ſteam begins to run in about an hour and a half, and will give, in the courſe of the day, 220 gallons, or two puncheons, of oil-proof rum, *i. e.* of ſpirit in which olive oil will ſink; and thus the manufacture, if ſo it may be called, is complete. There will remain in the ſtill a conſiderable quantity of weaker ſpirit, commonly about 70 gallons, which is returned to the low-wine butt. Thus 220 gallons of proof-rum are made, in fact, from 530 gallons of low-wines, or about 113 of rum from 1200 of waſh. By this proceſs the Jamaica diſtiller may fill weekly, working only by day-light (a neceſſary precaution in this employment), and at a ſmall expence of labour and fuel, twelve puncheons of rum, containing each 110 gallons of the Jamaica ſtandard. The proportion of the whole rum to the crop of ſugar, is commonly eſtimated

in

RUM

in Jamaica as three to four. Thus a plantation, ſuch as we have above deſcribed, is ſuppoſed to ſupply annually 150 puncheons of rum of 110 gallons each, or 82 gallons of Jamaica proof to each hogſhead of ſugar; and this quantity is ſometimes fairly made from canes planted in rich and moiſt lands; but on a general eſtimate, Mr. Edwards thinks this to be too great an allowance; and that 200 gallons of rum to three hogſheads of ſugar, which is in the proportion of about two-thirds rum to the crop of ſugar, is nearer the truth. The following ſtatement warrants the above concluſion. The general ſupply of ſcummings to the liquor-houſe is ſeven gallons out of every 100 gallons of cane-liquor. Suppoſing, therefore, that 2000 gallons of cane-juice are required for each hogſhead of ſugar of 16 cwt., the ſcummings, on a plantation making 200 hogſheads *per annum*, will be 28,000 gallons, equal to 4666 gallons of melaſſes.

Add the melaſſes from the curing-houſe, which, if the ſugar is of a good quality, will ſeldom exceed 60 gallons *per* hogſhead	12,000
Total of ſweets	16,666 gallons.

This quantity, diſtilled at or after the rate of 12 *per cent.* ſweets in the fermenting ciſtern, will give 34,720 gallons of low-wines, which ought to produce 14,412 gallons of good proof rum, or 131 puncheons of 110 gallons each. When a greater proportion than this is made, either the ſugar diſcharges an unuſual quantity of melaſſes, or the boiling-houſe is defrauded of the cane-liquor by improper ſcumming; which latter circumſtance frequently happens.

It is the practice of late, we are told, with many planters, to raiſe the proof of rum: thus gaining in ſtrength of ſpirit what is loſt in quantity: and ſome managers make it a rule to return the ſcummings to the clarifiers, inſtead of ſending them to the ſtill-houſe. This laſt-mentioned practice reduces the crop of rum more than one-third; but is ſuppoſed to yield in ſugar more than is loſt in rum: and if the price of ſugar is very high, and that of rum very low, it may be prudent to adopt this method.

For the duty, &c. on rum, ſee *Foreign* SPIRITS.

RUM, in *Geography*, a town of Tonquin, on the coaſt. N. lat. 19° 35′. E. long. 105° 18′.—Alſo, a river of America, which runs into the Miſſiſippi, N. lat. 45°. W. long. 93° 48′.

RUM, one of the Hebrides, or Weſtern iſlands of Scotland, is ſituated to the weſtward of the iſle of Skye, and is compriſed, politically, in the pariſh of Small-Iſles, and in the county of Argyle. It derived its name from the Gaelic, *Rhum*, ſignifying extent, in alluſion to its being the largeſt iſland in the pariſh to which it belongs. It is computed to meaſure eight miles in length, and nearly the ſame in breadth; and to contain about 22,000 ſquare acres. Rum is in general rugged, mountainous, and barren, and more adapted for paſturage than for agriculture. Horſes are reared in this iſland for ſale, and though diminutive in ſize, are remarkably high mettled and hardy. Here are likewiſe reared a conſiderable number of ſheep, which are the beſt ſtock with which a mountainous country, like Rum, can be ſupplied. The general breed is a ſmall white-faced ſheep, which is much praiſed, both for the delicate flavour of its fleſh, and for the excellence of its wool. This iſland formerly abounded with deer; but that animal is now totally extirpated, owing to the copſe wood, which ſerved as a cover to their fawn, having been deſtroyed. Before the uſe of fire-arms, the method adopted by the inhabitants to kill deer was ſo ſingular as to deſerve notice. On each ſide of a glen formed by two mountains, ſtone dykes were conſtructed at a conſiderable height up the hills, and extended from thence to the lower part of the valley, always drawing nearer to each other, till they approached within three or four feet. This narrow paſs opened into a circular ſpace, incloſed by a wall of ſufficient height to reſtrain the deer, which were purſued hither and deſtroyed. The remains of one of theſe ancient deer-traps are ſtill to be traced. Birds of prey are numerous in Rum; and there are likewiſe a few grouſe, pigeons, termagants, and wild ducks, beſides thoſe birds which frequent the iſland only at ſtated ſeaſons of the year. The air of Rum, from its proximity to the weſtern ocean, is moiſt, and the weather extremely rainy. The only harbour here is Loch-Serefort, which penetrates a conſiderable way into the iſland, on its eaſtern coaſt. It is ſpacious, its ground good, and its depth of water from five to ſeven fathoms. Near the head, on the ſouth ſide of this harbour, a pier has been lately erected. The general appearance of Rum is, that the land ſlopes towards the eaſt; but on the weſt preſents precipices of a tremendous height. At the baſe of the hill Sgormor are found abundance of agates, of that ſpecies called by Cronſtedt "Achates chalcedoniſans," improperly white cornelians. Here are ſeveral remarkable ſtrata; ſuch as grey quartz; a mixture of quartz and baſaltes; a black ſtone ſpotted with white, like porphyry, but with the appearance of lava; fine grit or free-ſtone; and the cinereous indurated bole of Cronſtedt. There being no mill in this iſland, the corn is "gradanned," or burnt out of the ear, inſtead of being thraſhed. This is performed in two ways: firſt by cutting off the ears and drying them in a kiln, and then ſetting fire to them on the floor, and picking out the grains; and ſecondly, by burning the ſheaf entire, which is a moſt ruinous practice, as it deſtroys both thatch and manure. Gradanned corn is conjectured to have been the parched corn of holy writ.

Rum not being a pariſh of itſelf, its population is not ſtated in the parliamentary returns; but it is eſtimated to contain about 500 inhabitants. The Statiſtical Account of Scotland, by ſir John Sinclair, bart. 8vo. vol. xvii. 1796. Beauties of Scotland, vol. v. 8vo. 1808. Carliſle's Topographical Dictionary, 4to. 1813.

RUMELY, a town of Syria, in the pachalic of Tripoli, on the coaſt; 15 miles S. of Bairut. N. lat. 33° 33′. E. long. 35° 28′.

RUMEN, the firſt ſtomach of animals which chew the cud, and which are hence called *ruminants*.

The food is tranſmitted into the rumen without any other alteration in the mouth than being a little rolled and wrapped up together.

For an account of the rumen, ſee *Anatomy of* MAMMALIA.

RUMEX, in *Botany*, the Dock and Sorrel genus; named, as it ſeems, by the Latins themſelves, from *rumex*, a ſort of pike, ſpear, or halberd, which the ſhape of the leaves, in various

various species, much resembles. We cannot but prefer this etymology to that taken from *rumo*, to suck, by which the acid flavour of Sorrel, useful in allaying thirst, was supposed to be indicated.—Linn. Gen. 178. Schreb. 238. Willd. Sp. Pl. v. 2. 249. Mart. Mill. Dict. v. 4. Ait. Hort. Kew. v. 2. 318. Sm. Fl. Brit. 390. Prodr. Fl. Græc. Sibth. v. 1. 244. Brown Prodr. Nov. Holl. 421. Pursh 247. Juss. 82. Lamarck Illustr. t. 271. Gærtn. t. 119. (Lapathum; Tourn. Inst. 504. Acetosa; ibid. 502. t. 287.) —Class and order, *Hexandria Trigynia*. Nat. Ord. *Holeraceæ*, Linn. *Polygoneæ*, Juss.

Gen. Ch. *Cal.* Perianth inferior, of three obtuse, reflexed, permanent leaves. *Cor.* Petals three, ovate, similar to the calyx, but larger, converging, permanent, forming valves over the seed. *Stam.* Filaments six, capillary, very short; anthers erect, of two lobes. *Pist.* Germen superior, triangular, turbinate; styles three, capillary, reflexed, projecting between the petals; stigmas large, laciniated. *Peric.* none, the converging, triangular, hardened corolla, enfolding the seed. *Seed* solitary, triangular.

Ess. Ch. Calyx of three leaves. Petals three, converging, permanent. Seed solitary, triangular, superior, without a seed-vessel. Stigmas many-cleft.

Obs. *R. digynus* excludes one-third in the number of every part of the fructification, except the stamens. Those species which compose the Sorrel tribe, have flowers with stamens on one plant, flowers with pistils mostly on another, being dioecious, or in some instances monoecious. *R. spinosus* is monoecious; and the perianth of the female flowers becomes hooked and rigid. *R. alpinus* is polygamous. In several species the petals are distinguished by a tumid, hard, mostly coloured, grain, or roundish tubercle, at the back, most conspicuous when the seed ripens; sometimes of equal size in all, sometimes obsolete in two of the petals. This is a genus of hardy, perennial, almost invariably herbaceous plants, nearly allied to Rheum; see that article. They have small pretensions to be considered as ornamental, and, on the contrary, are generally esteemed weeds, because they mostly grow where they are a nuisance and encumbrance. The agriculturist stigmatizes with the name of Docks, all large, biennial or perennial, strong-rooted, rank-growing herbs, and generally pays for their extirpation, according to a settled rate, under that denomination. The roots of the various species of *Rumex* are astringent; their herbage is likewise often so, though sometimes very acid. Every part of the plant is greenish, with a strong tendency to become red by age. Botanists differ about the denomination of the parts of the flower. Analogy and theory teach the whole of the integuments in this genus and *Rheum* to be a calyx; but the three inner divisions in *Rumex* having a separate insertion, somewhat of a different texture or structure, and being so remarkably altered, in most species, as the fruit ripens; while in such species as have, after flowering, an enlarged or hardened calyx these inner segments remain unchanged, never undergoing any alteration in concert with the three outer segments; all this evinces that nature is not always conformable to our rules. The genus *Rumex* therefore is one of those in which we are obliged to use our discretion, as to the denomination of the *calyx* and *corolla*, in spite of arbitrary and absolute principles.

The species in Willdenow amount to 36. They are in general well defined, but several are misunderstood, or given twice; so that we must exhibit as compendious a view as possible of the whole, having also some to add. Eleven are natives of Britain. The Hortus Kewensis enumerates 27, two of which do not occur in Willdenow. They are commodiously disposed in three sections.

Sect. 1. *Stamens and pistils in the same flowers. Valves distinguished by a granular tubercle.*

1. R. *Patientia.* Patience Dock or Rhubarb. Linn. Sp. Pl. 476. Willd. n. 1. Ait. n. 1. Ehrh. Pl. Off. n. 273. (Hippolapathum sativum; Ger. Em. 389. H. hortense; Matth. Valgr. v. 1. 407.)—Flowers united. Valves entire, ovate; one of them minutely granular. Leaves ovato-lanceolate, taper-pointed.—Native of Italy. Long cultivated in kitchen or rustic gardens, having been sometimes used as a pot-herb, and the root occasionally employed as a purgative medicine, in the place of Rhubarb. Hence it is sometimes called Monk's Rhubarb, though that name is now retained rather for the *Rumex alpinus*. The *Patientia* is four or five feet high, erect, smooth, green; its *leaves* from twelve to eighteen inches long, rather narrow. *Flowers* in whorled or tufted clusters, copious, pendulous. *Petals* large, ovate, reticulated with veins; the midrib of one of them swelling, in its lower part, into an oblong, not very evident, grain. We now rather prefer the above cut of Gerarde, to that of Dodonæus cited by Linnæus.

2. R. *sanguineus.* Bloody-veined Dock. Linn. Sp. Pl. 476. Willd. n. 2. Ait. n. 2. Pursh n. 1. Fl. Brit. n. 1. Engl. Bot. t. 1533. (Lapathum sativum sanguineum; Ger. Em. 390.)

β. R. acutus; Curt. Lond. fasc. 3. 21, the description, not the figure. (R. Nemolapathum; Ehrh. Phytoph. n. 94. Linn. Suppl. 212. Bloodless Dock; Petiv. H. Brit. t. 2. f. 6.)—Flowers united. Valves entire, oblong; one of them chiefly granular. Leaves lanceolate, heart-shaped at the base.—Native of Europe, in woods and by way sides. Dr. Sibthorp found it in Greece, and though not very common in England, it occurs in various parts. Mr. Pursh says it grows in shady woods and moist meadows, from Pennsylvania to Virginia, flowering in June and July. The green variety, β, is very common in England, under the shade of trees in rather dry woods. Perhaps it ought to be esteemed the original species; the kind whose stalks and veins contain a crimson juice, being perhaps the variety. This last appears, by Gerarde's herbal, to have been first known here as a pot-herb. Linnæus mentions Virginia only as its native country, and marks it as biennial. With us both varieties are certainly perennial. The plant is erect, three or four feet high, branched, rather slender, and of a delicate appearance. *Flowers* small, in long clusters of very numerous tufts or whorls; their *petals* oblong and obtuse, one of them bearing an extremely large, globular, red grain.

3. R. *spatulatus.* Spatulate Cape Dock. Thunb. Prodr. 67. Willd. n. 3.—"Leaves obovate, obtuse. Valves granular."—Found by Thunberg at the Cape of Good Hope.

4. R. *crispus.* Curled Dock. Linn. Sp. Pl. 476. Willd. n. 7. Ait. n. 3. Pursh n. 2. Fl. Brit. n. 2. Engl. Bot. t. 1998. Curt. Lond. fasc. 2. t. 20. (Lapathum longifolium crispum; Munt. Brit. t. 104.)—Flowers united. Valves ovate, wavy, entire, all granular. Leaves lanceolate, undulated, acute.—In waste ground, pastures, and by way sides, common throughout Europe, as well as in North America, flowering in June and July, and accidentally throughout the summer. This is a very troublesome and unprofitable weed; readily distinguished, as a species, from all other English Docks, by the curved *leaves*, and large entire *valves*, each bearing an ovate grain. These are by accidental error termed *calyx-valves* in *English Botany*. The *root* is tap-shaped, yellowish. *Stem* two or three feet high, branched, nearly smooth to the touch. *Leaves* of a lightish green. *Clusters* rather long; leafy in their lower part.

5. R. *verticillatus.* Whorled American Dock. Linn.

Sp. Pl. 476. Willd. n. 4. Purſh n. 3.—Flowers united. Valves ſomewhat deltoid, entire, all granular. Leaves flat, lanceolate; with tubular, membranous ſheaths embracing the ſtem. Cluſters nearly leafleſs.—In rivulets and ſhady woods, from Canada to Virginia, flowering in July, perennial. *Purſh.* The *ſtem* is ſomewhat zigzag, aſcending, angular and furrowed, ſmooth, inveſted above every leaf with a tubular, pale, membranous, intrafoliaceous *ſtipula*, or ſheath, near an inch long. *Leaves* flat and even. *Flowers* twice the ſize of the laſt, with very large oblong grains, which are often wrinkled. The *petal* itſelf is alſo ſtrongly marked with projecting reticulated veins.

6. R. *Britannica.* Virginian Water-Dock. Linn. Sp. Pl. 476. Willd. n. 5. Purſh n. 4.—Flowers united. Valves ovate, obtuſe, all granular. Leaves flat, lanceolate; with ſcarcely any ſheaths. Cluſters panicled, leafleſs.—Near rivulets in Virginia and Carolina; perennial, flowering in June and July. *Purſh.* This is readily diſtinguiſhed from the laſt, with which Linnæus ſometimes negligently confounded it, notwithſtanding his own clear definition. The want of the tubular ſheathing *ſtipulas* is alone ſufficient. The grains on the *valves* are, moreover, much ſmaller, and Mr. Purſh has well adverted to the panicled infloreſcence, compoſed of numerous, lax, many-flowered *cluſters.* The ſpecific name *Britannica*, not *britannicus*, alludes to former controverſies, of Muntingius and others, about what was the true *Herba Britannica;* but why this American plant ſhould be ſo called, we know no good reaſon, nor is it worth while to examine which of the bad figures in the verboſe and uſeleſs author laſt named, is moſt, or leaſt, like our plant. None of them, we believe, is properly referrible to it. The *Herba Britannica* of the ancients is ſaid to have been a powerful antiſcorbutic, or tonic, and was found on our own, or the neighbouring, coaſts.

7. R. *perſicarioides.* Perſicaria Dock. Linn. Sp. Pl. 477. Willd. n. 9. Ait. n. 4. Purſh n. 5.—Flowers united. Valves lanceolate, taper-pointed, toothed, all granular. Leaves lanceolate, wavy, nearly entire.—In ſhady wet woods, on the banks of ditches, in Virginia and Carolina, flowering in July, annual. Sent to Kew in 1773, by the chevalier Murray, profeſſor at Gottingen, but we preſume it is ſcarcely preſerved, being ſo like our common docks, except the advantage, in this caſe, of having only an annual root. The *cluſters* are accompanied, at each whorl, with a ſtalked leaf, rather ſmaller than thoſe on other parts of the branched *ſtem. Flowers* ſmall, erect. *Valves* narrow, with long ſlender points, and each bearing a large, oblong, ſlightly kidney-ſhaped, ſmooth, tawny grain.

8. R. *criſpatulus.* Criſped Dock. Michaux Boreali-Amer. v. 1. 217. Purſh n. 6.—Flowers united. Valves heart-ſhaped, obtuſe, three-toothed at each ſide; two of them granular. Cluſters leafleſs. Leaves criſped and wavy at the margin; the lower ones oval; upper lanceolate.—Native of Kentucky. *Michaux.* Akin to the laſt. Its habit is ſaid to be like *R. acutus*, but the *valves* inveſting the *ſeed* are much larger. One of them bears no granular tubercle, and the grains of the two others are unequal in ſize. The upper *leaves* are minutely crenulated.

9. R. *ægyptiacus.* Egyptian Dock. Linn. Sp. Pl. 477. Willd. n. 10. Ait. n. 5. (Lapathum ægyptium annuum, parietariæ folio, capſulâ ſeminis longiùs barbatâ; Till. Piſ. 93. t. 37. f. 1.)—Flowers united. Valves with three very long capillary points at each ſide; one only bearing an ovate grain. Gathered near Memphis, by J. B. de Georgis, ſurgeon to the grand duke of Tuſcany, whence it was introduced into the garden at Piſa, and ſoon after, as it appears, ſent to Miller at Chelſea. The *root* is annual. This ſpecies is readily known by the fine capillary teeth of its *valves*, ſpreading in every direction, and giving the *cluſters*, which are long, denſe, and leafy, a hairy appearance. Each *valve* is ſmall, reticulated with ſtrong veins.

10. R. *dentatus.* Sharp-toothed Dock. Linn. Mant. 226. Syſt. Veg. ed. 13. 284. Willd. n. 11. Ait. n. 6. (Lapathum ægyptium, capſulâ ſeminis albâ et crenatâ; Boerh. Ind. Alt. v. 2. 85. Dill. Elth. 191. t. 158. f. 191.)—Flowers united. Valves with awl-ſhaped teeth; all granular. Cluſters denſe, leafy. Leaves lanceolate.—Gathered in Egypt, by the unfortunate Auguſtin Lippi, afterwards murdered by the barbarians of Nubia. This plant was originally confounded, by Linnæus, with the laſt, from which it differs eſſentially, having *valves* thrice as large, bordered with awl-ſhaped teeth, ſcarcely exceeding their own length, each valve bearing a large, pale, ovate grain.—The plant is annual, a ſpan high, branched from the bottom.

11. R. *maritimus.* Golden Dock. Linn. Sp. Pl. 478. Willd. n. 12. Ait. n. 7. Fl. Brit. n. 6. Engl. Bot. t. 725. (Lapathum anthoxanthum; Bauh. Hiſt. v. 2. 987.)—Flowers united. Valves deltoid, with ſetaceous teeth; each bearing a nearly cylindrical grain. Cluſters denſe. Leaves linear.—Native of marſhes in various parts of Europe, chiefly near the ſea. It is perennial, flowering in July and Auguſt. This is moſt akin to *R. ægyptiacus*, with which its denſe leafy *cluſters*, and tawny or golden hue, agree. But the *foliage* is more linear, and the teeth of the *valves*, though almoſt capillary, not one-third ſo long, while the valves themſelves are larger, and every one of them marked with a *grain*, which is oblong, and nearly cylindrical, not ovate. The *ſtem* is ſtrongly angular and furrowed, roughiſh, reddiſh, a little zigzag. *Leaves* ſtalked, bluntiſh, flat. *Whorls* very denſe, and crowded into cylindrical leafy cluſters, often of a rich golden hue. *Seed* very ſmall, compared with our common docks.

12. R. *paluſtris.* Yellow Marſh Dock. Fl. Brit. n. 7. Engl. Bot. t. 1932. Ait. n. 8. (R. maritimus; Ehrh. Herb. n. 74. Curt. Lond. faſc. 3. t. 23. Lapathum aquaticum, luteolæ folio; Bocc. Muſ. v. 2. 143. t. 104. Hydrolapathum minus; Lob. Ic. 286. Ger. Em. 309.)—Flowers united. Valves lanceolate, toothed at the baſe; each bearing an oblong grain. Leaves linear-lanceolate. Whorls diſtant.—Native of marſhes, ditches, and wet waſte places in Germany, Italy, and England. Found in ſeveral ſituations near London; alſo at Acle and Saham in Norfolk. It is perennial, flowering in July and Auguſt. Many botaniſts have confounded this with the laſt, from which it differs in having diſtant leafy *whorls*, and lanceolate *valves*, each furniſhed at the baſe, on each ſide, with three ſlender teeth, much ſhorter than the foregoing. The *leaves* are linear-lanceolate and acute; the radical ones very large. *Stem* furrowed, reddiſh, rough to the touch. The *root*, as Curtis obſerved, is red internally.

13. R. *divaricatus.* Spreading Italian Dock. Linn. Sp. Pl. 478. Willd. n. 13. Ait. n. 10. (Lapathum arvenſe ſubhirſutum, folio retuſo, caule longiùs brachiato, capſulâ ſeminis crenatâ; Till. Piſ. 93. t. 37. f. 2.)—Flowers united. Valves heart-ſhaped, toothed, granular. Leaves heart-ſhaped-oblong, obtuſe, downy.—Native of fields in Italy. *Root* annual. Linnæus truly ſays, that Haller conſidered this as the ſame with *R. pulcher* hereafter deſcribed. We have ſeen no ſpecimen; but though in Tilli's figure the *valves* inveſting the *ſeed* are not very unlike thoſe of *pulcher*, the large oblong *leaf*, not at all contracted in the middle, and hairy as well as its *footſtalk*, has

has a very different appearance. Moreover, this ſpecies is cultivated at Kew, where it was introduced in 1793, by Mr. Hunnemann, and is publiſhed by Mr. Aiton as diſtinct. It flowers in July and Auguſt. See *R. auratus*, n. 30.

14. R. *acutus*. Sharp Dock. Linn. Sp. Pl. 478. Willd. n. 14? Ait. n. 11. Fl. Brit. n. 3. Engl. Bot. t. 724.

β. Lapathum acutum minimum; Dill. in Raii Syn. 141. Bauh. Hiſt. v. 2. 985. (Small Sharp Dock; Petiv. H. Brit. t. 2. f. 4.)—Flowers united. Valves oblong, obſcurely toothed, each bearing a roundiſh prominent grain. Leaves oblong, pointed; ſomewhat heart-ſhaped at the baſe. Cluſters leafy.—Native of marſhy meadows in England, and other parts of Europe, perennial, flowering in July. The *ſtem* is erect, or ſomewhat zigzag, angular, furrowed, ſmooth to the touch. *Leaves* narrow; the lower ones only ſlightly heart-ſhaped; all ſmooth and flat. *Branches* elongated into long ſpreading *cluſters*, conſiſting of numerous, diſtinct, and rather diſtant, *whorls*, each of which is accompanied by a ſmall, lanceolate, ſtalked leaf. The *flowers* are occaſionally polygamous, and ſome of the males have been obſerved by Mr. Sowerby to be furniſhed with twelve *ſtamens*; the greater part of the flowers however have uſually ſix only, in the ſame calyx with the piſtil. The *ſeed* is ſmall. *Valves* oblong and bluntiſh, moſtly entire, though ſometimes toothed at the baſe, each of them bearing a large, red, almoſt globular, *grain*, of the ſame ſize in all.

This is a ſpecies about which there has been more doubt and controverſy than any other. Moſt botaniſts have miſtaken for it our green variety of *R. ſanguineus*, n. 2, and we can by no means be certain how far Mr. Curtis has committed the ſame error. The two plants however are perfectly diſtinct, nor is there any uncertainty in the characters by which we have defined them. The preſent has a large grain on each *valve*, and the whorls are moſt of them, if not all, accompanied by a leaf. The other has two of the *valves* without grains, the third bearing a very large one, and there is only a leaf or two, here and there, at the lower whorls; the long ſeries of them above being leafleſs. By an attention to this laſt character, the figures of old authors, bad as they are, may be determined. With reſpect to Mr. Curtis's fine plate, we confeſs we remain in uncertainty. His *cluſters* are almoſt leafleſs, like the *ſanguineus β*, but his ſeparate *flowers* unqueſtionably belong to the *acutus*. We have no doubt that he confounded theſe ſpecies, and that his expreſſion of two of the *valves* being "generally naked," is calculated to ſquare with both. Two of them are really in *ſanguineus* always naked, nor do we find any uncertainty in this character.

15. R. *obtuſifolius*. Broad-leaved Dock. Linn. Sp. Pl. 478. Willd. n. 15. Ait. n. 12. Purſh n. 7. Fl. Brit. n. 4. Engl. Bot. t. 1999. Curt. Lond. faſc. 3. t. 22. (L. ſylveſtre, folio minùs acuto; Ger. Em. 388. Lob. Ic. 285.)—Flowers united. Valves toothed; one principally grained. Radical leaves heart-ſhaped, obtuſe. Stem roughiſh.—A common and troubleſome weed throughout Europe, flowering in July and Auguſt. The long, perennial tap *root* runs deep into the ground, and is yellowiſh, not red, within. *Stems* numerous, two or three feet high, furrowed; rougheſt in the upper part. Radical *leaves* very large and ſpreading; wavy, more or leſs blunt, not unlike thoſe of horſe-radiſh, but hardly ſo big; their *footſtalks* long and channelled. Stem *leaves* much narrower and more pointed, on ſhorter ſtalks, ſomewhat criſped and crenate. *Cluſters* generally bearing a few leaves, though often deſtitute of any. *Seed* large. *Valves* rather large, oblong-heart-ſhaped, entire at the extremity, but having three ſharp prominent teeth near the baſe. The outermoſt bears an oblong *grain*, ſmaller in proportion to the valve than in moſt of the foregoing, and the grains of the two other valves are hardly diſcernible.

Mr. Curtis recommends frequent mowing as a ſure means of deſtroying this dock. Mr. Purſh ſpeaks of it as a common weed in old paſtures and gardens in North America, though probably introduced from Europe.

16. R. *pulcher*. Fiddle Dock. Linn. Sp. Pl. 477. Willd. n. 16. Ait. n. 13. Fl. Brit. n. 5. Engl. Bot. t. 1576. (Lapathum pulchrum bononienſe ſinuatum; Bauh. Hiſt. v. 2. 988. Fiddle Dock; Petiv. H. Brit. t. 2. f. 10.)—Flowers united. Valves many-toothed; one of them bearing a larger grain than the reſt. Radical leaves fiddle-ſhaped. Stem ſmooth, ſtraggling.—Native of dry gravelly paſtures, and waſte ground, in the more temperate parts of Europe, from England to Greece; perennial, flowering in Auguſt. The radical *leaves*, ſo remarkably contracted in one part as to reſemble a fiddle; the widely ſpreading, almoſt horizontal, *ſtems* and *branches*; and the ſharp numerous teeth of the ſtrongly reticulated *valves*, clearly mark this ſpecies. The outer *valve* bears an oblong reddiſh grain, larger than what uſually occurs on the others. *Seed* very ſmooth and poliſhed, with thin acute angles. A ſmall leaf accompanies each *whorl*, though ſometimes ſcarcely longer than the *flower*. The *petals* are larger and more coloured in ſome Swiſs ſpecimens, than we have noticed them in the flowering ſtate of our Engliſh plants. Willdenow repeats under this ſpecies the ſynonym of Tilli, which properly belongs to *R. divaricatus*; apparently on the authority of Willich. See our remarks under n. 13.

17. R. *aquaticus*. Great Water Dock. Linn. Sp. Pl. 479. Willd. n. 18. Ait. n. 9. Purſh n. 8. Fl. Brit. n. 8. Engl. Bot. t. 2104. Ehrh. Pl. Off. n. 114. (R. Hydrolapathum; Hudſ. 154. Willd. n. 6. Woodv. Med. Bot. t. 178. R. acutus; Ehrh. Pl. Off. n. 104. Lapathum, n. 1588; Hall. Hiſt. v. 2. 271. Hydrolapathum magnum; Lob. Ic. 285. Ger. Em. 389.)—Flowers united. Valves ovate, almoſt entire, bearing ſmall or obſolete grains. Leaves lanceolate, acute; the lower ones heart-ſhaped at the baſe.—Native of ditches, pools, and the borders of rivers, throughout Europe; as well as in North America, from Pennſylvania to Virginia, but, according to Mr. Purſh, not common. With us it is very plentiful and conſpicuous, being by far the largeſt of our docks, and flowering in July and Auguſt.—The *root* is large, knobby, and perennial. *Stems* erect, four or five feet high, angular, and ſtrongly furrowed. *Leaves* a foot long, (more or leſs,) coriaceous, ſmooth, with a glaucous hue, entire, ſometimes minutely curled at the edge. *Cluſters* branched, denſe, moſtly leafleſs. *Flowers* numerous, on ſlender drooping ſtalks. *Valves* ovate, veiny, entire, or very ſparingly notched, each bearing an ovate grain, various in ſize, or ſometimes having only a tumid rib. The former is uſually the caſe with our Britiſh plant, and is conſpicuous in Ehrhart's Pl. Off. n. 114, which he gives as *R. aquaticus* of Linnæus from Upſal; while his n. 104, without grains, is marked, certainly erroneouſly, *acutus* of Linnæus, and is likewiſe from Upſal. The authentic Swediſh ſpecimen, in the Linnæan herbarium, preciſely reſembles the firſt of theſe in habit, while its valves, having ſcarcely any indications of grains, agree with thoſe of the latter. We believe the preſence or abſence of grains, in this caſe, does not afford a ſpecific difference. Hence, however, it readily appears

 why

why authors have been led to describe the same plant twice, and to confound its synonyms.

Sect. 2. *Stamens and pistils in the same flowers. Valves naked, or without grains.*

18. R. *bucephalophorus*. Basil-leaved Dock. Linn. Sp. Pl. 479. Willd. n. 17. Ait. n. 14. Cavan. Ic. v. 1. 31. t. 41. f. 1. Sm. Fl. Græc. Sibth. t. 345, unpublished. (Acetosa ocimi folio neapolitana βουκεφαλοφορα; Column. Ecphr. part 1. 151. t. 150.)—Flowers united. Valves naked, veinless, with hooked teeth. Flower-stalks ternate, roughish; dilated and vaulted when in fruit.—Native of Italy, Barbary, and the Levant. Common in spring in the corn-fields of Greece and the neighbouring islands, according to Dr. Sibthorp, who judged it to be Λαπαθον το μικρον of Dioscorides. It is annual, and has been occasionally raised in our gardens for near 150 years past, for the sake of its curious and singular structure. The *root* is fibrous. *Herb* very variable in luxuriance; sometimes simple, two or three inches high; sometimes branched from the base into several ascending, leafy, simple *stems*, flowering almost all the way up. *Leaves* stalked, ovate, or spatulate, smooth, entire. *Stipulas* membranous, white, long, and taper-pointed. *Flowers* always three together, in a series of whorls, partly axillary, but chiefly leafless. *Flower-stalk* deflexed, red, roughish with minute granulations, as well as the tawny or reddish *calyx* and *petals*. The latter are three-lobed, and become ovate pointed *valves*, each beset at the margin, on each side, with about three awl-shaped, hooked teeth or spines. As the *fruit* advances, each *flower-stalk* becomes lengthened, and dilated towards the *calyx*, being convex above, and vaulted underneath, not properly, as Linnæus says, "plane," neither is it tumid or club-shaped. Columna, by a stretch of fancy, compares the valves in fruit to a bull's head, two segments of the reflexed *calyx* looking like horns.

19. R. *fimbriatus*. Fringed New Holland Dock. Brown n. 1.—"Flowers united. Valves naked, veiny, fringed with hooked teeth. Flower-stalks reflexed and thickened when in fruit."—Gathered by Mr. Brown, near Port Jackson, New South Wales. We have seen no specimen. This species seems very nearly akin to the last.

20. R. *vesicarius*. Bladder Dock, or Sorrel. Linn. Sp. Pl. 479. Willd. n. 20. Ait. n. 16. (Acetosa americana, foliis longissimis pediculis donatis; Bauh. Prodr. 54. Moris. sect. 5. t. 28. f. 7. A. vesicaria peregrina; Besl. Hort. Eyst. vern. ord. 6. t. 15. f. 3.)—Flowers united. Stalks mostly in pairs. All the valves very large, membranous, entire, folded back. Leaves undivided.—Native of Africa. A hardy annual in our gardens, where it appears to have been first cultivated by Tradescant, in 1656. It flowers in July and August. The *stem* is branched, from a span to 18 inches high, smooth. *Leaves* on long stalks, ovate and obtuse, but with two angles at the base, so as to approach a halberd-shape. The plant is chiefly remarkable for the beauty of its large shining membranous *valves*, reticulated with veins, and tinged with a light rose-colour. These invest the ripe *seed*, hanging on capillary drooping stalks in great abundance. The figure in the *Hortus Eystellensis* is much the best, were it not so difficult of access, on account of the unweildiness, and bad arrangement, of that pompous old book.

21. R. *roseus*. Rose-coloured Dock. Linn. Sp. Pl. 480. Willd. n. 21. Ait. n. 17. Sm. Fl. Græc. Sibth. t. 346, unpublished. (Acetosa ægyptia, roseo seminis involucro, folio lacero Lippi; Shaw Specim. n. 5. t. 1?)—Flowers united. Valves unequal, membranous, rounded, reticulated, toothed. Leaves undivided.—Native, as it is said, of Egypt. Dr. Sibthorp found it in the isle of Cyprus, and his fine figure is the only good one we have met with; for the miserable sketch of Shaw appears certainly to have been taken from the *tingitanus*, with whose *leaves* it accords, though not with those of *roseus*; yet from this plate it seems Linnæus borrowed a part of his character, "*foliis erosis*," which does not agree even with his own poor specimen. The true *roseus*, from a simple annual *root*, throws up several spreading, ascending, leafy *stems*, near a span high. *Leaves* on long stalks, undivided, entire, of an oblong, slightly hastate figure, but much narrower than in the last species. The whole *herb* is roughish, with a sort of hoary mealiness. *Flowers*, as well as their *stalks*, and the *valves* investing the *seed*, of an elegant rose-colour; the lobes of the *valves* semi-orbicular, membranous, strongly reticulated with red veins, and bordered with fine sharp teeth.

22. R. *tingitanus*. Tangier Dock. Linn. Sp. Pl. 479. Willd. n. 22. Ait. n. 18. (Acetosa dentata perpetua di Tanger; Zanon. Ist. 14. t. 5. (Lapathum maritimum fœtidum; Bauh. Prodr. 56.)—Flowers united. Valves heart-shaped, obtuse, membranous, entire. Leaves hastate, ovate, jagged.—Native of Barbary, Spain, and Cyprus. Hardy in our gardens, flowering from June to August.—*Root* perennial, creeping. *Stems* about a foot high, ascending, branched. *Leaves* on long stalks, roughish, consisting of a large, ovate, acute, central lobe, with two small transverse ones at the base; all crisped or jagged at the edges, sometimes pinnatifid. *Flowers* in long clusters, two or three together, with a membranous *bractea* under them. *Valves* not half the size of the two last, whitish and shining. Shaw's figure, cited under *roseus*, exactly represents this species, and we find Desfontaines has removed it hither.

23. R. *scutatus*. French, or Garden, Sorrel. Linn. Sp. Pl. 480. Willd. n. 23. Ait. n. 19. (Acetosa rotundifolia hortensis; Moris. sect. 5. t. 28. f. 9. Oxalis franca seu romana; Ger. Em. 397.)—Flowers united. Leaves hastate, somewhat heart-shaped. Stem round. Native of Switzerland, the south of France, and some parts of Germany, in stony places. Cultivated for the use of the table, in every kitchen-garden, since the days of Gerarde. It is a perennial herb, flowering in June and July. The *leaves* are very smooth and rather glaucous, quite entire, supported by long stalks. Their flavour is very gratefully acid, either recent or stewed. *Flowers* small, racemose, pendulous. *Valves* orbicular, entire.

R. glaucus, Jacq. Ic. Rar. t. 67, is a more glaucous and small-leaved variety, whose *stem* is said to be in some degree woody.

24. R. *nervosus*. Three-ribbed Dock. Vahl. Symb. v. 1. 27. Willd. n. 24. (R. persicarioides; Forsk. Ægypt. Arab. 76.)—Flowers united. Valves orbicular, entire, naked. Leaves oblong, three-ribbed. Gathered by Forskall, on the mountains of Hadi, in Arabia. The *stem* is rather shrubby, with round striated *branches*. *Leaves* stalked, oblong; the uppermost lanceolate; all of them acute, entire, fleshy, very smooth, glaucous, an inch or more in length, with three ribs, but no veins. *Stipulas* membranous, sheathing, abrupt. *Panicle* terminal. *Flower-stalks* capillary, thickened under the *flower*, longer than the *fruit*. *Calyx* reflexed. *Valves* orbicular, smooth, without grains. *Vahl.*

25. R. *digynus*. Mountain Sorrel. Linn. Sp. Pl. 480. Willd. n. 25. Ait. n. 20. Pursh n. 9. Fl. Brit. n. 9. Engl. Bot. t. 910. Fl. Dan. t. 14. (Welsh Sorrel; Petiv. H. Brit. t. 3. f. 4.)—Flowers united. Styles two. Valves ovate, entire, naked. Leaves broadly emarginate. —Native of Alpine rivulets, on the mountains of Lapland, Labradore,

Labradore, Siberia, Switzerland, Wales, Scotland, and the north of England, always in very elevated ſpots, at leaſt in our iſland, flowering in June. The *leaves* are nearly all radical, on long ſtalks, kidney-ſhaped, an inch wide, wavy, veiny, pale green, acid, each terminating in a broad ſhallow notch. *Stem* a ſpan high, panicled. *Flower-ſtalks* in ſmall groups or tufts, capillary. *Valves* ovate, emarginate, entire, reddiſh, with no traces of *grains*. The *flowers*, having but two *ſtyles*, afford a deciſive ſpecific character of themſelves, as well as an excellent name. The ſegments of the *calyx* are but two, as well as the *petals*, or *valves*. The *ſeed* is orbicular and flattiſh, having a broad border.

26. R. *lanceolatus*. Lanceolate Cape Dock. Thunb. Prodr. 67. Willd. n. 26.—"Leaves lanceolate, with a reflexed border. Stem angular."—Found by Thunberg at the Cape of Good Hope. We have never ſeen it.

27. R. *graminifolius*. Graſs-leaved Sorrel. — Leaves linear, entire, very narrow. Stipulas ſheathing, imbricated. Panicle angular.—Native of Siberia. Communicated by profeſſor Rudolph to A. B. Lambert, eſq. under the above name, which very aptly deſcribes the numerous, long, graſſy *leaves*. The *ſtem* ſeems ſhrubby. *Flowers* ſmall, in a forked racemoſe *panicle*. Our ſpecimen is not perfect enough to ſhew whether the *ſtamens* and *piſtils* are in the ſame *flower* or not, neither are the *valves* diſcernible. We therefore merely mention here, for further enquiry, this very curious and diſtinct ſpecies, of which we find no publiſhed account.

Sect. 3. *Perfect ſtamens and piſtils in ſeparate flowers.*

28. R. *Lunaria*. Tree Sorrel. Linn. Sp. Pl. 479. Willd. n. 19. Ait. n. 15. (R. polygamus; Cavan. Ic. v. 1. 14. t. 22. Acetoſa arboreſcens, ſubrotundo folio; Pluk. Almag. 8. Phyt. t. 252. f. 3.)—Flowers monoecious. Males with twelve ſtamens. Anthers oblong. Females with ſix abortive ones. Valves rounded, granular. Stem ſhrubby. Leaves ſlightly heart-ſhaped.—Native of the Canary iſlands, from whence it was brought into the Engliſh green-houſes, as ſoon as tender exotics became much cultivated. It flowers in June and July. The *ſtem* is ſhrubby, branched, ſpreading, often reddiſh. *Leaves* alternate, on longiſh ſtalks, fleſhy, entire, ſmooth, of a pale glaucous hue and acid taſte. *Stipulas* ſheathing, broad, membranous, whitiſh. *Flowers* in a large, terminal, branched, racemoſe *panicle*; their particular ſtructure Cavanilles firſt explained, and we have nearly verified his deſcription. He knew not that his was a Linnæan plant, nor did the editors of Hort. Kew. diſcover his ſynonym. Some *flowers* are entirely male, with a three-cleft *calyx*, three very minute unchangeable *petals*, and twelve *ſtamens*, whoſe *anthers* are divided half way down. Other *flowers*, in the ſame panicle, have a ſimilar *calyx* and *petals*, but the latter are ſubſequently enlarged into three orbicular, emarginate, veiny *valves*, each bearing a ſmall *grain*. Theſe flowers have moſtly the rudiments of ſix *ſtamens*, but entirely ineffectual, hardly viſible to the naked eye. We preſume the large capillary tufts, deſcribed by Cavanilles, are the real *ſtigmas*, the *ſtyles* being bent down to the bottom of the flower, as in many other ſpecies, with whoſe *ſtigmas* theſe plumoſe tufts exactly accord. But this we have not aſcertained, as yet, in the living plant. Conſidering the preſent ſpecies as in fact monoecious, not polygamous, we have removed it to this ſection.

29. R. *haſtulatus*. Little-halberd-leaved Sorrel.—Flowers ſeparated, dioecious? Anthers orbicular. Stem ſhrubby, angular. Leaves halberd-ſhaped, revolute. Gathered by Mr. Menzies in Chili. The *ſtem* is woody, with numerous, long, lax, zigzag, angular *branches*. *Leaves* half an inch long, or rather more, entire, minutely roughiſh, obtuſe, tapering at the baſe into a *footſtalk*, about half their own length. *Stipulas* ſhort, membranous, obtuſe. *Flowers* in ſolitary, terminal *cluſters*, with a concave, thick, permanent *bractea*, and ſeveral minute membranous ones, under each little aſſemblage of three partial ſtalks. Segments of the *calyx*, as well as the *petals*, concave, reflexed. *Stamens* ſix, ſhorter than the calyx. *Anthers* of two round lobes, opening externally. We can diſcover no other than male flowers.

30. R. *auratus*. Golden-flowered Dock. (Favrodine dorée; Reynier Mém. de la Société de Lauſanne, v. 2.)—Flowers ſeparated, dioecious? Stamens nine or twelve. Anthers oblong. Petals none in the male. Stem herbaceous, angular. Leaves ovato-lanceolate, ſomewhat crenate, with hairy ribs.—Native of Switzerland. *Reynier, Davall.* Firſt found by M. Favrod, in a meadow not far from the village of Caſtrod. M. Reynier, who conceived this plant to form a diſtinct genus from *Rumex*, on account of the want of *petals*, and the ſuper-abundance of *ſtamens*, named it as above. His own ſpecimen, now in our hands, and thoſe of Mr. Davall, are entirely male. We have never ſeen either female flowers, or *fruit*; nor can we find any indication of this *Rumex* in Haller, or elſewhere. The *habit* of the herb bears a general reſemblance to our common Docks, *acutus*, *criſpus*, &c. The *ſtem* is angular, and ſtrongly furrowed, panicled above, with long leafleſs *cluſters* of innumerable ſmall male *flowers*, of a green and tawny hue, on drooping capillary *ſtalks*. The *leaves* are lanceolate, ovate, or ſomewhat heart-ſhaped; their ribs, veins, and long *footſtalks*, hairy. This laſt character induces a ſuſpicion that the plant before us may poſſibly be the male of *R. divaricatus*, n. 13, a ſpecies concerning which very little is known, and which Haller, on the authority of Willich, reports to have, on cultivation, become the ſame as *pulcher*. Our *auratus* indeed is diſtinct from *pulcher*, but may be a variety of *divaricatus*, become occaſionally dioecious, if it be not always ſo. The three ſegments of the *calyx* are ſpreading, linear, keeled and channelled, rather ſhorter than the *anthers*, which are cloven at the top.

31. R. *alpinus*. Alpine Dock, or Monk's Rhubarb. Linn. Sp. Pl. 480. Willd. n. 27. Ait. n. 21. (Lapathum folio rotundo, alpinum; Bauh. Hiſt. v. 2. 987. Hippolapathum rotundifolium; Ger. Em. 389.)—Flowers monoecious, or polygamous. Valves entire, naked. Leaves heart-ſhaped, obtuſe, rugoſe.—Native of the alps of Switzerland, France, and Savoy, as well as of Greece and the Bithynian Olympus, flowering in July. Cultivated ever ſince Gerarde's time in our gardens, where it thrives, even in the ſmoke of London, and makes a very handſome appearance with its ample rich-green foliage. The *root* is thick, certainly perennial, though Linnæus and Willdenow mark it as biennial, and is ſaid to poſſeſs the medical virtues of Rhubarb; in a weaker degree. *Footſtalks* very long. *Stipulas* membranous, ſheathing. *Stem* two feet high, erect, leafy, round, furrowed, ſmooth. *Cluſters* forming an oblong, denſe, leafy *panicle*, of innumerable green *flowers*, ſome of which have *ſtamens* with a, uſually imperfect, *germen*; others are entirely female. *Valves* heart-ſhaped, ſtrongly reticulated with veins; their midrib a little tumid, but not granular. *Seed* ſmall.

32. R. *ſpinoſus*. Prickly-ſeeded Dock. Linn. Sp. Pl. 481. Willd. n. 28. Ait. n. 22. Sm. Fl. Græc. Sibth. t. 347, unpubliſhed. (Beta cretica, ſemine aculeato; Bauh. Prodr. 57. B. cretica, ſemine ſpinoſo; Bauh. Hiſt. v. 2. 963.)—Flowers monoecious. Calyx of the females of one leaf

leaf, pitcher-ſhaped, with three ſpreading ſpinous points. Stem decumbent. Leaves ſlightly haſtate. — Native of Gibraltar, Zante, Crete, and the neighbourhood of Athens; alſo of the Cape of Good Hope; cultivated here in 1656, by Tradeſcant. This is a proſtrate, annual, widely ſpreading, and rank-growing herb, with the aſpect and green hue of ſome kind of Beet. The *branches* are zigzag, round, ſtriated. *Leaves* ſtalked, ſpreading, about two inches long and one broad, entire and ſmooth. Tufts of female *flowers* ſeſſile, axillary; thoſe of the males much fewer, leafleſs, about the ends of the branches, ſtalked and drooping. *Calyx* and *petals* of the latter alike, concave, obtuſe, equal. *Stamens* ſix. *Calyx* of the former triangular, with ſix ribs, and curious depreſſions between; the three ſegments ſpreading, heart-ſhaped, folded, ſpinous-pointed, finally very hard and rigid. *Petals* ſmall, oblong, triangular, erect, permanent, but ſcarcely enlarged, the body of the *calyx* encloſing the *ſeed*. This ſingular ſpecies, in its *fruit*, as well as habit, approaches the nature of *Beta* and *Spinacia*.

33. R. *giganteus*. Tall Dock. Ait. n. 23.—"Flowers monoecious. Valves naked. Leaves oblong-ovate."—Native of the Sandwich iſlands, from whence it was brought by Mr. Menzies, in 1796. It is a perennial green-houſe plant, flowering from June to Auguſt. *Aiton*.

34. R. *tuberoſus*. Tuberous-rooted Dock. Linn. Sp. Pl. 481. Willd. n. 29. Ait. n. 24. Sm. Fl. Græc. Sibth. t. 348, unpubliſhed. (Oxalis tuberoſa radice; Bauh. Hiſt. v. 2. 991. Ger. Em. 396.)—Flowers dioecious. Valves naked. Leaves oblong-arrow-ſhaped; their lobes ſpreading. Root with oval knobs.—Native of Italy, Aſia minor, and the iſlands of Cyprus and Lemnos. Miller is ſaid to have cultivated this ſpecies, but it ſeems now loſt. The *root* is perennial, with oval or oblong knobs, like thoſe of *Spiræa Filipendula*. *Stems* a foot high. *Leaves* entire, with two divaricated lobes or points at the baſe, ſmooth. *Cluſters* panicled, of an elegant roſe-colour, eſpecially when ripening *ſeed*. *Anthers* orange. *Stigmas* pink. *Valves* orbicular, obtuſe; heart-ſhaped at the baſe, without *grains*.

35. R. *Acetoſa*. Common Sorrel. Linn. Sp. Pl. 481. Willd. n. 31, excluding the laſt variety. Ait. n. 25. Fl. Brit. n. 10. Engl. Bot. t. 127. Woodv. Med. Bot. t. 69. (Oxalis, ſive Acetoſa; Ger. Em. 396.)—Flowers dioecious. Valves granular. Leaves oblong-awl-ſhaped; their lobes converging, often notched.—Native of graſſy paſtures throughout Europe, from the alps of Lapland to Greece, flowering early in June. The *root* is perennial, tapering, running deep into the ground, tufted at the top, and throwing up ſeveral *ſtems*, one to two feet high, round, ſimple, leafy, ſtriated. *Leaves* deep green, paler beneath; the lower and radical ones ſtalked; the upper ſeſſile, ſomewhat revolute, claſping the ſtem; the points at the baſe of all rather directed inward than otherwiſe, and not in any degree divaricated; their edges nearly entire, or ſlightly criſped. *Stipulas* long, tubular, jagged at the ſummit. *Cluſters* compound or aggregate, whorled, reddiſh. *Flowers* drooping, completely dioecious. *Petals* in both oblong-ovate, larger than the *calyx*, which latter is reflexed when in fruit. *Valves* ovate, obtuſe, entire, each bearing an ovate *grain*. Linnæus in Fl. Lapp. ed. 2. 99, and Dillenius in Raii Syn. ed. 3. 143, mention a large alpine variety, for which the former cites Muntingius, (*de vera herba Britannica*,) Acetoſa Hiſpanica maxima, 225. t. 213. This author's plant ſeems rather the *arifolius* hereafter deſcribed, which we can ſcarcely believe to have been found either in Lapland or Merionethſhire. *R. Acetoſa* taſtes gratefully acid, with a pleaſant and wholeſome aſtringency. It is, according to Linnæus, much uſed by the Laplanders for preparing a kind of whey from rein-deer's milk, which will keep a long time, and is in great requeſt among people of all ages.

36. R. *Acetoſella*. Sheep's Sorrel. Linn. Sp. Pl. 481. Willd. n. 32. Ait. n. 26. Purſh n. 10. Fl. Brit. n. 11. Engl. Bot. t. 1674. Curt. Lond. faſc. 5. t. 29. (Oxalis tenuifolia; Ger. Em. 397. O. ſive Acetoſa, minor; Matth. Valgr. v. 1. 406.) — Flowers dioecious. Valves naked. Leaves lanceolate-haſtate.—Native of barren ſandy or gravelly paſtures and fields, throughout Europe, flowering in June and July. This is but half the ſize of the laſt, more ſlender in every part, and more of a red or tawny colour. The *root* is perennial and creeping. *Leaves* numerous; the radical ones haſtate, their tranſverſe lobes ſpreading at right angles with the central lobe, narrow and entire; ſtem-leaves often undivided. *Cluſters* panicled, numerous. *Valves* ovate, nearly entire, all deſtitute of *grains*. The herb is acid.

37. R. *multifidus*. Many-cleft Sorrel. Linn. Sp. Pl. 482. Willd. n. 30. Sm. Fl. Græc. Sibth. t. 349, unpubliſhed. (R. Acetoſella β; Linn. Sp. Pl. 482. Acetoſa minor erecta, lobis multifidis; Bocc. Muſ. v. 2. 164. t. 126. Tourn. Inſt. 503.)—Flowers dioecious. Leaves lanceolate-haſtate; their ſide lobes palmate.—Native of Italy, Sicily, and the Levant. Dr. Sibthorp gathered it on the hills of Greece, as well as near Conſtantinople. Linnæus ſeems never to have ſeen it, and has fallen into a ſtrange error, in quoting Boccone's ſynonym for two different things, within four or five lines. This Willdenow did not preſume to correct, but aggravated the error by one figure. He reminds us of the very ſubmiſſive young man, who ſaw Rouſſeau eat the berries of *Hippophäe*, without daring to tell him they were reputed poiſonous. The preſent ſpecies differs from the laſt merely in the diviſions of its ſide lobes. We have never ſeen its *valves*, but the *flowers* are exactly like *Acetoſella*, of which it may poſſibly be a variety.

38. R. *bidens*. Toothed-valved Sorrel. Brown n. 2.—"Flowers ſeparated. Valves naked, haſtate. Leaves linear-lanceolate, tapering at the baſe."—Gathered by Mr. Brown, in Van Diemen's iſland. Whether this be dioecious or monoecious is not expreſſed.

39. R. *aculeatus*. Prickly-valved Sorrel. Linn. Sp. Pl. 482. Willd. n. 33. Sm. Prodr. Fl. Græc. Sibth. v. 1. 249. (Acetoſa cretica, ſemine aculeato; Bauh. Prodr. 55. Oxalis minor aculeata Candiæ; Bauh. Hiſt. v. 2. 991.)—Flowers monoecious. Leaves lanceolate, ſtalked. Fruit reflexed. Valves fringed with hooked prickles.—Native of Spain, Crete, Greece, and the neighbourhood of Conſtantinople. A very curious little perennial ſpecies, ſomewhat like *Acetoſella* in herbage, except that the *leaves* are more glaucous, and ſimply lanceolate, not haſtate. The *cluſters*, or *ſpikes*, are ſolitary at the top of each branch, and look at firſt ſight like thoſe of ſome *Reſedæ*. *Flowers* ſmall, monoecious in both the Linnæan ſpecimens, though on one there are more males, on the other more females. The latter are ſtrongly curved downwards. *Valves* ovate, curiouſly fringed with rigid, hooked, or forked, prickles; ſome are furniſhed with a ſmall *grain*.

40. R. *luxurians*. Spreading Cape Sorrel. Linn. Mant. 64. Suppl. 212. Willd. n. 34. (R. ſagittatus; Thunb. Prodr. 67. Acetoſa montana pumila, ſegopiri folio; Bocc. Muſ. v. 1. 165. t. 126?)—Flowers monoecious. Leaves haſtate, taper-pointed; ſomewhat heart-ſhaped. Stem much branched, angular, diffuſe. Valves orbicular, naked. —Native of the Cape of Good Hope, according to a ſpecimen

men from Dr. Bladh, in the Linnæan herbarium. The ſynonym of Boccone, which ſurely can have nothing to do with this plant, cauſed it to be thought of Italian origin. Linnæus cultivated it at Upſal, and we have a ſpecimen from the Paris garden, but our Engliſh cultivators ſeem to know nothing of this *Rumex.* The *root* is tuberous like *Spiræa Filipendula*, or *R. tuberoſus*, n. 34, and, of courſe, perennial. *Stems* many, twelve or eighteen inches long, proſtrate, branched, zigzag, leafy, marked with five angles, and ſtriated. *Leaves* on long ſtalks, very acid, purpliſh at the margin, waved, but ſcarcely crenate; their form triangular, with taper ſpreading points; their length an inch and a half or two inches; and they are cut away at the baſe, up to the ſide ribs. *Cluſters* terminal, numerous, compoſing a large ſpreading *panicle*, with fine, capillary, ſingle-jointed *partial ſtalks*. *Flowers* certainly monoecious in the above-mentioned ſpecimen, the only one we have ſeen; the males towards the extremity of the cluſters. *Calyx* in both ſexes oblong, incurved, concave, obtuſe. *Petals* larger, orbicular, reddiſh. *Stamens* ſix, with oblong cloven *anthers*. *Valves* twice as large as the permanent inflexed calyx, orbicular, finely reticulated, and, as far as we can diſcover, deſtitute of *grains*. It might puzzle any reader to determine what the younger Linnæus meant, in the *Supplementum*, by the inner and outer *valves*. The latter are the *calyx*, but there is no authority, nor analogy, to juſtify his phraſeology, nor is the *calyx* awl-ſhaped. We are enabled to ſolve Willdenow's difficulty concerning *R. ſpinoſus* of Thunberg, as we have the real *ſpinoſus* from the Cape, and the preſent plant anſwers ſo exactly to his *ſagittatus*, a ſpecies apparently overlooked by Willdenow.

41. R. *arifolius.* Great Arum-leaved Sorrel. Linn. Suppl. 212. Willd. n. 35. Ait. n. 27. Allion. Pedem. v. 2. 204? (R. abyſſinicus; Jacq. Hort. Vind. v. 3. 48. t. 98. Acetoſa montana lato ari rotundo folio; Bocc. Muſ. v. 1. 165. t. 125? ſee alſo t. 126.)—Flowers dioecious. Leaves all ſtalked, haſtate, with ſimple divaricated lobes. Valves heart-ſhaped, rounded, naked, entire.—This ſpecies is reported to have been brought from Abyſſinia by Mr. Bruce, as every thing communicated by that celebrated traveller was, at one time, ſuppoſed to have been; juſt as the gardeners have ſince attributed every new plant, even the Great Barbary Oat, to Botany Bay. We can ſcarcely doubt that Allioni's is the ſame ſpecies, for few plants vary more ſurprizingly in luxuriance than we have ſeen this; and if ſo, *R. arifolius* is a native of the Alps. We gathered it by the great high road over Mount Cenis, in 1787. To prevent miſtakes, we ſhall deſcribe our ſpecimens, and leave our readers to obſerve how nearly they agree with Jacquin's luxuriant garden ones, which he ſays were from ſix to nine feet high. *Root* perennial. *Stems* from three to five feet high, erect, ſimple, leafy, ſomewhat angular, ſtrongly furrowed, ſmooth, light green, often reddiſh. *Leaves* of a light bright green, not of the deep hue of *R. Acetoſa*, from two to four inches long, ſometimes more, oblong inclining to ovate, with two ſpreading, acute, entire lobes at the baſe, very variable in ſize. *Footſtalks* very long in the lower and radical leaves, and ſcarcely entirely wanting in the uppermoſt. *Cluſters* numerous, forming a large, terminal, compound, leafleſs *panicle* of innumerable, very ſmall, green *flowers*, male on one plant, female on another. *Calyx* of the latter reflexed, permanent. *Valves* thrice as large, pale brown, tinged with pink, membranous, without *grains*, finely reticulated, nearly orbicular, wavy, but not crenate. *Seed* pale brown, above half the length of the valves, its angles ſharp and greatly compreſſed. It muſt be obſerved that though Jacquin's figure, which is far from exquiſitely finiſhed, ſeems to indicate *grains* on the *valves*, his deſcription ſays there are none. We are not very doubtful of Boccone's ſynonym, as his figures are generally diminiſhed, and our plant is ſo variable in ſize.

42. R. *bipinnatus.* Cut-leaved Sorrel. Linn. Suppl. 211. Willd. n. 36.—Flowers dioecious. Leaves doubly pinnatifid.—Native of Morocco, in ſandy ground, according to a ſpecimen in the Linnæan herbarium, the only one we have ſeen, which is juſt about flowering, and ſeems entirely male. *Stem* aſcending, about a ſpan long, ſimple, leafy, angular, ſtriated, ſmooth. *Leaves* an inch or more in length, apparently very fleſhy, heart-ſhaped, deeply pinnatifid almoſt to the mid-rib; their ſegments deeply, irregularly and obtuſely ſubdivided, ſo that the whole leaf bears ſome reſemblance to various ſpecies of Pelargonium; ſee that article. *Footſtalks* about equal to the leaves, or longer. *Stipulas* large, membranous, pale, ovate, acute, ſheathing at the baſe. *Cluſters* compoſing a terminal panicle, with large ſhining *bracteas*, reſembling the *ſtipulas*. *Calyx* of three roundiſh, concave, membranous-edged leaves. We can ſcarcely diſcern even the rudiments of *petals*. *Stamens* ſix, with oblong, reddiſh, cloven *anthers*.

43. R. *hoſtilis.* Armed, or Prickly Dock. Loureir. Cochinch. 217.—Flowers dioecious. Leaves lanceolate, entire. Stem prickly. Valves naked.—Native of Cochinchina, where it is called *Cây dieò gai.* The *ſtem* is three feet high, erect, round, prickly. *Leaves* flat, ſpreading. *Flowers* ſpiked. *Valves* all without grains, entire, ſmooth, unarmed. *Seed* triangular. *Petals* three, greeniſh. *Loureiro.*

The author laſt named has a *R. criſpus*, found near rivers in Cochinchina, which he mentions as eatable. This is very unlikely to be our Linnæan *criſpus*, eſpecially as he ſays each *valve* bears three briſtles, nor was he at all acquainted with European plants, except from deſcription. Still we dare not, without ſpecimens, adopt the ſpecies in queſtion as a new one.

Rumex, in *Gardening*, contains plants of the herbaceous, perennial, and woody evergreen kinds, of which the ſpecies cultivated are, the common ſorrel (R. acetoſa); the French ſorrel (R. ſcutatus); the patience dock, or rhubarb (R. patientia); the bloody-veined dock, or bloodwort (R. ſanguineus); and the tree ſorrel (R. lunaria).

In the firſt ſpecies the whole herb is acid, with a degree of aſtringency not unpleaſant or unwholeſome. It is often cultivated as a culinary herb. And there is a variety of it with broad leaves, termed great mountain ſorrel.

The ſecond ſort, which is called round-leaved ſorrel, is a more grateful acid than the firſt kind, and of courſe preferred for kitchen uſe, in ſoups, &c.

Method of Culture.—The firſt and ſecond ſorts and varieties of theſe plants may be increaſed by ſeed and parting the roots, but more particularly the firſt, as the latter may be very readily increaſed by the roots. The ſeeds ſhould be ſown in a bed or border in the early ſpring, as March, raking them in evenly. When the plants come up, they ſhould be regularly thinned, and when of ſome growth, in the ſummer, be planted out in rows on a bed or border, about eight or nine inches apart in the common ſort, and, in the other a foot or more, watering them well; when they will be proper to cut the latter end of the ſame ſummer and in the autumn, continuing for ſeveral years; but as the ſeedling plants in the firſt kind moſtly produce larger leaves than the older plants, freſh ſupplies ſhould be raiſed annually, or every other year. And the parted roots may be planted out in the ſame ſeaſon, or in autumn, in rows a foot apart, giving them a good watering when they grow readily and

and furniſh leaves in the latter end of ſummer and in the autumn. The ſecond ſort is readily raiſed in this way. They afterwards only require to be kept clean, and to have the ſeed-ſtems cut down in the ſummer, as well as the rank leaves in the autumn, that more full ſupplies of freſh leaves may be afforded.

And the third and fourth ſorts may be raiſed alſo from ſeeds in the ſame way, and the former from offsets of the root planted out in the autumnal ſeaſon; when they grow very readily.

The laſt ſort is eaſily increaſed by cuttings of the young ſhoots in the ſpring and ſummer months, being planted in pots at the former ſeaſon, plunging them in a hot-bed; but in the latter they ſucceed without artificial heat, either in pots or the natural ground, being occaſionally ſhaded and watered; when they become well rooted by the autumn. The third and fourth ſorts afford variety in the clumps and borders, and the laſt among the green-houſe collections of plants.

Rumex, in the *Materia Medica*. The root of the R. aquaticus, or water-dock, has ſcarcely any ſmell; it has a ſtrong auſtere taſte, ſtrikes a black colour in a ſolution of ferrum vitriolatum, or ferri ſulphas, and yields its active matter both to water and to rectified ſpirit. All the lapatha were formerly officinal herbs. Their name is derived from λαπαζω, *evacuo*, and they are alluded to by Horace in the following lines:

"—— Si dura moralitur alvus,
Mitulus et viles pellent obſtacula conchæ
Et lapathi brevis herba." Sat. 4. l. 2. v. 27.

The water-dock has been eſteemed to be the moſt efficacious. The leaves, which manifeſt conſiderable acidity, are ſaid to poſſeſs a laxative quality, and have therefore been uſed to relieve coſtiveneſs; the roots are ſtrongly aſtringent, and have been much employed, both externally and internally, for the cure of ſcurvy, eſpecially when the gums are ſpongy, and frequent hemorrhages ſupervene. It is alſo recommended in various other cutaneous defœdations, and in viſceral obſtructions: and in order to give it additional importance, Muntingius has laboured to prove that this hydrolapathum is the "Herba Britannica" of the ancients; but many medical men ſtill think that this root does not peculiarly differ from other aſtringents, and are ſo ſceptical, as not to place any faith in the great virtues aſcribed to it by Muntingius and ſir John Hill; ſo that it is now ſcarcely ever employed. The powdered root is ſaid by Murray to be an excellent dentifrice. The leaves of the R. acetoſa, or common ſorrel, have an agreeable acid taſte, like that of oxalis acetoſella, or wood-ſorrel, which this plant reſembles in its medical properties; and as it is eaſily procured in great abundance, may be ſubſtituted for it. (See Oxalis.) Sorrel, taken in conſiderable quantity, or uſed variouſly prepared as food, will undoubtedly be found beneficial, where a refrigerant and antiſcorbutic regimen is required; and Linnæus informs us, that the Laplanders experience "ſerum acetoſatum" to be in this reſpect an uſeful and pleaſant diet. The acidulous taſte of ſorrel-leaves is ſaid to depend on the preſence of ſuperoxalate of potaſs, which they contain. The leaves are diuretic as well as refrigerant. Their expreſſed juice diluted with water, or a decoction of them in whey, affords an uſeful drink in caſes of inflammatory fever; and eating them in large quantities daily as a ſalad, may prove ſerviceable in ſome cutaneous affections. In France the plant is cultivated for the uſe of the table. Woodville. Thomſon.

RUMFORD, in *Geography*. See Romford.

Rumford, a town of America, in Cumberland county, Maine, on the N. bank of Androſcoggin river, about 80 miles N.W. of Portland. The townſhip is about eight miles ſquare, ſeven of which lie N. of Androſcoggin river, which meanders through it about twelve miles; about a mile from its E. line there is a large fall. Ellis's river runs through it on the weſt ſide.

Rumford. See Concord.

RUMI, in the *Materia Medica*, a name given by Avicenna and Serapio to maſtic of the finer kind. They diſtinguiſh this drug into two ſorts; the one called by this name *rumi*, which was white and pure; the other called *cupti*, which was foul and blackiſh; the former came from the iſland of Chios, the latter from ſome parts of Ægypt.

Rumi *Ramba*, in *Geography*, a plain near Quito, in Peru, full of large fragments of rocks, thrown thither from a volcano, formerly in the famous mountain of Pichincha.

RUMIGNY, a town of France, in the department of the Ardennes, and chief place of a canton, in the diſtrict of Rocroy; 12 miles S.W. of Rocroy. The place contains 779, and the canton 8944 inhabitants, on a territory of 230 kiliometres, in 27 communes.

RUMILLY, a town of France, in the department of Mont-Blanc, and chief place of a canton, in the diſtrict of Annecy; 7 miles W.S.W. of Annecy. The place contains 2757, and the canton 13,585 inhabitants, on a territory of 197½ kiliometres, in 26 communes.

RUMINANT, Ruminans, in *Natural Hiſtory*, an animal which chews over again what it has eat before: this is popularly called "chewing the cud."

Joah. Con. Peyer has an expreſs treatiſe "De Ruminantibus et Ruminatione," where he ſhews, that there are ſome animals which do really ruminate, ſuch as oxen, ſheep, deers, goats, camels, hares, and ſquirrels; whereas others only appear to ruminate, which he calls *ruminantia ſpuria;* of which number are moles, crickets, bees, beetles, crabs, mullets, and ſeveral other fiſhes.

This latter claſs, he adds, have the ſtomachs compoſed of muſcular fibres; by means of which the food is ground up and down, much as in real ruminants.

Ruminants, Mr. Ray obſerves, are all quadrupedal, hairy, and viviparous; ſome with hollow and perpetual horns, others with deciduous ones. See Quadrupeds.

The horned ruminants have all four ſtomachs appropriated to the office; *viz.* 1. The κοιλια μεγαλη of Ariſtotle, the *rumen*, *venter magnus*, or what we call the *paunch*, or *inward*, which receives the meat ſlightly chewed, retains it awhile, and then delivers it back again into the mouth, which is what we call the *cud*, to be re-chewed. 2. The κεκρυφαλος, or *reticulum*, which we call the *honeycomb*, from its internal coat being divided into cells like honeycombs. 3. The εχινος, which Mr. Ray thinks has been wrongly tranſlated *omaſus*, and which he chooſes to call the *echinus:* this being difficult to clear, our people throw it away, and call it the *manifold.* 4. The ενυστρον of Ariſtotle, by Gaza called the *abomaſus;* and, among us, the *maw.*

Again, all the horned ruminant animals want the dentes primores, or broad teeth in the upper jaw; and they afford that hard kind of fat called *ſuet*, *ſebum*, στεαρ, which is firmer and leſs liquefiable in them than the adeps of other animals. See *Anatomy of* Mammalia.

It is remarked by Mr. Feron, that the retrograde motion of the œſophagus in ruminating cattle, ſuch as cows, ſheep, goats, &c. renders them capable of bringing up the ſoftened graſs from their firſt ſtomach. But when theſe animals fill themſelves too full of clover, or of wet graſs, or of ſome other young vegetables, which are liable to run into fermention, tation, the ſtomach becomes diſtended with air, and death frequently enſues. See Cud and Hoven.

Great care is therefore to be taken with all theſe ſorts of animals when they are firſt turned into rich full graſſed paſtures, to ſee that they do not ſtay in them too long at a time, or fill themſelves too full of ſuch rich food. They are beſt and ſafeſt when only put into them for a ſhort period at any one time, on being firſt turned upon them. And the propereſt ſeaſon for them, as well as the graſs, is probably to conſume it when it is in the dry ſtate, as when eaten while very wet, there may be injurious conſequences in both ways.

RUMINATIO, in *Medicine*, which literally ſignifies *chewing the cud*, is applied by analogy to expreſs one of the ſymptoms of indigeſtion, nearly allied to *ructation*, when the ſtomach, by repeated ſpaſmodic efforts, throws up into the mouth, not only flatus and ſome of its ſecretions, but portions of the undigeſted food. Dr. Cullen defines *dyſpepſia*, or indigeſtion, by enumerating this among other ſymptoms by which it is, in different inſtances, characterized. "Anorexia, nauſea, vomitus, inflatio, ructus, *ruminatio*, &c." See his Synopſ. Noſolog. Method, Gen. 45. See Ructation, Indigestion, &c.

RUMINATION, in *Comparative Phyſiology*, a technical term equivalent to the common phraſe of "chewing the cud." It denotes the aſcent of the food from the paunch, or firſt ſtomach, into the mouth, and the ſecond maſtication which it there undergoes; a proceſs confined to thoſe mammalia which have complicated ſtomachs. When this ſecond maſtication has been accompliſhed, the food deſcends, not into the paunch, which receives it when it is firſt ſwallowed, but into the ſecond ſtomach; and thence ſucceſſively into the third and fourth. The mechaniſm, by which the animal has the power of conveying its food either into the paunch or the ſecond ſtomach at will, as well as the ſtructure of the ſtomach of ruminating animals altogether, is deſcribed in the article Mammalia. It is a ſingular example of voluntary power over the motions of an organ, which in other reſpects and in other animals are completely involuntary. "The influence of the will," ſays Blumenbach, "in the whole affair of rumination, is inconteſtible. It is not confined to any particular time, ſince the animal can delay it according to circumſtances, when the paunch is quite full. It has been expreſsly ſtated of ſome men, who have had the power of ruminating (inſtances of which are not very rare), that it was quite voluntary with them. I have known two men who have ruminated their vegetable food: both aſſured me that they had a real enjoyment in doing this, which has alſo been obſerved of others: and one of them had the power of doing it or leaving it alone, according to circumſtances." Comparative Anatomy, p. 138, note.

The final purpoſe of rumination, ſays the ſame author, as applicable to all the animals in which it takes place, and the chief utility of this wonderfully complicated function in the animal economy, are ſtill completely unknown: what has been already ſuggeſted on theſe points is quite unſatisfactory. Fabricius ab Aquapendente has ſufficiently refuted the old dream of Ariſtotle and Galen, that rumination ſupplied the place of inciſor teeth, the materials of which are applied in theſe animals to the formation of horns. Perrault and others ſuppoſed that it contributed to their ſecurity; as they eat much, and are timid, they ſuppoſed it removed the neceſſity of their remaining long employed in chewing in an open paſture. But the Indian buffalo ruminates, although it does not fly even from a lion, but rather attacks, and often vanquiſhes that animal. And the wild goat dwells in alpine countries, which are inacceſſible to beaſts of prey. Comparat. Anat. loc. cit.

RUMMAGE, probably derived from the Saxon *raum*, *room*, or *ſpace*, in the *Sea Language*, ſignifies to clear a ſhip's hold, or to remove goods or luggage from one place to another.

RUMMEL, in *Geography*, a river of Algiers, which paſſes by Conſtantina, and afterwards joins the Wed el Kibbeer, 18 miles N.W. of Conſtantina.

RUMMELSBURG, a town of Farther Pomerania, ſituated on the Wipper; 25 miles S. of Rugenwalde. N. lat. 53° 55′. E. long. 65° 53′.

RUMNEY. See Romney.

Rumney, or *Romney Marſh*, a tract of land in the county of Kent, (ſee Romney,) governed by certain ancient and equitable laws of ſewers, compoſed by Henry de Bathe, a venerable judge in the reign of king Henry III. who granted a charter to this diſtrict, impowering twenty-four men, thereunto choſen, to make diſtreſſes equally upon all thoſe which have lands and tenements in the ſaid marſh, to repair the walls and water-gates of the ſame, againſt the dangers of the ſea. The commiſſioners of ſewers, in other parts of England, may act according to the laws and cuſtoms of Rumney Marſh, or otherwiſe, at their own diſcretion; ſubject to the diſcretionary reviſion of the court of king's bench.

Rumney, or *Romney*, a townſhip of New Hampſhire, America, in Grafton county, on a north branch of Baker's river, about 7 or 8 miles N.W. of Plymouth, on the W. ſide of the Pemigewaſſet, incorporated in 1767, and containing 765 inhabitants.

RUMOUR, in *Law*. Spreading falſe rumours is criminal, and puniſhable at common law.

RUMP *of a Bird*. See Uropigium, and *Anatomy of* Birds.

RUMPHIA, in *Botany*, was inſcribed by Linnæus to the memory of George Everard Rumph, M.D. counſellor to the Dutch Eaſt India Company, whoſe remembrance muſt ever be dear to all ſtudents of tropical botany, for the ſake of his *Herbarium Amboinenſe*. This work, of ſeven volumes folio, was the fruit of his long reſidence, and great authority, in Amboyna, nor does it, as a ſtore of faithful practical information, fall ſhort of any performance of the kind. It has indeed ſome of the faults, or rather misfortunes, of a poſthumous publication; and the reader muſt always keep in mind that the figures, far inferior to thoſe of the *Hortus Malabaricus*, are generally not more than half the ſize of nature. The original drawings, ſtill in exiſtence, are ſaid to be very fine. The author was born at Hanau in 1637, and died in 1706. His ardour for natural ſcience roſe above the moſt formidable obſtacles, ſuch as the loſs of ſight, at forty-three years of age, and the deſtruction by fire of all his papers and collections, ſeven years afterwards. He publiſhed at Amſterdam, in 1706, a ſplendid and excellent work on ſhells in Dutch, and is ſaid to have left behind him, in manuſcript, a political hiſtory of Amboyna. Happy were it if his gentle and benevolent ſpirit tended, in any way, to meliorate the cruel and ſordid policy of his countrymen there, or any where elſe! He was a member of the Imperial Academy *Naturæ Curioſorum*, and well deſignated by that body, according to their cuſtomary mode, as the Indian Pliny.—Linn. Gen. Pl. 23. Schreb. 31. Willd. Sp. Pl. v. 1. 187. Mart. Mill. Dict. v. 4. Vahl. Enum. v. 2. 36. Juſſ. 370. Lamarck Illuſtr. t. 25.—Claſs and order, *Triandria Monogynia*. Nat. Ord. *Tricoccæ*, Linn. *Terebintaceæ*? Juſſ.

Gen. Ch. *Cal.* Perianth inferior, of one leaf, three-cleft, erect, flat. *Cor.* Petals three, oblong, obtuſe, equal, much exceeding the calyx. *Stam.* Filaments three, awl-ſhaped, the

the length of the corolla; anthers fmall. *Pift.* Germen fuperior, roundifh; ftyle awl-fhaped, the length of the ftamens; ftigma triangular. *Peric.* Drupa coriaceous, turbinate, with three furrows. *Seed.* Nut ovate, undivided, of three cells.

Eff. Ch. Calyx three-cleft. Petals three. Drupa coriaceous. Nut of three cells.

1. R. *amboinenfis.* Linn. Sp. Pl. 49. (Tsjem-tani; Rheede Hort. Malab. v. 4. 25. t. 11. Myxa pyriformis, officulo trifpermo; Raii Hift. v. 2. 1556.)—Native of wild ftony fandy places, in the hills of Parakaroo, and other parts of the country of Malabar, flowering in December, and bearing fruit in January, which remains long on the branches. This is a tree of vaft fize, with a thick *trunk*, and rough *bark*. *Leaves* evergreen, fcattered, ftalked, heart-fhaped, pointed, fharply crenate, with five radiating branched ribs, roughifh and hairy; dark green on the upper fide; paler beneath. *Flowers* white, in axillary clufters. They are reprefented with a hairy tubular *calyx*, and three feeming *bracteas* at the bafe; but the latter appear to be what Linnæus defcribes as the *calyx*. We have feen no fpecimen, nor do we know whence he formed his generic defcription, which certainly does not accord, in the laft-mentioned refpect, with Rheede's plate. The aromatic, acefcent, or fomewhat acrid, qualities attributed to the plant by this writer, juftify Juffieu's opinion of its natural affinities. The fpecific name, *amboinenfis*, is either incorrect, or muft have been founded on the authority of a fpecimen from Amboyna, feen perhaps by Linnæus, but of which no record remains.

RUMPNEY, in *Geography*. See Remney.

RUMSEY. See Romsey.

RUMZE, a river of Moravia, which runs into the Marfch, 15 miles S. of Olmutz.

RUN *of a Ship*, fo much of her hull as is always under water; growing thinner and lanker by degrees, from the floor-timber to the ftern-pofts.

This is alfo called the *fhip's way aftward.*

A fhip is faid to have a *good* run, when it is long, and the water paffes eafily to her rudder, her tuck not lying too low, which is of great importance to her failing. If the water do not come ftrongly to her rudder, by reafon of her being built too broad below, fhe cannot fteer well; and a fhip that cannot fteer well, cannot keep a good wind, nor will have any frefh way through the fea, but will always be falling to leeward.

And yet a fhip with a large and good run lofes much ftowage, becaufe it is made narrow below.

Run, in the *Manege.* To run a horfe is to put him to his utmoft fpeed. Some ufe the word *running* for any kind of gallop.

Run *Out*, in *Agriculture*, a provincial term applied to land that is exhaufted. It alfo fignifies to *fprout* as corn in a wet harveft; and likewife to *fcour*, as in the cafes of cattle.

It is a very bad and mifchievous practice, though one which is too much indulged in by farmers in many places, to fuffer lands to be quite run out, as they are very difficult, troublefome, and expenfive to bring into order again; and in a great many cafes, it is almoft impoffible ever to reftore them to the fame ftate of cultivation they were in before fuch injuries happened to them. As fuch ill confequences are, therefore, not unfrequently caufed in an intentional manner, it may be neceffary to provide againft them by the infertion of fuitable claufes in leafes.

Runs, a term ufed for the lines of planks on which the navigators wheel their barrows, when employed in the excavation of a canal. In fome inftances the fame term has been applied to inclined planes.

RUNACHUSAN, in *Geography*, a fmall ifland near the W. coaft of Scotland. N. lat. 58° 13′. W. long. 5° 4′.

RUNAN, a town of Pruffia, in Ermeland; 4 miles N.W. of Heilfberg.

RUNAWAY Bay, a bay on the N.W. coaft of the ifland of Antigua, between the fort on Corbizon's point N., and fort Hamilton S.—Alfo, a bay on the N. coaft of Jamaica, W. of Great Laughlands river and Mumby bay, and 9 or 10 miles E. of Rio Bueno. N. lat. 18° 30′. W. long. 77° 11′.

Runaway, *Cape*, a cape on the E. coaft of New Zealand; fo called by Cook in 1769, from the hafty retreat of the enemy, after having threatened hoftilities. S. lat. 37° 32′. W. long. 181° 48′.

RUNCARIA, in our *Old Writers*, fignifies land full of brambles and briars. (1 Inft. 5.) The word comes from the Latin *runca*, *a weed*.

RUNCATION, a term ufed in the *Ancient Hufbandry* to exprefs the clearing away the weeds from among the corn, and other fown plants.

They ufed, when the corn or other plants were an inch or two high, to draw a fort of rake or harrow over the ground indifcriminately over the corn and weeds, and when this was done, a perfon followed over all the field, and picked up all the weeds with the hand: the treading down the young corn, however, by this perfon's feet, and the injury done to it by the rake, were fo great, that the crop always fuffered greatly by it; and many of the Romans chofe to omit the ufe of the rake or harrow, as a thing that did as much injury to the corn as to the weeds, and contented themfelves with the fending a perfon to pick up the weeds without it.

This was a fort of firft hint to the horfehoeing hufbandry of the moderns, though fo injudicioufly managed, that it was of very little, if any ufe, in this its infancy. But had thefe farmers been inftructed to fow their corn in rows, and then to ufe the rake or harrow, as we do the hoe, only between thofe rows, they would then have had all the advantage of deftroying weeds by it, and of ftirring the earth, and no injury would have been done to the crop. See Husbandry.

RUNCHES, in *Agriculture*, a term applied to charlock when dry and withered.

RUNCINATUM, Folium, in *Botany*. See Leaf.

RUNCOL, in *Geography*, a town of Walachia; 15 miles N.W. of Tergofyl.

RUNCORN, a large townfhip, royalty, and parifh, in the weftern divifion of the hundred of Bucklow, county palatine of Chefter, England, is fituated on the S. bank of the river Merfey, at the diftance of about 14 miles N.E. from the city of Chefter. The royalty belongs to the earl of Cholmondeley, as annexed to the honour of Halton. Runcorn appears to have been anciently a town of confiderable confequence. Ethelfleda, the celebrated fifter of king Edward the Elder, built a caftle here, fome traces of which can ftill be difcovered on an eminence called the Caftle Rock, fituated about a quarter of a mile from the parifh church. This fortrefs muft have been important, as it commanded the paffage from the kingdom of Mercia to that of Northumberland. In the year 1133, a priory for regular canons of the Auguftine order was founded at Runcorn by William Fitz-Nigel, but they were fhortly afterwards removed to Norton. The church, which belonged to this monaftery, contains monuments in memory of of fir John Chefshyre, prime ferjeant to queen Anne and king George I. who died in 1738, and alfo of three baronets of the Brooke family. Thofe of fir Richard Brooke, who deceafed in 1781, and the late fir Richard, who died in 1795, were executed in marble by John Bacon, fculptor. Since the formation of the duke of Bridgewater's canal, which joins the Merfey clofe to Runcorn, this place has greatly increafed in population and wealth, and has been improved by the erection of many handfome buildings. For fome years paft it has likewife been a fafhionable refort for change of air and falt-water bathing.

The parifh of Runcorn is extenfive, and comprifes nineteen townfhips. According to the population returns of 1811, the parifh contained 1171 houfes, and 6317 inhabitants, of whom 2060 refided in the townfhip of Runcorn. Here are many fine quarries of free-ftone, large quantities of which are fent by water-carriage to Chefter, Liverpool, Manchefter, and various other places. Lyfons's Magna Britannia, vol. ii. Chefhire, 4to. Lond. 1810. Beauties of England, &c. vol. ii.

RUNDAL, a river of Norway, which runs into the fea, near Bergen.

RUNDENDORF, a town of Bavaria, in the bifhopric of Bamberg; 7 miles N.N.W. of Bamberg.

RUNDLES, or ROUNDLES, in *Heraldry*, the fame as balls or pellets.

RUNDLET, RONLET, or *Roundlet*, a fmall veffel, containing an uncertain quantity of any liquor, from three to twenty gallons.

RUNDULLA, in *Geography*, a town of Hindooftan, in Baglana; 10 miles E. of Naderbar.

RUNEHOLM. See RUUN.

RUNEKA, in *Hindoo Mythology*, is fabled as the mortal mother of Parafu Rama, an incarnation of Vifhnu. Her hufband was Jamadagni, one of the feven Rifhis, or patriarchal fages. Under thefe feveral names or words explanations will be refpectively found. On the death of Jamadagni, as related in that article, Runeka declared her intention of becoming Sati, that is *pure*, by the act of felf-immolation on her hufband's funeral pile. (See SATI.) The avaricious Raja, who had caufed her hufband's death, became thus charged with this double murder, and the vindictive Sati imprecated curfes on him and his tribe, enjoining their valorous fon Rama to avenge the death of his parents by the condign punifhment of the impious Raja and the military tribe of Kfhetria, (fee SECTS *of Hindoos*,) whofe meafure of iniquity and oppreffion was completed by this final atrocity.

The prayers or imprecations of a Sati are never inefficiently uttered; the great gods themfelves cannot liften to them unmoved. Vifhnu accordingly infpired Rama with a portion of his divinity, and fent him forth to combat the Raja; who, after twenty battles, was flain, the military race of Kfhetria annihilated, and his ufurped kingdoms relieved from oppreffion.

On the occafion of this felf-immolation of Runeka, it is related, that to ftrengthen the potency of her maledictions on the head of the murderous Raja, fhe, in addition to her own felf-facrifice, performed alfo the ceremony of Naramedha, or the facrifice of a man, thereby rendering her folicitations to the avenging deities abfolutely irrefiftible. And fo lafting is faid to be the effect of the wrath felt and tranfmitted by the vindictive Sati, and its attendant facrifice and incantations, (fee MANTRA and NARAMEDHA,) that nothing can avert its feverity, continued even to the prefent day, but a counteracting Naramedha; and that with the permiffion of Parafu Rama (who is confidered as ftill living in the Kokan or Concan): a man is accordingly facrificed to appeafe the wrath of Runeka Devi, in every generation, by the tribe called Karhara, a military fect, many of whom are fettled in the Kokan, Guzerat, and other weftern provinces of India.

Mr. Wilford, difcuffing fome of thefe topics in the third volume of the Afiatic Refearches, obferves, that although human victims, Naramedha, allowed by ancient authorities, are now prohibited under pain of the fevereft torments in the next world, the prohibition is faid to be difregarded by the Pamaras, or Pariar races, in different parts of India. But he cannot imagine that any Brahman would now officiate at fo horrid a ceremony, denounced as it is in the Brahma and Aditya Puranas, and in the Sri Bhagavat itfelf.

Notwithftanding, however, the general incredibility of the fact, refearches have fince brought to light that a tribe of Brahmans, called, from officiating for that tribe, Karhara Brahmans, do ftill actually countenance and practife the horrible ceremony in queftion. They bear, at all events, the odium of it, and are confequently fhunned by their holy brethren of more humane practices and tribes. They are themfelves very referved on the fubject; and deny the prefent practice, but admit of its former exiftence. On this curious point many particulars, for which we have not room, are collected in Moor's Treatife on Hindoo Infanticide; to which, p. 195, we refer thofe defirous of farther information. Inftances of recent facrifices, and the names of the fuppofed victims, are there given.

The name of this maleficent lady is fometimes written Renuci, and Renuka. In the eleventh volume of the Afiatic Refearches the following paffage occurs, defcriptive of her perfon and family. "In the white Ifland," which in paffing we will obferve Mr. Wilford endeavours to prove to be Albion, "lived Jamadagni, a great Muni (fee MUNI), who can at his will deftroy the world, who beftows rewards and inflicts punifhments, knows the paft and the future, and of whom the gods ftand in awe. His wife was Renuka; in her manners and gait fhe is like Reti, the mother of Kama. (See thofe articles.) The whole world gazed at her with aftonifhment: her eyes are more beautiful than thofe of the antelope of the foreft; her face is like the moon; fhe is a goddefs, incapable of decay, immediately born of the fupreme being. She is Ifwari, the fovereign queen (fee ISWARA); from her was born Rama, ever victorious," &c.

RUNGA, in *Geography*, a town of Hindooftan, in the circar of Cicacole; 25 miles S.W. of Cicacole.

RUNGIS, a town of France; 6 miles S. of Paris.

RUNGPOUR, a circar of Hindooftan, bounded on the N. by Coos Beyhar, on the E. by the Burhampooter, on the S. by Goragot, and on the W. by Dinagepour and Surroopour. The capital is Rungpour.

RUNGPOUR, a town of Bengal; 72 miles N.E. of Mauldah. N. lat. 24° 43′. E. long. 89° 23′.

RUNGS, in a *Ship*, the fame with the floor or ground-timbers, being the timbers which conftitute her floor, and are bolted to the keel, whofe ends are called *rung-heads;* and more properly floor-heads.

RUNG-*Heads* are made a little bending to direct the fweep or mold of the futtocks, and naval timbers; for here the lines, which make the compafs and bearing of a fhip, do begin.

RUNIC, a term applied to the language and letters of the ancient Goths, Danes, and other northern nations.

The word *rune*, according to Mallet, is derived from a word in the ancient Gothic language, fignifying *to cut:* but Wormius, with greater probability, derives *rune* from either *ryn*, *a furrow*, or *ren*, *a gutter* or *channel*. As thefe characters were firft cut in wood or ftone, the refemblance to a furrow, or channel, would eafily fuggeft the appellation. Others, however, derive the term from *ryne*, fignifying art, efpecially that of magic.

Some have been of opinion that Gulphilas, or Ulphilas, a Gothic bifhop, about the year 370, was the firft inventor of the Runic character: but Olaus Wormius fhews at large, that Ulphilas could only be the firft who taught it to foreigners; for that the Runæ, or characters themfelves, were older than he.

In reality, Ulphilas, according to other authors, was fo far even from teaching the character, that he invented an alphabet of his own, on purpofe to put the Runic characters, which had been made fubfervient to the fuperftitions of heathenifm, out of ufe. See GOTHIC *Character*.

Many learned writers have adopted the opinion, firft fuggefted by Dr. Hickes, that the Runic character was borrowed from the Roman, and they farther maintain, that it was not known in the North before the introduction of Chriftianity. If it were allowed, that the Runic characters are borrowed from the Roman alphabet, it by no means follows, that the Scandinavians had waited for the fecret till the introduction of Chriftianity among them: but it is juftly obferved by Wormius, that they are as eafily reducible to the Greek and Hebrew alphabets as to the Roman. An evident proof that the Runic were not derived from the Roman letters, refults not only from their form, which has fcarcely any refemblance to thefe, but from their number (being but 16), and their order and names, which have nothing in common with the Roman, Greek, or Gothic characters of Ulphilas. A comparative view of the Runic and Gothic in thefe refpects may be feen in the Englifh tranflation of Mallet's Northern Antiquities, vol. i. p. 370. M. Mallet has fufficiently fhewn, that all the old chronicles and poems of the North univerfally agree in affigning to the Runic characters a very remote antiquity, and in attributing the invention of them to Odin or Woden himfelf, whom their poets exprefsly call the inventor of the Runes. Befides, inftances occur of princes and pagan heroes, who made ufe of this character in an age long before Chriftianity had penetrated into the North.

In Blekingia, a province of Sweden, there is a road cut through a rock, on which are various Runic characters, faid to have been engraved there by king Harold Hyldetand, in honour of his father; and king Harold is faid to have afcended the throne about the beginning of the feventh century. It is, therefore, extremely probable that Odin introduced the Runic characters into the North, intending by the introduction of letters and writing to acquire refpect from the rude uncivilized inhabitants of Scandinavia; who would be ready enough to conceive that there was fomething divine or magical in them. Accordingly we find, that they were actually employed, in fpells and enchantments, for the pretended purpofe of working prodigies.

A few years before the birth of Chrift, as it has been faid, foon after Mithridates had been overthrown by Pompey, a nation of Afiatic Goths, who poffeffed that region of Afia which is now called Georgia, and is connected on the fouth with Perfia, alarmed at the progreffive encroachments of the Roman armies, retired in vaft multitudes under the conduct of their leader Odin, or Woden, into the northern parts of Europe, not fubject to the Roman government, and fettled in Denmark, Norway, Sweden, and other diftricts of the Scandinavian territory. As they brought with them many ufeful arts, particularly the knowledge of letters, which Odin is faid to have invented, they were hofpitably received by the natives, and by degrees acquired a fafe and peaceable eftablifhment in the new country, which feems to have adopted their language, laws, and religion. Odin is faid to have been ftyled a god by the Scandinavians; an appellation which the fuperior addrefs and fpecious abilities of this Afiatic chief eafily extorted from a more favage and uncivilized people.

This migration is confirmed by the concurrent teftimonies of various hiftorians: but there is no better evidence of it, than that confpicuous fimilarity fubfifting at this day between feveral cuftoms of the Georgians, as defcribed by Chardin, and thofe of certain cantons of Norway and Sweden, which have preferved their ancient manners in the pureft degree. Not that other ftriking implicit and internal proofs, which often carry more conviction than direct hiftorical affertions, are wanting to point out this migration. The ancient inhabitants of Denmark and Norway infcribed the exploits of their kings and heroes on rocks, in characters called Runic; and of this practice many marks are faid ftill to remain in thofe countries. This art or cuftom of writing on rocks is Afiatic. Modern travellers report, that there are Runic infcriptions now exifting in the deferts of Tartary. (See Voyage par Strahlemberg, &c. A Defcription of the northern and eaftern parts of Europe and Afia.) Schroder fays, from Olaus Rudbeckius, that Runes, or letters, were invented by Magog the Scythian, and communicated to Tuifco, the celebrated German chieftain, in the year of the world 1799. (Præf. ad Lexicon Latino-Scandic.) The *written mountains* of the Jews are an inftance that this fafhion was oriental. On the fubject of this migration, allowed by fome writers and contefted by others, fee the articles GOTHS and ODIN.

The Runic characters were diftinguifhed into various kinds. The *noxious*, or *bitter Runes* were employed to bring various evils on their enemies; the *favourable* averted misfortunes; the *victorious* produced conqueft to thofe who ufed them; the *medicinal* were infcribed on the leaves of trees for healing; others ferved to difpel melancholy thoughts, to prevent fhipwreck, as antidotes againft poifon, as prefervatives againft the refentment of their enemies, and in order to render a miftrefs favourable. Thefe various kinds differed only in the ceremonies obferved in writing them, in the materials on which they were written, in the place where they were expofed, in the manner in which the lines were drawn, whether in the form of a circle, a ferpent, or a triangle, &c.

The Runic characters were alfo employed for more rational purpofes: for writing epiftles and epitaphs, and for various kinds of infcriptions, which, the older they are, fo much the better are they engraven. They are rarely written from the right hand to the left; but it is not uncommon to meet with the line running from the top to the bottom, after the manner of the Chinefe and other Indian nations; or from the top to the bottom, and then turning round to the left, and fo up again to the place it begins at; or elfe from the left to the right, and fo back to the left again, which was the manner of the early Greeks. The greater part of the ancient monuments written in the Runic character, which are ftill preferved, confifts of infcriptions difperfed here and there in the fields, and cut out on large ftones or pieces of rock. They are alfo found in churches, and fometimes in other buildings.

The Saxons, who were fond of tracing the defcent of their princes from Odin, and who became poffeffors of England in the fixth century, imported into this country the old Runic language and letters. This appears from infcriptions on coins, ftones, and other monuments, and from fome of their MSS.

There are fome Runic medals in the clofets of the curious; and fome modern Danifh and Englifh medals, the infcriptions of which are Latin, and the character Runic.

There

There is extant a coin of king Offa with a Runic inscription, which shews, that this character had been used by the Saxons as well as their Scandinavian brethren.

There are also Runic inscriptions in this island; one in Cumberland, and another in Scotland. See Hickes' Thes. Ling. Sept.

But the conversion of the Saxons to Christianity, which happened before the seventh century, entirely banished the common use of those characters, which were esteemed unhallowed and necromantic; and with their ancient superstitions, which yet prevailed for some time in the popular belief, abolished in some measure their native and original vein of poetical fabling. They suddenly became a mild and polished people, addicted to the arts of peace and the exercise of devotion; and the poems they have left us are chiefly moral rhapsodies, scriptural histories, and religious invocations, intermixed even with frequent allusions to the old Scaldic fables and heroes. See SCALDS.

We may here observe, that the enchantments of the Runic poetry are very different from those in our romances of chivalry. The former chiefly deal in spells and charms, such as would preserve from poison, blunt the weapons of an enemy, procure victory, allay a tempest, cure bodily diseases, or call the dead from their tombs; in uttering a form of words, or inscribing Runic characters; whereas the magicians of romance are chiefly employed in forming and conducting a train of deceptions. In the incantations of the former there is an air of barbaric horror: the latter often present visions of pleasure and delight; and although not without their alarming terrors, sometimes lead us through flowery forests, and raise up palaces glittering with gold and precious stones. The Runic magic is more like that of Canidia, in Horace; the romantic resembles that of Armida, in Tasso. The operations of the one are frequently but mere tricks, in comparison of that sublime solemnity of necromantic machinery, which the other so awfully displays.

In the tenth and eleventh centuries the Runic gave way to the Roman character; till at length the missionaries succeeded in totally abolishing them, as tending to retain the people in their ancient superstitions. It is said that the Goths, when they became Christians, manifested a blind and indiscreet zeal in destroying several ancient monuments, and burning a great number of books, because they were written with those characters; and that about the year 1001, the Runic characters were quite laid aside in Sweden, and the Roman letters taken in their room, the Swedes being persuaded to adopt this measure by the pope, and by Sigfrid, a British bishop. In Spain they were forbidden in 1136 by Alphonso, king of Castille and Navarre, and condemned by the council of Toledo in 1115. They are, however, still retained among the mountaineers of one province in Sweden. Mallet's Northern Ant. vol. i. p. 359, &c.

It is supposed they were called Runic, as being mysterious and scientifical, like the Egyptian hieroglyphics. See Wormius de Literatura Runica; and Hickes's Thesaurus of the ancient Northern Languages.

In several parts of Sweden, stones may be met with, which were formerly set up as obelisks in memory of the dead; and these monuments are marked with the ancient northern letters called *Runor*, or the Runic characters. In some places the characters vary from the Runic, particularly in free-stones found in Helsingland, of which Mr. Celsius has given us a description, with an explanation. See Philos. Trans. N° 445. sect. 3.

From these Helsingland inscriptions an alphabet of sixteen letters may be derived, which is very singular. In other alphabets different sounds are generally denoted by different figures; but here the same character, according to the diversity of its place and altitude between two parallels, denotes different sounds.

But these characters, however different they may appear at the first sight from the Runic, may easily be derived from them; or, *vice versâ*, the Runic may be derived from the Helsingic, if these be supposed the most ancient. The subtraction of a perpendicular line in the first case, or its addition in the latter, brings the two characters to a near resemblance.

The inscription, which Mr. Celsius considers, was published in Mons. de la Motraye's Travels, but erroneously.

RUNIC *Staffs* were a kind of calendars or compendious almanacs used in the North, marked out by lines upon short pieces of board or smooth sticks; some of which bear the appearance of great antiquity. They were called, in the North, *rim-stocks* and *prim-staffs*; and exhibited, by different lines or marks, the fasts and festivals, the golden number, Dominical letter, epact, &c. Dr. Plot, in his History of Staffordshire, p. 418, &c. describes one of these instruments under the name of a *clog*, and illustrates the construction of it by a figure. He observes, that this kind of almanac is a remain of the Danish government, and that it was still in use amongst the meaner sort of people. Those which he met with in Staffordshire had only the prime and immoveable feasts upon them; whereas others of a more perfect kind, preserved in the cabinets of the curious, have likewise the Dominical letters. And of those imperfect ones there are two kinds; some public, of a larger size, which were commonly hung at one end of the mantle-tree of the chimney, for the use of the whole family, as Wormius informs us they disposed of them in Denmark; and others private, of a smaller size, which they carried in their pockets. This chronological instrument is sometimes, by an evident corruption, called *runstock*.

RUNJETZ, in *Geography*, a town of Bohemia, in the circle of Chrudim; nine miles N. of Chrudim.

RUNIUS, JOHN, in *Biography*, one of the most celebrated of the Swedish poets, was born at West Gothland in 1679. Having received the early parts of his education at Skara, he went, in 1700, to Upsal, and after completing his studies, was appointed by count Stromberg to be his secretary. He died at Stockholm of a consumption in 1713, in the 35th year of his age. He is said to have written Swedish poetry at the age of 18, which displayed great beauty, and afterwards produced a variety of pieces on different subjects, which added very greatly to his poetical fame. He wrote with so much care, and his versification is so smooth and pleasing to the ear, that he is accounted by the Swedes one of the most successful of their poets. "Some of his poems are said to be very excellent, but many of them bear evident marks of carelessness and haste, for he experienced the common lot of genius, having been doomed, throughout life, to struggle with all the ills of poverty; and his distresses would have pressed upon him much heavier, had he not been frequently relieved by count Stromberg." His poems, which he began to collect in his life-time, when he found that they were in general request, were published, after his decease, under the title of "Dudaim," Stockholm, 1714, in two parts; the first contains sacred poems, and the second epithalamia, epitaphs, and congratulatory odes. In 1733 both parts were reprinted, with the addition of a third, containing pieces on different subjects, among which were several poems written in Greek, French, and German. Gen. Biog.

RUNKEL, in *Geography*, a town of Germany, in the county of Wied-Runkel, situated on the Lahn, and consisting fifting of about 120 houfes. It has a citadel belonging to it, feated on a high hill, which was formerly the refidence of the counts. The fubfiftence of the inhabitants is derived from agriculture, gardening, and the breeding of cattle. In the year 1634, this town was plundered and reduced to afhes by the Croats; 14 miles E. of Naffau. N. lat. 50° 23′. E. long. 8° 7′.

RUNN, a lake of Sweden, in the province of Dalecarlia; four miles S. of Fahlun.

RUNNAGAUT, a town of Bengal; 15 miles S. of Kifhenagur.

RUNNEAH, a town of Hindooftan, in Candeifh; four miles N.E. of Peploud.

RUNNEL, in *Rural Economy*, a term fignifying a fort of rill.

Runnel is alfo ufed to fignify pollard wood.

RUNNER, in the *Sea Language*, a rope belonging to the garnet, and to the two bolt-tackles. It is reeved in a fingle block, feized to the end of a pennant, and has at one end a noofe to hitch into any thing, and at the other end a double block, into which is reeved the fall of the tackle, or the garnet; by which means it purchafes more than the tackle or garnet could allow.

To *overhale the runner* is to pull down the hooked end, and hitch it into the fling.

RUNNET. See Rennet.

Ariftotle will have the runnet to be the proper fubftance of the milk; but he is miftaken when he fays it is found in all animals which give milk, efpecially in all ruminants.

RUNNING, in *Antiquity*, made one of the exercifes performed in the *pentathlon*, (which fee,) or quinquertium. See Race and Stadium.

This exercife was in fo great efteem among the ancient Greeks, that fuch as prepared themfelves for it, thought it worth their while to burn, or parch their fpleen, becaufe it was believed to be a hindrance to them.

Indeed, all thofe exercifes that conduced to fit men for war, were more efpecially valued; and that fwiftnefs was efteemed fuch in an eminent degree, appears from Homer's giving his hero the epithet of ποδας ωκυς Αχιλλευς.

Running *of the Eyes*, in infants. See Infant.

Running-*Fights*, at fea. See Fights.

Running-*Fire*. See Fire.

Running *out a Warp*, in *Sea Language*, the act of carrying the end of a rope out from the fhip in a boat, and faftening it to fome diftant place, to remove the fhip towards the faid place, or keep her fteady while her anchors are lifted, &c.

Running-*Rigging* denotes all that part of a fhip's rigging which paffes through the blocks, to dilate, contract, or traverfe the fails. See Rigging.

Running *the Gauntlet*, in *Military Language*. See Gantlope.

Running *of Goods*, a clandeftine landing of goods, without paying the legal cuftoms or duties for the fame. See Smuggling.

Running-*Saddle*. See Saddle.

Running-*Thrufh*, or *Frufh*, in *Farriery*, denotes an impofthume, that fometimes gathers in a horfe's frog; or a fcabby and ulcerous difpofition which fometimes caufes it to fall off. When this difcharge is natural, the feet fhould be kept merely clean. When an impofthume appears, the fafeft courfe is to pare out the hard part of the frog, or that which appears rotten, and to wafh the bottom of the foot three times a day with old chamber-ley. But if a horfe has been neglected, and there be a ftrong flux to the part, it will be neceffary, in order to prevent its degenerating into a canker, to bathe the thrufh with the following lotion, laying over the ulcer a little tow dipped in the fame, and ufing the purges and diuretics recommended in the greafe. Take fpirit of wine and vinegar, of each two ounces; tincture of myrrh and aloes, one ounce; Ægyptiacum, half an ounce; and mix them together. See Bartlet.

Running, in *Rural Economy*, a provincial term fignifying rennet, or the coagulum made ufe of in cheefe-making.

Running *Bull*, in *Agriculture*, a term applied to the part of a harrow where the draught is attached in fome cafes. See Harrow.

RUNNO, in *Geography*, an ifland near the E. coaft of Sweden, in the Baltic. N. lat. 57° 51′. E. long. 16° 33′.

RUNNODE, a town of Hindooftan, in the Malwa country; 30 miles N.W. of Chanderee. N. lat. 25° 7′. E. long. 78° 15′.

RUNNYMEAD, or Runnemead, a tract of land on the fouth bank of the river Thames, in the parifh of Egham, and county of Surrey, England, is celebrated in hiftory for the ever memorable conference which occurred here between king John and his barons, in the year 1215. In that conference the articles of Magna Charta, or the Great Charter, as it is called, by way of eminence, were agreed upon; and on the 15th of June the fame was formally figned and fealed by the monarch, and a copy of it ordered to be depofited in the record office of each county. A fmall ifland in the Thames, adjoining the Mead, ftill retains the appellation of Magna Charta ifland, from a tradition that the charter was actually figned on that fpot. There is at prefent a houfe upon it, and a ferry for foot paffengers to Ankerwyke. It is faid that Runnemead was ufed, in Saxon times, for holding councils. If fo, obferves Mr. Bray in "The Hiftory and Antiquities of the County of Surrey," its name may have been derived from the Saxon word "Rune, fignifying council, the council mead." It contains about 160 acres of ground, tithe free, and is the property of ten perfons, who have the fole ufe of it from March to the 12th of Auguft, when it becomes common to all the parifhioners of Egham, who turn out upon it an indefinite number of cattle; but in the laft week of the fame month it is appropriated as a race courfe, in conjunction with fome adjoining inclofed lands, which are thrown open for the occafion. Near Runnymead are two meadows, called Long-mead and Yard-mead, to the fouthward of which the land rifes to a ridge of hills, one of which, called Cooper's hill, has been immortalized by the ftrains of the poet Denham. The Roman road from London to Silchefter paffed through Runnymead. The Hiftory and Antiquities of the County of Surrey, by the Rev. Owen Manning, continued by W. Bray, efq. F.S.A., of Shire, vol. iii. Lond. 1814, fol.

RUNO. See Ruun.

RUNOR. See Runic.

RUNRIG, in *Agriculture*, an ancient inconvenient diftribution of common field land, by which fmall portions or ridges of land were let to different individuals in a mixed manner.

The circumftances of land being diftributed in alternate ridges as the property or poffeffion of different tenants or holders, was unqueftionably a confequence of early farming townfhips. It is a fort of arrangement which muft have firft taken place on account of fome imperfect and confufed notion or intention of doing juftice in an equal manner to all the tenants or holders of land in fuch farming villages, by allotting to, or beftowing upon, every one of them the fame number of ridges near their houfes, and an equal number in remote fituations. And in order to render the abfurdity of fuch a mode of holding and occupying land ftill more prepofteroufly complete, if poffible, fuch ridges were, in many caſes, not unfrequently exchanged; ſo that one tenant poſſeſſed, in the ſucceeding year, the land which was held or occupied by his neighbour the preceding one.

It is remarked, that in many parts of the highlands of Scotland, the land under this diſtribution has been firſt ploughed, without leaving any boundaries, except the furrows between the ridges; then the field was divided, by putting ſmall branches of trees into the ground, in order to mark off every tenant's portion before the field was ſown. No man knew his own land until the ſeed was to be put into the ground; and it became almoſt impoſſible for him to have the ſame portion of land any two ſucceſſive years. This is a mode of diviſion, it is ſuppoſed, which is analogous to that which Cæſar has aſſerted to have prevailed among the ancient Gauls; which muſt abſolutely debar the very leaſt improvement.

This inconvenient and improper method of proceeding was greatly foſtered by the feudal notions of the times; in which he that could muſter the greateſt number of retainers, generally conſtituted to himſelf the greateſt eſtate. But in the preſent times nothing can be more abſurd than to ſee two or three, or perhaps four men, yoking their horſes together in one plough, and having their ridges alternately in the ſame field, with or without a bank of unploughed land between them, by way of boundary. Theſe diminutive poſſeſſions, it is ſaid, were carried to ſuch a length, that in ſome parts of Scotland, towards the northern extremity, the term a *horſe's foot*, the ſixteenth part of a plough-gate of land, is not yet wholly laid aſide. The land is ſtated to be like a piece of ſtriped cloth, with banks full of weeds and ridges of corn in conſtant ſucceſſion, from one end of a field to the other. Under ſuch management, all ſuch occupiers or poſſeſſors muſt have concurred in one opinion with regard to the time and manner of ploughing every field, the kind of grain to be ſown, the ſeaſon and weather fit for ſowing, and whether they and their horſes were to be employed or idle. So late as even thirty or forty years ago, this practice is ſtated to have prevailed, not only over the greater part of the county of Perth, but, with very few exceptions, over all other parts of Scotland. Since that period, however, it has been, it is ſaid, gradually going into diſuſe; and that the benefit of laying it aſide entirely is ſo apparent, that any remains of the runrig ſyſtem, which may ſtill be met with, muſt ſoon give way and diſappear, except, it is ſuppoſed, where the landlord is as much a Goth as his tenants.

When the various avocations, which theſe tenants muſt have, and the frequent jarring animoſities which muſt neceſſarily ariſe in a cloſe neighbourhood, where oppoſite intereſts are conſtantly interfering, are fully conſidered, it is ſuppoſed impoſſible to expect, that under ſuch a ſyſtem any ſpecies of improvement can be undertaken or carried on. In ſhort, townſhips and runrig are ſuppoſed ſuch obſtacles to improvement, and bolt the door ſo firmly againſt all good cultivation, that it cannot have the leaſt entrance; they are conſequently greatly deſtructive of all good management; and beſides, hold the people in the chains of idleneſs and poverty wherever they may be found to prevail. It is only by the proper ſeparation, diviſion, and incloſure of land into diſtinct portions, whether ſmall or large, for each individual tenant, occupier, or proprietor, that it can be cultivated and improved in the beſt manner, and to the greateſt advantage.

RUNSH, in *Huſbandry*, a term provincially applied to the troubleſome weed wild muſtard or charlock.

RUNSTYCKEN, or ORE, in *Commerce*, a money of account in Sweden, being the twelfth part of the ſkilling, and 48 ſkillings being = a rikſdaler. Alſo a copper coin, of 1 ore koppar and half runſtycken: the other copper coins are ſingle and double ſlants, at 1 and 2 ore ſilver, or 3 and 6 ore koppar: 96 double ſlants, 192 ſingle ſlants, or 576 runſtycken, are to paſs for 1 ſpecie rikſdaler; but in large payments, no perſon is obliged to take more copper coin than the value of half a rikſdaler. Un. Camb.

RUNT, the name uſed, with the diſtinction of places, for ſeveral ſpecies of pigeons. Theſe are the Leghorn, the Spaniſh, the Frieſland runt, &c. The *columba domeſtica Piſarum, Hiſpaniæ, et Friſiæ*, of Moore.

The Leghorn runt is a ſtately large pigeon, ſeven inches or better in the legs, cloſe-feathered, and faſt fleſhed, extremely broad-breaſted, and very ſhort in the back. He carries his tail, when he walks, ſomewhat turned up like a duck's; his neck is longer than any other pigeon's, and he carries it bending, like a gooſe or ſwan; he is gooſe-headed, and his eye lies hollow in his head, with a thin ſkin round it, like that of the Dutch tumbler; his beak is very ſhort for ſo large a bird, and has a ſmall wattle on it, and the upper chap falls a little over. It is a very valuable pigeon, but is tender, and requires care.

The Spaniſh runt is the longeſt bodied of all the pigeons; it is ſhort-legged and looſe-feathered, and does not walk ſo upright as the Leghorn runt. Theſe are of a great variety of colours, but are apt to have accidents in ſitting, from their ſitting too heavy, and often breaking their eggs.

The Frieſland runt is a large pigeon, and has all its feathers reverted, or looking as if placed the wrong way.

The Roman runt is a pigeon of the ſame general make with the common kind, but ſo large and heavy, that it can hardly fly.

The Smyrna runt is middle-ſized, and is feather-footed, and that to ſuch a degree ſometimes, as to look as if there were wings upon the feet; the feathers of theſe are ſometimes four or five inches long, and often pull the eggs and young out of the neſts.

The common runt is the common blue pigeon, kept for the table, and known to every body. Moore's Columb. p. 42. See PIGEON.

RUNT is alſo a name given to Canary-birds, when three years old. See CANARY-*Bird*.

RUNT, in *Rural Economy*, a name given to a ſmall kind of black cattle brought from Wales and Scotland.

But though this term be moſt uſually applied to the ſmall cattle of Wales and Scotland, it is not unfrequently employed in deſcribing the properties and qualities of the ſmaller, and mixed Engliſh breeds, eſpecially thoſe which have a ſtiff compact, runt-like appearance, and which, in their feeding and their habits, have conſiderable reſemblance to them. This ſort of cattle ſtock is often very ſuitable for grazing farmers, in diſtricts where the paſtures are of the inferior kinds, and for feeding out on the artificial graſs-paſtures, where a large ſtock is wanted which will ſoon become fit for the butcher.

RUPALA, in *Botany*, Willd. Sp. Pl. v. 2. 536. Mart. Mill. Dict. v. 4. See RHOPALA and ROUPALA.

RUPAS, in *Geography*, a town of Hindooſtan, in Bahar; 18 miles S. of Hajypour.

RUPEE, ROUPIE, or *Roupias*, in *Commerce*, a money of account, and alſo a coin in various parts of the Eaſt Indies. During the prevalence of the Mogul power in Hindooſtan, one principal coin, denominated the "ſicca rupee," was every where current: it was of a determinate weight, called the "ſicca," which ſerved as a ſtandard for other weights. The principal piece of gold was the "Mohur," which was of the ſame weight as the ſicca rupee; and both were intentionally minted without any alloy. The ſame denominations of money are ſtill current in India; but they differ from each other, and have deviated from their original purity.

The

The Eaſt India Company have adhered to it as nearly as poſſible; but the monies of ſome of the native princes, which are of a high degree of fineneſs, are ſubject to frequent alterations; ſo that aſſayers and money-brokers, under the appellations of "ſhroffs, are appointed to ſet a value upon the different coins that are offered in payment.

The principal money of account in India is the "current rupee," to which real coins are reduced before they are entered into books of accounts. This reduction is performed by adding to the ſpecies a certain per-centage, called the "Batta," and varying according to the value of the coins, and alſo to the rate of exchange.

In Bengal, or Calcutta, accounts are kept in current rupees; each rupee being divided into 16 annas, and each anna into 12 pice. The Eaſt India Company, however, keep their accounts in ſicca rupees, annas, and pice, which bear a batta of 16 *per cent.* againſt current rupees, annas, and pice; and in their public and financial ſtatements, which are ſubmitted to parliament, each ſum of ſicca rupees is reduced to current rupees, by adding to it this batta; and the current rupee is then reckoned at 2*s.* ſterling. The Bengal coins, ſtruck at the Calcutta mint, are ſicca rupees, called alſo ſilver rupees, and gold mohurs, ſometimes called gold rupees; 16 of the former being, by regulation, to paſs for one of the latter. Thirty-two punns, or 2560 cowries, are generally reckoned for a current rupee; but the value of cowries fluctuates, nor are they conſidered as a legal tender above the value of 1 anna piece, without mutual conſent of parties. A lack of rupees is a ſum of 100,000, and a crore is 100 lacks, or 10,000,000 of rupees.

The ſicca rupee is to weigh 1 ſicca, correſponding to 179$\frac{2}{3}$ Engliſh grains, and to be 11 oz. 15 dwt. fine; thus it ſhould contain 175.927 grains of fine ſilver, and its value is 24$\frac{1}{2}$*d.* ſterling, or, more accurately, 24.566*d.* Theſe rupees were formerly called ſicca, only during the firſt year after their coinage, when the batta they bore on current rupees was 16 *per cent.*; the ſecond year this was reduced to 13; and the third and following years, the batta was 11 *per cent.* They were then called "ſonaut" or "ſunat" rupees. But by way of aboliſhing this diſtinction, all the rupees coined of late years by the Eaſt India Company have been dated, the 19th ſun, that is, the 19th year of the Mogul emperor's reign; and thus all the rupees of the above weight and fineneſs are conſidered of equal value, in whatever year they may have been coined.

According to theſe regulations, the current rupee is worth 21.177*d.*, valuing ſilver according to the mint price in England; but the market price in India is generally much higher, making this rupee worth 2*s.* nearly, and the ſicca rupee about 2*s.* 6*d.* In the Company's books, 243 current rupees are valued at 100 dollars.

In the upper provinces of Bengal, there is another rupee, ſtruck at the Ferruckabad mint, which weighs 173 grains, and contains 165.215 grains of pure ſilver; and therefore its ſterling value is 23*d.* nearly.

The ſilver coins at Madras or Fort St. George are "Arcot" rupees. Each of theſe weighs 176.4 grains, and contains 166.477 grains of fine ſilver; and therefore its ſterling value is 23$\frac{1}{4}$*d.* It is divided into 12 annas and 192 pice, like the other rupees.

At Bombay accounts are kept in rupees; each rupee being divided into four quarters, and each quarter into 100 reas. The rupee is alſo divided into 16 annas. An urdee is two reas; a doreca, 6 reas; a dooganey, or ſingle pice, 4 reas; a fuddea, or double pice, 8 reas. A paunchea is 5 rupees, and a gold mohur, 15 rupees. The annas and reas are only imaginary monies.

The coins of Bombay are the mohur, or gold rupee; the ſilver rupee and its half; alſo the double and ſingle pice, the urdee, and doreca, which are copper coins, with a mixture of tin or lead. The old Bombay rupee was the ſame as that formerly coined at Surat under the Mogul: it weighed 178.314 Engliſh grains, and contained 1.24 *per cent.* of alloy. It was agreed that both ſhould circulate at an equal value, and the coin be kept to its exact ſtandard of weight and fineneſs. At length, in 1800, the Company found it expedient to order the Surat rupee, which had been debaſed by an augmentation of alloy, to be ſtruck at Bombay; and ſince that period, the rupees of both places have been kept at an equal value, weighing 179 Engliſh grains, and containing 164.74 grains of fine ſilver, which anſwer to 11 oz. 1 dwt. fine; and thus they are worth 23*d.* ſterling.

In the Company's financial accouuts, which are ſubmitted to parliament, the Bombay rupee is reckoned at 2*s.* 3*d.*, and then it bears a batta of 16 *per cent.* againſt current rupees, though in the tables the batta is ſtated at 10 *per cent.* It was ſettled in 1800 that the mohur ſhould be of the ſame weight and fineneſs as the ſilver rupee, and that it ſhould paſs for 15 ſuch rupees.

At Anjengo, on the Malabar coaſt, a ſilver rupee is worth, 7 old fanams, or 6 new ones, called gallon fanams: the fanam is 12 pice, or 16 vis; and a pice 4 budgerooks: all theſe are real coins. In the Company's accounts, an Anjengo fanam is reckoned to be worth $\frac{4}{5}$ths of a Calicut fanam, or $\frac{1}{5}$th of a Surat rupee, which gives its intrinſic value about 4$\frac{3}{4}$*d.* ſterling. At Calicut, 5 fanams are commonly reckoned for one rupee. The fanam is a ſmall gold coin, with a conſiderable alloy of ſilver and copper, and the tar ($\frac{1}{16}$th of the fanam) is a ſmall ſilver coin. The Calicut fanams have been found, by aſſays made at Bombay, to contain 52$\frac{1}{2}$ parts of gold, 29 of ſilver, and 17$\frac{1}{2}$ of copper. They are worth 6*d.* ſterling. At Cambay, on the Malabar coaſt, accounts are kept in rupees of 48 pezas. The rupee is worth about 2*s.* ſterling. A Venetian ſequin paſſes here for 5 rupees; a Perſian abaſſi for 1$\frac{1}{12}$ rupee; and a Perſian mamoodi for 24 pezas. At Cochin, accounts are kept in rupees of 16 annas. Theſe are reckoned of equal value to the Surat rupees. Accounts are alſo kept in fanams, 20 of which are generally reckoned for a rupee.

At Mangalore, accounts are generally kept in ſultanny pagodas, rupees, and annas; the pagoda being 4 rupees, and the rupee 16 annas. At Maſulipatam, accounts are kept in pagodas, rupees, and annas. The pagoda is 3$\frac{1}{2}$ ſilver rupees, and the rupee 16 annas. The coins are gold rupees, weighing 171$\frac{1}{3}$ Engliſh grains, about 23$\frac{3}{4}$ carats fine, and worth 1*l.* 10*s.* ſterling; pagodas of nearly the value of the ſtar pagoda of Madras; and ſilver rupees, 24$\frac{1}{4}$ of which weigh a ſeer, or 4293 Engliſh grains, and the fineneſs of theſe rupees is 11 oz. 12$\frac{1}{2}$ dwt. The value is, therefore, 23$\frac{1}{2}$*d.* ſterling.

The coins of the Myſore country are gold mohurs, paſſing for 4 pagodas; ſultany pagodas, and other pagodas, all paſſing for 13 fanams; and alſo ſultany fanams and cantery fanams, two ſmall gold coins of baſe alloy. Alſo ſultany rupees, and rajah rupees, 26 of which paſs for 7 ſultany pagodas; copper dudus, called by the Engliſh dubs: 260 dudus are the market price for a ſultany pagoda. The ſhroffs, in exchanging copper for gold or ſilver, pay at the rate of 234 dudus for a pagoda; but in changing gold and ſilver for copper, they receive 240; whilſt the price fixed by government is 182 dudus *per* pagoda. The ſultany rupee weighs 177 grains, and is 11 oz. 5$\frac{1}{2}$ dwt. fine; and is therefore worth 23$\frac{1}{4}$*d.* ſterling nearly.

At Pondicherry, accounts are kept in pagodas of 24 fanams, and the fanam is ſubdivided into 60 caſh. The coins are gold pagodas, and ſilver rupees and fanams, mentioned under Madras rupee; alſo copper caſhes, and dudus, a copper coin, 20 of which are reckoned to a fanam. Gold and ſilver are weighed by the ſeer, pagoda, rupee, and fanam. A ſeer weighs $24\frac{1}{8}$ rupees, $81\frac{1}{4}$ pagodas, or $731\frac{1}{4}$ fanams. A rupee weight equals 30 fanams, or 480 nellos; a pagoda weight, 9 fanams, or 144 nellos. Thus 3 rupees are equal in weight to 10 pagodas.

At Scindy, the coins current are ſilver rupees of 16 annas, or 48 copper pice. At Surat, accounts are kept in rupees of 16 annas, or 64 pice. The coins are mohurs or gold rupees, and ſilver rupees, with halves and quarters. A gold rupee paſſes for 15 ſilver rupees. Here are alſo pezas or pice, of copper or lead, 64 of which are reckoned to one ſilver rupee. See the coins under Bombay, *ſupra*.

At Tranquebar, accounts are kept in rixdollars of 12 fanams, and alſo in rupees of 8 fanams; and the fanam is divided into 80 caſh. The coins are ſilver rupees, double and ſingle fanams, and copper dudus or caſh. Rupees are here coined under ſuch regulations, that 1302 of them are worth 600 old Spaniſh dollars, weighing 43 lb. 7 oz. 2 dwt. troy. The value of the Tranquebar rupee is therefore $24\frac{1}{8}$ *d.* ſterling.

The following Table ſhews the Aſſay and Value of Rupees.

	Aſſay.			Weight.		Contents in pure Silver.	Value in Sterling.	
		oz.	dwt.	dwt.	gr.	grains.	s.	d.

The inscriptions on the silver coins of the East Indies are as follow:

The sicca rupee has the legends nearly the same as on the mohur, and may be thus translated: "Struck in the seven climates (date of the Hegira), by the shadow of God's favour, Shah Allum king, disciple in the faith of Mahomet;" and on the other side, "Struck at (name of the place), in the 19th year of the august and glorious reign of the emperor," &c. Some rupees do not bear the date of the Hegira, but only that of the emperor's reign; and all the rupees struck in Bengal of late years, at the Company's mint, have been dated the 19th year of his reign, as above.

The Arcot rupee has on one side, "Blessed coin of the conquering king" (the name); on the other side, "Struck at Arcot in the year —— of the reign," and the date of the Hegira. But it may be observed, that in these and many other rupees, except such as are coined by the East India Company, the legends are often illegible, owing to the edge being clipt or worn, or to the piece being too small to receive the impression.

The rupee of the Dutch East India Company has on one side, "Coin of the company of Holland," and the date of the Christian era; on the other side, "In the great island of Java."

The sultany rupee of Tippoo bears the same impressions and legends nearly as Tippoo's mohur.

The rupee of Persia, or piece of 10 mamoodies, has various legends. Some bear the sovereign's name, as "Sultan Shahrokh;" and on the other side, "May God prolong his reign, coined at" (the name of the place and date of the Hegira). On other rupees, the king of Persia styles himself "The servant of the monarch," that is, of the Iman Riza, the head of their religion, whom the Persians consider as the real sovereign of their empire; and the coins are often struck in the name of the Iman Riza, with this legend, "By the divine decree, the coin of happy omen has been struck in the name of Ally Riza, son of Musa;" and on the other side, "There is no God but God, Mahomet is the apostle of God, Ally is the favourite of God, struck at ——," with the date of the Hegira.

The silver fanam of Pondicherry bears on one side several flower de luces; and on the other, various flowers, dots, and lines, without any inscription.

The larin is a silver wire about half an inch in length, doubled up, and flattened on one side to receive the impressions of some characters. It was first made in Arabia, and has become scarce, but is still used as money of account.

The mohur, or gold rupee, (coined under the reign of the emperor Shah Allum, which began in 1770,) has on one side, "He who is the shadow of God's favour, the protector of the religion of Mahomet, the emperor Shah Allum, coins money for the seven climates," with the date of the Hegira; on the other side, "Struck at —— the year —— from the happy accession." Some mohurs have only, on one side, "Coin of the emperor Shah Allum," with the date of the Hegira; and on the other, the year of the reign. The coins struck by the East India Company bear the name of the Mogul emperor; and those minted of late years are dated the 19th year of the emperor's reign, and the number 19 is visible on some part of the piece.

The mohur of Tippoo has on one side, "The faith of Mahomet, the most excellent in this world, is supported by the splendour of the victories of Hyder. Hyder! exalted in equity; struck at Seringapatam, the year pre-eminent in prosperity," with the date of the Hegira. On the other side, "He alone is the equitable sultan; the epoch of the accession was a year of happy omen," with the date of the reign. Some of Tippoo's coins are dated according to an Indian era, which is divided into cycles of 60 years each; of which cycles 81 are supposed to be now elapsed.

The faruki, or quarter mohur of Tippoo, has on one side, "Mahomet, he is the only and right sultan," with the date; and on the other side, "Faruki, struck at Pattan" (Seringapatam), with the date of Tippoo's reign, and a Persian H, the initial of Hyder.

The zodiacal rupees are pieces of twelve different impressions, representing the twelve signs of the zodiac. They were coined between the years 1616 and 1624 of the Christian era, by Jehangeer, and have been long out of circulation. They are, however, much sought after, and highly valued as objects of curiosity. Each sign, or figure, is surrounded by rays representing the sun; and on the reverse is the following inscription: "This ornamented coin in Agra found its face (received its impression) in the year —— from the sovereign Jehangeer, son of king Akber."

The zodiacal rupees are exceptions to the Mahometan law, which forbids the representation or embossment of figures; but it is said that Jehangeer had little respect for his religion; and it is further stated by some writers, that his favourite queen, Nur Mahal, had obtained permission to reign for one day, (others say for one year,) and that she caused these coins to be struck, to perpetuate the memory of her short reign. This account, however, cannot be quite correct, as the dates of these rupees are different.

We shall here add, that, in the business of exchange, London draws on Bengal in current rupees at 2*s.* more or less, or in sicca rupees at 16 *per cent.* above current; also on Madras in pagodas at 7*s.* 6*d.* more or less; and on Bombay in rupees at 2*s.* 2*d.* more or less.

Such bills are mostly at 60 or 90 days sight: but bills from those places on London are generally drawn at 6, 9, or 12 months sight; in which case, the sicca rupee is valued at 2*s.* 6*d.*, the pagoda at 8*s.*, and the Bombay rupee at 2*s.* 4*d.* sterling, more or less.

The bank of Bengal has been incorporated by a charter for seven years, granted under the governor-general in council, by virtue of the authority vested in him by the act of the 47th of George III. sec. 2. cap. 28.

The capital of the bank is 5,000,000 sicca rupees, that is, 50 lacks. It is divided into 500 equal shares, 100 of which belong to the government, and the other 400 to individuals.

The business of the bank chiefly consists in issuing notes, keeping cash for others, discounting bills, and granting loans at short periods, for the accommodation of merchants, and the general convenience of the public.

The notes of this bank are issued at sums not less than 10 sicca rupees, and not exceeding 10,000: they are paid off in specie when presented, and are therefore accepted as cash in all transactions, although they have not been declared a legal tender, except in payments to be made to government at their general treasury, and other offices of the presidency; and likewise at the provincial treasuries, but under certain conditions and limitations.

The interest of money in India fluctuates from 8 to 12 *per cent. per annum*, and it has been even higher; but the bank, which engages not to charge above 12, has already lowered the rate of interest, and has in many other respects rendered essential service to trade and commerce. We are indebted for the materials of this article to the excellent work of Dr. Kelly, entitled the "Universal Cambist."

RUPELA, in *Geography*, a town of European Turkey, in the Morea; 12 miles S.W. of Corinth.

RUPELLENSIS SAL, *Rochelle Salt*, in *Chemiſtry*, a name given to a peculiar ſalt, invented by M. Seignette, apothecary, at Rochelle, and extolled as a very valuable medicine.

The preparation of it was kept a great ſecret, till Meſſrs. Boulduc and Geoffroy diſcovered and publiſhed its compoſition.

To prepare this ſalt, cryſtals of marine alkali are to be diſſolved in hot water, and into this liquor powdered cream of tartar is to be thrown. When the effervеſcence ceaſes, more cream of tartar is to be added, till the liquor is ſaturated; it is then to be filtered and evaporated; and very fine and large cryſtals may be obtained by cold, each of which is the half of a polygonous priſm cut in the direction of its axis.

The cryſtallization of this ſalt, according to M. Baumé, as well as of the vegetable ſalt, is much more eaſy and more beautiful, when the liquor, in which it is made, contains an exceſs of alkali, which does not prevent the ſalt from being exactly neutral, after it has been well drained.

The ſalt of Seignette has a ſaline taſte, moderately ſtrong, and diſagreeable. It retains much water in its cryſtallization, is ſoluble in a leſs quantity of hot water than of cold water, and becomes farinaceous in a dry air.

This ſalt is uſed only in medicine; being a good purgative, when taken from an ounce to an ounce and a half. It is diſſolved in pure water, or in ptiſans and mineral waters, to render them purgative. It is alſo given in ſmall doſes of one or two drachms, as an alterative, aperitive, and corrector of other purgatives. But, upon the whole, it does not differ much from ordinary ſoluble tartar. This is now known under the name of "tartrate of potaſs and ſoda," &c. &c. See SODA.

RUPERT, *Prince*, in *Biography*, third ſon of Frederic, elector palatine of the Rhine, and Elizabeth, daughter of James I., and he was, conſequently, nephew to king Charles I., was born in the year 1619. His education, like that of moſt German princes, eſpecially the younger brothers, qualified him for arms, and he was ſoon diſcovered to be extremely well fitted in reſpect to natural abilities, and acquired accompliſhments for a great commander. In his thirteenth year he accompanied the prince of Orange to the ſiege of Rhinberg, and ſo greatly diſtinguiſhed himſelf, that at the age of eighteen he was entruſted with the command of a regiment of cavalry. He was taken priſoner in the following year by the Imperialiſts, who detained him a conſiderable time. Having obtained his liberty, upon the ruin of the houſe-palatine in Germany, he came to England with his brother Maurice in 1642, and offered his ſervices to their relation Charles I., between whom and the parliament, war had juſt commenced. Through the whole war he behaved with great intrepidity; and on many occaſions his exertions were attended with very extraordinary ſucceſs. Almoſt at the outſet of the buſineſs he was placed at the head of a body of horſe, with which he immediately routed a part of lord Eſſex's cavalry, and eſtabliſhed his character for ſpirit and enterpriſe. At the ſubſequent fight at Edge-Hill he commanded the right wing of the royaliſts, with which he drove out of the field the parliament horſe; but, by an incautious purſuit, the king's infantry were left expoſed, and ſuffered ſeverely, ſo that the reſult was a drawn battle. In the next he proceeded into the weſt to join the Corniſh royaliſts: and afterwards he undertook the ſiege of Briſtol, which city he carried by aſſault. He was preſent at the battle of Newbery, where he broke the enemy's horſe; but was repulſed in his charge on their foot. The king, on account of his great ſervices, advanced him to the dignity of a peer of England, by the title of earl of Holderneſſe, and duke of Cumberland. In 1644 he relieved Newark, beſieged by the parliamentarians; after which, having collected a conſiderable force, he marched againſt the earl of Mancheſter, then inveſting York, and made a junction with the marquis of Newcaſtle. Contrary to the advice of that nobleman, he engaged the parliament army in a pitched battle at Marſton-Moor, and placed himſelf in the right wing. He was there oppoſed by Cromwell, and in the conflict prince Rupert's cavalry was put to flight. The final iſſue was a defeat of the royaliſts, which was, in fact, the commencement of the misfortunes that thenceforth attended the king's arms. In this action the courage of prince Rupert was ſignally diſplayed; but his precipitation, and want of attention to the marquis of Newcaſtle, were very much cenſured; he, however, redeemed his character by ſome ſpirited ſervices which he performed between this and the battle of Naſeby, in which he took a moſt diſtinguiſhed part. He commanded in the right wing; and by the impetuoſity of his charge he defeated the parliament's left, under the command of Ireton; but committing his uſual fault of purſuing inconſiderately, the battle was loſt before he could return to reſtore order. After this event, he withdrew towards the weſt, and threw himſelf into the city of Briſtol. That important place, thus garriſoned, was expected to make a vigorous defence; but the prince ſeems to have loſt himſelf on this occaſion, and ſurrendered the city to Fairfax before a cloſe attack was made. The king was ſo indignant at his conduct, that he recalled all his commiſſions, informing him he could thenceforward diſpenſe with his ſervices.

When a part of the Engliſh navy, in 1648, went over to Charles II., it was placed under the command of prince Rupert, who attempted, in vain, the relief of ſome maritime towns and fortreſſes, attacked by the republicans. He then carried on a predatory war, by which the Engliſh trade in the weſtern ſeas was ſo much annoyed, that admiral Blake was ſent with a ſquadron in purſuit of him. He took ſhelter in Kinſale, whence he eſcaped to Portugal, and was protected from his purſuer. He, however, loſt a great part of his fleet on the coaſt of Spain, and with the remainder ſailed to the Weſt India iſlands, where, for ſome time, he ſupported himſelf by making prizes of Spaniſh and Engliſh ſhips. His brother, prince Maurice, who commanded a ſeparate ſquadron, being ſhipwrecked among the iſlands, Rupert ſailed to France, where he diſpoſed of his prizes and ſhips, and joined Charles at the French court. Between this period and the reſtoration he occupied himſelf with thoſe ſtudies which afterwards rendered him celebrated in the annals of ſcience, and to which we ſhall have occaſion to refer at the concluſion of this article.

On the king's reſtoration, prince Rupert was invited into England, where the king, who had a ſincere affection for him, gave him various offices worthy of his high birth. In 1666 the king entruſted him, in conjunction with the earl of Albemarle, to command the fleet, and he ſoon manifeſted all

all the great qualities that could be defired in an admiral; for, by his happy return to the fleet, he wrelted from the Dutch the only victory they had the appearance of gaining, and, afterwards, on the 24th of June, beat them effectually, purfued them to their own coaft, blocked up their harbours, and made them fully fenfible of the fuperiority of Englifh courage when not oppreffed by numbers. In the autumn of the fame year, having the fole command of the fleet, and learning that the Dutch were endeavouring to join a French fquadron of forty fail under the duke of Beaufort, he followed them fo clofely into the Boulogne road, that, to avoid a battle, they hauled fo near the fhore, as in all probability they muft either have been funk or burnt, if a fudden ftorm had not forced the prince to return to St. Helen's bay.

On the prince's return home he was kindly received by the king, and grew into high efteem with the nation. The Dutch war was again renewed in 1673, the French being at this time in alliance with the Englifh. Prince Rupert was appointed admiral of the Englifh fleet, having under him fir Edward Spragge, and the earl of Offory. Two indecifive actions enfued in May and June, and prince Rupert, whofe bravery could not be doubted, was fufpected, probably without reafon, of being difinclined to the favourite political fchemes of affifting the French to ruin the Dutch, and of augmenting the royal auhority at home. On his part he complained that he was ill fupplied with neceffary articles by the admiralty, which was under the controul of the duke of York. To prove the fact, he, without particular orders, returned home, immediately after the battle of the 5th of June, and had addrefs enough to perfuade the king to come and examine the ftate of the fleet with his own eyes. This put the matter beyond all cavil and difpute, and obtained the neceffary fupplies without any delay, and as he had fhewn his fpirit by appealing to the fenfes of his majefty, fo he gave as fignal a proof of his activity and enterprife, by carrying the whole fleet through the Narrow feas on the 19th of July, and appearing on the Dutch coaft, almoft as foon as they had received certain intelligence of his returning to his own. In the following Auguft, however, an engagement took place off the Texel, in which the two maritime rivals difplayed all the obftinate valour that had rendered their former contefts fo memorable in naval hiftory, and of which a full and moft interefting account will be found in Campbell's Lives of the Admirals, vol. ii. ed. 1813. Prince Rupert was perfonally oppofed to De Ruyter, and by the greateft exertions he difengaged his fquadron from numerous affailants, and came to the relief of that of fir Edward Spragge, which had loft its brave commander. (See Spragge.) The French kept aloof, and both fides claimed the victory. This was the clofe of prince Rupert's warlike fervices.

On his return from the command, the king expreffed fome coolnefs, which was owing, not more to the arts of his highnefs's enemies, than to the quicknefs of his letter, in which he gave an account of this laft fight, the contents of which a contemporary hiftorian gives in the following words. "In the midft of fo many intrigues of oppofition here at home, fo many delays of his commiffion, fo few powers contained in it, fuch fcanty number of feamen, fo little affurance of divers chief commanders, fuch failure of provifions; fuch want of ammunition, and all other neceffaries, fuch deceit of navy officers, fuch non-obfervance of orders at fea, amongft his own Englifh, and fo many manifeft defections of the French, not to be ftaggered in his refolution, nor to be put out of all patience and prudence in action, nor to abate of his affection and zeal for the honour and fervice of his majefty, the fafe-guard and intereft of religion and the kingdom; in a feafon when fo many Popifh projectors played a game under board, and above too; will be an everlafting argument of his highneffes's valour and renown, and muft needs be a ftrong obligation upon the king, the parliament, and the people of England, who are now left to judge, whether it was not a wonderful good providence of God, or one of the moft memorable pieces of fervice ever done at fea, to furmount all thofe difficulties, and even envy itfelf; and, after all, to bring home the fleet royal of England, without the lofs of one man of war, to her own fhore in fafety, in defpite of all enemies that defigned otherwife by fea and land."

But the king's difpleafure was not lafting, and he was foon replaced in his favour. After this, prince Rupert led a quiet and, in a great meafure, a retired life, moftly at Windfor caftle, of which he was governor, and fpent a great part of his time in the profecution of chemical and philofophical experiments, as well as the practice of mechanic arts, for which he was very famous. He is mentioned by foreign authors with applaufe for his fkill in painting, and celebrated by one of the moft judicious of our own, for his invention of mezzo-tinto prints, fince rifen, from their foftnefs and beauty, into fo high efteem. He likewife delighted in making locks for fire-arms, and was the inventor of a compofition called, from him, Prince's metal. He communicated to the Royal Society his improvements upon gunpowder, by refining the feveral ingredients, and making it more carefully; which, as appears upon feveral trials reported to that learned body, augmented its force, in comparifon of ordinary powder, in the proportion of ten to one, an invention which, though too expenfive for common occafions, deferves to be remembered, becaufe, in particular cafes, it may be of fingular utility. He alfo acquainted them with an engine he had contrived for raifing water, and fent them an inftrument, of which he made ufe, to caft any platform into perfpective, and for which they deputed a felect committee of their members to return him their thanks. He was the inventor of a gun for difcharging feveral bullets with the utmoft fpeed, facility, and fafety, which was generally and juftly admired. The Royal Society received likewife from his highnefs the intimation of a certain method of blowing up rocks in mines, and other fubterraneous places. The very ingenious and indefatigable Dr. Hooke has preferved another invention of his for making hail-fhot of all fizes. He devifed a particular kind of fcrew, by the means of which, obfervations taken by a quadrant at fea were fecured from receiving any alteration by the unfteadinefs of the obferver's hand, or through the motion of the fhip. It was faid that he had alfo, among other fecrets, one that was very curious, and, if preferved, might be very beneficial, which was that of melting or running black lead, like a metal, into a mould, and reducing it back again into its original form.

As to his public character in the laft ten years of his life, it was that of a patriot, which was owing to the innate honefty of his temper, and not to his having any liking to intrigues. He gave indefatigable attention to whatever appeared to him conducive to the public good. He was a great promoter of the trade to Africa, and a principal protector of the Royal African Company; as a proof of which, before the firft Dutch war in this reign, he offered his majefty to fail with a fquadron to the coaft of Guinea, in order to vindicate the honour of the crown, affert the juft rights of the company, and redrefs the injuries done to the nation; but the king, unwilling to hazard his perfon at fuch a diftance, and in fo fickly a climate, though he received the motion kindly, would not confent to it, but contented himfelf

felf with taking an officer of his recommendation (captain Holmes), under whom the fquadron was fent. He was an active member of the council of trade. It was owing to his folicitations, after being at great expence, not only in the inquiry into the value, but in fending fhips thither, that the Hudfon's Bay Company was erected, of which he was the firft governor appointed by the charter. In memory of him, a confiderable opening on the eaft fide of that bay, in Terra de Labrador, is called Rupert's river. In general, his highnefs was a great friend to feamen, and to all learned, ingenious, and public-fpirited perfons, and affifted them with his purfe, as well as afforded them his countenance. He was concerned in the patent for annealed cannon, in a glafs-houfe, and other undertakings for acquiring or improving manufactures, for which fome have cenfured him, as giving encouragement to projectors. But furely this cenfure is very ill placed, fince, without fuch patrons, induftry and ingenuity would want fupport, and many ufeful inventions, many valuable difcoveries, barely emerge, and then fink again into oblivion. But ftrict juftice has been done to his highnefs's many virtues, and amiable qualities, by abler and more impartial judges, efpecially in that excellent character of him by the elegant pen of bifhop Sprat. In refpect to his private life, he was fo juft, fo beneficent, fo courteous, that his memory remained dear to all who knew him. This, obferves Campbell, I fay of my own knowledge; having often heard old people in Berkfhire fpeak in raptures of prince Rupert.

He died at his houfe in Spring-Gardens, on the 29th of November 1682, in his grand climacteric, leaving behind him a natural fon, ufually called Dudley Rupert, by a daughter of Henry Bard vifcount Bellemont, though ftyled in his father's laft will and teftament Dudley Bard. He received the firft tincture of letters at Eton fchool, where the gentlenefs of his temper, and the modefty and amiablenefs of his behaviour, procured him univerfal efteem. His genius, however, inclining rather to arms than ftudy, he was placed under the care of that celebrated mathematician fir Jonas Moore at the Tower. Here he continued till the demife of that prince, when he made a tour into Germany to take poffeffion of a confiderable fortune which had been bequeathed to him. He was very kindly received by the Palatine family, to whom he had the honour of being fo nearly allied. In 1686 he made a campaign in Hungary, and diftinguifhed himfelf at the fiege of Buda, where he had the misfortune to lofe his life, in the month of July or Auguft, in a defperate attempt made by fome Englifh gentlemen upon the fortifications of that city, in the 20th year of his age, and, though fo young, he had fignalized his courage in fuch an extraordinary manner, that his death was exceedingly regretted. Hume. Campbell's Lives of the Admirals.

Rupert, in *Geography*, the north-wefternmoft townfhip of Bennington county, in the ftate of Vermont, America, containing 1630 inhabitants; 20 miles N. of Bennington.

Rupert's *Bay*, a bay on the N.W. coaft of the ifland of Dominica, which is deep, capacious, and fandy, and affords good fhelter from the winds. It is the principal bay of the ifland, and on it is erected the town of Portfmouth. N. lat. 15° 40′. W. long. 61° 18′.

Rupert's *Fort*, lies at the bottom of Hudfon's bay, in North America, fituated on a river of the fame name, on the E. fide of James's bay, between Slade river N., and Nordway river S. N. lat. 51° 50′. W. long. 80° 5′.—Alfo, a fort on the W. coaft of the ifland of Barbadoes; 1 mile N. of Speight's town.

Rupert's *Head*, a cape on the W. coaft of the ifland of Dominica. N. lat. 15° 41′. W. long. 61° 19′.

Rupert's *Ifland*, the moft wefterly of four iflands in the ftraits of Magellan, forming the S. fide of Royal Reach; 3 miles S. of Paffage Point.

Rupert's *River*, a river of North America, which runs from lake Miftafin into James's bay, Hudfon's bay. N. lat. 51° 28′. W. long. 78° 56′.

Rupert's *Drops*, *lacrymæ Batavicæ*, a fort of glafs drops with long and flender tails, which burft to pieces on the breaking off thofe tails in any part, faid to have been invented by prince Rupert, and therefore called after his name.

The hiftory of thefe drops is this: they were firft brought into England by prince Rupert out of Germany, and fhewn to king Charles II. who communicated them to the Royal Society at Grefham College; and a committee, appointed on this occafion by the fociety, gave the following account of them. They muft be made of green glafs well refined, for till the metal, as the glafs-men call it, is perfectly refined, they never fucceed if made of it; but always crack and break foon after they are dropped into the water.

The beft way of making them is to take up fome of the metal out of the pot upon the end of an iron rod, and immediately let it drop into cold water, and there lie till it is cold. If the metal be too hot when it is dropped into the water, the bufinefs does not fucceed, but the drop frofts and cracks all over, and falls to pieces in the water, and every one that does not crack in the water, but lies in it whole till it is quite cool, is fure to be good. There is great nicety in the hitting a due degree of heat in the metal, and the workmen who beft know their bufinefs cannot promife before hand which fhall fucceed, but often two fail for one that hits right. Some of them froft over the furface without falling to pieces, and others break into pieces before the red heat is quite over, and that with a fmall noife; others break foon after the red heat is over and make a great noife, and fome neither break nor crack till they feem to be quite cold; and others hold together while they are in the water, but fly to pieces with a fmart noife when they are taken out of it; fome do this on the inftant, others an hour or two after, and others will keep feveral days, nay weeks, and at laft fall to pieces without being touched.

Thefe drops, thus formed, are fo hard, that they will bear fmart blows of a hammer, on the rounded end, without breaking; and yet if you grind the furface, or break off the tip of the tail, they will fhatter, with a loud report, into powder; and in an exhaufted receiver, with greater impetuofity than in the open air, and into a finer powder, exhibiting light, when the experiment is made in the dark. But if the drops are ground with powder of emery and oil, or annealed by the fire, they will efcape breaking.

This furprifing phenomenon is fuppofed to arife from hence; that while the glafs is in fufion, or in a melted ftate, the particles of it are in a ftate of repulfion; but being dropped into cold water, it fo condenfes the particles in the external parts of their fuperficies, that they are thereby reduced within the power of each other's attraction, and by that means they form a fort of hard cafe, which keeps confined the before-mentioned particles in their repulfive ftate; but when this outer cafe is broke by the breaking off the tail of the drop, the faid confined particles have then liberty to exert their force, which they do by burfting the body of the drop, and reducing it to a very peculiar form of powder. See a paper on the phenomena and explication of thefe glafs-drops, by Dr. Le Cat, in the Philof. Tranf. vol. xlvi. p. 175, &c. See *Annealing of* Glass.

RUPERTS.

RUPERTSDORF, Hohen, in *Geography*, a town of Auftria; five miles S.W. of Ziſterſdorf.

RUPICAPRA, in *Zoology*, a fpecies of antilope. See Chamois. See alfo Ovis *Ammon*.

RUPICHSTERADT, in *Geography*, a town of the duchy of Berg; four miles N.E. of Blankenberg.

RUPINIA, in *Botany*, from *rupes*, a rock, alluding to its place of growth, is a name given in the Supplement of Linnæus to what Forfter had called *Aitonia*, after the celebrated curator of Kew garden; there being another *Aitonia* in that fame work. Mr. Dickfon difcovered, by examining original fpecimens, that Forfter's plant is no other than *Marchantia hemifphærica*, without fructification; the fuppofed *anthers* being nothing but the hairs of the leaf!

RUPITANI, a name given to the Donatifts. See Campitæ.

RUPOLY, in *Geography*, a town of Bengal; 22 miles W. of Purneah.

RUPPAN, a town of Bohemia, in the circle of Pilfen; 17 miles S. of Pilfen.

RUPPE, a town of France, in the department of the Vofges; eight miles N. of Neufchateau.

RUPPEL, a river of France, formed by the union of the Senne, the Demer, and the Dyle, which joins the Scheldt at Rupelmonde.

RUPPERTSGRUN, a town of Saxony, in the Vogtland; fix miles N. of Plauen.

RUPPIA, in *Botany*, was named by Linnæus, in memory of Henry Bernard Ruppius, native of Gieffen, a ftudent of phyfic, who foon gave up that and every other purfuit for botany. Haller characterizes him as "of fhort robuft ftature, with the eyes of a lynx, unwearied limbs, a penetrating genius, and moft tenacious memory." He travelled through various parts of Germany, living with the mountain cottagers, difdaining every indulgence, except the ftudy of plants. He feems to have died at an early age. The firft edition of the *Flora Jenenfis*, compiled from his papers, and arranged after the fyftem of Rivinus, which he much approved, was publifhed in 1718, by J. H. Schutte. Another came forth in 1726; and a third, under the care of Haller, with beautiful plates, in 1745. Each makes an octavo volume.—Linn. Gen. 68. Schreb. 92. Willd. Sp. Pl. v. 1. 717. Mart. Mill. Dict. v. 4. Ait. Hort. Hew. v. 1. 281. Purfh 121. Sm. Fl. Brit. 198. Prodr. Fl. Græc. Sibth. v. 1. 109. Juff. 19. Lamarck Illuftr. t. 90. Gærtn. t. 84. (Buccaferrea; Mich. Gen. 72. t. 35.)—Clafs and order, *Tetrandria Tetragynia*. Nat Ord. *Inundatæ*, Linn. *Naiades*; Juff.

Gen. Ch. *Cal.* Perianth none. *Cor.* none. *Stam.* Filaments none; anthers four, feffile, equal, roundifh, of two roundifh valves, burfting tranfverfely. *Pift.* Germens four or five, nearly ovate, crowded clofe together; ftyles none; ftigmas obtufe. *Peric.* none. *Seeds* four or five, ovate, oblique, each elevated on a long flender ftalk, and terminated by the permanent, flat, orbicular ftigma.

Eff. Ch. Calyx none. Corolla none. Seeds four, on long footftalks.

1. R. *maritima*. Sea Ruppia. Linn. Sp. Pl. 184. Willd. n. 1. Fl. Brit. n. 1. Engl. Bot. t. 136. Lightf. Scot. 124. t. 8. f. 1. (Potamogiton maritimum, gramineis longioribus foliis, fructu ferè umbellato; Raii Syn. 134. t. 6. f. 1. Fucus ferulaceus; Ger. Em. 1573. Buccaferrea maritima, foliis acutiffimis; Mich. Gen. 72; as well as fol. minùs acutis; ibid. t. 35.)—Native of falt-water ditches, in moft parts of Britain, flowering in July, and ripening feed in Auguft. Dr. Sibthorp obferved it in Cyprus, as well as on the claffic fhore of Argos. Mr. Purfh fays it occurs about the mouths of moft rivers in America. The habit of the plant agrees with Potamogeton; fee that article. The *root* is probably annual. *Stems* capillary, very much branched, clothed with alternate, linear, more or lefs pointed *leaves*, which embrace the ftem with a membranous united *ftipula*. *Flower-ftalks* axillary, folitary, fimple, variable in length, according to the depth of the water in which the herb grows, and often fpiral, accommodating itfelf to any alteration, that the *flowers*, which ftand two together at the top, one a little above the other, may not be fpoiled by immerfion. The plant is moft diftinguifhable when in *fruit*, by means of the fingularly ftalked, and as it were umbellate, *feeds*. Dillenius, in his edition of Ray's *Synopfis*, greatly errs in reporting that the *flowers*, or *ftamens*, grow remote from the *fruit*, and that the latter appears firft.

Labillardiere, in his account of the plants of New Holland, v. 2. 116. t. 264, defcribes a *Ruppia antarctica*, whofe genus he merely conjectured, having feen nothing of the fructification. This is referred, perhaps more properly, though likewife from the habit only, by Mr. Brown, to Decandolle's genus *Caulinia*; fee Br. Prodr. Nov. Holl. v. 1. 339.

RUPPIN, New, in *Geography*, a town of the Middle Mark of Brandenburg, the capital of a county or circle of the fame name, containing two Lutheran churches, and 800 burghers. It is fituated on a large lake, formed by the river Rhine, and has confiderable manufactures of cloth. "Old Ruppin" is fituated on the fame lake, oppofite to New Ruppin; 30 miles N.N.W. of Berlin. N. lat. 52° 55′. E. long. 12° 55′.

RUPPOLI, a mountain of Etruria; 10 miles S.W. of Florence.

RUPRECHTSHOFEN, a town of Auftria; 12 miles S.E. of Ips.

RUPSTA, a town of Sweden, in Eaft Gothland; fix miles W. of Linkioping.

RUPTORIUM, in *Surgery*, a cauftic applied with a view of opening an abfcefs.

RUPTURE. See Hernia.

Rupture-*Wort*, in *Botany*. See Herniaria.

Although there be no foundation for the virtues afcribed to this plant, and implied in its name in the curing of ruptures; yet there is another cafe in which German phyficians ftrongly recommend it. It is in the diforder of the eyes which is brought on by reading or writing by candle-light, or by examining nice objects, or very fine work. This diftemperature feems to be properly a diminution of fight, without any apparent caufe, or vifible alteration in the eye, and is probably owing to a vifcid matter obftructing the optic nerves, and preventing a fupply of their proper fluid. The herniaria, being a gentle and mild attenuant, is fuppofed to be adapted for the relief of this diforder. Gruhlman De Novo Caliginis Remedio.

The author gives many inftances of the fuccefs of this remedy, and mentions two methods of giving it; the one in powder, and the other in tincture: the former way is preferred, and the method is to gather the herb in its prime, and powder it after it has been dried in the fhade; then to fprinkle the quantity of a fcruple of this powder on the bread and butter ufed for breakfaft. If this is not liked, the tincture is to be made with fpirit of wine, as ftrong as the plant will make it, and forty drops are to be taken every morning and evening in any liquor.

The diftemperature this is propofed to cure is very common, yet this is almoft the only thing, as it has been faid, that has been prefcribed by way of remedy, and deferves to

be

be fairly tried. But no modern practice seems to warrant the above-mentioned author's recommendation of it.

RUPUTTY, in *Geography*, a town of Hindoostan, in Bahar; 12 miles E. of Chuprah. N. lat. 25° 44'. E. long. 85° 11'.

RURAL, or RUSTIC, formed of *rus*, *ruris*, *country*, something that relates to the country.

RURAL *Dean*, in the *Ancient Church*. See DEAN.

RURAL *Economy*, a term which comprehends the amelioration and improvement of the landed and different other property, habits, and customs of a country, in whatever way or by whatever means of a rural nature they may be capable of being accomplished, as, whether in the laying out, inclosing, and cultivating the ground, or in the management of the different practices, operations, and processes which have a relation to it, or to its produce, the regulation of the various kinds of labour which attends them, as well as that of the sale of the different articles of provisions which are raised from it in the several fairs and markets, and the provision of a variety of substances which are necessary for use as fuel, as well as for many other purposes of the rural kind. In these views, the bettering of the condition of different sorts of land, by the particular modes and practices of husbandry which have been lately discovered, are of very great importance, as well as the improved management in feeding animals, dairying, and making a great number of other articles, and the working of different sorts of quarries and pits for the raising of materials which are useful in various rural intentions, besides those of being consumed as fuel.

There are many other kinds of works, establishments, and constructions which are partly of this nature, and which contribute in no small degree to the general improvement and advantage of a country, such as those of roads, so far as the state, form, and convenience of them are beneficial in this way; the construction of convenient railways for the more ready conveyance of weighty articles of slate, coal, and other kinds of produce; the formation of canals, and the widening and altering of rivers, for the benefit of water-carriage for different bulky matters; and the raising of embankments against the sea, or large rivers, for the better cultivation, protection, and acquisition of land. To which may be added, the establishing of fisheries of different kinds, and improving the management of them, as well as some other undertakings.

The rural habits and practices of a country, which are necessarily either different at different times, in consequence of the changes which are always taking place in the circumstances and conditions of it, or fixed by the hilly and mountainous nature of its surface, are constantly slow in their progress towards the state of amelioration and perfection; on which account, they and the industry of the rural population of a nation ought to be looked upon and considered in respect to what they were formerly at different periods of time, what they are now, and what there is the probability of their becoming by the progress of man in the state of society.

In the infant state of a country, while its riches and resources chiefly consist in the number of herds and flocks which it can support, the attention and exertion of the people are, for the most part, with much propriety, directed to the rearing, feeding, protection, and management of these sorts of live-stock. Afterwards, when the tillage system becomes, in some measure, to be connected and incorporated with the pastoral state, there is a division of their cares and labours, between the cultivation of the soil for the raising of grain, and the attendance on their cattle, stocks, and sheep flocks. And ultimately, when the benefits and numerous advantages of commerce begin to be known and appretiated, no small part of them leave the cattle and the tillage plan for that of trade, and the manufacturing of different kinds of articles for its use and benefit.

The history of all nations, as well as that of the same nation at different periods of time, furnishes numerous instances in proof of these progressive stages of change in their rural state. It is therefore a great absurdity, as well as error, to stigmatize and reprobate the customs and practices of a people or country, in any one of such stages or changes of their rural means, by the comparison of those of another, as the object of their industry and application is widely different at the different times, and consequently the test by which they ought to be judged of, must be equally different. Thus, the condemnation and reprehension of particular modes, practices, and habits of the rural kind, from preconceived notions peculiar to the situation and way of life in which the persons have been themselves placed, are highly preposterous and foolish, as any one is well employed in pursuing an useful and laudable occupation or undertaking with industry and perseverance, whatever the nature of it may be, whether it be that of tending and managing herds and flocks, or that of conducting some other business, practice, or process, each contributing to the convenience of the community, however different their engagements may be, or the rank which they hold in society.

The practice and custom of attending herds and flocks, which prevailed in a certain stage of society in all countries, was more quickly departed from in cases where the land was suitable for the purposes of tillage than in other instances; but most so on the sea-coasts and the banks of navigable rivers.

Improvements of this nature are always highly deserving the attention and encouragement of the public, on account of the general influence which they have in promoting and bettering the state and condition of society; as they may be said to embrace the introduction of whatever is useful and advantageous, as well as, in some measure, what is ornamental, into a country. These beneficial changes and alterations are accomplished in a great variety of different ways, and by a number of different methods, but principally by the discovery of new means, the cultivation of what has been formerly overlooked or neglected, and by having recourse to superior and more enlightened modes of management in the whole. In this manner a vast increase of produce of different kinds, as well as of national wealth, may be brought forth, and at the same time much ornamental effect and convenience be produced.

RURAL *Architecture*, the nature of any sort of country building, but principally those of the farm or agricultural kind. See FARM.

RURAL *Artificers*, all those persons who are employed in the making of any sort of tool, implement, or machinery, for the purpose of agriculture, husbandry, or any other rural art or business. The excellencies or defects of these sorts of workmen depend upon their ingenuity and knowledge of the nature of mechanism in general, or their deficiency in both these respects.

Wherever the construction of machinery has made any considerable progress, there is most commonly a portion of the same spirit diffusing itself among the rural artificers of the same neighbourhood; but where this has not happened, the contrary is always the case. It is, however, of vast importance to the farmer and landed interest in general to be in possession of, or capable of procuring, ingenious and intelligent workmen of this description, as the progress

and

and advancement of the art of farming greatly depends upon it.

The writer of the Agricultural Report of the County of Middlesex has remarked, that not only the common wheelwrights and smiths of that diſtrict have no ideas of machinery, or the capacity of executing any thing from drawings or ſpecifications; but that the generality of the farmer's labourers are equally ſtupid, and unwilling to execute their work in any way to which they are not accuſtomed. Hence, it is contended, the difficulty of introducing any thing new in the implements or practice of huſbandry is almoſt inſurmountable. Even the moſt trifling alteration, or deviation from the old ſyſtem or plan, is reſiſted, it is ſaid, both by the artificers and labourers; and every poſſible obſtruction thrown in the way of the farmers, to prevent what they deem an innovation on the eſtabliſhed cuſtom of the place, or part of the county where it may take place. The ſame is the caſe in regard to all the more complex kinds of machinery, as it is aſſerted that it is abſolutely impoſſible to get a plough, a threſhing-mill or machine, a winnowing machine, or indeed any other ſimilar ſort of implement of huſbandry, conſtructed on a good principle by the artificers of this county; and that it is not much leſs difficult to induce the labourers to make uſe of them, when they are brought from any other place at a diſtance. Thus the farmer is reduced to the neceſſity of treading in the ſteps of his forefathers, though the practice may be at war with his own better judgment and inclination; and many uſeful alterations and improvements in the art of cultivation retarded and kept back.

But though there may be ſome expert, ingenious, and ſenſible mechanics in a diſtrict, who are capable, and fully competent to execute orders for all kinds of implements and machinery, which may be uſeful or neceſſary to the different purpoſes of agriculture and huſbandry, their exertions and labours are often more conſiderably leſſened in utility and value than might be ſuppoſed, on account of the unavoidable wear and tear which they undergo, neceſſarily ſubjecting them to frequent repairs, which are utterly impoſſible to be got done in any ſkilful manner by the common country artificers; and the great inconvenience, expence, and loſs of time, which muſt be ſuſtained by ſending them for ſuch purpoſes to the original conſtructors of them, who are not unfrequently at a great diſtance. This is another great drawback on improvements in the practice of farming.

Mere theoretical cultivators, who have not experienced theſe difficulties and inconveniencies, and are ſo frequently condemning the whole body of farmers as obſtinately reſiſting every attempt at improvement in the art, often diſplay their own want of knowledge and ſuperficialneſs on the ſubject, by beſtowing that degree of reprobation and cenſure on the farmer, which ought to have been applied to his labourers and rural artificers.

The proper encouragement of good and expert rural artificers is conſequently a matter which tends greatly towards promoting and bettering the ſtate and condition of agriculture, in various eſſential points, as well as to augment and render its conveniencies much more numerous and beneficial.

Rural *Buildings* and *Seats*, in *Gardening*. See Retreat and Seat.

Rural *Gates*, in *Ornamental Gardening*, are ſuch as are employed for ornamenting the entrances to country reſidences, or other ſimilar purpoſes. They ſhould have a form and conſtruction, ſo as in ſome meaſure to harmonize and accord with the nature and ſtyle of the reſidence to which they are to belong; the ſame general principles being, in ſome degree, applicable here as in the caſe of rural lodges. It is indeed ſuggeſted, that they both preſent ample ſcope for invention, which has been productive of two great evils: the firſt of which is, that too many deſigns of this nature have been given to the public; and the latter, that the proprietors and other perſons have adopted, copied, and executed them, without any regard to the nature of the ſituation, or the character of the manſion or reſidence to which they are to be affixed. It is believed that no perſon will require proofs of this, who has ſeen any thing of the country. In regard to what relates to economy and utility in gates for common purpoſes, it may be ſeen under the head Gate.

Rural *Lodges*, are ſuch adorned ſmall buildings as are neceſſary for the entrances, or other parts of the approaches or drives of country reſidences. Thoſe for the former, according to the opinion of Mr. Loudon, ſhould be deſigned and conſtructed in a character and on principles ſomewhat analogous to that of the reſidence to which they belong; while thoſe of the latter, or for the drives, ſhould ſeldom be more than improved rural cottages, unleſs the nature of the ſituation ſhould ſuggeſt ſome peculiarity of form, or deſcription of them. It is ſuppoſed, that the notion of appropriating a country, by ſtamping all ſuch buildings, as well as ſome others, with ſomething which may denote the continuation of the proprietor's eſtate, is only calculated to gratify the vanity and oſtentation of ſuch perſons. The truly great, it is conceived, need nothing to make them appear ſo; and in the country, they will ever be more aſſiduous to render themſelves agreeable to their neighbours, than to ſhew the unſociable diſpoſition of monopolizing territory. In regard to their grounds, it is ſuggeſted that they will be ready with Marlborough, Argyle, Howard, and other noble proprietors of grand reſidences, to ſay with the marquis of Ermeonville, "This, the farm, only is ſhut up; the three others, the wood, the foreſt, and the meadow, are open to every body; and I only wiſh that they ſhould think themſelves as much at home as if they belonged to them." On the whole, thoſe ſorts of buildings ſhould always partake ſomewhat of the nature of the ſituations, and the ſtyles of building in the reſidences to which they are to be attached. See *Country* Residence.

RUREMONDE, or Roermond, in *Geography*, a town of France, and principal place of a diſtrict, in the department of the Lower Meuſe, late of Upper Guelderland, in the Auſtrian Netherlands, ſituated at the conflux of the Roer and Meuſe. It derives its name from that of the former river and the term *Mondt*, ſignifying mouth, both expreſſing its ſituation at the Mouth of the Roer. It was encompaſſed with walls and ſix gates by Otho, ſurnamed the Cripple, 14th count of Guelderland. In 1290 it obtained from Rodolphus the privilege of coining money; and in 1562 it was created into a biſhopric by pope Paul IV., under the archbiſhopric of Malines. The cathedral is the only pariſh church. Its magiſtracy is compoſed of nine echevins and two ſecretaries. In 1665 an accidental fire deſtroyed almoſt all the houſes, convents, and the biſhop's palaces. It has been often taken and retaken by the Dutch and Spaniards, in their civil wars; 30 miles N. of Aix-la-Chapelle. The town contains 3788, and the canton 14,621 inhabitants, on a territory of 222½ kiliometres, in 20 communes. N. lat. 51° 12′. E. long. 5° 50′.

RUREY, a town of France, in the department of the Doubs; 4 miles E. of Quingey.

RURROW, a town of Hindooſtan, in Dooab; 30 miles E. of Etaya.

RUS, a mountain of Arabia, in Yemen; 8 miles S. of Sana.

RUSAZUS, in *Ancient Geography*, a town of Africa, on the coast of Mauritania Cæsariensis, between Rusubirsis and Vabar, according to Ptolemy. Pliny gives to this town the appellation of Colonia Augusta; and in the Itinerary of Antoninus it is named Rusazis Municipium, and placed between Iomnium Municipium and Saldis Colonia.

RUSBACH, in *Geography*, a river of Austria, which runs into the Danube, 2 miles above Hainburg.

RUSBACH, *Hohen*, a town of Austria; 9 miles N. of Korn Neuburg.

RUSCEK, a town of European Turkey, in Bulgaria, on the Danube; in which are 20 mosques, 3 churches, and a Jews' synagogue. It is defended by a castle, with a garrison; 50 miles E. of Nicopoli. N. lat. 53° 52'. E. long. 25° 15'.

RUSCINO, in *Ancient Geography*, a town of Gallia Narbonnensis, the capital of the people called Consuarani. It was in this town that the people of the country assembled, to deliberate on the passage demanded by Hannibal, according to Livy, lib. xxi. cap. 24. It was a Roman colony, according to Mela; and Pliny says, that it enjoyed the jus Latinum. It was ruined by the Normans, and its name is preserved in Roussillon. In the Itinerary of Antonine, this town was marked on the route from Narbonne to Castulo, between Combusta and Ad Centuriones.—Also, a river of Gallia Narbonnensis, according to Strabo, who says that it had its source in the Pyrenées, and watered a town of the same name. Ptolemy calls it Ruscio, and places its mouth between those of the Illiberis and Atages.

RUSCINONA, a port of Africa, whither, according to Dr. Shaw, the Carthaginian fleet retired, the night before it engaged with Scipio near Utica. This name is said to be of Phœnician origin; the first part of it, *Rus* or *Ras*, denoting cape; and the latter, *annona*, expressing the great quantity of corn and provisions that were shipped off from this place. These circumstances lead Shaw to conclude, that Ruscinona is the present "Porto Farina," on the coast of Tunis, called by the inhabitants, from an ancient saltwork near it, "Gar-el-Mailah," *i. e.* the cave of salt. This port, especially the Cothon, or inward part of it, is safe in all accidents of weather, and opens into a large navigable pond, formed by the Majerdah or ancient *Bagrada*, which at present discharges itself through it, in its way to the sea. The town belonging to this port was formerly very considerable.

RUSCIUD, in *Geography*, a river of Persia, which runs into the Persian gulf, 48 miles W. of Ormus.

RUSCUNIÆ COLONIA, *Temendfuse*, in *Ancient Geography*, a promontory and colony of the eastern part of Mauritania Cæsariensis, according to Ptolemy, Pliny, Mela, and the Itinerary of Antonine. Antonine places it 15 miles E. of Icosium. The ruins are still visible.

RUSCURIUM, RUSUCCORÆ of Ptolemy, and the *Rusuccuro* of the Peutingerian Tables, now *Dellys*, formerly an ancient city, but at present a small town, of Africa, on the coast of Algiers, situated partly at the foot and partly upon the declivity of a high mountain. In a wall, just over the harbour, is a small niche, with an image, in the attitude of a Madonna; but the features and drapery, says Dr. Shaw, are defaced.

RUSCUS, in *Botany*, an ancient name, whose derivation has been given up by most authors, as hopeless. De Theis justly observes, that it was originally *Bruscus*, and this leads him to the Celtic name of the plant in question, *Beuskelen*, equivalent to Box-holly, which is certainly the best explanation that has ever fallen in our way.—Linn. Gen. 534. Schreb. 709. Willd. Sp. Pl. v. 4. 874. Mart. Mill. Dict. v. 4. Ait. Hort. Kew. v. 5. 420. Sm. Fl. Brit. 1073. Juss. 42. Lamarck Illustr. t. 835. Gærtn. t. 16.—Class and order, *Dioecia Triandria*. (*D. Syngenesia*, Linn. *D. Monadelphia*, Willd.) Nat. Ord. *Sarmentaceæ*, Linn. *Asparagi*, Juss.

Gen. Ch. Male, *Cal.* Perianth of six ovate-oblong, rather spreading, convex leaves, reflexed at the sides. *Cor.* Petals none, except three alternate leaves of the calyx be taken for such. Nectary central, ovate or cylindrical, the size of the calyx, hollow, erect, coloured, perforated at the summit. *Stam.* Filaments none; anthers three, spreading, seated on the extremity of the nectary, connected at the base. *Pist.* obsolete.

Female, *Cal.* as in the male. *Cor.* Petals as in the male. Nectary the same. *Pist.* Germen superior, oblong-ovate, concealed within the nectary; style cylindrical, the length of the nectary; stigma obtuse, projecting out of the orifice. *Peric.* Berry globose, of three cells. *Seeds* two in each cell, globose.

Obs. There is one species, *R. racemosus*, with united flowers, whose calyx is globose, with six segments at the mouth only. It is seldom that in this genus and its allies, *Smilax*, *Tamus*, *Convallaria*, &c., the seeds all come to maturity. One of them commonly suffocates the rest.

Ess. Ch. Male, Calyx of six leaves. Petals none. Nectary ovate, tubular, bearing the stamens on its margin within.

Female, Calyx and Nectary like the male. Stamens none. Style one. Berry superior, of three cells, seeds originally two in each cell.

The species of this genus are not in general truly shrubby, but biennial evergreens, with perennial roots. Their young shoots resemble asparagus.

The substance of the herbage is peculiarly hard and rigid. The green colour either dark and opaque, or bright and polished. Flowers in most instances borne by the leaves.

1. R. *aculeatus*. Prickly Butcher's-broom. Linn. Sp. Pl. 1474. Willd. n. 1. Ait. n. 1. Fl. Brit. n. 1. Engl. Bot. t. 560. Woodv. Med. Bot. suppl. t. 237. Mill. Illustr. t. 96. (Ruscus; Ger. Em. 907. Matth. Valgr. v. 2. 555. Camer. Epit. 935.)

β. R. laxus; Sm. Tr. of Linn. Soc. v. 3. 334. (R. flexuosus; Mill. Dict. ed. 8. n. 6.)

Leaves sharply pointed, flowering on the upper side, without a leaflet.—Native of bushy woody places, throughout the middle and southern countries of Europe, especially on a gravelly or barren soil, flowering early in spring. Not uncommon in England. The variety β was observed at Stoke, near Gosport, by Mr. G. Caley, growing plentifully. This is an old inhabitant of Chelsea garden, and we have no hesitation in adopting professor Martyn's opinion, as to Miller's synonym. The *root* of this species is branched, and rather creeping. *Plant* truly herbaceous, though so firm and rigid. After living one year without flowering, and remaining in leaf all the winter, it dies down to the root, after ripening fruit, in the following autumn. Every part is devoid of pubescence. *Stems* about two feet high, round, striated, branched, rather spreading. *Leaves* alternate, spreading every way, not quite sessile, twisted, hard, ovate, entire, tipped with a sharp thorn, and bearing a solitary pale *flower* about the middle of their upper side. *Nectary* purplish. *Berry* scarlet, the size of a black currant, with a ſweet pulp, encloſing one or two large, ſhining, globular, horny or ſemitranſparent *ſeeds.* The above-mentioned variety has longer, more lax, *branches,* and elliptical *leaves,* tapering at each end; but there are many intermediate ſtates, which connect it with the common kind. Mr. Woodward has rightly obſerved, that the *flower* has a real ſtalk, immerſed in the *leaf,* under the cuticle. We would remark, that the ſtrict union of the leaves and the branches, in this genus, is like that of Moſſes, and Ferns, which laſt they reſemble further in mode of infloreſcence, and exceed them in firmneſs of texture.

2. R. *Hypophyllum.* Broad-leaved Butcher's-broom. Linn. Sp. Pl. 1474. Willd. n. 2. Ait. n. 2. (Laurus alexandrina et Chamædaphne; Column. Ecphr. 164. t. 165. f. 1.)

β. R. latifolius, fructu in medio foliorum extra pendente; Till. Piſ. 149. Dill. Elth. 333. t. 251. f. 323.

Leaves flowering on the under ſide, without a leaflet.—Native of rather hilly ſituations in Italy. Dr. Sibthorp gathered it alſo on mount Athos, in ſhady woods, and took it for the Χαμαιδαφνη of Dioſcorides, of which we conceive there can be no doubt. The *roots* are much like thoſe of the foregoing, but the *plant* is not branched, and the *leaves* are much larger, more elliptical, with an acute, but not ſpinous, point. Each *leaf* bears, from the middle of its under ſide, a pair of ſtalked pendulous *flowers,* whoſe ſegments and *nectary* are of a more ſlender form than in the *aculeatus.* Their *ſtalks* are accompanied at the baſe by a ſmall ſcaly *bractea,* but not by any acceſſory leaf, as in the following. The *berries* are red.

3. R. *Hypogloſſum.* Double-leaved Butcher's-broom. Linn. Sp. Pl. 1474. Willd. n. 3. Ait. n. 3. Sm. Fl. Græc. Sibth. t. 955, unpubliſhed. (Hippogloſſum Dioſcoridis, et Lauro-Taxa Plinii; Column. Ecphr. 166. Hypogloſſon; ibid. t. 165. Δαφνη αλεξανδρεια, Dioſc. *Sibth.*)—Leaves flowering on the upper ſide, under a leaflet.—Native of Hungary, Italy, mount Athos, and the borders of the Black ſea, in buſhy, rather hilly ſituations. Gerarde appears to have cultivated it in 1596. The plant is kept in ſome curious gardens, where it bloſſoms imperfectly early in ſpring, but we have never ſeen the berries, which in Dr. Sibthorp's figure make a beautiful appearance, being of a deep rich ſcarlet, the ſize of black currants. The habit of this ſpecies is like the laſt, but the *leaves,* though variable in breadth, are commonly narrower, and particularly diſtinguiſhed by the ſmall leaf on their diſk, from beneath which proceeds a ſolitary, ſtalked, pale-green *flower,* with a ſlender, purpliſh, curved, furrowed *nectary.* The *ſtems* are ſimple, ſcarcely a foot high, not quite erect.

4. R. *androgynus.* Climbing Butcher's-broom. Linn. Sp. Pl. 1474. Willd. n. 4. Ait. n. 4. (R. latifolius, è foliorum ſinu florifer et baccifer; Dill. Elth. 332. t. 250.)—Stem twining, branched. Leaves flowering at the edge.—Native of the Canary iſlands, and long cultivated in England, where it proves a hardy green-houſe plant, flowering moſt part of the ſummer. We have never ſeen this ſpecies in ſuch perfection as in the celebrated garden of the late Dr. Fothergill at Upton, where, under the foſtering care of his worthy ſucceſſors, ſeveral relics of his collection ſtill remain. The *Ruſcus,* trained up the inſide of the old green-houſe, to the height of many feet, makes a very elegant appearance with its broad, ovate, drooping *leaves,* of a rich ſhining green, from one of whoſe margins proceeds a copious tuft of cream-coloured *flowers,* male and female on the ſame plant. The *berries* are deſcribed by Dillenius nearly the ſize of the laſt, yellowiſh, and uſually ſolitary, one ripe *ſeed* in each.

5. R. *racemoſus.* Alexandrian Laurel, or Cluſtered Butcher's-broom. Linn. Sp. Pl. 1474. Willd. n. 5. (Laurus alexandrina anguſtifolia ramoſa; Moriſ. ſect. 13. t. 5. f. 4. L. alexandrina, fructu è ſummitate caulium prodeunte; Herm. Lugd. Bat. 679. t. 681.)—Stem erect, branched. Cluſter terminal. Flowers united.—Native of Portugal, according to Mr. Aiton. Linnæus was unacquainted with its origin, and Willdenow by miſtake, it ſeems, mentions the iſlands of the Archipelago, as Dr. Sibthorp did not obſerve the plant any where in his tour, though he could not poſſibly have over-looked it at any ſeaſon of the year. Nothing is more common in ſhrubberies, and ruſtic gardens. The *ſtems* are buſhy, from two to four feet high. *Leaves* ſeſſile, lanceolate, twiſted, of a bright and poliſhed green. *Flowers* in terminal cluſters, pale buff or cream-coloured, the *ſtamens* and *piſtils* complete in each flower, but they afford no great quantity of *fruit;* except occaſionally, in retired country ſituations, where the herb grows luxuriantly. The *berries* are orange-coloured.

6. R. *reticulatus.* Reticulated Butcher's-broom. Thunb. Prodr. 13. Willd. n. 6.—"Stem climbing. Leaves ovate, many-ribbed, reticulated. Flowers ſolitary, ſtalked."—Native of the Cape of Good Hope.

7. R. *volubilis.* Twining Butcher's-broom. Thunb. Prodr. 13. Willd. n. 7.—"Stem twining. Leaves ovate-oblong, many-ribbed."—From the ſame country. We know nothing of this or the laſt, but from Thunberg's ſhort definitions.

Miller has a *R. trifoliatus,* from Zante and the Greek iſlands, which profeſſor Martyn juſtly prefers to *Hypophyllum.* The ſame author deſcribes another ſpecies, under the name of *R. fruteſcens,* gathered by Houſtoun near Carthagena. This we conceive to be a *Jacquinia;* probably the *ruſcifolia* of Linnæus.

Ruscus, in *Gardening,* contains plants of the ſhrubby and under-ſhrubby evergreen kind, of which the ſpecies cultivated are, the prickly-butcher's-broom (R. aculeatus); the broad-leaved butcher's-broom (R. hypophyllum); the double-leaved butcher's-broom (R. hypogloſſum); the Alexandrian laurel (R. racemoſus); and the climbing butcher's-broom (R. androgynus).

Method of Culture.—Theſe plants are capable of being readily increaſed by the roots, which ſend up numerous ſtalks or ſuckers, which may be taken up in autumn, winter, or ſpring in open weather, and divided into many ſeparate ſets, each forming a proper plant, though they need not be divided very ſmall unleſs where a great increaſe is required, planting the largeſt at once where they are to remain, and the ſmalleſt in nurſery rows, &c., when each plant ſoon increaſes by offsets, and aſſumes a buſhy growth. They are alſo capable of being raiſed from ſeeds, but they often remain in the ground till the ſecond ſpring. The ſeeds of the hardy ſort ſhould be ſown in any bed or border an inch deep, and the tender kind in pots, placed under ſhelter in cold weather; and when the plants are a year old, pricking them out in March, the hardy ſorts in nurſery-beds for two or three years, and the tender ſorts in pots.

All the different hardy ſorts are proper for being placed out near the verges of ſhrubberies, or any cloſe plantations, as they thrive under the drip of trees, and remain green the year round. But the laſt tender ſort requires the ſhelter of a green-houſe in winter, where it affords variety among other potted plants of that kind.

RUSE, in *Geography,* a town of European Turkey, in Romania; 60 miles N.E. of Adrianople.

RUSECK, a town of Bohemia, in the circle of Koniggratz; two miles N. of Koniggratz.

RUSEI, a town of Walachia, in the Kodmana; 45 miles W. of Bucharest. N. lat. 44° 21′. E. long. 24° 47′.

RUSGUNIA, in *Ancient Geography*, *Rustonium* of Ptolemy, *Ruthisia* of Mela, and *Rusconia* of Pliny and others, a cape near Algiers, on the coast of Africa, now Temendfuse, or Metasus, with a tabled land, as the mariners call a flat hillock that rises up in the middle of it. The Turks have here a small castle for the security of the adjacent roads, once the chief station of their navy, where are still the traces of an ancient Cothon, with several heaps of ruins of the same extent with those of Tefessad, and which have no less contributed to the fortification of Algiers.

RUSH, Benjamin, in *Biography*, an eminent physician, and professor of the institutes and practice of medicine in the university of Pennsylvania, was born near Bristol, in the state of Pennsylvania, on the 5th of January, 1745. His ancestors belonged to the society of Quakers, and were of the number of those who followed the celebrated William Penn to Pennsylvania, in the year 1683: his grandfather, James Rush, resided on his estate near Philadelphia, and died in the year 1727: his son, who was the father of the subject of these memoirs, inherited both his farm and his trade, which was that of a gun-smith. He died while Benjamin was yet young. His widow, a most excellent woman, upon whom the education of young Rush thus necessarily devolved, placed him, at an early age, under the direction of the late Rev. Samuel Finley, at West Nottingham, in Chester county, Pennsylvania, by whom he was taught the rudiments of classical knowledge. Dr. Finley, afterwards better known as the president of Princeton college, New Jersey, was an able scholar and faithful teacher, and, being also related to Mrs. Rush, may be supposed to have paid great attention to the improvement of his young pupil. But whatever may have been the assiduity with which his education was directed by his preceptor, he possessed an ardent desire for knowledge, and was most unwearied in the pursuit of it.

From the academy of Dr. Finley he was removed to the college of Princeton, where he finished his classical education, and was admitted to the degree of A. B. in 1760, when he had not yet completed his sixteenth year. He was now left to choose a profession, and in the choice which he made, he doubtless was actuated by conscientious motives. He seems to have fully known his own character, and to have formed a proper estimate of his talents, and by applying them to the science and practice of medicine, to have been desirous of doing all possible good to the family of mankind. That he was directed by these motives, may be inferred from his own opinion of the utility of medicine. "So great," says he, "are the blessings which mankind derive from it, that if every other argument failed to prove the administration of a providence in human affairs, the profession of medicine would be fully sufficient for that purpose."

He accordingly, soon after leaving college, placed himself under the care of the late Dr. John Redman, of Philadelphia, a gentleman who had deservedly obtained an extensive share of professional business, and who was justly considered an excellent practitioner. With Dr. Redman young Rush continued some time, zealously engaged in the acquisition of the several branches of medicine. At that day, however, no institution for the purpose of medical instruction was established in Philadelphia, and his thirst for knowledge being rather excited than gratified with what he had learned from his preceptor, he formed the resolution of going abroad in order to avail himself of those advantages which were not within his reach in his native country. The university of Edinburgh, at that time, was at the zenith of its reputation, and justly boasted of its able professors, among whom were the elder Munro, the elder Gregory, Dr. Cullen, and Dr. Black. Thither Rush repaired, and was graduated M.D. in 1768, after having performed the usual collegiate duties with much honour, and published his inaugural dissertation "De Concoctione Ciborum in Ventriculo." In this performance he candidly acknowledged himself indebted, for many of the opinions which he advanced, to his distinguished teacher Dr. Cullen.

About the period of Dr. Rush's return to his native country, the first attempt was made in Philadelphia for the organization of a medical school. Lectures on anatomy and surgery had indeed been delivered in that city, in 1763 and 1764, to a small class of pupils, by the late Dr. William Shippen, who, two years before, had returned from Europe, where he had completed his education under the direction of the celebrated Dr. William Hunter; and, in 1765, Dr. John Morgan, also, gave instruction on the institutes of medicine and the practice of physic. Three years after this, the venerable Dr. Kuhn, who had been a pupil of the illustrious Linnæus, and had preceded Dr. Rush in his medical honours at Edinburgh only one year, was made the professor of botany and the materia medica. To this list of teachers, Dr. Rush himself was added as professor of chemistry, immediately upon his arrival from England in 1769. Such was the first organization of the medical college of Philadelphia.

That Dr. Rush had, in an eminent degree, the qualifications of a teacher, and discharged with exemplary fidelity the important duties belonging to the elevated station to which he was chosen, the popularity attending his lectures, the yearly increase in the number of his hearers, and the unexampled growth of the college with which he was connected, bear ample testimony. Shortly after this period, he was elected a fellow, and also one of the curators of the American Philosophical Society.

While Dr. Rush was thus engaged in the active pursuits of his profession, the dispute of the then American colonies with Great Britain arose. Considering the claims of the British government unjust, he entered with warmth into the defence of the rights of his countrymen. His talents were already well known, and the fullest confidence was placed in his integrity and patriotism. The crisis demanded his services; and in the year 1776 he was chosen a member of congress for the state of Pennsylvania, and, on the 4th of July, with eight other delegates from that state, he signed the instrument of independence. Upon the 11th day of April, 1777, he was appointed surgeon-general of the military hospital in the middle department. His colleague in the medical school, Dr. Shippen, on the same day was appointed director-general of all the military hospitals for the armies of the United States, and Dr. J. Jones was made physician-general of the hospital in the middle department. The office of surgeon-general was not long held by Dr. Rush, for upon the 1st of July, 1777, he was created physician-general of the hospital, in the middle department, in the room of Dr. Jones.

On the 6th of February ensuing, Dr. Rush resigned the station of physician-general, and Dr. William Brown was appointed in his place.

Doctor Rush, however, still continued to take an active part in the politics of the state to which he belonged. The original government of Pennsylvania is known to have been perfectly unique in its form, and the constant source of incalculable mischief. The house of representatives, chosen annually by the people, and on which there was no check, was the sole legislative power; and each succeeding assembly often made it their business to undo all that their predecessors had done. This kind of government was justly reprobated by Dr. Rush, and the necessity and wisdom of a reformation in it were too apparent not to be attempted. Dr. Rush, and many other distinguished abettors of the cause, had soon after the satisfaction of seeing a new form of government established in Pennsylvania, by a general convention of the people.

Soon after, he formed the resolution of retiring from political life, and of devoting the remainder of his days, with increased ardour, to his profession. He was still further induced to this resolution, from the consideration of the state of medicine in his native country at that time, which, it is scarcely necessary to remark, was in a very low condition. Happy for medical science and the interests of humanity, that he so early formed such a resolution, and that he was so steady, uniform, and indefatigable in the accomplishment of it!

During the long and brilliant career of Dr. Rush's life, from this time to its termination, he may be considered as exclusively occupied in duties pertaining to his profession, and not unlike another Howard, in "surveying the mansions of sorrow and pain," and in mitigating and removing the distresses of all within his power. His biography, therefore, like that of most other scientific men, consists chiefly in a history of his professional labours. How numerous and important his services, as an author, have been, will be readily seen from a brief detail of his writings, which we shall attempt to give, as nearly as practicable, in chronological order.

The first fruits of his professional labours, as an author, was an account of the effects of the Stramonium, or thorn apple; this appeared in the year 1770, and was published in the Transactions of the American Philosophical Society, vol. i. The same year he addressed a letter, on the usefulness of Wort in ill-conditioned ulcers, to his friend Dr. Huck, of London, which was published in the Medical Observations and Inquiries of London, vol. iv. In 1774 he read, before the Philosophical Society, his interesting Inquiry into the Natural History of Medicine among the Indians of North America, which formed the subject of an anniversary oration. He this year again addressed another letter to Dr. Huck, containing some remarks on Bilious fevers, which was printed in the London Medical Observations and Inquiries, vol. v. To this succeeded his Account of the Influence of the Military and Political Events of the American Revolution upon the Human Body, and Observations upon the Diseases of the Military Hospitals of the United States, which his situation in the army eminently qualified him to make. In 1785 he offered to the Philosophical Society of Philadelphia an Inquiry into the Cause of the Increase of Bilious and Intermitting Fevers in Pennsylvania, published in their Transactions, vol. ii.; and soon after, in quick succession, appeared Observations on Tetanus, an Inquiry into the Influence of Physical Causes upon the Moral Faculty, Remarks on the Effects of Ardent Spirits upon the Body and Mind, and his Inquiry into the Causes and Cure of the Pulmonary Consumption. About this time, also, appeared his paper entitled Information to Europeans disposed to migrate to the United States, in a letter to a friend in Great Britain; a subject which had already occupied the attention of Dr. Franklin, but which Dr. Rush considered still further deserving notice, on account of the important changes which the United States had lately undergone. To this paper followed his Observations on the Population of Pennsylvania, Observations on Tobacco, and his Essay on the Study of the Latin and Greek Languages, which was first published in the American Museum of Philadelphia. This last-mentioned paper, which has been the fertile topic of much animadversion, was, with several other essays of Dr. Rush, and his Eulogiums on Dr. Cullen and the illustrious Rittenhouse, the former delivered in 1790, the latter in 1796, embodied in an octavo volume, entitled Essays, Literary, Moral, and Philosophical, and published in 1798.

In 1791, the medical colleges of Philadelphia, which, on account of certain legislative proceedings, had existed as two distinct establishments since the year 1788, became united under the name of the University of Pennsylvania; and Dr. Rush was appointed to the chair of the professorship of the institutes of medicine and clinical practice. He now gave to the public his Lectures upon the Cause of Animal Life. The same year he presented the Philosophical Society his Account of the Sugar Maple Tree of the United States, which was published in their Transactions, vol. iii.; and in 1792, Observations, intended to favour a supposition that the Black Colour of the Negro is derived from Leprosy; published in their Transactions, vol. iv.

The year 1793 is memorable in the medical annals of the United States, on account of the great mortality occasioned by the yellow fever, which prevailed in the city of Philadelphia; and the history of that epidemic, which was published by Dr. Rush in 1794, cannot be too highly valued, both for his minute and accurate description of the disease, and the many important facts he has recorded in relation to it. It was comprised in one volume octavo, and has undergone several editions, and been extensively circulated in the Spanish and in the French languages. About this period, also, he offered to the medical world his observations on the Symptoms and Cure of Dropsy in general, and on Hydrocephalus Internus; an Account of the Influenza, as it appeared in Philadelphia in 1789, 1790, and 1791; and Observations on the State of the Body and Mind in Old Age. In 1797 came out his Observations on the Nature and Cure of Gout, and on Hydrophobia; an Inquiry into the Cause and Cure of the Cholera Infantum; Observations on Cynanche Trachealis, &c.

It is proper to state, as connected with the literary labours of Dr. Rush, that in 1788, many of his medical papers were collected together, and that he offered them to the public under the title of Medical Inquiries and Observations, vol. i. These he, from time to time, continued, embracing most of the writings above enumerated, besides observations on the climate of Pennsylvania, and some others, until a fifth volume was completed in 1798. In 1801 he added to his character as a writer, by the publication of six Introductory Lectures to a course of Lectures upon the Institutes and Practice of Medicine, delivered in the University of Pennsylvania. In 1804 a new and corrected edition of his Medical Inquiries, &c. was printed in four volumes, octavo. In 1806 he also published a second edition of his Essays. In 1809, such was the demand for the Medical Inquiries and Observations, he again revised and enlarged the work throughout, and enriched the medical profession with a third edition. In this edition he continued his several histories of the yellow fever, as it prevailed in Philadelphia from 1793 to 1809. It also contained a Defence of Blood-letting, as a Remedy for certain Diseases; a view of the comparative state of Medicine in Philadelphia between the years 1760 and 1766, and the year 1809; an Inquiry into the various sources of the usual forms of Sum-

mer

mer and Autumnal Difeafes in the United States, and the means of preventing them; and the recantation of his opinion of the Contagious nature of the Yellow Fever.

He now formed the idea of felecting fome of the beft practical works for republication in America, and in order to render them more ufeful, of adding to them fuch notes as might the better adapt them to the difeafes of his own country. His editions of Sydenham and of Cleghorn were publifhed in 1809, and in 1810 appeared thofe of Pringle and Hillary. In 1811 appeared a volume of Introductory Lectures, containing thofe he had formerly publifhed, with ten others delivered at different years before his clafs, and alfo two upon the pleafures of the fenfes and of the mind. His work upon the Difeafes of the Mind, which had long and ardently been looked for, was next added to his writings. It appeared towards the clofe of 1812, in one volume octavo. The laft effort of his pen was a letter on Hydrophobia, containing additional reafons in fupport of the theory he had formerly advanced, as to the feat of the difeafe being chiefly in the blood-veffels. It was addreffed to Dr. Hofack, and written not many days before his fatal illnefs.

While thus affiduoufly engaged in enriching medical fcience with the valuable fruits of his long and extenfive experience, and in the active difcharge of the practical duties of his profeffion, he was, on the evening of the 13th of April, feized with fymptoms of general febrile irritation, which were foon accompanied with confiderable pain in his cheft. His conftitution was naturally delicate, and he had acquired, from previous illnefs, a predifpofition to an affection of his lungs. He loft a moderate quantity of blood, by which he felt himfelf confiderably relieved. But his ftrength was not fufficient to overcome the feverity of his complaint; the beneficial effects refulting from the moft fkilful treatment were but of temporary duration. His difeafe rapidly affumed a typhus character, attended with great ftupor, and a difinclination to converfation. In other refpects, however, he retained his faculties, and the perfect confcioufnefs of his approaching diffolution. On Monday evening enfuing, after a fhort illnefs of five days, and in the 69th year of his age, he ended his truly valuable and exemplary life. His death was the fubject of univerfal lamentation, and he was followed to the grave by thoufands, who affembled to bear teftimony to his excellence.

In January, 1776, he married Mifs Julia Stockton, daughter of the Hon. Judge Stockton, of New Jerfey, a lady of an excellent underftanding, and whofe amiable difpofition and cultivated mind eminently qualified her as the companion of Dr. Rufh. Thirteen children were the fruits of their marriage, nine of whom ftill furvive. Two of thefe are chofen to offices of high refpectability in the general government of the United States.

It were no eafy tafk to do adequate juftice to the great talents, the ufeful labours, and the exemplary character of Dr. Rufh. From the preceding fketch, it is prefumed, fome idea may be formed of his inceffant devotednefs to the improvement of that profeffion of which he was fo bright an ornament. His merits, as a practitioner, are too well known to need particular notice; he was fully aware of the great refponfibility attached to the medical character, and uniformly evinced the deepeft folicitude for the recovery of his patient. His kindnefs and liberality in imparting aid to thofe from whom no remuneration was ever to be expected were unbounded, and arofe from the generous impulfe of his nature, the cordial concern he felt in whatever affected the interefts of his fellow creatures. His mind was of a fuperior order: to a perception naturally ready and acute, he united a difcriminating judgment, a retentive memory, which was greatly improved by habits of clofe attention, a brilliant imagination, and a highly cultivated tafte. He poffeffed a comprehenfive underftanding; his knowledge was varied and profound, and he eminently excelled in the feveral departments of his profeffion. In his affiduity and perfeverance in the acquifition of knowledge he had no fuperior, and few equals. Accuftomed to conftant and regular exercife, his intellectual powers acquired additional vigour from employment. Notwithftanding the great fatigue he had to undergo in the difcharge of the practical duties of a laborious profeffion, and the conftant interruptions to which he was expofed, when engaged in his purfuits as an author, he never for a moment abated of his ardour in the caufe of fcience. His habits of punctuality to every kind of bufinefs in which he was employed, added to a judicious arrangement of time for his multifarious occupations, fecured to him fufficient leifure for the publication of thofe works which have given fuch celebrity to his name.

His writings claim our attention, both on account of their extent and their variety. Inftead of being a mere collator of the opinions of others, he was conftantly making difcoveries and improvements of his own, and from the refults of his individual experience and obfervation, added more facts to the fcience of medicine, than all who had preceded him in his native country. His defcription of difeafes, for minutenefs and accuracy of detail, cannot be exceeded, and may fafely be regarded as models of their kind. His volume on the difeafes of the mind, as far as it exhibits the infinitely varied forms which thofe difeafes exhibit, is a ftorehoufe of inftruction. Had his labours been limited to thefe fubjects alone, his character would defervedly have been cherifhed by future ages. His reputation, however, will permanently depend upon his feveral hiftories of the epidemics of the United States, which have rendered his name familiar wherever medical fcience is cultivated, and will hereafter caufe to be infcribed upon the fame imperifhable column that bears teftimony to the merits of Sydenham and Boerhaave, the illuftrious name of Benjamin Rufh. The refpect and confideration which his publications procured for him among his contemporaries, were fuch, that the higheft honours were accumulated upon him in different parts of Europe, as well as in his own country, and he was admitted a member of many of the moft diftinguifhed literary and philofophical affociations.

There are other qualities which ftill more entitled Dr. Rufh to our refpect and efteem. In private life, his difpofition and deportment were in the higheft degree exemplary. Admired and courted for his intellectual endowments, he riveted to him the affections of all who enjoyed the pleafure of an intimate acquaintance. The affability of his manners, the amiablenefs of his temper, and the benevolence of his character, were ever confpicuous. He was ardent in his friendfhips and forgiving in his refentments, and yet entertaining a due regard for himfelf and a high fenfe of honour, he poffeffed a manly independence of fpirit which difdained every thing mean and fervile. He had an extraordinary command of language, and always imparted his thoughts in a peculiarly impreffive and eloquent manner. Thofe who had the happinefs to experience the delights of his converfation, will long recollect, with pleafure, his unaffuming modefty, and the rich ftores of knowledge he poured forth on the moft inftructive topics. Even when his opinions were folicited, they were given, not as the dictates or admonitions of a fuperior, but as the kind advice of a friend and equal. He never evinced any of that haughtinefs and affectation of importance, which fometimes attaches to

men

men of eminence, and which fo materially leffens the pleafures and comforts of focial life.

He was a believer in Chriftianity from an examination of its principles and the deepeft conviction. The purity of its doctrines, and the excellence of its precepts, were a frequent topic of his converfation; its practical influence upon his conduct through life he often acknowledged, and cherifhed with a fervent hope the animating profpects it affords. His writings, in numerous places, bear teftimony to his Chriftian virtues; and in a manufcript letter, written a fhort time previous to his fatal illnefs, and now before the writer of this imperfect fketch, he candidly declares that he had "acquired and received nothing from the world which he fo highly prized as the religious principles he received from his parents." It is peculiarly gratifying to obferve a man fo diftinguifhed in a profeffion in which, by the illiberal, religious fcepticifm is fuppofed to abound, directing his talents to the maintenance of genuine piety, and the enforcing of Chriftian virtue. To inculcate thofe principles which flow from the fource of all truth and purity, and to impart them as a legacy to his children, was an object dear to his heart, and which he never failed to promote by conftant exhortation and the powerful influence of his own example.

There is one particular circumftance in the character of Dr. Rufh, which we cannot permit to be paffed over without obfervation; we allude to the union, fo eminently confpicuous in him, of the eminent practitioner, and the able and voluminous writer. But our limits will not allow us to enlarge. The materials of the above biographical article have been extracted from the American Medical and Philofophical Regifter, conducted by Dr. Hofack and Dr. Francis, of New York; July, 1813.

Rush, in *Botany*. See Juncus.

Rufhes always indicate a deepifh rich foil, and they thrive moft in land that is too wet and cold for moft other plants. It has been obferved that plants of the rufh kind may be eafily removed by preventing the ftagnation of moifture near the furface by judicious under or furface draining, and the application of fubftances of the faline or calcareous kinds, as afhes, lime, drift from the roads, and other fimilar materials. Thefe are beft made ufe of in a dry feafon in either the autumn or fpring, but the latter is probably the beft; as thefe abforbent materials will thereby be made ufe of at the time fuch plants begin to fhoot and eftablifh themfelves, and when there will be the leaft danger of their operation being leffened or prevented by too great a degree of moifture. It has been ftated by Mr. Kent, that in naturally coarfe meadows, or fuch as become fo in confequence of rufhes growing upon them before they have been rendered fufficiently dry by draining, it forms a great improvement to apply a thin coat of fand evenly over the furface of them in the proportion of from twenty to thirty common loads. By this means the fward is rendered much finer, and a much better fort of herbage brought up, white clover being predominant in moft cafes. And there is ftill another method, that, in particular fituations, may be more eafy and convenient, and which has been found to quickly deftroy plants of this coarfe kind by bringing up thofe of a finer defcription. It is a mode that may, at firft, feem fingular to thofe who have not feen its fudden and aftonifhing effects. It is that of conducting water over the furface of fuch ground; but in this intention it fhould not be fuffered to have the leaft degree of ftagnation, but be conveyed off with as much expedition as poffible, by fuitable drains being made. Frequent cutting over while in their young growth has alfo been found ufeful in deftroying them.

Another method of deftroying rufhes is to fork them up clean by the roots in July, and after having let them lie a fortnight or three weeks to dry, lay them in heaps and burn them gently, and the afhes which thefe afford will be tolerable manure for the land; but, in order to prevent their growing again, and to make the pafture good, the land fhould be drained, otherwife there will be no deftroying them entirely; but after it is well drained, if the roots are annually drawn up, and the ground kept duly rolled, they may be fubdued. Miller.

Rush, *Flowering*, or *Water Gladiole.* See Butomus.

Rush, *Leffer Flowering.* See Scheuchzeria.

Rush, *Round, Black-headed, Marfh*, or *Bog.* See Schoenus.

Rush, *Sweet.* See Acorus.

Rush-*Grafs.* See Scirpus.

Rushes, *Petrified.* What is ufually called by this name is a kind of foffile coral. But we have in England, alfo, another not uncommon fubftance, frequently called by the fame name: this is an incruftation of fparry matter, in the form of a ftony cruft on the outfides of real rufhes; though, in this cafe, it is no real petrifaction, but only a covering of this ftone-like matter.

Incruftations and petrifactions are ufually confounded together, and the generality of people do not attend to the diftinction, which is, that in a real petrifaction, the ftony matter penetrates the very fubftance of the body, as is the cafe in the petrified wood of Ireland, and other places; whereas, in thefe incruftations the fubftance itfelf remains unaltered within, and its outer part alone is covered with the ftony fubftance; this is the cafe with what is called the petrified mofs at Scarborough, and in other parts of England, and this is the cafe in regard to what we call fometimes petrified rufhes.

Rush, in *Rural Economy*, a term fignifying a tuft, clufter, or a knot of plants of the corn or grafs kind.

Rushes is alfo a term provincially applied to the wire rufh.

Rush, in *Geography*, a fifhing-town of the county of Dublin, Ireland, well fituated for carrying on bufinefs to advantage. The ling cured here, of which much is exported, is celebrated for its fuperior flavour. It is fituated on a point of land projecting into the Irifh fea; $13\frac{1}{2}$ miles N. by E. from Dublin.

Rush, *The*, a fand-bank near the E. coaft of Ireland, and county of Wexford, about four miles long, and hardly one broad; a little to the fouth of Glafscarrick Point.

RUSHA, a fmall ifland near the W. coaft of Scotland. N. lat. 58°. W. long. 2° 20'.

RUSHIN, or Castle Rushin. See Castle-town.

RUSHWORTH, John, in *Biography*, was born in or about the year 1607, fomewhere in the county of Northumberland. Of the early part of his education we have no account. He was fome time a ftudent in the univerfity of Oxford, after which he entered himfelf at Lincoln's Inn, and was called to the bar. He was, however, more attached to politics than to the purfuits of the profeffion, and was almoft perpetually an attendant on the parliament, ftar-chamber, and other courts, taking notes, in fhort-hand, of the proceedings at thofe places. In the troubles of that period he attached himfelf to the parliamentarian and prefbyterian parties, and in 1640 he was admitted an affiftant clerk of the houfe of commons. He foon gained the confidence of the houfe, and, during the king's refidence at York, was employed to convey to him its addreffes and meffages, on which occafions he is faid, even at that period, to have rode from London to that city in 24 hours. For thefe fervices he was recommended by the houfe to a place in the excife. In 1643 he took the covenant, and fir Thomas Fairfax, to whom he was nearly related, being made general of the parliamentary forces, appointed Mr. Rufhworth to be his fecretary. In this fituation he was very zealous and active in performing his duties, public and private. In 1649 he attended Fairfax to Oxford, where he was created M.A. as a member of Queen's college. When Fairfax refigned his commiffion, Rufhworth took up his refidence in London, and was nominated in 1652, by the houfe of commons, one of the commiffioners to reform abufes in the common law. At this time he was engaged in the compilation of his "Hiftorical Collections," of which the firft part appeared in 1659, dedicated to Richard Cromwell, at that time Protector. He was at this period member of parliament for Berwick-upon-Tweed. In 1660 he was appointed one of the clerks of the new council of ftate. After the Reftoration, he endeavoured to ingratiate himfelf with Charles II. by prefenting to him feveral books of the privy-council during the former reign, which he had preferved from deftruction, for which, however, he probably received no higher reward than that of thanks. In 1667, fir Orlando Bridgeman, keeper of the great feal, made him his fecretary, when he was again elected reprefentative for Berwick in the parliament of 1678-9, and the fubfequent one held at Oxford. After the diffolution of the latter, having always been carelefs of his private affairs, he fell into neceffitous circumftances, and lived in great obfcurity in Weftminfter, affiduoufly employed in his Collections, of which he publifhed the fecond part in 1680. He was at length arrefted for debt, and committed to the king's bench prifon, where he fpent, in great wretchednefs, the laft fix years of his life. He died in 1690, at the age of 83. He had feveral daughters, one of whom was married to fir Francis Vane. The "Hiftorical Collections" of this author include private paffages of ftate, weighty matters of law, remarkable proceedings in parliament, &c. and they commence in the reign of king James, in the year 1618, and were brought down to 1740. The third and fourth parts, printed from his MSS., extend to the death of Charles I. in 1648-9. The whole was reprinted uniformly in 7 volumes, folio, in 1721. Of his Collections, the writer in the Biographia Britannica fays, all that have written on the Puritan or Prefbyterian fide have highly extolled, nay almoft idolized them; fuch as Coke, Rapin, Oldmixon, &c. Others, on the contrary, who were favourers of king Charles I. and his caufe, condemn them as extremely partial, and have difcredited them as much as poffible. But the perfon who profeffedly fet himfelf to oppofe them was John Nalfon, L.L.D., who publifhed, by command of king Charles II., "An Impartial Collection of the great Affairs of the State, from the Beginning of the Scotch Rebellion in the Year 1639, to the Murder of King Charles I." &c. Dr. Nalfon did not continue his hiftory lower than January 1641-2. He brings four capital accufations againft Rufhworth, *viz.* that he does not inform us whence he had his materials, and therefore that his facts do not ftand upon fufficient authority;—that he prints falfe and erroneous copies of fome papers;—that, under the colour of epitomizing others, he has not only obfcured, but, in many places, corrupted and difguifed the fenfe;—and that he has recorded little but what relates to the juftification of thofe whom he favours, and their proceedings, omitting what might ferve to manifeft the king's innocence. In a compilation of fuch extent, it is no wonder there fhould be errors, and the writers of the "Parliamentary Hiftory" have taken pains to frame a long lift of his miftakes, which is copied in a note to the article RUSHWORTH, in the Biog. Brit.; they, however, attribute them rather to the negligence and ignorance of tranfcribers, than to wilful mifreprefentation. It can, however, fcarcely be expected that a man, writing as he did, fhould be free from partialities, or that his perfonal attachments fhould not enter into his work. Befides, it is certain that the firft part of his work was fubmitted to the revifion of Oliver Cromwell, who being too much occupied to examine it himfelf, put it into the hands of Whitelock, under whom it underwent various alterations. Neverthelefs, Mr. Rufhworth profeffes great impartiality and faithfulnefs, affuming that he muft be in poffeffion of a fufficient degree of knowledge and information for all the objects he had in view; and he, moreover, gives himfelf as an inftance, that it is poffible for a man to be of a *party* and not *partial*. The value of the "Hiftorical Collections" arifes from their having preferved together feveral detached pieces, which otherwife would have been loft, and from being the fulleft compilation during the period of which they treat. Biog. Brit.

RUSHY LAND, in *Agriculture*, that which is much infefted and troubled with the growth of rufhes upon it. Lands of this nature and quality prevail in many places to very confiderable extents, which, when properly reclaimed and managed, conftitute extremely good meadows and paftures. They are alfo, in fome cafes, capable of being broken up and converted to the purpofe of tillage, with great advantage.

In many inftances of this nature, very great benefit has been derived from a thick covering of chalk rubbifh, or the rubbifh of lime-ftone and free-ftone quarries, applied in a confiderably reduced or powdery ftate, after the land had been fufficiently freed from ftagnant water by means of pipe or other kinds of under draining, as fuch heavy materials foon fink in the ground, and by confolidating it are the caufe of bringing up another fort of better plants of the grafs kind. When fuch rufhy lands have once acquired a certain ftate and degree of firmnefs by thefe or any other means, they may be further benefited and improved by rolling, and clofe feeding down with fheep ftock, which fhould be confined on particular portions of them, in great numbers, in order to infure the fulleft effect and advantage.

It is better likewife, where they are capable of it, to let thefe forts of lands remain for fome years in the ftate of pafture, than to bring them directly under the mowing fyftem; as, in that way, they are conftantly advancing to a more folid and finer ftate of herbage, whereas under the contrary practice, they are invariably getting more open, loofe, and coarfe in their produce. See RUSH.

RUSIBIS PORTUS, in *Ancient Geography*, a port of Africa, in Mauritania Tingitana, between the mouth of the river Cofa and that of Afama, according to Ptolemy. It is called *Rutubis Portus* by Pliny.

RUSICADA, SGIGATA, a town of Africa, according to Mela and Ptolemy. It was fituated towards the middle of the gulf of Numidia, about 30 miles E. of Collops Magnus. In the Itinerary of Antonine, this town is placed in Mauritania Cæfarienfis, upon the route from Carthage to Leninx, between Chuli Municipium and Paratianæ. Here are fome remains of antiquity. Its cifterns ferve as a corn magazine.

RUSICIBAR, a town of Africa, in Mauritania Cæfarienfis, between Ruftonium and Medunga, according to Ptolemy. Antonine calls it Rufubbicari, and in the Peutingerian Tables it is Rufibricari Matidiæ.

RUSIN, in *Geography*, a town of Bohemia, in the circle of Schlan; 4 miles N.W. of Prague.

RUSK, AL, a town of Curdiftan; 18 miles S.E. of Amadieh.

RUSKO, a town of Sweden, in the government of Abo; 6 miles N.W. of Abo.

RUSKOBAGAN, the Indian name of Parker's iſland in Kennebeck river.

RUSKY, or Ruskybridge, a ſmall poſt-town of Ireland, in the county of Leitrim, where there is a bridge over the Shannon. It is 67 miles N. by W. from Dublin, and 7 from Longford.

RUSLAM River, a river of Upper Canada, which runs into lake St. Clair, between Point aux Roches and Belle river; it is navigable by a loaded boat ſix miles upwards. The land on its banks is very good, and at the diſtance of a few miles in aſcending it there is an Indian ſettlement.

RUSMA, in *Natural Hiſtory*, the name given by the Eaſtern nations to the ſubſtance called by the ancient Greeks *ſory*, and uſed as a depilatory.

The Turks call this ſubſtance *ruſma*, and the Arabians *nouret*. It is not, as ſome have imagined, a mineral ſubſtance found ready for uſe, as a depilatory, in the bowels of the earth; but it requires a preparation and an alloy to give it that property. Bellon, who firſt deſcribed (at Cuta, in Galatia,) "the ſource of a mineral which they call *ruſma*," adds, that this mineral alone cannot be uſed "till it has been beaten into a very fine powder, putting half as much quick-lime as ruſma, which is then diluted in a veſſel with water." Thus, the ruſma of Bellon is not of itſelf a depilatory; but it contains ſome cauſtic matter, which being mixed with lime, gives it that property. This preſumption is confirmed by M. Velmont de Bomare, who, having received from Conſtantinople ſome ſmall pieces of mineral ruſma, perceived, that on throwing it upon hot coals, there immediately exhaled from it a vapour, which gives reaſon for ſuſpecting that it is a "colchitis" mineralized by ſulphur and arſenic. This mixture is the true ruſma of the Turks, and the nouret of the Arabs. There are different names of the ſame ſubſtance, or rather of the ſame compoſition. It is, in fact, with arſenic or orpiment, mixed with quick-lime, that the drug for taking off the hair is prepared in the Egyptian baths. The proportion is ſeven parts of lime to three of orpiment. It is neceſſary for the perſon who deſires to uſe it, to keep in a very warm place, ſuch as the hot baths of the Eaſt, in which a profuſe ſweat exudes from all parts of the body. The mixture is diluted with water, and lightly rubbed on the parts from which the hair is to be taken off. After a few moments, it will be ſeen if the hair be looſened; it can then be plucked out without pain, and the ſkin is afterwards waſhed with hot water. Care muſt be taken, however, that this liniment does not remain on too long, becauſe it would burn the ſkin. This does not prevent the hair from growing again, and at the end of ſome time the operation muſt be repeated.

Mr. Boyle tells us, he made a fine powder of equal parts of ruſma and quick-lime, and letting them ſoak a little time in water, they became a ſoft paſte, which he ſpread on the part he would free from hair; and after letting this paſte lie on about three minutes, he wiped it off with a wet cloth, and found the hair taken away by the roots without any inconvenience to the part.

RUSOER, in *Geography*. See Risoer.

RUSOOLPOUR, a town of Hindooſtan, in Allahabad; 35 miles N. of Gazypour.

RUSPACH, a town of Auſtria; five miles S. of Sonneberg.

RUSPÆ, Shé-ah, in *Ancient Geography*, a town of Africa, on the gulf of Numidia, according to Ptolemy, ſituated between Achola and Brachodes Exterma; ſix miles S. of Achola. Some ruins ſtill remain.

RUSPEN, in *Geography*. See Roszwein.

RUSPINA, Sahaleel, in *Ancient Geography*, a town of Africa, on the gulf of Numidia, between Leptis Minor and Adrumettium, according to Ptolemy. It was ſituated on the declivity of an eminence about a mile from the ſea, S.E. of Adrumettium. It is known by ſome ancient remains.

RUSPONO, in *Commerce*, a gold coin of Tuſcany, which is a piece of 3 ſequins, weighing 8 denari 21 grani, Florence weight, and paſſing for 40 lire or 60 paoli. In gold and ſilver weight, the pound contains 12 ounces; the ounce, 24 denari or 576 grani. This pound weighs 11 oz. 2 deniers 8 grains, French poids de Marc, or 5241 Engliſh grains; ſo that 100lbs. of this weight anſwer to 91lbs. Engliſh troy weight. The aſſay and value of the ruſpono are as follow: compared, as to fineneſs, with the Engliſh ſtandard of 22 carats, and as to value with the mint price of gold in England, *i. e.* 3*l.* 17*s.* 10½*d. per* oz. ſtandard, *viz.*

	Aſſay.	Weight.	Contents in pure Gold.	Value in Sterling.
	car. gr.	oz. dwt. gr.	grains.	*L. s. d.*
Ruſpono - -	B. 1 3¾	0 6 17¼	160.8	1 8 5½
Zecchino, or ſequin	B. 1 3¾	0 2 5¾	53.6	0 9 5¾
Ruſpono of Etruria	B. 1 3⅞	0 6 17¼	161.6	1 8 6

The impreſſions on the ruſpono are a lily, with the name and title of the reigning prince, thus: FERDINANDUS III. D. G. A. A. M. D. ETR. that is, *Dei Gratia Archidux Auſtriæ, Magnus Dux Etruriæ*, (Ferdinand III. by the grace of God, archduke of Auſtria, grand duke of Tuſcany); reverſe, a figure repreſenting St. John the Baptiſt; legend, S. JOANNES BAPTISTA. Some pieces, coined about the year 1738, bear the head of the reigning prince; legend, FRANCISCUS III. D. G. LOTH. BAR. ET M. ET. D. REX HIER. (Francis III. by the grace of God, duke of Lorraine and Bar, grand duke of Tuſcany, king of Jeruſalem); reverſe, arms of the prince; legend, IN TE DOMINE SPERAVI, (in thee, O Lord, have I hoped).

The new ruſpono of the kingdom of Etruria bears the ſame impreſſions as above; legend in thoſe coined in 1803, LUDOVICUS I. D. G. HISP. INF. REX ETRURIÆ, (Louis I. by the grace of God, infant of Spain, king of Etruria); and in thoſe ſtruck in 1804, CAROLUS I. D. C. REX ET M. ALOYSIA R. RECTRIX, (Charles I. by the grace of God, king of Etruria, and Maria Louiſa queen regent).

The ſequin of Tuſcany has the ſame impreſſion as the ruſpono.

RUSS, in *Geography*, a town of Pruſſian Lithuania, and principal place of a diſtrict, ſituated at the mouth of the river Ruſſe; 20 miles N.W. of Tilſit.—Alſo, a ſmall iſland in the Eaſt Indian ſea, near the W. coaſt of Naſſau. S. lat. 2° 53′. E. long. 99° 48′.

RUSSE, a river of Pruſſia, one of the branches of the Memmel, which runs into the Curiſch Haff.

RUSSELE'E, a town of Aſiatic Turkey, in the province of Diarbekir; 58 miles S. of Moſul.

RUSSELIA, in *Botany*, received that name from Jacquin, in honour of Dr. Alexander Ruſſel, for many years phyſician to the Engliſh factory at Aleppo, and author of a "Natural Hiſtory" of that place, publiſhed in 1756; which was ſubſequently re-edited by his brother, the late worthy Dr. Patrick Ruſſell, ſo well known by his works on the Plague, and on Indian Serpents. (See Russell.) This original *Ruſſelia* was neglected by Linnæus; but in the *Supplementum*, printed in in 1781, his son gave that appellation to another genus, now established under the name of VAHLIA, as will hereafter be shewn when we come to that article. The younger Linnæus appears to have puzzled himself between the words *Russelia* and *Roussea*; for the latter was what his father had intended; see ROUSSEA. The result of all this confusion is, that Jacquin's *Russelia* is now finally restored to its due rank.—Jacq. Amer. 178. Schreb. 419. Willd. Sp. Pl. v. 3. 344. Mart. Mill. Dict. v. 4. Ait. Hort. Kew. Epit. 373. Juss. 118. Lamarck Illustr. t. 539.—Class and order, *Didynamia Angiospermia*. Nat. Ord. *Personatæ*, Linn. *Scrophulariæ*, Juss.

Gen. Ch. *Cal.* Perianth inferior, of one leaf, in five deep, ovate, concave, acute, taper-pointed, erect, small, permanent segments. *Cor.* of one petal, ringent; tube cylindrical, somewhat compressed, erect, several times longer than the calyx, hairy at the lower side internally; limb two-lipped; the upper lip roundish, flat, cloven, spreading, reflexed at the summit; lower rather the longest, in three deep, oblong, obtuse, flat, widely spreading segments. *Stam.* Filaments four, thread-shaped, erect, rather shorter than the tube, two of them longest; anthers ovate. *Pist.* Germen superior, ovate; style thread-shaped, erect, the length of the shorter stamens; stigma globose, undivided. *Peric.* Capsule roundish, beaked with the permanent base of the style, of two cells and two valves, about as long as the calyx. *Seeds* numerous, minute.

Eff. Ch. Calyx in five deep taper-pointed segments. Upper lip of the corolla emarginate; lower in three deep segments; tube much longer than the calyx, hairy within. Stigma globose. Capsule of two cells, and two valves, with many small seeds.

1. R. *sarmentosa*. Trailing Russelia. Jacq. Amer. 178. t. 113. Willd. n. 1.—Leaves ovate, nearly sessile. Stalks axillary, three-flowered. Gathered by Jacquin in woods and bushy places about the Havannah. The *stem* is shrubby, with numerous long, weak, square, smooth, leafy *branches*, supporting themselves against the neighbouring bushes, and pendulous at the ends. *Leaves* opposite, on very short stalks, ovate, acute, serrated; rather hairy on the margin and upper surface; smooth at the back. *Flowers* about an inch long, inodorous, of a fine red, growing two or three together on axillary stalks, not so long as the leaves. The partitions of the *capsule*, being formed of the inflexed valves, probably separate from the central column as the fruit ripens, and led Jacquin to describe the *capsule* as of one cell. The same thing is observable in *Verbascum*.

2. R. *rotundifolia*. Round-leaved Russelia. Cavan. Ic. v. 5. 9. t. 415.—Leaves sessile, heart-shaped, roundish. Clusters many-flowered, axillary and terminal, in pairs. Gathered by Louis Née, near Acapulco, flowering and seeding in February, March, and April. The *stem* is erect, shrubby, four feet high, with obscurely quadrangular, downy *branches*. *Leaves* about two inches in diameter, almost orbicular, though somewhat pointed, reticulated with veins, downy, especially when young, broadly serrated. *Flowers* scarlet, smaller than the preceding, in twin *clusters*, with small *bracteas* under each pair of partial stalks. Central column of the *capsule* hairy. *Seeds* minute, black. *Cavan.*

3. R. *multiflora*. Many-flowered Russelia. Sims in Curt. Mag. t. 1528.—Leaves ovate, pointed, stalked. Cluster terminal, whorled, compound; the stalks cymose. Found by Mr. Cowan, in the mountainous tract of South America, between Vera Cruz and Mexico. Mr. Lambert raised the plant from seed, and it flowered in his stove at Boyton in the autumn of 1812. The *stems* and *branches* are weak and trailing, as in the first species; but the *leaves* are larger, and the *flowers* much more numerous, composing dense whorled *clusters* at the ends of each branch. *Corolla* scarlet, about the size of *R. sarmentosa*, but the points of the *calyx* are longer.

RUSSELL, *Lord* WILLIAM, in *Biography*, a distinguished patriot and martyr to the cause of liberty, was the third son of William, the first duke of Bedford, by a daughter of the earl of Somerset. He was born about the year 1641, and was brought up in those principles of liberty of which his father was an assertor, and which are congenial to the spirit of the English constitution. Being in the fervour of youth at the time of the restoration of Charles II. he joined in the gaieties of the court; till his marriage in 1667, with Rachel, second daughter and co-heiress of the earl of Southampton, reclaimed him from any irregularities into which he had fallen, and from this time he bore a most unblemished character. In four parliaments he represented the county of Bedford, highly esteemed for his patriotism and independent spirit. He was looked up to as one of the heads of the Whig party.

"A political intrigue of this period," says one of his lordship's biographers, "has brought an imputation on his memory, from which different methods have been taken to clear it. Charles II., one of the most profligate of public characters, had been exasperated against the court of France, by the withdrawing, on account of the marriage of the duke of York's daughter to the prince of Orange, that pension which he had hitherto been mean enough to receive, and he appeared desirous of joining the continental confederacy against Lewis XIV. A French war being always popular in England, the parliament voted a large supply of men and money for the purpose. The patriots, however, knowing that Charles was not to be trusted, and being at the same time full of alarms respecting popery and arbitrary power, were very unwilling to give him the disposal of an army, which might as probably be employed against the liberties of the country, as against France. In this point, therefore, their wishes coincided with those of Lewis, in raising an opposition to the measures of the English court: and by means of a M. de Rouvigny, who was a relation of lady Russell, they intrigued with Barillon, the French ambassador in England. From that minister's private dispatches, sir John Dalrymple copied, and published in his 'Memoirs of Great Britain,' his negotiations on this head, and also a list of members of parliament whom he had actually bribed." Lord W. Russell is not charged with being one of the number bribed; he and lord Hollis, it is asserted, positively refused to accept of money. There seems, however, little reason to doubt that he took a part in the intrigue. His intentions, no doubt, were perfectly upright: he was zealously inclined to defend the Protestant interest, which he saw was in imminent danger, and he hoped, by the course which was now taken, the blow might be warded off. To his good intentions, therefore, his biographers must appeal for the justification of a step confessedly of a suspicious nature, and not consistent with correct policy.

In the year 1679, the king found it expedient to ingratiate himself with the Whigs, by the appointment of a new privy council, of which lord Shaftesbury was president, and lord William Russell was a member. They soon found that they did not enjoy the king's confidence, who engaged in some important measures without their concurrence, among which was the recall of the duke of York; several of them resigned, and lord Russell among the number. His sense of the danger to the Protestant religion from a Catholic successor, induced him to take a moſt deciſive part in the attempt for the excluſion of the duke of York. He went publicly to Weſtminſter-hall, and at the court of king's bench preſented the duke as a recuſant: this was in June 1680, and in the following November, he carried up the Excluſion-bill to the houſe of lords, at the head of 200 members of the houſe of commons. The lead which he took in this matter, as it was highly diſpleaſing to the court, ſo it carried a great influence with the public, he being a perſon of high reputation for integrity, a man of very great fortune, and wholly deſtitute of private ambition. The king diſſolved the parliament, and ſeemed determined to govern without one. Arbitrary principles were openly avowed by the friends of the king, and the cauſe of liberty, civil and religious, was brought into the greateſt hazard.

This ſtate of affairs inſpired deſperate councils into ſome of the Whig leaders, and a conſpiracy was formed for an inſurrection, conducted by a council, conſiſting of the duke of Monmouth, lords Ruſſell, Eſſex, and Howard, Algernon Sydney, and Hampden, who were to act in concert with the duke of Argyle, and the Scotch malcontents. Among theſe leaders different deſigns prevailed; but it is admitted, that the ſubject of this article had no other views than to procure the excluſion of the duke of York from the throne, and a redreſs of grievances. While theſe ſchemes were agitating, a minor plot was laid by ſome inferior conſpirators, which conſiſted of a plan for aſſaſſinating the king on his return from Newmarket, at a farm called the Rye-houſe, and which has given name to this plot. Although it is known that this conſpiracy was entirely apart from the ſcheme of an inſurrection, yet two of the perſons engaged in the Rye-houſe plot had acceſs to ſome of the leaders in the other plan, and the detection of the one plot, led to the diſcovery of the other, and orders were inſtantly iſſued for the apprehenſion of thoſe engaged in it. Lord William Ruſſell was in conſequence committed to the Tower, and after ſome of the Rye-houſe conſpirators had been condemned and executed, and the nation was fully impreſſed with horror of a plot ſuppoſed to be connected throughout with a deſign of aſſaſſination, he was brought to trial in July 1683. A jury of zealous royaliſts was packed for the purpoſe of convicting the priſoner: in the indictment, the noble lord was charged with the treaſonable purpoſe of killing the king, which was made an inference from his being engaged in a plan of inſurrection. "On the whole," ſays Hume, "having deſcribed the nature of the evidence produced on the trial, it was undoubtedly proved, that the inſurrection had been deliberated on by the priſoner, and fully reſolved; the ſurpriſal of the guards deliberated on, but not fully reſolved, and that an aſſaſſination had not been once mentioned or imagined by him. So far the matter of fact ſeems certain: but ſtill, with regard to the law, there remained a difficulty, and that an important one. The Engliſh laws of treaſon, both in the manner of defining that crime, and in the proof required, are the mildeſt and moſt indulgent, and conſequently the moſt equitable, that are any where to be found. The two chief ſpecies of treaſon contained in the ſtatute of Edw. III. are the compaſſing and intending of the king's death, and the actually laying of war againſt him; and by the law of Mary, the crime muſt be proved by the concurring teſtimony of two witneſſes, to ſome overt act, tending to theſe purpoſes. But the lawyers, partly deſirous of paying court to the ſovereign, partly convinced of ill conſequences which might attend ſuch narrow limitations, had introduced a greater latitude, both in the proof and definition of the crime. It was not required that the two witneſſes ſhould teſtify the ſame preciſe overt act. It was ſufficient that they both teſtified ſome overt act of the ſame treaſon; and though this evaſion may ſeem a ſubtilty, it had long prevailed in the courts of judicature, and had at laſt been ſolemnly fixed by parliament at the trial of lord Strafford. The lawyers had uſed the ſame freedom with the law of Edward III. They had obſerved, that, by that ſtatute, if a man ſhould enter into a conſpiracy for a rebellion, ſhould even fix a correſpondence with foreign powers for that purpoſe, ſhould provide arms and money, yet, if he were detected, and no rebellion enſued, he could not be tried for treaſon. To prevent this inconvenience, which it had been better to remedy by a new law, they had commonly laid their indictment for intending the death of the king, and produced the intention of rebellion as a proof of that other intention. But though this form of indictment and trial was very frequent, and many perſons had been convicted and executed upon it, it was unqueſtionably irregular, and plainly confounded, by a ſophiſm, two ſpecies of treaſon, which the ſtatute not only had diſtinguiſhed, but meant accurately to diſtinguiſh. What made this refinement more exceptionable was, that a law had paſſed ſoon after the Reſtoration; in which the conſulting or the intending of a rebellion was, during Charles's life-time, declared treaſon, and it was required, that the proſecution ſhould be commenced within ſix months after the crime was committed. Lord Ruſſell's crime fell within the ſtatute of Charles II., but the facts ſworn to by two witneſſes, were beyond the ſix months required by law, and to the other facts there was only a ſingle witneſs, and he an accomplice. Lord Ruſſell perceived this irregularity, and deſired to have the point argued by counſel. The chief juſtice told him, that could not be granted, unleſs he previouſly confeſſed the facts charged upon him." The artificial confounding of two ſpecies of treaſon, though a practice ſupported by many precedents, is the chief, but not the only, hardſhip of which the noble lord had to complain on his trial. His defence was feeble, contenting himſelf with proteſting that he never had entertained any deſign againſt the life of the king. The jury, after a very ſhort deliberation, found the priſoner guilty. Such a victim was too deſirable to the court, and too agreeable to the vindictive feelings of the duke of York, for him to expect the royal mercy; and though his father, whoſe only ſon he now was, offered a large ſum, a hundred thouſand pounds, to the ducheſs of Portſmouth, for his life; and his excellent wife, the daughter of a moſt diſtinguiſhed royaliſt, implored forgiveneſs in the moſt pathetic manner, his doom was irrevocable, and he obtained the remiſſion only of the moſt ignominious part of the ſentence. After his ſentence, he was attended by Tillotſon and Burnet, who, though afterwards favourers of the revolution, now urged upon the noble victim an acquieſcence in the doctrine of non-reſiſtance. This point, however, he was too firm and honeſt to concede, though a declaration to that purpoſe offered the only chance of a pardon. It was not quite creditable to the nobleneſs of his nature, that he ſhould condeſcend, even to ſave his life, to write a petitionary and rather humiliating letter to the duke of York, promiſing to forbear all future oppoſition to him, ſhould his life be ſpared. He alſo wrote a letter to the king, which was not to be delivered to him till after his death; this, though ſubmiſſive, was not at all abject. It is almoſt certain he muſt have taken theſe ſteps in compliance with the ſolicitations of his friends, rather than from the deſire of ſaving his own life; for he refuſed the generous offer of lord Cavendiſh to favour his eſcape, by changing clothes with him in prifon; and he alfo declined the duke of Monmouth's propofal of furrendering himfelf, fhould lord William Ruffell think it might contribute to his fafety. "It will be no advantage to me," he faid, "to have my friends die with me." Conjugal affection was the feeling that clung clofeft to his heart; and when he had taken his laft farewel of his wife, he faid, "The bitternefs of death is now over." He fuffered the fentence of his judges with refignation and compofure. Some of his expreffions imply much good humour in this laft extremity. The day before his execution he was feized with a bleeding at the nofe: "I fhall not now let blood to divert this diftemper," faid he to Burnet, who was prefent; "that will be done to-morrow." A little before the fheriffs conducted him to his carriage, that was to convey him to the fcaffold, he wound up his watch, "Now I have done," faid he, "with time, and henceforth muft think folely of eternity."

The execution was performed July 21ft, not on Tower-hill, the common place of execution for men of high rank, but in Lincoln's-Inn-Fields, in order that the citizens might be humbled by the fpectacle of their once triumphant leader, carried in his coach through the city; a device which, like moft others of the kind, produced an effect contrary to what was intended. The multitude imagined they beheld virtue and liberty fitting by his fide. As he was the moft popular among his own party, fo was he the leaft obnoxious to the oppofite faction; and his melancholy fate united every heart, fenfible of humanity, in a tender compaffion for him. Without the leaft change of countenance, he laid his head on the block, and at two ftrokes it was fevered from his body. He was, at the time of his death, only 42 years of age. To his character for probity, fincerity, and private worth, even the enemies to his public principles bear teftimony. Of his underftanding, bifhop Burnet fays "that he was flow, and of little difcourfe, and had a true judgment, when he confidered things at his own leifure." At Wooburn Abbey is preferved, in gold letters, the fpeech of lord Ruffell to the fheriffs, together with the paper delivered by his lordfhip to them at the place of execution.

Mr. Calamy, in fpeaking of lord Ruffell, fays, "that an age would not repair the lofs to the nation, and whofe name fhould never be mentioned by Englifhmen without fingular refpect." He paffed through and left this world, with as great and general a reputation as any one of the age, and his memory will be had in grateful and everlafting remembrance. Honour and friendfhip attended lord Ruffell beyond the grave. Lord Cavendifh married his eldeft fon to one of the daughters of his deceafed, his *murdered* friend; for fo the deed was defcribed in the act of 1688-9, for reverfing the attainder. The houfe of commons, at the fame time, appointed a committee to examine who were the advifers and promoters of the *murder* of lord Ruffell. In May 1694 his father, the earl of Bedford, was created marquis of Taviftock and duke of Bedford; and the reafons for beftowing thefe honours upon him are in part as follow: "That this was not the leaft, that he was the father to lord Ruffell, the ornament of his age, whofe great merits it was not enough to tranfmit by hiftory to pofterity, but they (the king and queen) were willing to record them in their royal patent, to remain in the family as a monument confecrated to his confummate virtue, whofe name could never be forgotten, fo long as men preferved any efteem for fanctity of manners, greatnefs of mind, and a love to their country, conftant even to death. Therefore, to folace his excellent father for fo great a lofs, to celebrate the memory of fo noble a fon, and to excite his worthy grandfon, the heir of fuch mighty hopes, more cheerfully to emulate and follow the example of his illuftrious father, they entailed this high dignity upon the earl and his pofterity."

Russel, *Lady* Rachel, the worthy wife of the fubject of the foregoing article, diftinguifhed herfelf equally by the affectionate zeal with which fhe ferved her hufband, and by the magnanimity with which fhe bore her lofs, and the reverence fhe cherifhed for his memory. Upon his trial, fhe accompanied him into court; and when he was refufed a counfel, and permitted only to employ an amanuenfis, fhe ftood forth as that affiftant, exciting the fympathy and admiration of all the fpectators. After his death, fhe wrote an affecting letter to the king, afferting that the paper delivered by him to the fheriffs was of his own compofition, and not dictated by any other perfon, as had been fufpected. She was the faithful guardian of her hufband's fame. A few days after the defeat and death of the duke of Monmouth, with whom lord Ruffell had an intimate connection, fhe made ufe of the opportunity for declaring her conviction that his grace's late attempt was a new project, and not at all depending on any former defign, if there was any real one, which, fhe faid, fhe was fatisfied, was no more than her lord admitted, *viz.* talk; and it is poffible that converfation might have proceeded fo far as to confider, if a remedy for fuppofed evils might be fought, how it could be formed. "He had," continues her ladyfhip, "fo juft a foul, fo firm, fo good, that he could not warp from fuch principles that were fo, unlefs mifguided by his underftanding, and that his own and not another's: for I dare fay, as far as he could difcern, he never went into any thing confiderable upon the mere fubmiffion to any one's particular judgment." Lady Ruffell alfo, in the fame affectionate regard to her lord's memory, after the revolution, made ufe of her intereft in favour of his chaplain, Mr. Samuel Johnfon, and was inftrumental in procuring him a penfion. As fhe had promifed her lord to take care of her own life, for the fake of his children, fhe was religioufly mindful in keeping her promife, and continued his widow to the end of her life, which did not happen till Michaelmas day 1723, at the age of 87. Biog. Brit. Hume. Letters of Lady Rachel Ruffell.

Russell, Alexander, a phyfician, who refided feveral years in the Englifh factory at Aleppo, was a native of Edinburgh, and at an early period of his life was devoted by his father to the profeffion of medicine. His education was, of courfe, obtained in his native univerfity; and on coming to London, he was induced to embark for Turkey, and fettled at Aleppo, with the appointment of phyfician to the Englifh factory there. He applied himfelf affiduoufly to the acquifition of the language of the country, and to form an acquaintance with the moft experienced practitioners, in order to learn their modes of practice. But he foon obtained a proud pre-eminence above all the phyficians there, and was confulted by all nations, ranks, and profeffions, by Franks, Greeks, Armenians, Jews, and even Turks themfelves. The pacha of Aleppo particularly diftinguifhed him by his friendfhip, and this intimacy enabled Dr. Ruffell to render the moft important fervices to the factory. The pacha, indeed, did not fail to confult him refpecting every act of importance; and many criminals, who were natives, owed their lives to the doctor's interpofition. The pacha carried his efteem for Dr. Ruffell fo far, that he fent fome valuable prefents to his aged father, faying to him, "I am obliged for your friendfhip and affiftance."

In 1755 Dr. Ruffell publifhed his "Natural Hiftory of Aleppo,"

Aleppo," a valuable and interefting work, containing efpecially fome important obfervations relative to the plague, which have been found ufeful in Europe, and poffibly have tended to check the progrefs of that dreadful fcourge. This work has been tranflated into different European languages.

On his return to England, in 1759, he fixed his refidence in the metropolis, and was elected phyfician to St. Thomas's hofpital, a fituation which he held to the time of his death, which occurred in 1770. The Royal Society were obliged to Dr. Ruffell for feveral valuable communications, and he prefented many important papers to the Medical Society.

Russell, Patrick, brother of the preceding, and his fucceffor as phyfician to the Englifh factory at Aleppo. He publifhed a copious "Treatife on the Plague," having had ample opportunities of treating that peftilential difeafe during the years 1760, 1761, and 1762. In this work, befides a journal of the progrefs, and a medical hiftory of the plague, Dr. P. Ruffell has inferted a full difcuffion of the fubjects of quarantine, lazarettoes, and of the police to be adopted in times of peftilence. He likewife publifhed a new edition of his brother's "Natural Hiftory of Aleppo," upon a very enlarged fcale.

Russell, a myfterious character in London, about the middle of the laft century. He was regarded as a parafite among people of fafhion; feems to have been in Italy, fung in good tafte, and compofed fome very elegant and pleafing Englifh ballads: fuch as, "Can Love be controlled by Advice;" "At fetting Day and rifing Morn;" "Young Daphne, brighteft Creature;" "If Truth can fix thy wavering Mind;" "Soft God of Sleep;" "Sweet were once the Joys I tafted;" "To curb our Will," &c.

Russell, in *Geography*, a county of Virginia, bounded N. by Greenbriar, and S. by Lee county; containing 6816 inhabitants.—Alfo, a townfhip in Hampfhire county, Maffachufetts; 15 miles W. of Springfield; incorporated in 1792, and containing 422 inhabitants.—Alfo, a townfhip in the county of Leeds, Upper Canada, lying to the northward of Kitley.

RUSSELLÆ, Roselle, in *Ancient Geography*, a town of Italy, in Etruria, S.E. of Populonium and Vetulonii, fituated on the right of Umbro, and at a fmall diftance from it. It engaged with fome other towns in fuccouring the Latins againft the Romans, according to the report of Dionyfius Halicarnaffus. Pliny fays, it became a Roman colony. Some veftiges of it appear at Rofelle.

RUSSELLED, in *Rural Economy*, a term fignifying withered or fhrivelled, as an apple.

RUSSELSHEIM, in *Geography*, a town of Heffe-Dermftadt, on the Maine; 6 miles E. of Mentz.

RUSSELVILLE, a town in Logan county, in the fouthern part of Kentucky, in a populous part of the ftate, about 40 miles from Nafhville.

RUSSET, a country word for a dark brown colour.

RUSSEY, Le, in *Geography*, a town of France, in the department of the Doubs, and chief place of a canton, in the diftrict of St. Hippolyte; 9 miles S. of it. The place contains 910, and the canton 5455 inhabitants, on a territory of 240 kiliometres, in 22 communes.

RUSSGANGENUM, in *Natural Hiftory*, a name given by the people of the Eaft Indies to a yellow and brafs-like foffile fubftance, found in many places there; it refembles the marcafites, only that on trial it is found to contain very little fulphur: it is probably an ore of zinc.

RUSSI, in *Geography*, a town of Italy, in the department of the Amona; 8 miles N.E. of Faenza.

RUSSIA comprehends, in its moft general acceptation, the whole Ruffian empire; but in a more limited fenfe, it properly includes thofe principalities and provinces, which for many paft ages, *i. e.* for about 1300 or 1400 years, have been inhabited by Ruffians. In this latter fenfe its divifions are as follow: *viz.* 1. Great Ruffia, to which the name of Ruffia, in the ftricteft import, has been applied, and which comprifes thofe large tracts of country, under different denominations, that have, without interruptions, compofed the Ruffian dominion, fuch as Mofcow, Vladimir, Novgorod, &c. &c. 2. Little Ruffia, comprehending the Ukraine, *i. e.* "the borders," or, in general, the three prefent governments of Kief, Tchernigof, and Novgorod-Sieverfkoi; long feparated from Ruffia, but again united to it in the year 1654. 3. White Ruffia, formerly denoting the prefent government of Smolenfk, to which have been added the two governments of Polotfk and Mohilef, fometimes called the White Ruffian territory. 4. New Ruffia, denoting the large tracts of country near the Ukraine, towards Poland and the Turkifh dominion, *viz.* New Servia and the province of St. Elizabeth, now belonging to the government of Ekaterinoflaf. But the Ruffian empire, in a more extended fenfe, includes not only the countries abovementioned, but other regions, added to it by conquefts and appropriations: fuch as, the kingdom of *Kazan*, the kingdom of *Aftrakhan*, and the vaft country of *Siberia*, which fee refpectively: the provinces on the fhores of the Baltic, captured from the Swedes by Peter I. and for ever incorporated with the Ruffian empire by two treaties of peace, *viz.* Livonia, Efthonia, Finland, and Ingria, or the prefent governments of Riga, Revel, Vyborg, and St. Peterfburg: the countries taken from Poland, now the governments of Polotfk and Mohilef, united to the empire by Catharine II.: the territory annexed by her to Ruffia in the peace concluded with the Turks in 1774: the Krim and the Cuban, or the province of Taurida and the government of Caucafus, united to the empire by that fovereign in 1783: the tributary iflands in the eaftern ocean, now added to Ruffia: the countries that have more recently fubmitted to the Ruffian fupremacy, *viz.* Kartuelia or Kartalinia, &c.: the poffeffions in America, confifting partly of the iflands, and partly of the continent of California, in which the principal eftablifhment is called Donalefk: and fome other countries, incorporated with the empire at various periods, as the Kirghis-Kozaks, of the middle and little horde, who fubmitted themfelves in 1731, and feveral others. From this furvey it appears, that the amplitude of the Ruffian empire is far greater than that of the largeft monarchy in ancient or modern times. Of its extent the emprefs, in 1783, thus expreffes herfelf: "The Ruffian empire is diftinguifhed on the globe by the extent of its territory, which reaches from the eaftern borders of Kamtfchatka to beyond the river Duna, which falls into the Baltic at Riga, comprifing within its limits 165 degrees of longitude; extending from the mouths of the rivers Volga, Kuban, Don, and Dnieper, which fall into the Cafpian, the Palus Mæotis, and the Euxine, as far as the frozen ocean, over 32° of latitude." If we take into the account fome iflands, which the emprefs has not mentioned, the Ruffian empire, fays Mr. Tooke, according to the neweft and beft charts, will be found to extend from about the 43d to the 78th degree of N. latitude, and from the 39th to the 215th degree of longitude, thus including the iflands lying in the eaftern ocean. Without reckoning the iflands, the empire extends in length above 9200 Englifh miles, and in breadth 2400. The writer now cited gives the following comparifon between the Roman empire, at the

the height of its grandeur, with that of Ruſſia. The Roman empire contained about 1,600,000 ſquare miles; or exactly as much as only the European part of Ruſſia. Its greateſt length, from the Euphrates to the weſtern ocean, amounted to 3000 miles, and the greateſt breadth, from the wall of Antoninus to the pillars of Hercules, 2000 miles; but if we take the length of the Ruſſian empire, we ſhall find it to be, from Riga to Anadyrſkoioſtrog, 9684 miles, and thence to the haven of Peter and Paul, in Kamtſchatka, 1750 more. Moreover, the poſſeſſions of the Romans extended ſomewhat ſhort of 32 degrees of latitude; whereas Ruſſia compriſes 35½. The Ruſſian empire received a freſh augmentation at the treaty of peace concluded with the Porte the 29th of December 1791; that is, the whole territory of Ochakof or Otchakov on the Bogue, as far as the Dnieſter, which laſt-mentioned river is now ſettled to be the boundary for ever.

Ruſſia has various frontiers: on the N. and E., omitting the eſtabliſhment on the continent of America, it is bounded by ſeas; on the other ſides, its limits are partly terra firma, partly ſeas, and here and there rivers, *viz.* to the W. Denmark, Sweden, and the Baltic; to the S. Courland, Poland, Turkey, the Euxine and the Caſpian, Perſia, China, and various tribes of almoſt ſavage, nomadic, or uncivilized nations. Other frontiers are fixed by treaty; as, with Denmark, concerning Lapland and Finland, in 1602; with China and the Mongoles in 1727; with Perſia in 1732, the river Terek being in ſome reſpects now regarded as the line of limitation; with Poland by various treaties, finally adjuſted in 1795; with Sweden in 1721 and 1743; with the Turks by ſeveral treaties from 1739 to 1791; with Courland in 1783, which finally ſurrendered its independence in 1796. From Tchutzkaia Zemlia, northwards over Kamtſchatka, the empire borders very nearly on America; being, by the lateſt obſervations, only ſeparated from it by a ſtrait of the ſea, called Behring's or Cook's ſtraits, not more than 175 Engliſh miles in breadth.

With regard to climate and temperature, the Ruſſian empire has been divided into three large regions, *viz.* the region lying above the 60th degree, and extending to the 78th degree of N. latitude; that lying between 50° and 60°; and that lying to the S. of 50° and reaching to 43°. The firſt is the rudeſt and coldeſt, and contains the greater part of the governments of Irkutſk, Tobolſk, and Vologda, the entire governments of Archangel, Olonetz, and Vyborg, with part of thoſe of Perm, Novgorod, and St. Peterſburg. The ſecond region, with regard to fertility, may be called temperate; and it comprehends the governments of St. Peterſburg, Revel, Riga, Polotſk, Mohilef, Smolenſk, Pſcove, Novgorod, Tver, Yaroſlaf, Koſtroma, Viætka, Permia, Kolyvan, a good portion of Irkutſk and Ufa, the governments of Moſcow, Vladimir, Niſhnei-Novgorod, Kazan, Kaluga, Tula, Riazan, Voronetch, Tambof, Penza, Simbirſk, Kurſk, Orel, Novgorod-Sieverſkoi, Tchernigof, and the greater part of Kief, Kharkof, and Saratof. The third region is the hot climate, yielding products, *e. g.* wine and ſilk, which the two former do not: in this lie Taurida, Ekaterinoſlaf, the greater part of Caucaſia, and a part of Kief, Kharkof, Voronetch, Saratof, Kolyvan, and Irkutſk. Mr. Hermann divides the empire more accurately by its climates into four regions; the firſt is the very cold region, from 60° to 78° N. lat., including Vyborg, Olonetz, Archangel, the greater part of Irkutſk, Tobolſk, and Vologda, and a part of Perm, Novgorod, and St. Peterſburg; the ſecond being the cold region from 55° to 60° N. lat., comprehending Revel, Riga, Polotſk, Pſcove, Tver, Moſcow, Yaroſlaf, Vladimir, Koſtroma, Viætka, the greater part of Perm and Kazan, and a part of Irkutſk, Kolyvan, Ufa, Simbirſk, Niſhnei-Novgorod, Kaluga, and Smolenſk: the third and moderate region extends from 50° to 55° N. lat. and includes Mohilef, Tchernigof, Orel, Kurſk, Tula, Tambof, Penza, the greater part of Kief, Kharkof, Voronetch, Riazan, Saratof, Kaluga, Simbirſk, Ufa, Kolyvan, and a part of Irkutſk, Kazan, Niſhnei-Novgorod, and Smolenſk. The fourth or hot region reaches from 43° to 50° N. lat. and contains Taurida, Ekaterinoſlaf, the greater part of Caucaſia, and a part of Kief, Kharkof, Voronetch, Saratof, Ufa, Kolyvan, and Irkutſk. In many diſtricts of the firſt region there is hardly any ſummer; the ſpring has in general much froſt, ſnow, and rain; the winter is always ſevere. In the ſecond region the ſummer is in many parts ſhort, and yet in moſt of them ſo warm and the days ſo long, that the fruits of the earth uſually come to perfect maturity, in a much ſhorter ſpace of time than elſewhere; the winter too, particularly in the governments of Irkutſk, Tobolſk, Perm, Viætka, &c. is for the moſt part very ſevere. In the third region there are very extenſive diſtricts, *e. g.* in the governments of Irkutſk, Kolyvan, and Ufa, where the winter is alſo long and cold, which is chiefly owing to the lofty mountains with which they abound; but the governments in the European diviſion of Ruſſia, lying under this meridian, moſtly enjoy a ſhort and tolerably temperate winter, and a fine warm ſummer. In the fourth region the winter is ſhort, the ſummer warm, often hot, and in many parts very dry.

The whole Ruſſian territory conſiſts at preſent of fifty alike-organized provinces, called governments or viceroyalties. Each government is again divided into ſeveral circles; and ſome of the largeſt are farther diſtributed into diſtricts. In each circle is a circle-town, where the circle-adminiſtration has its ſeat, and one of theſe circle-towns is at the ſame time the government-town, in which the governor-general and the principal officers reſide, and by which the whole government is uſually denominated. Beſides theſe fifty governments, there are two more countries, having a military civil conſtitution, *viz.* the country of the Donſkoy-Kozaks, and the country of the Euxine-Kozaks. (See Cossacks.) The whole number of provinces is therefore fifty-two: and, moreover, the Georgian ſtates Karduelia and Kakhetty, ſeveral petty diſtricts in the parts of Caucaſus, together with the country of the Kirghis-Kozaks, are to be reckoned among the countries under the protection and in the dependance of Ruſſia.

Hiſtory of the Ruſſian Empire.—Although no other European empire has been ſo frequently and ſo well deſcribed in the three laſt centuries by foreign travellers as the Ruſſian; yet neither did any other remain ſo long unknown to the civilized nations of our quarter of the globe. This fact may juſtly excite our ſurprize, if we conſider, that ſo early as the thirteenth century, the adventurers and ambaſſadors, who either viſited for private purpoſes, or were diſpatched by their ſuperiors to the courts and territories of the Tſchingiſkanides, partly took their route through Ruſſia (for inſtance, Carpin and his attendants: ſee Voyage de Jean du Plan Carpin, chap. 1. in the Recueil de Bergeron): that in the ſame century the Hanſe towns eſtabliſhed numerous factories and a flouriſhing commerce, both at Novgorod and Pleſco, and the Teutonic knights had founded a powerful ſtate on the borders of Ruſſia: that about the ſame period the Genoeſe, Venetians, and other Italian republics, occupied with colonies the coaſts of the Euxine, and the rivers that flow into that ſea, or at leaſt navigated them, and from theſe colonies and coaſts carried on an extenſive trade with all the countries far and near: that even long before this, enter-

priſing

prifing Danes and Normanni, for the purpofes either of traffic or depredation, explored the harbours of the White fea, and even the defart fhores of the great northern ocean, abounding in coftly furs: and that finally, Ivan the Threatening, and his fon Vaffilli Ivanovitch, waged frequent wars with the Poles, the Swedes, and the Teutonic knights, and had frequent correfpondence by embaffies, not only with their neighbours, but likewife with diftant princes and populations. Whether the warriors, merchants, and artifts who had a view of Ruffia, neglected to write down their obfervations, or their written remarks were never publifhed; the fact is, that as far down as the commencement of the fixteenth century, the learned of Europe knew much lefs of Ruffia than we at prefent know of New Holland. It is likewife often difficult to difcover from the earlieft writers on Ruffia, when it was they wrote, or when their writings were firft committed to the prefs; and though we fhould happily find out both the one and the other, we are not unfrequently at a lofs, whether to arrange thefe ancient journalifts and geographers according to the time when they wrote, or that in which their works were publifhed.

The firft particular accounts of Ruffia are found in the "Viaggio di Meffer Jofafa Barbaro alla Tana," and in the "Viaggio del magnifico M. Ambrofio Contarini," both in the fecond volume of the "Raccolta" of Ramufio. It is fcarcely probable that thefe travels were printed earlier than the collection of Ramufio, fince they are quoted by no author prior to the middle of the fixteenth century. Barbaro travelled in 1436, as a merchant alla Tana, or to the Crimea, and remained there fixteen years. He fpeaks only in the two laft chapters of Ruffia, and of the Tartarian countries which lay to the fouth and to the eaft of Ruffia; particularly of Citracan, or Aftrachan; and of Cafan, which city he defcribes as the principal mart of the trade in furs, which in his opinion were brought thither from Zagatai and Moxia. Barbaro muft have wrote his journey long after his return from the Crim, as he remarks that the Ruffians had conquered Cafan and Novgorod. Contarini travelled, in 1483, in quality of ambaffador from his republic, through Poland and the Ukraine to the court of Perfia, and returned, in 1487, acrofs the Cafpian, by Aftrachan, and through Ruffia proper. It is curious enough that he fpeaks of a *Roffia baffa* and *alta*, and of a *gran Roffia bianca*. Of Novgorod he fays: "la qual confina quafi con la Francia, et con la Almagna alta."

A great part of the Ruffian empire was anciently inhabited towards the N.E. and N. by a people of Finnifh origin, perhaps defcended from the ancient Scythians. Towards the N.W. were tribes confifting of a motley race of Sauromates and Grecian colonifts; and from them are defcended the modern Lithuanians, Lettovians, Livonians, and Courlanders; as were alfo the ancient Pruffians. The whole fouthern part of Ruffia, even to the Krimea or Crimea, was for fome time inhabited by Goths; and between the Volga, the Don, and mount Caucafus, was a nation defcended from the Medes, called Sauromates, that is, the northern Medes. In procefs of time, when barbarian nations iffued in fwarms from the E., and fome of the different tribes of Goths had, fince the middle of the third century, penetrated into the weftern regions of the Roman empire; fome of the Sauromates were under the neceffity of retiring farther towards the N. and the W. The fame political conftitution which is now prevalent, exifted at that remote period. Each individual of the nation was either mafter or flave. The various tribes which occupied the country derived their appellation from fome river, town, or diftrict; and from the more modern Varagian Roffi, the Ruffians, it is faid, about the year 862, received their name. No country in the globe contains fuch a mixture and diverfity of inhabitants: each diftinct nation having its own language, in fome cafes debafed and corrupted, and retaining, more or lefs, its own religion and manners; while the generality of the main ftems bear in their bodily ftructure, and in the features of their faces, the diftinctive impreffion of their defcent, which neither time nor commixture with other nations has been able altogether to efface.

The aborigines of Ruffia were *Finns* and *Slavonians*, fee each refpectively. Of the Slavonians, who inhabited the country about the Dnieper and the Upper Don, fome, oppreffed by the Bulgarians, fpread themfelves farther northward on the Dnieper, and conftructed Kief, while another colony penetrated up the Volkhof, and laid the foundation of Novgorod. After a dark period of more than 100 years, the Slavonians appear again among the Finns, and at this time the Ruffian ftate received its origin from the Scandinavians or Northmanni. The Slavonian fettlers, both on the Volkhof and the Dnieper, were oppreffed by two hoftile nations, *viz.* the Khazares from the Euxine, and the Varagians, Varingians, or Northmanni from the Baltic. (See KHAZARES and VARAGIANS.) In the ninth century, the Varagians conquered from the Ruffians, who were a kindred north-gothic people, firft mentioned in the year 839, and belonging to the Varagian race, and of courfe originally Normanns or Scandinavians, the modern diftricts of Revel, St. Peterfburg, and Archangel, and fubjected the Slavonians, Krivitfches, Tfchudes, Veffenians and Meræenes, various tribes, partly Slavonians and partly Finns, to a tribute. The Ruffians retired to Finland and Karelia; but at length the Slavonians, aided by the other tribes juft mentioned, expelled the Varagians, and formed themfelves at the lake Ilmen, near Novgorod, into a federative democratical republic. After experience of the imperfection of this conftitution, and finding it productive of internal difturbances, the five united nations refolved to call in the Ruffians for the purpofe of reftoring tranquillity, and affording them protection; and with this view they voluntarily offered to refign the fovereignty to them. The Ruffian prince Rurik, with his brothers Sineus and Truvor, accepted the invitation. Rurik, having collected together all his people, came in the year 862 to the mouth of the Volkhof, and affumed the government of the newly erected ftate; which, from its firft formation, confifted of fix feveral tribes, *viz.* Slavonian, Finnifh, and Varagian, extending over the regions of the prefent governments of Riga, Revel, Polotfk, Pfcove, Vyborg, St. Peterfburg, Novgorod, Smolenfk, Olonetz, Archangel, Vladimir, Yaroflaf, Koftroma, and Vologda. Whilft the Varagians, under Rurik, compofed the predominant part, the Slavonians and Ruffians were foon blended into one nation; and though the name of the latter was transferred to the whole nation, yet the Slavonian language and manners retained the fuperiority, that people being confidered as the moft prevalent, both with regard to number and civilization. Rurik, fixing his refidence at Staraya Ladoga, affumed the title of grand-prince; and when both his brothers died childlefs, he reunited their territories with his own, and in the fourth year of his reign, removed his refidence from Old Ladoga to Novgorod, which from that time became the capital of the Ruffian monarchy. Soon after the elevation and eftablifhment of Rurik, the Slavonians on the Dnieper, being oppreffed by the Khazares, befought Rurik to give them a prince of his own race; and he accordingly fent his ftep-fon Ofkold, who fubdued the Khazares, and founded at Kief the fecond Slavo-Ruffian dominion, dependent on the Novgorodian empire. Oleg, the immediate successor of Rurik, united Kief with the Russian territory, and appointed this second Slavonian family seat to be his residence and the capital of the country. Under the following reigns, the power of the empire rapidly increased. Russian armies appeared before the gates of Constantinople; many nations were rendered tributary; the Russians carried on a regular commerce to the coasts of the Euxine; they built cities, and not only embellished but gave laws to such as already existed. On the death of Vladimir the Great, in the year 1015, who embraced the Christian religion, and introduced it into Russia, the progress of the nation was checked by the partition of its territory among his twelve sons. This was followed by a variety of sanguinary contentions, till at length there arose a third state, *viz.* White Russia, or Vladimir. Of these three states, *viz.* Vladimir, Kief, and Novgorod, the principal was Vladimir, and Susdal was its capital. This distinction afterwards devolved on Vladimir; and finally on Moscow, a city which was founded in the year 1147, by George I. In the year 1237, the Mongoles and Tartars, who under their khan Tschingis had united themselves into a powerful state at the beginning of the 13th century, and subjected the greater part of Asia, put themselves under the conduct of his descendant Batu, khan of Kaptschak, and fell upon Southern Russia, where they founded a formal sovereignty. The Tartars, having effected their conquest, numbered the people in the principalities, imposed on them a heavy tribute, and thus riveted the oppressive yoke of foreign sovereignty which the Russians endured for upwards of 200 years.

Whoever has studied the Russian history with attention, must naturally be surprized that the nation, in consequence of the numerous and formidable revolutions which it underwent, was not utterly demolished or dispersed, their dominion entirely subverted, and their very name, as has been the case with so many other nations, totally effaced. The Russian nation, however, not only weathered out all the storms, which so frequently menaced its dissolution, but rose, as if refreshed with juvenile vigour, extended its gigantic arms on every side, vanquished all its hostile neighbours, and at a very early period of its greatness crossed the mountains, which for immemorial ages had been styled by their inhabitants the girdle of the globe, and there, as in a new world, progressively made conquests, no less for geography and natural history, than for their immense domain.

In 1462, Ivan Vassillievitch I. ascended the throne of Moscow, and after a reign of fourteen years, refused obedience to the Tartars, and by a series of victories, gained possession of the Tartarian kingdom of Kazan, and reduced its sovereign to a state of tributary vassalage. In 1477, the republic of Novgorod submitted to the force of his arms, and a similar fate befel the principalities of Pscove and Tver. Lithuania lost a considerable part of its territory. The princes of Severia voluntarily surrendered; and the increasing power of Ivan was withstood only by the Teutonic order in Livonia. Under his successor Kazan was lost for a short time; but Smolensk was incorporated into the Russian state. Ivan Vassilievitch II. at length burst the last shackles of the Mongole-Tartarian sovereignty. The entire conquest of Kazan was completed in seven years, the capital of the kingdom surrendering in 1552. Two years afterwards, Astrachan became a Russian province: and Ivan advanced into Caucasus, and subdued the whole Kabardey. Although the Ottoman Turks, aided by the Tartars of the Krim, ravaged the capital of Russia, this disaster was amply counterbalanced by the channel opened for maritime commerce by way of Archangel, and by the conquest of Siberia, events which date their commencement from the reign of Ivan, but which owed their completion to his successors. As others state these events, Ivan III., surnamed the Threatening, was the first who, towards the latter end of the fifteenth century, began to demolish this baneful oligarchy, and to throw off the yoke of the Tartars. The most considerable annexation he procured to his empire consisted in the reduction of Novgorod, and the northern provinces, which ages ago had been conquered by the Novgorodians, and retained under their dominion. His son and his grandson Vassillie Ivanovitch and Ivan Vassillievitch the Terrible, completed the grand project, which the father and grandfather had left for their successors. Under the reign of Vassillie Ivanovitch, baron Herberstein laid down the first perspicuous geography of the Russian empire, according to which we shall describe the boundaries of it towards the latter end of the fifteenth, and the commencement of the sixteenth centuries.

Herberstein uses the term Russia in a two-fold acceptation. By the one he understands all those countries that were inhabited by Russians; and in this larger sense he even comprehends the king of Poland and the grand duke of Lithuania among the Russian princes, since both of them possessed territories that were occupied by Russians. In the more contracted import, that author comprises simply the countries subject to the grand prince of Moscow. In the description of this proper Russia, taking his departure from Moscow, he first mentions the eastern and southern, and then the western and northern provinces.

Eastward, therefore, of the province of Moscow, the grand prince of Russia possessed the provinces of Vladimir, Nishnei-Novgorod, and Riazan; the river Sura forming the boundary between the Russian and Casanian territories. (Sura fluvius Mosci, et Casanensis regis dominium dividit, page 65.) Towards the south-east, during the reign of Ivan III. the Russian confines reached only about a day's journey from the city of Riazan; for Contarini arrived at the city Riazan the day after he entered the Russian territory. (Ramus. ii. 122. fol. b.) To the south, Tula was the last Russian city towards the Tartarian steppes (Herberst. p. 66. Tulla—est ultimum oppidum ad campestria deserta); and somewhat farther to the west was Kaluga, the fortified city, where the grand prince annually assembled his troops against the incursions of the Crimean Tartars. (Ibid. p. 68.) Towards the south-west, Vassillie Ivanovitch first conquered the principality of Novgorod Sieverskoi, which at that time comprehended also Tchernigof, and a part of the present government of Orel. (Ibid. 68—70.) Towards the west, Smolensk, which province Vassillie Ivanovitch, in 1514, severed from Poland or Lithuania, Pscove, and a part of the present Petersburg government, to the mouth of the Narova, formed the boundary. To the north of Moscow lay, lastly, the provinces Tver, Great Novgorod, Yaroslaf, Kostroma, and the provinces formerly subject to the Novgorodians, namely, Vologda, Ustiug, Viætka, Perm, and Dvina.

Reckoning the principalities specified by Herberstein to the division of the governments and viceroyalties made by Catharine II. then the empire subject to the grand prince Vassillie Ivanovitch, excepting Moscow and a part of the Petersburg government, comprised only those of Pscove, Tver, Novgorod, Archangel, Vologda, Yaroslaf, Kostroma, Viætka, Perm, Smolensk, Tchernigof, Novgorod Sieverskoi, Orel, Kaluga, Tula, Riazan, Vladimir, and Nishnei-Novgorod. Short of the present number of viceroyalties by those of Petersburg almost entirely, then those of Viborg, Revel, Riga, Olonetz, at least in part, Tobolsk, Polotsk, Mohilef, Kharkof, Kursk, Kurfk, Kazan, Simbirfk, Penza, Tambof, Voronetz, Saratof, Ufa, Kolyvan, Irkutfk, Minfk, Ifiaflaf, Brazlau, Kief, Ekaterinoflaf, Caucafus, and Taurida, together with the country of the Don Coffacks, and the provinces which fell to Ruffia on the laft partition of Poland.

Ivan the Terrible continued the aggrandizement of the empire, of which his father and grandfather had laid the foundation, with equal zeal and fuccefs. He conquered, in 1552 and 1554, Kazan and Aftrachan, and united the countries dependent on thofe cities for ever with his empire. It was during his reign that a band of Don Coffacks, whom he had driven as robbers from the inferior Volga, forced their paffage acrofs the Uralian mountains, overturned the dominion of the Tartars on the Tobol and Irtifch, and, unknown to the grand prince, conquered the north-weftern diftricts of Siberia to the laft-mentioned river. Though it cannot be faid that the Ruffian tzars had neglected to make conquefts in the northern Afia; it may, neverthelefs, be affirmed, in a certain fenfe, that the conqueft of Siberia was completed of itfelf in nearly the fame manner in which it was begun. The court of Mofcow undoubtedly liftened with encouraging atttention to the advantageous propofals that were made refpecting the extenfion and fortification of the Siberian diftricts, and royally rewarded the perfons who, by their prudence and bravery, had deferved fo well of the empire. The tzar fent, or at leaft agreed to the reinforcements that were wanted for the farther profecution, or the defence of the acquifitions, now that they were made. Thefe reinforcements were, however, generally fo fmall, that in Mofcow, much lefs abroad, they were fcarcely remarked. The hopes of obtaining riches either by a fortunate chace, or by extortions practifed on the unarmed tribes that were found inhabiting the fteppes and wilds of Siberia, annually allured thoufands of bold hunters and warriors into thofe parts; and thefe adventurers, fpurred on by their infatiable avarice and unbounded licentioufnefs, were perpetually exploring new regions and populations, which were not yet exhaufted and plundered of their all. Thus it happened, that about a century after Yermak had deftroyed the empire of the Tartars upon the Irtifch, almoft the whole of that prodigious tract of country was fubdued at a far lefs expence of blood and treafure than the fmalleft of the weftern and northern provinces which had hitherto been conquered had coft, or, as was afterwards feen, thofe which then remained to be fubdued.

Feodor, the fon and immediate fucceffor of Ivan the Terrible, abandoned his claim to Efthonia, and in return forced from Sweden in 1594, the ceffion of Ingria and Karelia. By Feodor's death, in 1598, the dynafty of Rurik became extinct; and during the fubfequent interregnum, many pretenders, under the name of Demetrius, involved the empire in confufion, till, in 1613, Mikhaila Romanof, or Michael Feodorowitz, of the dynafty of Romanow, defcended in the female line from Ivan IV. was elected fovereign, and by large facrifices purchafed the repofe of his empire. To the Swedes he was obliged to relinquifh Ingria and Karelia, and to the Poles, Smolenfk, Severia, and Tchernigof, and to make a formal renunciation of all claims upon Livonia, Efthonia, and Courland. From that period to the prefent day, Ruffia has not only been gaining its ancient poffeffions, but fo far extending and enlarging them, that the prefent circumference of the empire has no parallel in the hiftory of the world. Alexey, or Alexis, the fon and fucceffor of Michael, not only reconquered the countries ceded by his father to the Poles, but alfo reduced Kief and the Ukraine on the E. fide of the Dnieper, in 1655, to a re-union with the parent ftate of the Slavo-Ruffian nation. His fon, Peter I., "the creator of modern Ruffia," acquired to his empire in 1721, by a twenty years' war with Sweden, the provinces on the fhores of the Baltic, which had occafioned bloody contentions among the northern powers for many centuries: Livonia, Efthonia, Ingria, and a part of Kexholm and Karelia, were fubjected to the Ruffian fceptre, thus adding to the Ruffian empire great advantages for commerce, and a refpectable rank among the principal European powers. Catharine II. aggrandized Ruffia both within and without, by a reform of its government, and by feveral fuccefsful wars. She obtained from the Porte, in 1774, the poffeffion of the city of Azof, with its territory; and for the fecurity of the Ruffian navigation on the Euxine, the forts of Kinburn, Kertfch, and Yenicaly in the peninfula of the Krimea. In 1783 the whole province became, by treaty, a Ruffian government; and recovered its ancient name of the Tauridan Cherfonefe. Ruffia alfo, by the fame convention, enlarged her borders to the fouth by the Kuban, where at prefent the Caucafian mountains form the boundary of the Ruffian dominion. Afterwards the Porte was compelled to furrender a confiderable tract of country on the fhores of the Euxine, between the Bogue and the Dniefter. In the difgraceful partition of Poland, Catharine obtained for her fhare, in 1773, the four Lithuanian voivodefhips of Smolenfk, Vitepfk, Mftiflaf, and Polifh Livonia, with a part of the voivodefhips of Polotfk and Minfk. An unprofperous war terminated in 1793, with the lofs of the fertile provinces of the Leffer Poland and Lithuania; and at length the capital of the kingdom fell into the hands of the Ruffians; its political exiftence was annihilated, and in 1796 the laft veftiges of it were loft in the confines of the bordering ftates. One confequence of the annihilation of Poland was the acquifition of the duchies of Courland and Semigallia, including the circle of Pilten, which, on the diffolution of their feudal connection with the republic, by a refolution of the ftates of the country, fubmitted themfelves unconditionally in 1795 to the fceptre of the emprefs.

Catharine extended her territory, by the mild authority of her laws, and the methods of civilization which fhe adopted, as well as by her conquefts and treaties. Accordingly the tzar of Kartuelia and Kakhetty put himfelf under the protection of the Ruffian empire, by acknowledging, in 1783, the fupremacy of its monarch. She alfo invited people from all countries to fettle in her dominions, and thus eftablifhed numerous colonies. She reduced a multitude of tributary nations dwelling in the interior of Siberia to fubmit to her laws. She fet on foot and encouraged feveral voyages of difcovery, which obtained for the Ruffian empire a new fovereignty in the eaftern ocean, and on the weftern coaft of America.

The brilliant conquefts of Catharine may, indeed, immortalize her fame as a conqueror; but they alone will never render the memory of that accomplifhed and fagacious monarch beloved and bleffed. Cordial affection and admiration are the proper tribute both of contemporaries and pofterity, due only to her as the wife and benign legiflatrix, inftructrefs, and patronefs of her numerous populations and countries. Thoufands of perfons, to whofe judgment even upright and excellent fovereigns cannot be indifferent, lament at prefent, and will lament to lateft ages, that the emotions of affection and admiration, fo congenial to the heart with which the exalted legiflatrix, inftructrefs, and patronefs of the nations obedient to the Ruffian fceptre has infpired, and ever will infpire them, are painfully difturbed

turbed and abated, either by the recollection of the blood which one half of her conquefts coft, or the maxims that were followed in obtaining poffeffion of the other.

Refearches refpecting the extent and dimenfions of countries would be of far greater value than can at prefent be allowed them, if the internal ftrength of empires increafed in equal ratio with their extenfion, or the real happinefs of their inhabitants with both. Ruffia affords the moft convincing proof that this is not the cafe. No European nation ever ruled over countries of fuch vaft extent as the Ruffian; and yet there have been, and ftill are in Europe, feveral nations exceeding the Ruffian in population, or at leaft in power and well-being. The ftatements of the magnitude of the Ruffian empire lofe greatly of their intereft by differing fo widely from each other. Le Clerc gives to the Ruffian empire a fuperficial content of 949,375 leagues, and cenfures the hiftorian l'Evêque for having erred in his ftatement by at leaft 424,375 leagues. The German geographers have not fo great a difcrepancy in their account as the French. In the mean time, between thofe who fet it down at the leaft, and thofe who affign to it the greateft number, there is a prodigious interval, an interval which Germany and France together could not fill up. We mean France before the revolution. Three hundred thoufand fquare geographic miles compofe the leaft, three hundred and thirty thoufand the greateft extenfion which German authors have affigned to the Ruffian empire.

Of thofe tribes called Kozaks or Coffacks, which are of Ruffian origin, we have given a brief account under the article COSSACKS. Of the three Slavonian nations, properly fo called, that are inhabitants of the Ruffian empire, next to the principal nation, the *Poles* are the moft numerous. Thefe, it is faid, at the fame time with the Ruffian Slavi, and on the fame occafion, came from the Danube to the Viftula. Their ftate, now nearly extinct, was probably founded in the ninth century; and they fprung from the fame ftock with the Ruffians. According to the prefent ftate of the Ruffian empire, the Poles form a very confiderable part of the aggregate population. They may be found, in an immenfe multitude, in the governments of Polotfk, Mohilef, Minfk, Brazlau, Vofnefenfk, Podolia, Volhynia, Vilna, and Slonimfk; and in fmaller numbers, as colonifts, in the circle of Selenghinfk, on the Irtifch, and in various other parts of the empire. The third Slavonian nation within the borders of Ruffia is compofed of the people called *Servians* or *Serbes*. (See SERVIANS.) Befides thofe tribes which we have already enumerated, there are two others in the Ruffian empire, who are fuppofed to be related to the Slavi: thefe are the Lithuanians and the Lettifh. (See LITHUANIA and LETTES.) For an account of the *Kalmucks*, *Mandfhures*, *Mongoles*, and *Tartars*, as compofing primitive ftocks of the nations dwelling in Ruffia; fee thefe feveral articles refpectively. In the Ruffian empire there are alfo fome nations whofe origin is utterly uncertain. Mr. Tooke reduces them to two claffes, one comprifing the *Samoyedian*, and the other the eaftern *Siberian* nations. (See SAMOYEDES and SIBERIA.) Of the European nations, fome bodies of which are difperfed through the Ruffian empire, the moft numerous are the German. In the governments of Riga, Revel, and Courland, they form the moft confiderable, though not the moft numerous, part of the inhabitants. The Germans refiding in the government of Riga amount, according to the lateft enumeration, to 30,000, and thofe in that of Revel to 15,000; and in Courland they are thought to be ftill more numerous. In Mofcow and St. Peterfburg they live by thoufands; in the latter alone they are known to be upwards of 17,000. As colonifts, properly fo called, many thoufand German families came, in 1763, into the governments of St. Peterfburg, Saratof, Voronetch, and Tchernigof, as fettlers, the number of whom, fince the year 1783, is much increafed by new fettlements in the government of Ekaterinoflaf, and in the province of Taurida. All thefe, and the multitude of fuch as live feparately about the empire, taken together, may, as Mr. Tooke fuggefts, probably far exceed 100,000. Of the other European nations, there are only detached colonies, efpecially in the large towns. In the governments of Vyborg and Revel, and in fome of the iflands of the Baltic, there are Swedes, but not amounting to a very confiderable number. The iflands Vorms and Rugen, in the Baltic, are partly inhabited by Danes, but they are moft numerous in Mofcow and St. Peterfburg, and fome of the large towns. In moft of the fea-ports there are Englifhmen, who make no long ftay, but return to their native country as foon as their affairs permit. French and Italians are alfo difperfed over the whole empire. In Little Ruffia, at Nefhin, in the government of Tchernigof, in that of Ekaterinoflaf, and in Taurida, the Greeks form fome refpectable colonies. In the government of Ekaterinoflaf there are alfo Albanians, Moldavians, Valakhians, and Arnauts, though their number is not great. The Ottoman Turks are, in a great degree, difperfed; but they are found together in fmall numbers at Orenburg, in the former Otchakof fteppe, and in fome other places. In the diftricts of Aftrachan and Orenburg there are many Perfians, and on the Kamma there is a colony of Perfians and Arabs. The Armenians are numerous in the towns of Orenburg, Kitzliar, Mofdok, St. Peterfburg, and Mofcow; but in the governments of Caucafus and Ekaterinoflaf they compofe a colony confifting of fome thoufands. The town Nachitfchevan, on the Don, is almoft wholly inhabited by them. In Aftrachan and Kitzliar are fettlements of Indians. The Jews are numerous in fome of the provinces, particularly thofe of Poland, now annexed to the Ruffian empire, and in Taurida, where they are partly fixed as ancient inhabitants. Gypfies are found ftrolling in large companies in the provinces both of Great and Little Ruffia. Upon the whole, Mr. Tooke obferves, that the inhabitants of the Ruffian empire form at leaft 80 diftinct nations, differing effentially in lineage, and alfo in manners and language.

Climate, Weather, and natural Qualities of the Soil of Ruffia.—As to the *foil* as well as the *climate*, there is a great diverfity in the different provinces of the Ruffian empire. Some tracts of land in Great and Little Ruffia, in the provinces bordering on the Baltic, and many others, are kept in conftant cultivation and tillage. In other diftricts, *e. g.* in Little Ruffia, about the Don, &c. the land is only cultivated occafionally; and again in other parts of the empire, lands fit for agriculture are left wholly unemployed, for want of labourers. The quality of the foil is very different in different tracts; in Livonia and Efthonia, good fields yield 8, 10, and 12-fold, and, in fome cafes, 16, or more than 20-fold; but in different ground about 3. The harvefts about the Don are commonly 10-fold; but towards Tomfk, on the Tfhumufh, and in the whole region between the Oby and the Tom, many fields afford an increafe of 25 to 30-fold; and at Krafnoiarfk a crop has not been known to fail: of winter corn they reap 8, of barley 12, and of oats 20-fold. In Little Ruffia, on the Don, and in many other places, the foil is fufficiently fertile, without manure. This is alfo the cafe in a great part of Siberia, *e. g.* on the Samara; on the Ufa, in the country of the Bafhkirs; here and there in the Baraba; and alfo on the Kamma, in the government of Ifetfk; on the Oby near Barnaul, at Krafnoiarfk, and on the Selenga.

All travellers agree in praiſing the ſalubrity of the atmoſphere in Ruſſia, and the abſence or infrequency of ſeveral diſeaſes with which the other countries of Europe are viſited, ariſing from it. Herberſtein and his followers, from the general healthineſs of the Ruſſian climate, have explained this remarkable fact: that, from time immemorial, the plague has never communicated itſelf from the ſources of the Don to the north and eaſt; which opinion, however, has been confuted, even in ancient times, by ſeveral dreadful peſtilences, and likewiſe in the laſt century, by the formidable plague which, in 1770—1772, raged in the city and territory of Moſcow. Since the diſtricts of the Lower Don and Dnieper, and thoſe between the Dnieper and the Dnieſter, have been incorporated with the Ruſſian empire; the country of the Don Coſſacks, and what was formerly called Poliſh Ukraine, form an exception to the juſtly boaſted ſalubrity of the climate of European Ruſſia. Almoſt every year thouſands of perſons are carried off by all kinds of ardent and putrid fevers, dyſenteries, inflammations of the cheſt, pleuriſies, &c. from July to the beginning of winter, eſpecially in thoſe parts which are ſurrounded with fetid moraſſes, or have no other than ſtagnant and putreſcent water.

While, upon the whole, they extol the ſalubrity of the Ruſſian climate, they, in general, complain of the intenſe cold of the winter, and the equally exceſſive heat of the ſummer, which, in the northern and central Ruſſia, very often prove deſtructive to men and beaſts, no leſs than to the fruits of the earth. Almoſt all travellers adduce the ſame allegations, or inſtances of the inſufferable heats and froſts of the Ruſſian empire. The winter, ſay Herberſtein and his followers, laſts from ſix to eight months. During that ſeaſon, all the rivers and lakes are covered with ell-thick ice, and the ground with ell-deep ſnow. Where the ground is not covered, it is rent in wide and deep chaps by the winter cold, as in the milder parts of Europe by long continued ſummer drought and heat. In the coldeſt days, on firſt going out of the warm apartments into the open air, the breath is taken away, or contracted almoſt to ſuffocation. Spittle ejected is converted into ice before it reaches the earth; and if we touch metal with moiſt hands, the ſkin is left adheſive to it, as though the metal were glowing hot, and the ſame ſenſation is experienced from the contact. With the utmoſt precaution it nevertheleſs frequently happens, that thoſe who take only a ſhort walk, in a few minutes have their noſe, ears, or fingers frozen. Men and cattle bringing proviſions to town are often frozen to death. Ravenous and other birds fall dead to the ground, and fruit-trees are riven by the piercing froſt. It is affirmed by Gœteeris, pp. 88, 89, that it ſometimes happens that fleſh and fiſh, which have been boiling and roaſting more than an hour, on being cut up on table, were ſtill frozen within. The ſame author relates that the beards of himſelf and others were hard frozen to the bed-clothes while aſleep. The greateſt advantage ariſing from long and ſevere winters in Ruſſia is this; that it levels all roads, and opens them in every direction, ſo that travelling from one place to another is incredibly rapid and cheap; therefore, even in ancient times, when many canals were not yet dug, many roads and bridges not conſtructed, and many ſwamps not drained, the winter, ſtill more than at preſent, was the proper ſeaſon for commerce and the tranſport of commodities. Whereas, no ſooner has the vernal ſun diſſolved the incruſtation of the waters and the land, but at once the rivers and ſtreams overflow their banks, converting the lower plains and vallies into lakes or moraſſes. Within a few days after the ſnow has diſappeared, the foreſts and trees are clothed with beautiful foliage, and the ploughed lands, meads, and paſture-grounds, with the moſt luxuriant corn and herbage, which, owing to the humidity of the ſoil, and the rapidly increaſing ardours, ſhoot upwards with an almoſt viſible growth. The times of ſowing and reaping, therefore, border on each other in Ruſſia much nearer than in other European countries. Violent rains, boiſterous winds, and continued fogs, are more frequent than thunder-ſtorms, as immoderate, or late froſts, are oftener injurious than long droughts. Sometimes, however, Ruſſia experiences ſuch hot and dry ſummers, that fields of ſtanding corn and foreſts take fire, ſo that entire provinces are filled with noxious ſmoke, and in ſome ſort darkened by it. Among the principal annoyances of the hot ſeaſons, are the innumerable ſwarms of muſquitos, from which no reſt is to be had night or day, and the cold nights that not unfrequently ſucceed to ſultry days.

Ruſſia being generally a level country, or at moſt only riſing to moderate hills, it is ſomewhat curious that, though deſtitute of mountains, it contains more foreſts, lakes, and rivers, more brooks and running ſprings, than any other territory in Europe.

The north-eaſtern provinces, from the Volga to the Ural, are deſcribed by former travellers as a country for the moſt part covered with inexplorable foreſts, and that even where it is cultivated, it ſtrikes the eye as having been not very long ſince clothed with wood. Herberſtein, p. 61, ſpeaks thus even of the province of Moſcow: "Totam porro regionem non ita diu admodum ſylvoſam fuiſſe, ex magnis arborum truncis, qui etiamnum extant, apparet." "Il eſt vrai," ſays Miége, "qu'il eſt tellement plein de forêts, que dans l'éſpace de 500 lieuës, que nous fimes à travers ce pays là, nous en eumes toujours en vue, quoique ce fut la partie la mieux peuplée du pays." Ruſſia is, even at preſent, far more woody than any other European countries. The Volchonſkoi foreſt, through which the road lies from Viæſma to Moſcow, extends on all ſides to unknown diſtances; and in this foreſt it is ſaid, that, even in the laſt century, numerous colonies were diſcovered, which, from their origin, had been utterly unknown, not only to the government, but even to the neareſt inhabitants. Of ſuch colonies ſeveral may probably ſtill exiſt in the prodigious foreſts with which the diſtricts of Olonetz, Archangel, Perm, and other northern diſtricts are covered. Even the road between Moſcow and Peterſburg runs moſtly through an uninterrupted ſucceſſion of woodland, in which villages are rarely ſeen. The foreſts of Ruſſia conſiſt chiefly of cedars, pines, firs, linden, and birch; and the ſhores of the Volga, the Occa, the Don and its tributary rivers, are adorned with vaſt foreſts of oak, from which the ſhip-timber is conveyed to the ports of the Baltic, and to the wharfs of the Don and the Euxine. The regions between the inferior Volga, between the Don and Dneiper and Dnieſter, have fewer or even no woods at all, and the inhabitants are obliged, in many places, to dreſs their victuals with dried cow-dung.

It would be in vain to attempt at particularizing the lakes, pools, and marſhes, the rivers, brooks, and ſprings which are ſaid by the ancient travellers to be innumerable even to the inhabitants themſelves. Thoſe who came from Poland, or Livonia, repreſent travelling through Ruſſia as extremely perilous, not only on account of wolves and robbers, but from the badneſs of the roads, and the miſerable ſtate of the bridges. When people of quality were going a journey, orders were previouſly ſent to the country-folks of the parts adjacent, to make the roads and bridges in ſome degree paſſable. The high roads are now, in many parts of Ruſſia, as fine as in other European countries. If the wooden bridges are in ſome places badly maintained, and from the defect of here or there a balk are inconvenient and troubleſome to the traveller; they do not, however, ſo often endanger his neck. The roads are at leaſt ſufficiently wide, and every where provided

vided with verst-posts. See Coxe's Travels, vol. i. where the road between Petersburg and Moscow is described.

Those who have gone from Archangel up the Dwina and the Yug by ship, and then generally in sledges from Vologda to Moscow, unanimously affirm, that nowhere is more convenient and pleasant travelling than in Russia; the eye being incessantly delighted by the alternation of magnificent forests, rich pastures and corn-fields, but principally by the inexpressible abundance of running waters. (Fletcher, pp. 414, 415.) This latter commendation is, however, more fitly applicable to the northern than to the midland and southern parts of Russia, since in these the rivers have a slow current, and in summer are nearly stagnant; so that from Moscow quite to the Crimea scarcely any other than bad or indifferent spring-water is found. Suyef, p. 7.

On no topic are travellers more agreed, than in extolling the fertility of most of the Russian provinces. The soil, they inform us, consists generally of a black, fat mould, which produces all kinds of corn and grain, orchard fruits and garden vegetables, as also hemp and flax, in the greatest abundance; and, in many places, even without needing manure. The meadows and pasture-grounds feed incredible droves and herds both of large and small cattle: the forests are the haunts of an unspeakable quantity of not only the choicest species of game, but likewise of such animals as yield furs, which are every where eagerly sought after: the lakes, ponds, rivers, and brooks, in short, nourish a far greater variety of the most delicious kinds of fish, than all the other countries of our quarter of the globe taken together.

With respect to fertility of soil, the preference is generally given to the province of Vladimir, or somewhat rather, perhaps, to that of Riazan. The soil is, in the former of these provinces, of such fecundity, that not unfrequently from one bushel of sowing a produce of from twenty to thirty bushels is obtained. Still more prolific is the province of Riazan; where, according to report, very often one single grain of wheat will shoot out two or more straws, and they so thick and strongly grown together, that a horse cannot easily break his way through, and growse can with difficulty rise from among them. These provinces likewise produce honey, wax, fish, fowl, and all sorts of game, in the greatest profusion, and of the best quality; even the human inhabitants of them are bolder and more warlike than other Russians. If any one should think proper to put the Ukraine and the country of the Don Cossacks in competition with these two provinces, we have only to allege against it, that, indeed, in many parts of the Ukraine no manure at all is used; because if it were, it would either burn up the farina fecundans of the seed, or only produce enormous straws and foliage, destitute of ears and fruits. The stalks of the Ukraine corn are so tall and thick, that they are more like reed-stems than corn-straws.

Honey and wax are sought for in hollow trees, where the wild bees deposite their treasures, or in trunks of trees excavated for the purpose of serving as hives, which the boors fence with wires, to preserve them from the depredations of the bears. Several authors repeat the story, which Jovius heard of the ambassador Demetrius; that a boor once looking for honey in the forest, fell up to the neck in a hoard of it in a large hollow tree, whence, after passing a couple of days in that sweet situation, he was extricated at last by catching hold of the hind legs of a huge bear.

No country of Europe abounds so much as Russia in fish and game, particularly in the choicest wild-fowl, *viz.* the woodcock, the heath-cock, the pheasant, the partridge, the bustard, the snipe, &c. Cavear was already a principal article of commerce in the 16th century, and was exported by the French, Dutch, and English to Italy and France, having been first brought hither by Capt. Chancellor, in the reign of queen Elizabeth. It is mentioned by Shakspeare in his Hamlet: "Cavear to the multitude." But we must break off. To enter into details of wild and tame animals, of mines and metals, of edible roots and vegetables, of orchard fruits, of flowers and grasses, of wild herbs and berries, of the cheapness of the several necessaries of life, and the gradual increase of their prices, would swell this article beyond all proper bounds. We must, therefore, content ourselves with referring the reader for these and other particulars to the travellers who have given their observations to the public; such as Herberstein, Jovius, Olearius, Petreius, Margaret, Dr. Fletcher, Muller, the two Gmelins, Le Bruyn, Gœteeris, Cook, Korb, Tanner, Kupel, Herrmann, Hammard, Guagnino, Coxe, and more especially our inquisitive and laborious countryman Mr. Tooke; who have all treated not only of the climate, but also of the soil and produce.

It is easily conceivable, that in a country of such vast extent as Russia the climate must be extremely various, and this difference may even be reckoned, in some respects, among its advantages. In several provinces the winter is of long duration, and extremely cold; the short summer is, however, on that account, the hotter. And in these regions, for instance about Kolmogor, Archangel, several districts of Siberia, &c. the alternations of cold and heat are uncommonly rapid and frequent. The agreeable introduction to summer and winter, which we call spring and autumn, is here scarcely known. Amidst the burning heats of summer in these parts, you have frequently to contend with piercing cold. A simple change of the wind is able to produce this sudden alteration. In a place not quite 60° N. lat. it frequently happens that, after a sultry day, towards evening, if the wind veers to the north, such a cold ensues as to render a fur cloak not inconvenient. The formidable severity of the frost makes it necessary to adopt the practice of caulking the windows and covering the outside of the doors of the apartments with a felt made of cow-hair, called by the Russians *voilok*. To the same extremity of frost it is owing, that, in some parts of Russia, they have no orchard fruits.

In general the governments of Moscow, Nishnei-Novgorod, and Kazan, together with Astrachan, the Ukraine and Livonia, are the most temperate parts of the Russian empire. Upon the whole, the climate of Russia is not unfriendly to health and longevity. Proofs of this may be drawn from the unfrequency of diseases among the common people comparatively with other countries, notwithstanding their intemperate manner of life, from the considerable number of aged persons seen in Russia, though there are few physicians, excepting in St. Petersburg and Moscow, which swarm with doctors and surgeons (and where it is remarkable that deaths are earlier), and from the great fertility of the women. The sudden transitions from cold to heat, and *vice versâ*, which are occasionally experienced in Russia, are held unwholesome by many; and it must be confessed, that this is true respecting foreigners, yet only for a few years, till they are enured to these changes. For afterwards, strangers as well as natives, in spite of these vicissitudes, generally enjoy a good state of health in those provinces.

The Russian climate has, moreover, even in those regions where it is very rigorous and cold, its peculiar advantages and comforts, among which are the following: the winter, however rude and austere, is in some respects more pleasant than the winter of countries that boast of equable temperature. From the middle of November till April, nay, in some places from September till May, it scarcely ever rains. The roads are, therefore, in winter not so

 mirey

mirey and the ſtreets not ſo ſloppy as with us. The ſnow generally falls from November to January, or from Auguſt and September to December. Afterwards the ſky is almoſt conſtantly ſerene. It is likewiſe a well-known fact, that in Ruſſia far leſs hardſhip is ſuffered from the cold, than in countries where the climate is incomparably milder: for there proper precautions are taken againſt the cold, becauſe it is known for certain that it will be intenſe.

How comes it then, it will be aſked, that ſo many people are in Ruſſia annually frozen to death? That, for inſtance, in one winter, no fewer than two hundred perſons in Moſcow alone were found to have thus miſerably periſhed? In a country like Ruſſia, it may indeed unfortunately happen that perſons are frozen to death, eſpecially ſuch as have their buſineſs out of doors. Such diſaſters would, however, be very rarely heard of, if the people were more prudent. It is not ſo much the cold, as the brandy which the labouring claſs gulp down in ſuch quantities during the winter, that kills ſo many. From the years 1759 or 1795, no general concluſion can juſtly be drawn. The winter was then, in ſeveral countries, but particularly in Ruſſia, uncommonly ſevere. In ordinary years, the number of theſe caſualties throughout the empire is not ſo conſiderable.

One of the moſt important benefits of the Ruſſian climate is, that in winter (as we have already hinted) the public ways and roads are in excellent order. The quantity of ſnow renders them perfectly level and commodious for travelling. No ſeaſon is, therefore, more ſtudiouſly choſen for that purpoſe than the depth of winter; not only for the ſake of greater expedition, but many of the highways, being laid with balks or trunks of trees in all other parts of the year, are extremely rough and unpleaſant.

Travelling in Ruſſia is performed either with poſt-horſes and *yemſhiks*, or with hired horſes and *iſvoſchiks*. At the poſt ſtations only horſes are to be had; the carriage muſt be the traveller's. The expence of poſting is trifling, in compariſon of what is paid the extra poſt in Germany. When we travel with hired horſes and iſvoſchiks, it is not neceſſary to have one's own carriage. We agree with the iſvoſchik or driver for horſes, carriage, and proviſions for the whole journey, whether fifty, a hundred, or a thouſand verſts. This method of travelling is ſomewhat more tedious than with poſt-horſes, becauſe the ſame horſes being continued throughout, it is neceſſary to ſtop at nights; but it is very cheap. Of theſe iſvoſchiks, in St. Peterſburg alone are at leaſt five thouſand. The greater part of them gain their livelihood by letting out carioles and ſledges for going about the town. Each of them has a number ſtamped on a tin-plate at his back, which is renewed or changed every year. For long journies coaches are rarely uſed, but either *ſchlafwagens* or *kibitkis*. Both are half covered, and made nearly in the ſame form; only the former are better and more commodious than the latter. In both the paſſenger lies upon a bed; and they are ſo conſtructed, that he can eaſily change his poſition either by lying at length or ſitting upright. Both may be raiſed upon either wheels or ſledges, as the ſeaſon requires. Portmanteaus and deep trunks are not ſuitable to theſe carriages; but inſtead of them, flat boxes are placed beneath the bed. *Kozokes*, or ſledges entirely cloſe, having a door and a ſmall pane of glaſs for a window, are likewiſe not uncommon.

The traveller muſt provide himſelf with wine and various other articles of diet for the whole journey; as in all Ruſſia, to the exception of St. Peterſburg, Moſcow, and a few other towns, no regular inns are found, and nothing is to be had upon the road but bread, milk, which often abounds with taracans (a ſpecies of beetle deemed ſacred by the vulgar Ruſſians, believing that they procure a bleſſing to the houſe), wretched quas, and ſtill more wretched brandy. The Ruſſian miles or verſts are in length about one-ſeventh of a German mile, or ſomewhat above three quarters of an Engliſh mile. In ſhort, $104\frac{1}{2}$ verſts are calculated to make one degree of the equator. A Livonian verſt is rather longer than a Ruſſian. In moſt parts, verſt-poſts are ſet up from verſt to verſt; which though by far not ſo handſome as the Saxon and Hanoverian mile-ſtones, yet completely anſwer the ſame purpoſe.

One very beneficial effect of the climate ought not to be omitted, which is, that ſome animals change their colour in the winter. This is particularly obſervable with the hares and ſquirrels; the former turning perfectly white, the latter grey; in Siberia of ſo dark a grey as to border upon black, in the other parts of Ruſſia only light grey. When the hares, however, are ſaid to become white, it is to be underſtood of the generality of the common Ruſſian hares, of the *ſaitzi*, which are ſomewhat ſmaller and not quite ſo well flavoured as the hares of Germany and England. Beyond Moſcow, and in ſome other parts, a larger kind of hares are caught, called *ruſſaki:* theſe retain their hue. It is certain, that this change of colour in ſome animals of Ruſſia is owing to the climate, to the ſeverity of the cold. As heat is known to expand bodies, cold muſt naturally have a contrary effect, and cauſe contraction. This effect is firſt and moſt remarkably perceptible on the ſurface of bodies, which in animals abounds with hair-tubes. Theſe, on becoming contracted, can admit only the fine aqueous particles, and not the earthy parts of the blood. On this, however, depends the colour. They are white or in general brighter, when but few earthy particles can enter theſe hair-tubes. Such animals, therefore, as are not very ſtrongly conſtituted for reſiſting the cold, muſt, in intenſe froſt, after ſhedding their original dark hair, neceſſarily become whiter. That the ſquirrels do not, like the Ruſſian hares, turn white, but only grey, is a proof that theſe animals are ſtronger than the ſaitzi, and probably proceeds from hence, that the colour of the ſquirrel is naturally darker, or at leaſt deeper, than that of the Ruſſian hare. It is no objection, that the Siberian ſquirrel becomes dark grey, bordering upon black. Nothing more can be deduced from thence, than that theſe creatures are of an incomparably more robuſt and hardy nature than the Ruſſian ſquirrels. However dark their hue, it is however not ſo deep as the red-brown which they put on in ſummer. The black ſtripe along the back they retain both in ſummer and winter. If this explanation of the change of colour in animals be admitted; it muſt follow of courſe, that all white animals, including the tame, are weaker than the brown, and this ſeems warranted by experience; at leaſt wild cattle, which are in general accounted ſtronger than the tame, are commonly of a darker hue. To conclude; in Ruſſia the ſaitzi and the ſquirrel in the houſe change their colour as completely as in the foreſt, fodder and nouriſh them how you will.

The greater part of Ruſſia is a flat country, like Poland, of a rich ſoil, marſhy here and there. If we except the great Verchoturian and the Ural chain of mountains, which divide Siberia from the reſt of Ruſſia, the ridge which ſeparates Siberia from the country of the Kalmucks and Mongoles, and the Altai between the Irtiſch and Ob, that between the Yeniſei and the Baikal, called the Sayane mountains, and the leſs conſiderable between the Yeniſei and the Lena; we ſcarcely find in all Ruſſia any elevations that properly deſerve the appellation of mountains.

The *mountains* are diſtributed by Mr. Tooke into eleven claſſes, or diviſions, of which the greater part conſiſts of principal chains of themſelves, whilſt others are only con-

tinuations

tinuations of huge ridges, extending for the moſt part into the bordering territories; theſe diviſions are the *Sieverniya-gori*, or northern mountains, extending between the Baltic and the White ſea; the *Valday* mountains; the mountains of *Taurida;* the mountains of *Caucaſus;* the *Ural* mountains; the *Altay* mountains; the *Sayane* mountains; the *Baikal* mountains; the *Nerchinſkaia* mountains; the *Okhotſkoy* mountains; and the *Kamtſhatſkoy* mountains; an account of which occurs in appropriate parts of the Cyclopædia.

Foreſts rarely occur in ſome parts of the Ruſſian empire, but in others they abound even to ſuperfluity. Such is the caſe between St. Peterſburg and Moſcow, and between Vladimir and Arſamas: alſo in Siberia, about the Ural mountains, in the diſtrict of the river Tara, on the Ufa as far as the Kama, and between the provinces of Perm and Ufa. The foreſt of Aterſkoy is in extent 75 verſts.

For an account of the ſteppes of Ruſſia, ſee STEPPE. The *ſeas* forming the boundaries of the Ruſſian empire are the *Frozen*, or Northern ocean, the Eaſtern or *Pacific* ocean, the *Euxine* or Black ſea, the *Baltic* or Eaſt ſea: and the inland ſeas and lakes are the *Caſpian*, the *Baikal*, the *Ladoga* lake, the lake *Onega*, the lake *Peipus*, the *Ilmen* lake, the *Bielo-Ozero*, or White lake, the lake *Tſhany*, and the lake *Altin-nor*, which ſee reſpectively.

The chief navigable *rivers* that flow into the Baltic, are the *Duna* and the *Neva;* thoſe that fall into the White ſea are the *Dvina*, and the *Kuloi* and *Meſen*, both of which flow E. of the Dvina into the White ſea, not far from each other, in the diſtrict of the town of Meſenſk, the former taking its riſe in the government of Archangel, and the latter in that of Vologda. The rivers that fall into the Frozen ocean are the *Petſhora*, called alſo Bolſhaia, which takes its riſe in the weſtern ſide of the Ural mountains, in the government of Vologda, and following a N.W. courſe falls into the northern ocean, in the government of Archangel; the *Oby*, the *Irtyſh*, the *Tobol*, the *Yeniſſey*, the *Tunguſkis*, the *Khatanga*, the *Lena*, the *Yana*, the *Indighirka*, and the *Kolima*, which ſee. The rivers that flow into the Eaſtern or Pacific ocean are the *Anadyr*, the *Kamtſhatka*, and the Amoor or Amur, formed of the Argoon and the Shilka. The rivers that flow into the Caſpian are the *Yemba* or *Emba*, the *Ural*, formerly the Yaik, the *Volga*, which takes up the Kamma and the Okka, and the *Terek*. The rivers that fall into the Euxine are the *Kuban* or ancient Hypanis, the *Don* or Tanais, which takes up the Voronetz, the Khoper, the Donetz, and the Manitſh, the *Dnieper* or Boryſthenes, and the *Bogue*. See each reſpectively. For an account of the canals of Ruſſia, ſee CANAL.

Population of the Ruſſian Empire.—In adverting to the *population* and *populouſneſs* of the Ruſſian empire, Mr. Tooke, we obſerve, properly diſtinguiſhes between theſe two terms; meaning by the former the abſolute number of the inhabitants of a country, and by the latter, the relation which this number bears to the ſurface of ground on which they dwell. By a reviſion made, or at leaſt completed, in the year 1783, the 41 viceroyalties of which Ruſſia at that time conſiſted, contained of male inhabitants;

Merchants - - -	107,408
Burghers - - -	293,793
Odnodvortzi and free countrymen -	773,656
Exempt from taxes - -	310,830
Crown boors - - -	4,674,603
Private boors - - -	6,678,239
Total	12,838,529

By doubling the above total, we obtain for the whole number of males and females in the above mentioned viceroyalties, an amount of 25,677,000.

In order to obtain the augmented population ſince the year 1783, we have the following ſtatement:

The total for 1783 - - -	25,677,000
The amount of the Coſſacks of the Don and Euxine - -	220,000
Unnumbered tribes and claſſes at the reviſion in the year 1783 - -	1,500,000
Total for 1783	27,397,000
Annual increaſe of 250,000 in 12 years -	3,000,000
New acquiſitions ſince 1783, or the nine viceroyalties of Taurida, Minſk, Brazlau, Voſneſenſk, Podolia, Volhynia, Courland, Vilna, and Slonim - -	5,755,000
Grand Total	36,152,000

Whence, by the moſt moderate eſtimate, the whole population of the Ruſſian empire may be ſtated for the year 1795, in round numbers, at 36,000,000.

Of this maſs of population, the greateſt part belongs to European Ruſſia. The five governments of Perm, Ufa, Kolyvan, Tobolſk, and Irkutſk, comprehended under the general name of Siberia, contain, according to the reviſion-liſts, only 2,215,000, and allowing for the unnumbered claſſes and tribes, perhaps above 3½ millions of inhabitants. Hence it appears, that the population of the European part is about fourteen times greater; and the Ruſſian empire, which, with regard to ſuperficial contents, moſtly belongs to Aſia, muſt in reſpect of population be reckoned as belonging to Europe. The population of the different governments is very various; the moſt populous being that of Moſcow, which contains upwards of 1,139,000 perſons, and the leaſt populous is that of Taurida, the inhabitants of which are computed at about 150,000.

But although the Ruſſian empire ranks high in *population*, with reſpect to *populouſneſs* its place is very ſubordinate. European Ruſſia has a population of 405, and Aſiatic Ruſſia of 11 perſons to a ſquare mile: and if we compare the governments with one another, the reſult will be, that of 45 (the five newly acquired not being reckoned), eight contain below 100; nine contain from 100 to 500; ſeventeen from 500 to 1000; ſeven from 1000 to 1500; three from 1500 to 2000; and only one above 2000, inhabitants, on a ſquare mile. This laſt honourable precedence is held by the government of Moſcow, which (including the metropolis) numbers 2403 perſons on the foreſaid ſuperficies. To the ſecond claſs belong the governments of Kaluga, Tula, and Tchernigof: and to the third, Riazan, Kurſk, Kief, Orel, Kharkof, Yaroſlaf, and Novgorod Sieverſk. The ſixth and pooreſt claſs compriſes, with the countries of the Coſſacks, the north European and Siberian deſerts, where the degree of population is ſo low, that the government of Tobolſk has but ſeven, and that of Irkutſk only three perſons in every ſquare geographical mile. In theſe countries, however, the unregiſtered tribes are the moſt numerous. The moſt populous diſtrict of the Ruſſian empire lies between the 49th and 58th degrees of N. lat.; and further both to the N. and S., as well as E. beyond the 65th degree of longitude, this populouſneſs is continually decreaſing. From a table of birth, deaths, and marriages in 1799, extracted by Mr. Tooke from a German publication, we may deduce the following concluſions. The overplus of

births,

births, unparallelled in the annals of political economy, forms a characteristic feature of the Russian empire; and shews, that if the same increase of population should proceed for 10 years, the number of Russian subjects will be augmented by 5,000,000. It also appears, that upwards of 23 boys were born to 20 girls, whereas 104 persons only of the former died to 100 of the latter; and this favourable proportion of the males to the females indicates the military grandeur to which the Russian empire is capable of attaining; unimpeded by such wasteful wars as that which has recently occurred. Moreover, it appears that the mortality in common years throughout all the Russian dominions is as 1 to 58; whence it may be calculated, that the number of Russian subjects of the Greek church would amount, exclusively of the inhabitants of the eparchy of Bruzlaw, to 31,339,620 souls. Adding to this number the inhabitants of the new possessions in Poland, which in 1795 contained 4,592,544 persons, and about 5,000,000 of Russian subjects of various Christian sects, and of the Jewish, Laman, and Schaman professions, the whole population of the Russian empire will appear to amount to upwards of 40,000,000 of souls.

Progress of Population in Russia.—The first census, namely that in 1722, gave 5,794,928 males; which, admitting an equal number of women, makes a population of 11,589,856 individuals. How much ought we to add for the new acquisitions, in which the census, or revision, as it is termed in Russia, did not take place?

According to Mr. Hermann, in his Statistic Journal, vol. i. part 2. p. 54, an enumeration made in Little Russia, in 1768, gave 955,228 inhabitants; another made in Finland, in 1755, gave 117,998; Esthonia, in 1773, had 176,000; Livonia, 447,360. All these make a sum total of 1,696,586 persons. These enumerations, however, being made 20, 30, 50 years after the first revision, it is possible that the population may have increased or diminished during the interval. If we compare these data with the enumeration made in 1805, we shall find that Finland, in 49 years, has gained 64,392 inhabitants; Esthonia, in 31 years, 36,948; and Livonia, 138,097: making a sum total of 239,437. The population in the provinces bordering the Baltic, then, has gained about one-fourth during the latter half of the 18th century. On comparing the population of Little Russia, as above stated, with that of the governments of Tchernigof and Pultava, a surplus will be found, in 1804, of 1,465,465 individuals above the enumeration of 1768. According to this statement, the population has more than doubled during the last 50 years. This result corresponds very well with the observations made on the registers of births and deaths, that the progress of population is very slow in the Baltic provinces, and very rapid in Little Russia. It has gained of late, especially by the commerce of Odessa; the price of land has risen considerably, and the fertile steppes have likewise been cultivated.

Admitting the like proportion in the progress of population in these provinces, during the former half of the 18th century, which is certainly a great admission, we must deduct from the above stated population of the Baltic provinces one-fourth, and there will remain 555,979; and one half of the population of Little Russia in 1768, leaving 477,614. Agreeably to this statement, the population of all the provinces acquired posterior to 1722, may be estimated at 1,033,533.

It remains now to compute what may have been the number of free persons not included in the revision. Seeing that, at the last revision of 1796, there were 16,000,000 of males included in the list of those who paid the regular obrok, for 1,000,000 that did not pay that tax, we may compute, that at the first revision, in which the number of revisionaries was 5,000,000, there were 300,000 male freemen, composing, together with their wives, the sum of 600,000.

In conformity with these calculations, the probable population of Russia, in 1722, will be,

Revisionaries - - -	11,589,859
Free individuals - - -	600,000
Conquered provinces - -	1,033,533
	13,223,392

Le Clerc, in his Essay on the Population of Russia, published in 1777, states it at 14,000,000; Benedict Francis John Hermann, at the same; which is probably accurate. But when Voltaire reckons the population during the last years of Peter the Great at 18,000,000, he confounds a later period with the era of that monarch. It appears to me, adds Mr. C. T. Hermann, that 14,000,000 would be the most probable amount, if we consider the imperfection inseparable from a first census, and the uncertainty of the calculations respecting the newly conquered provinces.

The second revision, in 1742, gives 6,673,167 males; and, supposing a like number of females, we have 13,346,334 for the inhabitants of Russia at that time. To this must be added the conquered provinces, and the free individuals. As we subtracted a fourth from the population of the Baltic provinces in 1722, the deduction of one-eighth will suffice for their population in 1742; the remainder is 648,689: and, subtracting a quarter from the population of Little Russia in 1768, there remains 706,421; making a total of 1,355,110 for the population of the conquered provinces. The number of revisionaries having augmented by 1,000,000 since 1722, we must increase the number of freemen at least by 50,000, considering the progress of industry, and the better regulations adopted by government. The population, therefore, in 1742, will be,

Revisionaries - - -	13,346,334
Free individuals - - -	700,000
Conquered provinces - -	1,335,110
	15,381,444

Hermann admits for 1742 the round number of 16,000,000. This is a very probable estimate, as the enumerations in Russia are always below the mark.

The third revision, in 1762, gives 7,363,548 males, which supposes a total of 14,727,096 individuals; and, by the proper ratio, we take the population of the conquered provinces at 1,696,586. The revisionaries being nearly one half what they are at present, we may compute the same to hold with the freemen, which would make their number 400,000. The probable population, therefore, of 1762 is as follows:

Revisionaries - - -	14,727,096
Free individuals - - -	300,000
Conquered provinces - -	1,696,586
	16,723,682

Marshal in 1768 and 1770, and Williams also in 1768, admit 18,000,000; l'Evêque in 1782, and le Clerc in 1783, 19,000,000; Schlœtzer and Busching, in 1765, 20,000,000;

20,000,000; and Mr. C. T. Hermann is of this laſt opinion. The real number, in 1762, apparently lies ſomewhere between 18 and 19,000,000.

The fourth general reviſion, in 1782, gives 12,838,529, and, with the females, 25,677,058; or, according to Hermann, 26,358,822. The two capital cities, the military and the nomadic tribes, are not included in this calculation. Theſe at preſent amount to 2,960,000: at that time we may ſuppoſe them to have amounted to 2,000,000. By this ſtatement, the population of Ruſſia, in 1782, would have been between 27 and 28,000,000. Crome, in 1785, admits 23,000,000; Suſmilch, 24,000,000; Pleſchtſcheef (not reckoning the clergy, the civil eſtabliſhment, the military, and the Nomades) admits 26,617,698 in 43 governments; while Hupel in 1780 to 1790, and Hermann, compute 28,000,000.

The fifth reviſion, in 1796, gave 17,816,370 males, which, ſuppoſing an equal number of females, makes the population amount to 35,632,740; or, according to the datum 16,223,229, (which we conſider greatly below the truth,) 34,038,599. If we add the two capitals, the military, and the Nomades, computing them at 2,960,000, the population in 1796 will amount to 36,998,599. Buſching and Beauſobre make it 30,000,000; Schlœtzer, 33,000,000; Hermann, 33,250,000; Meuſel between 35 and 36,000,000; and Storck, 36,000,000.

Following theſe data, the progreſs of population in Ruſſia, brought on partly by the improvement of the interior, partly by new acquiſitions, has been as follows:

In 1722	-	14,000,000.
1742	-	16,000,000, after 20 years.
1762	-	19,000,000, after 20 years.
1782	-	28,000,000, after 20 years.
1796	-	36,000,000, after 14 years.
1806	-	41,000,000, after 10 years.

This aſtoniſhing increment has proceeded in a great meaſure from new acquiſitions. It would prove highly intereſting, were we able to aſcertain nearly the progreſs of the Ruſſian population, independent of the recent acquiſitions.

We ſhall admit for Little Ruſſia and the Baltic provinces the number exhibited by the enumerations of 1755, 1768, and 1772, which yields a total of 1,696,586; ſubjoining the new acquiſitions ſince 1773, according to the data publiſhed by general Oppermann on his map of 1796, conſtructed by order of government, for delineating the new limits. According to this author, Ruſſia acquired,

	Individuals.
By the firſt diſmemberment of Poland in 1773	1,226,966
By the peace with the Ottoman Porte in 1774 and 1783 - - - - - - -	171,610
By the peace with the ſame power in 1791 -	42,708
By the ſecond partition of Poland in 1793 -	3,745,663
By the annexation of Courland - - -	387,922
By the ſubſequent partition of Poland in 1795	1,407,402
Total of the acquiſitions ſince 1773 - -	6,982,271
Adding the Baltic provinces and Little Ruſſia, we get - - - - - -	8,678,357

Here we have the total amount of the population of the countries conquered, down to 1795.

All this, however, was obtained by means of firſt enumerations, which were of courſe incorrect. Thoſe made down to 1804 ought to be more accurate. The adminiſtration muſt have acquired conſiderable influence, eſpecially after the organization of the governments in 1775. It will be of importance, therefore, to know the effect of theſe cauſes, as exhibited by the laſt cenſus, in 1804, which Mr. Hermann delivers to us in the following tables.

Little Ruſſia comprehends the governments of Kief, Tchernigof, Pultava, Ukrainſkoi-ſlobode, with a part of Ekaterinoſlaf and Kurſk; to which muſt be added the country of the Donſkoi Coſſacks, as peopled by the inhabitants of Little Ruſſia. The whole of this vaſt territory, called the Ukraine, formed the boundary between the Turks and Tartars. Its population, in 1804, was as follows:

	Males.	Females.
Kief - - -	574,217	538,404
Tchernigof - -	534,712	538,570
Pultava - -	713,772	732,639
Ukrainſkoi-ſlobode -	420,304	418,781
Ekaterinoſlaf - -	210,815	183,363
Coſſacks of the Don	161,100	194,521
	2,614,920	2,606,278

The Swediſh provinces are a part of Karelia and Ingria, conſtituting at preſent the governments of St. Peterſburg, Finland, Eſthonia, and Livonia. Their population, in 1804, was as follows:

	Males.	Females.
St. Peterſburg -	268,748	270,920
Finland - -	94,397	87,393
Eſthonia - -	107,357	105,591
Livonia - -	290,014	295,443
	760,516	759,947

So that the number of individuals in the Swediſh provinces and in Little Ruſſia is 6,741,661.

On comparing this number with the preceding enumerations, it will be ſeen that the Swediſh provinces have gained one-fourth, and that Little Ruſſia has nearly doubled; ſince it is certain that, in this laſt cenſus, the ſeveral provinces belonging to Little Ruſſia in its largeſt extent have not been included.

The Poliſh provinces annexed from 1773 to 1795, including Courland, are White Ruſſia, Lithuania, and the Poliſh Ukraine, or the governments of Minſk, Vitepſk and Mohilef, Grodno and Vilna, Podolia and Volhynia. The ſtate of their population, in 1784, was as under:

	Males.	Females.
Minſk - - -	431,586	426,940
Vitepſk - -	343,716	330,624
Mohilef - -	403,614	397,381
Grodno - -	300,278	290,782
Vilna - - -	465,224	460,046
Podolia - -	379,215	556,870
Volhynia - -	564,586	522,182
Courland - -	191,910	189,366
	3,080,129	3,174,191

According to general Oppermann, the population of theſe provinces, in 1796, amounted to 6,767,953; whence it appears that the population of Poland is ſtationary.

The Turkiſh provinces are Cherſon, Taurida, the country of the Coſſacks of the Euxine, and the reſidue of Ekatebirths, unparallelled in the annals of political economy, forms a characteriftic feature of the Ruffian empire; and fhews, that if the fame increafe of population fhould proceed for 10 years, the number of Ruffian fubjects will be augmented by 5,000,000. It alfo appears, that upwards of 23 boys were born to 20 girls, whereas 104 perfons only of the former died to 100 of the latter; and this favourable proportion of the males to the females indicates the military grandeur to which the Ruffian empire is capable of attaining; unimpeded by fuch wafteful wars as that which has recently occurred. Moreover, it appears that the mortality in common years throughout all the Ruffian dominions is as 1 to 58; whence it may be calculated, that the number of Ruffian fubjects of the Greek church would amount, exclufively of the inhabitants of the eparchy of Bruzlaw, to 31,339,620 fouls. Adding to this number the inhabitants of the new poffeffions in Poland, which in 1795 contained 4,592,544 perfons, and about 5,000,000 of Ruffian fubjects of various Chriftian fects, and of the Jewifh, Laman, and Schaman profeffions, the whole population of the Ruffian empire will appear to amount to upwards of 40,000,000 of fouls.

Progrefs of Population in Ruffia.—The firft cenfus, namely that in 1722, gave 5,794,928 males; which, admitting an equal number of women, makes a population of 11,589,856 individuals. How much ought we to add for the new acquifitions, in which the cenfus, or revifion, as it is termed in Ruffia, did not take place?

According to Mr. Hermann, in his Statiftic Journal, vol. i. part 2. p. 54, an enumeration made in Little Ruffia, in 1768, gave 955,228 inhabitants; another made in Finland, in 1755, gave 117,998; Efthonia, in 1773, had 176,000; Livonia, 447,360. All thefe make a fum total of 1,696,586 perfons. Thefe enumerations, however, being made 20, 30, 50 years after the firft revifion, it is poffible that the population may have increafed or diminifhed during the interval. If we compare thefe data with the enumeration made in 1805, we fhall find that Finland, in 49 years, has gained 64,392 inhabitants; Efthonia, in 31 years, 36,948; and Livonia, 138,097: making a fum total of 239,437. The population in the provinces bordering the Baltic, then, has gained about one-fourth during the latter half of the 18th century. On comparing the population of Little Ruffia, as above ftated, with that of the governments of Tchernigof and Pultava, a furplus will be found, in 1804, of 1,465,465 individuals above the enumeration of 1768. According to this ftatement, the population has more than doubled during the laft 50 years. This refult correfponds very well with the obfervations made on the regifters of births and deaths, that the progrefs of population is very flow in the Baltic provinces, and very rapid in Little Ruffia. It has gained of late, efpecially by the commerce of Odeffa; the price of land has rifen confiderably, and the fertile fteppes have likewife been cultivated.

Admitting the like proportion in the progrefs of population in thefe provinces, during the former half of the 18th century, which is certainly a great admiffion, we muft deduct from the above ftated population of the Baltic provinces one-fourth, and there will remain 555,979; and one half of the population of Little Ruffia in 1768, leaving 477,614. Agreeably to this ftatement, the population of all the provinces acquired pofterior to 1722, may be eftimated at 1,033,533.

It remains now to compute what may have been the number of free perfons not included in the revifion. Seeing that, at the laft revifion of 1796, there were 16,000,000 of males included in the lift of thofe who paid the regular obrok, for 1,000,000 that did not pay that tax, we may compute, that at the firft revifion, in which the number of revifionaries was 5,000,000, there were 300,000 male freemen, compofing, together with their wives, the fum of 600,000.

In conformity with thefe calculations, the probable population of Ruffia, in 1722, will be,

Revifionaries - - -	11,589,859
Free individuals - - -	600,000
Conquered provinces - -	1,033,533
	13,223,392

Le Clerc, in his Effay on the Population of Ruffia, publifhed in 1777, ftates it at 14,000,000; Benedict Francis John Hermann, at the fame; which is probably accurate. But when Voltaire reckons the population during the laft years of Peter the Great at 18,000,000, he confounds a later period with the era of that monarch. It appears to me, adds Mr. C. T. Hermann, that 14,000,000 would be the moft probable amount, if we confider the imperfection infeparable from a firft cenfus, and the uncertainty of the calculations refpecting the newly conquered provinces.

The fecond revifion, in 1742, gives 6,673,167 males; and, fuppofing a like number of females, we have 13,346,334 for the inhabitants of Ruffia at that time. To this muft be added the conquered provinces, and the free individuals. As we fubtracted a fourth from the population of the Baltic provinces in 1722, the deduction of one-eighth will fuffice for their population in 1742; the remainder is 648,689: and, fubtracting a quarter from the population of Little Ruffia in 1768, there remains 706,421; making a total of 1,355,110 for the population of the conquered provinces. The number of revifionaries having augmented by 1,000,000 fince 1722, we muft increafe the number of freemen at leaft by 50,000, confidering the progrefs of induftry, and the better regulations adopted by government. The population, therefore, in 1742, will be,

Revifionaries - - -	13,346,334
Free individuals - - -	700,000
Conquered provinces - -	1,335,110
	15,381,444

Hermann admits for 1742 the round number of 16,000,000. This is a very probable eftimate, as the enumerations in Ruffia are always below the mark.

The third revifion, in 1762, gives 7,363,548 males, which fuppofes a total of 14,727,096 individuals; and, by the proper ratio, we take the population of the conquered provinces at 1,696,586. The revifionaries being nearly one half what they are at prefent, we may compute the fame to hold with the freemen, which would make their number 400,000. The probable population, therefore, of 1762 is as follows:

Revifionaries - - -	14,727,096
Free individuals - - -	300,000
Conquered provinces - -	1,696,586
	16,723,682

Marfhal in 1768 and 1770, and Williams alfo in 1768, admit 18,000,000; l'Evêque in 1782, and le Clerc in 1783, 19,000,000; Schlœtzer and Bufching, in 1765, 20,000,000;

20,000,000; and Mr. C. T. Hermann is of this laſt opinion. The real number, in 1762, apparently lies ſomewhere between 18 and 19,000,000.

The fourth general reviſion, in 1782, gives 12,838,529, and, with the females, 25,677,058; or, according to Hermann, 26,358,822. The two capital cities, the military and the nomadic tribes, are not included in this calculation. Theſe at preſent amount to 2,960,000: at that time we may ſuppoſe them to have amounted to 2,000,000. By this ſtatement, the population of Ruſſia, in 1782, would have been between 27 and 28,000,000. Crome, in 1785, admits 23,000,000; Suſmilch, 24,000,000; Pleſchtſcheef (not reckoning the clergy, the civil eſtabliſhment, the military, and the Nomades) admits 26,617,698 in 43 governments; while Hupel in 1780 to 1790, and Hermann, compute 28,000,000.

The fifth reviſion, in 1796, gave 17,816,370 males, which, ſuppoſing an equal number of females, makes the population amount to 35,632,740; or, according to the datum 16,223,229, (which we conſider greatly below the truth,) 34,038,599. If we add the two capitals, the military, and the Nomades, computing them at 2,960,000, the population in 1796 will amount to 36,998,599. Buſching and Beauſobre make it 30,000,000; Schlœtzer, 33,000,000; Hermann, 33,250,000; Meuſel between 35 and 36,000,000; and Storck, 36,000,000.

Following theſe data, the progreſs of population in Ruſſia, brought on partly by the improvement of the interior, partly by new acquiſitions, has been as follows:

In 1722	-	14,000,000.	
1742	-	16,000,000,	after 20 years.
1762	-	19,000,000,	after 20 years.
1782	-	28,000,000,	after 20 years.
1796	-	36,000,000,	after 14 years.
1806	-	41,000,000,	after 10 years.

This aſtoniſhing increment has proceeded in a great meaſure from new acquiſitions. It would prove highly intereſting, were we able to aſcertain nearly the progreſs of the Ruſſian population, independent of the recent acquiſitions.

We ſhall admit for Little Ruſſia and the Baltic provinces the number exhibited by the enumerations of 1755, 1768, and 1772, which yields a total of 1,696,586; ſubjoining the new acquiſitions ſince 1773, according to the data publiſhed by general Oppermann on his map of 1796, conſtructed by order of government, for delineating the new limits. According to this author, Ruſſia acquired,

	Individuals.
By the firſt diſmemberment of Poland in 1773	1,226,966
By the peace with the Ottoman Porte in 1774 and 1783 - - - - - - -	171,610
By the peace with the ſame power in 1791 -	42,708
By the ſecond partition of Poland in 1793 -	3,745,663
By the annexation of Courland - - - -	387,922
By the ſubſequent partition of Poland in 1795	1,407,402
Total of the acquiſitions ſince 1773 - -	6,982,271
Adding the Baltic provinces and Little Ruſſia, we get - - - - - - -	8,678,357

Here we have the total amount of the population of the countries conquered, down to 1795.

All this, however, was obtained by means of firſt enumerations, which were of courſe incorrect. Thoſe made down to 1804 ought to be more accurate. The adminiſtration muſt have acquired conſiderable influence, eſpecially after the organization of the governments in 1775. It will be of importance, therefore, to know the effect of their cauſes, as exhibited by the laſt cenſus, in 1804, which Mr. Hermann delivers to us in the following tables.

Little Ruſſia comprehends the governments of Kief, Tchernigof, Pultava, Ukrainſkoi-ſlobode, with a part of Ekaterinoſlaf and Kurſk; to which muſt be added the country of the Donſkoi Coſſacks, as peopled by the inhabitants of Little Ruſſia. The whole of this vaſt territory, called the Ukraine, formed the boundary between the Turks and Tartars. Its population, in 1804, was as follows:

	Males.	Females.
Kief - - -	574,217	538,404
Tchernigof - -	534,712	538,570
Pultava - -	713,772	732,639
Ukrainſkoi-ſlobode -	420,304	418,781
Ekaterinoſlaf - -	210,815	183,363
Coſſacks of the Don	161,100	194,521
	2,614,920	2,606,278

The Swediſh provinces are a part of Karelia and Ingria, conſtituting at preſent the governments of St. Peterſburg, Finland, Eſthonia, and Livonia. Their population, in 1804, was as follows:

	Males.	Females.
St. Peterſburg -	268,748	270,920
Finland - -	94,397	87,393
Eſthonia - -	107,357	105,591
Livonia - -	290,014	295,443
	760,516	759,947

So that the number of individuals in the Swediſh provinces and in Little Ruſſia is 6,741,661.

On comparing this number with the preceding enumerations, it will be ſeen that the Swediſh provinces have gained one-fourth, and that Little Ruſſia has nearly doubled; ſince it is certain that, in this laſt cenſus, the ſeveral provinces belonging to Little Ruſſia in its largeſt extent have not been included.

The Poliſh provinces annexed from 1773 to 1795, including Courland, are White Ruſſia, Lithuania, and the Poliſh Ukraine, or the governments of Minſk, Vitepſk and Mohilef, Grodno and Vilna, Podolia and Volhynia. The ſtate of their population, in 1784, was as under:

	Males.	Females.
Minſk - - -	431,586	426,940
Vitepſk - -	343,716	330,624
Mohilef - -	403,614	397,381
Grodno - -	300,278	290,782
Vilna - - -	465,224	460,046
Podolia - -	379,215	556,870
Volhynia - -	564,586	522,182
Courland - -	191,910	189,366
	3,080,129	3,174,191

According to general Oppermann, the population of theſe provinces, in 1796, amounted to 6,767,953; whence it appears that the population of Poland is ſtationary.

The Turkiſh provinces are Cherſon, Taurida, the country of the Coſſacks of the Euxine, and the reſidue of Ekate-

Ekaterinoſlaf, to which may be added Caucaſia. The population of theſe provinces is,

	Males.	Females.
Cherſon - -	145,814	124,321
Taurida - -	102,826	88,864
Coſſacks of the Euxine	20,240	9,155
Caucaſia - -	34,849	29,240
	303,729	251,580

As the Coſſacks of the Euxine have very few women, and ſtill retain many cuſtoms derived from their anceſtors, the famous Zaporogian Coſſacks, ſo called from *za*, *trans*, beyond, and *parogi*, cataracts, (the Coſſacks beyond the cataracts,) the foregoing ſtatement is probably correct. We learn from general Oppermann, that in the Turkiſh provinces conquered in 1774, 1783, and 1791, there were 214,318 individuals of both ſexes. This ſmall population, in a tract of country ſo immenſe, has increaſed undoubtedly, in conſequence of a more regular adminiſtration; but not ſo much as would at firſt ſight appear, becauſe we muſt ſtrike off the Coſſacks of the Euxine, Caucaſia, and the Ruſſian and foreign colonies domiciliated in theſe regions. Beſides, if we conſider the incompleteneſs of a firſt enumeration, it is but reaſonable to ſuppoſe that general Oppermann's eſtimate is too ſmall.

Thus it appears that the population of the territories acquired ſince 1773 was, in 1804,

Little Ruſſia - - -	5,221,198
Swediſh provinces - -	1,520,463
Poliſh provinces - - -	6,454,320
Turkiſh provinces - -	555,309
	13,751,290

According to the data above noticed, we are to ſubtract from the aggregate population of Ruſſia, for the provinces acquired,

From 14,000,000 in 1722		
1,033,533	-	12,966,467
From 16,000,000 in 1742		
1,355,110	-	14,644,890
From 19,000,000 in 1762		
1,696,586	-	17,303,414
From 28,000,000 in 1782		
8,678,857	-	19,321,143
From 36,000,000 in 1796		
13,751,290	-	22,248,710
From 41,000,000 in 1806		
13,751,290	-	27,248,710

The laſt column gives us the rate at which the population of Ruſſia proper has increaſed.

Whence it follows, that the population of Ruſſia, excluſive of the conqueſts ſince the reign of Peter I., gained in 20 years, between 1722 and 1742, 1,678,423, or 83,921 annually. In the 20 years between 1742 and 1762, 2,658,524, or 132,926 annually; that is to ſay, 49,005 more annually than during the firſt period. In the 20 years between 1762 and 1782, 1,676,253, or 88,812 annually; leſs by 49,114 than during the ſecond period. In the 14 years between 1782 and 1796, 2,927,567, or 146,378 annually; more by 62,566 than during the preceding period. In the 10 years between 1796 and 1806, 5,000,000, or 200,000 annually; more by 53,622 than during the antecedent period.

By the above table, it is obvious that the population of Old Ruſſia has more than doubled, or that it is at preſent to what it was in 1722, as $2\frac{1}{5}$th to 1. It is apparent alſo that the progreſs of population has not been uniform, that it has had accelerations and retardations, that the moſt favourable periods were during the reign of the empreſs Elizabeth, between 1741 and 1761, and the years of the peace of Catharine II. between 1782 and 1796. The population ſtill advances in the later periods, but the rate is ſlower. What may be the cauſe of theſe phenomena?

The population of Ruſſia has more than doubled during the laſt century, though Smith ſuppoſes that the population in civilized countries only doubles once in 500 years. It has doubled in conſequence of a better regulated adminiſtration; of the ſecurity the government has afforded to the nation; of the capitals belonging to foreigners placed in the country, and which for a long time conſtituted the ſoul of the inland commerce; in conſequence of the progreſs of national induſtry, which was the reſult; of the increaſe of knowledge, by new commercial connections with other countries of Europe, and by the means of inſtruction furniſhed by government to the other inhabitants of Ruſſia; and, finally, in conſequence of the removal of ſeveral obſtacles which checked the progreſs of induſtry, as the abolition of the cuſtom-houſes of the interior, under the reigns of the empreſſes Elizabeth and Catharine II., the improvement of the roads, and the multiplication of canals.

What a diſmal picture does Ruſſia preſent to us in the fifteenth, ſixteenth, and ſeventeenth centuries! Joſafa Barbaro, in 1436, reports, that from Moſcow to the frontiers of Poland, the whole country was one vaſt deſart; the villages, burnt and abandoned, offered no other accommodation to ſtrangers than a place to kindle a fire. Contarini confirms this ſtatement in 1483. Meyerberg, in 1661, found between Viaſma and Moſaiſk, a diſtance of 130 verſts, only a ſingle village. The road between Smolenſk and Moſcow was dangerous, according to Lyſeck, in 1675, on account of the wolves that attacked travellers. Ulfeldt, the Daniſh ambaſſador, in 1625, found the country between Moſcow, Novgorod, and Pſcove, laid entirely waſte by the inteſtine wars under Ivan Vaſſillievitch II. Poſſevin, in 1581 and 1582, travelled whole days in the interior of Ruſſia without meeting a ſingle individual. The whole country between Kazan and Aſtrachan was a continued deſart. Even the cities had greatly ſuffered. Poſſevin eſtimates the population of Moſcow at 30,000; that of Novgorod was diminiſhed by the plague to 3000; and Kief, in the time of Herberſtein, in 1516, was almoſt in ruins. Beſides the davaſtations committed by the domeſtic feuds and foreign invaders, the number of impoſts, and the ſeverity of the commiſſioners who levied them, depopulated the northern provinces which had not ſuffered from thoſe diſaſters. We learn from Fletcher, that in the year 1588, 50 villages were abandoned between Vologda and Yaroſlaf. At Uſtiug bread was almoſt unknown, and the ſame deſtitution of that article of life was felt on the Dvina in the time of Herberſtein. Famine and peſtilence often committed their ravages among the melancholy remnants of this unfortunate population, as in 1525, in 1601, and in 1615. M. Meiner informs us, that the city of Novgorod loſt in one winter no fewer than 18,000 individuals, conſtituting nearly the whole of its population.

It

It is neither to the mildnefs of the climate, nor to the fertility of the foil, that we are to afcribe the rapid increafe of population during the eighteenth century; but to a better organized adminiftration, and the fecurity which refulted from it. An infant ftate, fuppofing it tolerably well governed, and connected with countries long civilized, ought to make prodigious progrefs in improvement and population.

That period of the reign of Catharine II., in which fhe took in hand the amelioration of the feveral governments, was particularly propitious to the progrefs of population. The organization of the governments in 1775 was the great political fcheme that procured the fubjects a greater degree of fecurity and happinefs. The ukafe of 1782, refpecting the liberty of working the mines, the eftablifhment of normal fchools in 1783, the rights granted to the nobility in 1785, the improvement of the high roads in 1786, and efpecially the erection of the bank in the fame year, were all calculated to promote the happinefs of the fubject, as far as it depended on the government. The bank, from its very commencement, had a furprifing effect upon the progrefs of agriculture. That patriotic fovereign removed feveral obftacles to the profperity of her fubjects, fuch as the want of liberty to be induftrious, the want of communications, the want of knowledge, and of a medium of circulation.

The population of Ruffia has more than doubled during the eighteenth century. Have we reafon to expect the fame progrefs during the nineteenth?

If we confider only the extent of the furface capable of cultivation, which is computed at 80,000,000 of fquare miles, we muft conclude that Ruffia is capable of fupporting 960,000,000 of inhabitants, or almoft as many as at prefent exift on the earth. If we confider the furplus of births as a total gain to the population, this furplus, amounting at leaft to 500,000 annually, would in 32 years amount to 60,000,000, in 56, to 80,000,000, &c.

Experience, however, fhews us that the progrefs of population does not depend folely upon the extent of foil capable of cultivation. There are fpots left uncultivated in the countries where agriculture has made the greateft advances, even in England, Flanders, and Lombardy. This progrefs depends ftill lefs on the furplus of births. Every where the number of births exeeeds that of deaths. The population is always proportionate to the ftate of national wealth. The moft decifive proof, therefore, of the profperity of a country, is the increafe of the number of its inhabitants. In Ruffia the population has more than doubled in 34 years. Whence we may infer, that its agriculture, the principal branch of its induftry, has alfo doubled. The increafe of Ruffian commerce depends upon peace, and upon the augmentation of knowledge. On thefe accounts we cannot expect fo rapid an increafe of national riches, and confequently of population, during the nineteenth century as obtained during the eighteenth.

Experience has demonftrated the accuracy of this mode of reafoning. The progrefs of the population has become flower fince the fifth revifion. The annual furplus of 60,000 has been reduced to 50,000 during the laft ten years.

To eftablifh this fact, M. Hermann has compared the ftatements refpecting the population of the governments of Mofcow, Tula, Kaluga, Yaroflaf, Orel, Kurfk, Vladimir, Riazan, Penza, Kazan, Tver, Smolenfk, Tambof, Nijegorod, Pfcove, Voronetch, Simbirfk, Koftroma, Viætka, Novgorod, Saratof, Perm, Orenburg, Vologda, Olonetz. The ftatements refpecting the population of thefe 25 governments, according to the fourth revifion of 1782, gives 9,939,790, males; that of the fifth revifion of 1796, fourteen years after, 10,228,672; that of the enumeration of 1804, eight years after, 9,989,531. So that the population gained during the firft period 867,873, and during the fecond period loft 239,141. In the firft period there are only three governments whofe population has diminifhed; *viz.* Kaluga, Koftroma, and Voronetch. All the others had increafed. But during the fecond period Mofcow alone gained confiderably, namely, 100,000 males; Voronetch, which had loft before, gained 150,000 males; and Viætka gained 37,000. Kurfk and Orel have gained a few thoufands; Tula, Yaroflaf, and Perm, fome hundreds. The other feventeen governments have loft, and feveral of them confiderably. In like manner, Tambof has loft 88,000 men, Nijegorod 55,000, and Simbirfk 110,000 men in eight years!

It is worthy of obfervation, that thofe governments which have been long in a high ftate of cultivation, as Tula, Yaroflaf, Kaluga, Tver, Pfcove, Koftroma, Smolenfk, Vladimir, have neither loft nor gained much. The population, and of courfe the induftry, is ftationary. The governments lefs improved, as Viætka and Voronetch, have gained confpicuoufly; whereas the governments richeft in corn, as Tambof, Nijegorod, Simbirfk, have loft the moft.

The rapid progrefs of population between the fourth and fifth revifions is the natural effect of the fenfible advances made by agriculture, in confequence of the many recent beneficial inftitutions, and efpecially the eftablifhment of the bank. Thefe inftitutions and new funds have already produced their effect. At prefent, the ancient fources of national wealth flow lefs abundantly, and it is not eafy to open new ones. It may be prefumed then, that the population of Ruffia will remain a long time between 41,000,000 and 43,000,000. Unforefeen circumftances, however, may give a confiderable population to the fouth of Ruffia. For inftance, the aftonifhing commerce of grain at Odeffa, between 1800 and 1805, increafed the value of all the lands as far as Kief, and even the fertile fteppes were brought into cultivation. Labourers were wanting; and even half the produce was offered to thofe who would gather in the other half. The commerce of Taganrok likewife furnifhes ground for hope: and agriculture appears to be making fome progrefs among the nomadic tribes.

A country is fufficiently peopled when the generality of the inhabitants are in eafy circumftances. Such a population alone is defirable, and ufeful to government. A country is not fufficiently peopled when the demand for labourers, and the means of maintaining them, are exceffive, as in fome of the fouthern provinces of Ruffia. A country fuffers from its population, when the thoufands of rich are obliged to maintain the millions of poor. Such a fallacious population muft either perifh, or emigrate, or occafion revolutions.

The nations inhabiting the Ruffian empire are; Ruffians, Coffacks, of whom are four denominations, Samoyedes, Morduanes, Cheremiffes, Chuvafhes, Votiaks, Vogules, Permiaks, Sirianes, Oftiaks, Barabinzes, Tungufes, divided into the Connei Tungufi, Olenni Tungufi, and Sabatfhi Tungufi, thus difcriminated becaufe fome Tungufes travel with horfes, fome with rein-deer, and others with large dogs, Kalmucks, Burats, Yakutes, Yukagiri, Korzaki, Kamtfhadales, Tartars, who are likewife divided into feveral kinds, Finns, Efthonians, Lettes, Livonians, Armenians, Indians, befides the Germans and other Europeans. To thefe might be added the Chuktfhi, Tfhalatfhi, the Kurilli, and perhaps yet others. Thefe different tribes and populations are of as various manners, tempers, and habits of life: to fpecify them diftinctly would engage us in too wide a field of

Ekaterinoslaf, to which may be added Caucasia. The population of these provinces is,

	Males.	Females.
Cherson - -	145,814	124,321
Taurida - -	102,826	88,864
Cossacks of the Euxine	20,240	9,155
Caucasia - -	34,849	29,240
	303,729	251,580

As the Cossacks of the Euxine have very few women, and still retain many customs derived from their ancestors, the famous Zaporogian Cossacks, so called from *za*, *trans*, beyond, and *parogi*, cataracts, (the Cossacks beyond the cataracts,) the foregoing statement is probably correct. We learn from general Oppermann, that in the Turkish provinces conquered in 1774, 1783, and 1791, there were 214,318 individuals of both sexes. This small population, in a tract of country so immense, has increased undoubtedly, in consequence of a more regular administration; but not so much as would at first sight appear, because we must strike off the Cossacks of the Euxine, Caucasia, and the Russian and foreign colonies domiciliated in these regions. Besides, if we consider the incompleteness of a first enumeration, it is but reasonable to suppose that general Oppermann's estimate is too small.

Thus it appears that the population of the territories acquired since 1773 was, in 1804,

Little Russia - - - -	5,221,198
Swedish provinces - -	1,520,463
Polish provinces - - -	6,454,320
Turkish provinces - -	555,309
	13,751,290

According to the data above noticed, we are to subtract from the aggregate population of Russia, for the provinces acquired,

From 14,000,000 in 1722		
1,033,533	-	12,966,467
From 16,000,000 in 1742		
1,355,110	-	14,644,890
From 19,000,000 in 1762		
1,696,586	-	17,303,414
From 28,000,000 in 1782		
8,678,857	-	19,321,143
From 36,000,000 in 1796		
13,751,290	-	22,248,710
From 41,000,000 in 1806		
13,751,290	-	27,248,710

The last column gives us the rate at which the population of Russia proper has increased.

Whence it follows, that the population of Russia, exclusive of the conquests since the reign of Peter I., gained in 20 years, between 1722 and 1742, 1,678,423, or 83,921 annually. In the 20 years between 1742 and 1762, 2,658,524, or 132,926 annually; that is to say, 49,005 more annually than during the first period. In the 20 years between 1762 and 1782, 1,676,253, or 88,812 annually; less by 49,114 than during the second period. In the 14 years between 1782 and 1796, 2,927,567, or 146,378 annually; more by 62,566 than during the preceding period. In the 10 years between 1796 and 1806, 5,000,000, or 200,000 annually; more by 53,622 than during the antecedent period.

By the above table, it is obvious that the population of Old Russia has more than doubled, or that it is at present to what it was in 1722, as 2⅛th to 1. It is apparent also that the progress of population has not been uniform, that it has had accelerations and retardations, that the most favourable periods were during the reign of the empress Elizabeth, between 1741 and 1761, and the years of the peace of Catharine II. between 1782 and 1796. The population still advances in the later periods, but the rate is slower. What may be the cause of these phenomena?

The population of Russia has more than doubled during the last century, though Smith supposes that the population in civilized countries only doubles once in 500 years. It has doubled in consequence of a better regulated administration; of the security the government has afforded to the nation; of the capitals belonging to foreigners placed in the country, and which for a long time constituted the soul of the inland commerce; in consequence of the progress of national industry, which was the result; of the increase of knowledge, by new commercial connections with other countries of Europe, and by the means of instruction furnished by government to the other inhabitants of Russia; and, finally, in consequence of the removal of several obstacles which checked the progress of industry, as the abolition of the custom-houses of the interior, under the reigns of the empresses Elizabeth and Catharine II., the improvement of the roads, and the multiplication of canals.

What a dismal picture does Russia present to us in the fifteenth, sixteenth, and seventeenth centuries! Josafa Barbaro, in 1436, reports, that from Moscow to the frontiers of Poland, the whole country was one vast desart; the villages, burnt and abandoned, offered no other accommodation to strangers than a place to kindle a fire. Contarini confirms this statement in 1483. Meyerberg, in 1661, found between Viasma and Mosaisk, a distance of 130 versts, only a single village. The road between Smolensk and Moscow was dangerous, according to Lyseck, in 1675, on account of the wolves that attacked travellers. Ulfeldt, the Danish ambassador, in 1625, found the country between Moscow, Novgorod, and Pscove, laid entirely waste by the intestine wars under Ivan Vassillievitch II. Possevin, in 1581 and 1582, travelled whole days in the interior of Russia without meeting a single individual. The whole country between Kazan and Astrachan was a continued desart. Even the cities had greatly suffered. Possevin estimates the population of Moscow at 30,000; that of Novgorod was diminished by the plague to 3000; and Kief, in the time of Herberstein, in 1516, was almost in ruins. Besides the davastations committed by the domestic feuds and foreign invaders, the number of imposts, and the severity of the commissioners who levied them, depopulated the northern provinces which had not suffered from those disasters. We learn from Fletcher, that in the year 1588, 50 villages were abandoned between Vologda and Yaroslaf. At Ustiug bread was almost unknown, and the same destitution of that article of life was felt on the Dvina in the time of Herberstein. Famine and pestilence often committed their ravages among the melancholy remnants of this unfortunate population, as in 1525, in 1601, and in 1615. M. Meiner informs us, that the city of Novgorod lost in one winter no fewer than 18,000 individuals, constituting nearly the whole of its population.

It

It is neither to the mildneſs of the climate, nor to the fertility of the ſoil, that we are to aſcribe the rapid increaſe of population during the eighteenth century; but to a better organized adminiſtration, and the ſecurity which reſulted from it. An infant ſtate, ſuppoſing it tolerably well governed, and connected with countries long civilized, ought to make prodigious progreſs in improvement and population.

That period of the reign of Catharine II., in which ſhe took in hand the amelioration of the ſeveral governments, was particularly propitious to the progreſs of population. The organization of the governments in 1775 was the great political ſcheme that procured the ſubjects a greater degree of ſecurity and happineſs. The ukaſe of 1782, reſpecting the liberty of working the mines, the eſtabliſhment of normal ſchools in 1783, the rights granted to the nobility in 1785, the improvement of the high roads in 1786, and eſpecially the erection of the bank in the ſame year, were all calculated to promote the happineſs of the ſubject, as far as it depended on the government. The bank, from its very commencement, had a ſurpriſing effect upon the progreſs of agriculture. That patriotic ſovereign removed ſeveral obſtacles to the proſperity of her ſubjects, ſuch as the want of liberty to be induſtrious, the want of communications, the want of knowledge, and of a medium of circulation.

The population of Ruſſia has more than doubled during the eighteenth century. Have we reaſon to expect the ſame progreſs during the nineteenth?

If we conſider only the extent of the ſurface capable of cultivation, which is computed at 80,000,000 of ſquare miles, we muſt conclude that Ruſſia is capable of ſupporting 960,000,000 of inhabitants, or almoſt as many as at preſent exiſt on the earth. If we conſider the ſurplus of births as a total gain to the population, this ſurplus, amounting at leaſt to 500,000 annually, would in 32 years amount to 60,000,000, in 56, to 80,000,000, &c.

Experience, however, ſhews us that the progreſs of population does not depend ſolely upon the extent of ſoil capable of cultivation. There are ſpots left uncultivated in the countries where agriculture has made the greateſt advances, even in England, Flanders, and Lombardy. This progreſs depends ſtill leſs on the ſurplus of births. Every where the number of births exceeds that of deaths. The population is always proportionate to the ſtate of national wealth. The moſt deciſive proof, therefore, of the proſperity of a country, is the increaſe of the number of its inhabitants. In Ruſſia the population has more than doubled in 34 years. Whence we may infer, that its agriculture, the principal branch of its induſtry, has alſo doubled. The increaſe of Ruſſian commerce depends upon peace, and upon the augmentation of knowledge. On theſe accounts we cannot expect ſo rapid an increaſe of national riches, and conſequently of population, during the nineteenth century as obtained during the eighteenth.

Experience has demonſtrated the accuracy of this mode of reaſoning. The progreſs of the population has become ſlower ſince the fifth reviſion. The annual ſurplus of 60,000 has been reduced to 50,000 during the laſt ten years.

To eſtabliſh this fact, M. Hermann has compared the ſtatements reſpecting the population of the governments of Moſcow, Tula, Kaluga, Yaroſlaf, Orel, Kurſk, Vladimir, Riazan, Penza, Kazan, Tver, Smolenſk, Tambof, Nijegorod, Pſcove, Voronetch, Simbirſk, Koſtroma, Viætka, Novgorod, Saratof, Perm, Orenburg, Vologda, Olonetz. The ſtatements reſpecting the population of theſe 25 governments, according to the fourth reviſion of 1782, gives 9,939,790, males; that of the fifth reviſion of 1796, fourteen years after, 10,228,672; that of the enumeration of 1804, eight years after, 9,989,531. So that the population gained during the firſt period 867,873, and during the ſecond period loſt 239,141. In the firſt period there are only three governments whoſe population has diminiſhed; *viz.* Kaluga, Koſtroma, and Voronetch. All the others had increaſed. But during the ſecond period Moſcow alone gained conſiderably, namely, 100,000 males; Voronetch, which had loſt before, gained 150,000 males; and Viætka gained 37,000. Kurſk and Orel have gained a few thouſands; Tula, Yaroſlaf, and Perm, ſome hundreds. The other ſeventeen governments have loſt, and ſeveral of them conſiderably. In like manner, Tambof has loſt 88,000 men, Nijegorod 55,000, and Simbirſk 110,000 men in eight years!

It is worthy of obſervation, that thoſe governments which have been long in a high ſtate of cultivation, as Tula, Yaroſlaf, Kaluga, Tver, Pſcove, Koſtroma, Smolenſk, Vladimir, have neither loſt nor gained much. The population, and of courſe the induſtry, is ſtationary. The governments leſs improved, as Viætka and Voronetch, have gained conſpicuouſly; whereas the governments richeſt in corn, as Tambof, Nijegorod, Simbirſk, have loſt the moſt.

The rapid progreſs of population between the fourth and fifth reviſions is the natural effect of the ſenſible advances made by agriculture, in conſequence of the many recent beneficial inſtitutions, and eſpecially the eſtabliſhment of the bank. Theſe inſtitutions and new funds have already produced their effect. At preſent, the ancient ſources of national wealth flow leſs abundantly, and it is not eaſy to open new ones. It may be preſumed then, that the population of Ruſſia will remain a long time between 41,000,000 and 43,000,000. Unforeſeen circumſtances, however, may give a conſiderable population to the ſouth of Ruſſia. For inſtance, the aſtoniſhing commerce of grain at Odeſſa, between 1800 and 1805, increaſed the value of all the lands as far as Kief, and even the fertile ſteppes were brought into cultivation. Labourers were wanting; and even half the produce was offered to thoſe who would gather in the other half. The commerce of Taganrok likewiſe furniſhes ground for hope: and agriculture appears to be making ſome progreſs among the nomadic tribes.

A country is ſufficiently peopled when the generality of the inhabitants are in eaſy circumſtances. Such a population alone is deſirable, and uſeful to government. A country is not ſufficiently peopled when the demand for labourers, and the means of maintaining them, are exceſſive, as in ſome of the ſouthern provinces of Ruſſia. A country ſuffers from its population, when the thouſands of rich are obliged to maintain the millions of poor. Such a fallacious population muſt either periſh, or emigrate, or occaſion revolutions.

The nations inhabiting the Ruſſian empire are; Ruſſians, Coſſacks, of whom are four denominations, Samoyedes, Morduanes, Cheremiſſes, Chuvaſhes, Votiaks, Vogules, Permiaks, Sirianes, Oſtiaks, Barabinzes, Tunguſes, divided into the Connei Tunguſi, Olenni Tunguſi, and Sabatſhi Tunguſi, thus diſcriminated becauſe ſome Tunguſes travel with horſes, ſome with rein-deer, and others with large dogs, Kalmucks, Burats, Yakutes, Yukagiri, Korzaki, Kamtſhadales, Tartars, who are likewiſe divided into ſeveral kinds, Finns, Eſthonians, Lettes, Livonians, Armenians, Indians, beſides the Germans and other Europeans. To theſe might be added the Chuktſhi, Tſhalatſhi, the Kurilli, and perhaps yet others. Theſe different tribes and populations are of as various manners, tempers, and habits of life: to ſpecify them diſtinctly would engage us in too wide a field of of defcription. But of the principal nation, the Ruffians, it will be expected of us to make fome obfervations.

Characteriftics, &c. of the Inhabitants of Ruffia.—The Ruffians are defcribed as a moderate-fized, vigorous, and durable race of men. Their growth and longevity, however, are different in different diftricts; but upon the whole they are rather large than fmall, commonly well-built, and very feldom deformed. Their common or difcriminating features are, a fmall mouth, thin lips, white teeth, little eyes, low forehead, and nofe often fmall and turned upwards; the beard almoft always very bufhy, and the hair varying from dark-brown to red; but feldom quite black. Their countenance expreffes gravity and good nature or fagacity. Their fenfes of fight and hearing are very acute, and the gait or jeftures of the body indicate a peculiar and often impaffioned vivacity. As to the females, a delicate fkin and ruddy complexion are in the vulgar opinion regarded as the firft requifites of beauty. Young girls arrive at maturity in the 12th or 13th year, and this is afcribed to the frequent ufe of hot baths; but on the fame account married women feldom retain the frefh complexion and the peculiar charms of youth beyond the firft lying-in.

The character of the Ruffians is mixed, like that of moft other nations, as well as of individuals; the Ruffian character is, however, compofed of a very extraordinary mixture. The Ruffians are a people who, with a particular degree of pride, combine much fubmiffivenefs, levity, kindnefs, efpecially towards foreigners, prudence and cunning on one hand, but likewife fidelity and honefty on the other, a certain propenfity to fuperftition and ufury, and a great proportion of felfifhnefs. The Ruffian eafily runs from one extreme to the other. Prone as he is to fuperftition, fo apt is he to be carried into the contrary failing. He hefitates long before he engages in friendfhip; but being then generally firm in his attachment, he is revengeful when, in fpite of his caution, he is deceived in the choice of his friend: while he fcolds, threatens, and rages, no harm is to be apprehended; but if he makes no noife when he thinks himfelf offended, he is a dangerous enemy. He is greatly fwayed by felf-intereft, and furrenders himfelf entirely to the impetuofity of his paffions. Gaming and drinking have an irrefiftible authority over him. Among the lower fort it is generally the men who give themfelves up to thefe exceffes; though, indeed, a drunken woman ftaggering along the ftreets is no uncommon fight. The Ruffians are remarkable for their comelinefs of perfon, ftrength of body, courage and intrepidity in war, ingenuity, wit, and obedience to the commands of their fuperiors.

The infatiable greedinefs of the common people for fpiritous liquors, efpecially in the *maflanitza*, or carnival feafon, is in a great meafure afcribable to the rigorous fafts of the church, and the flender diet they live upon throughout the year. Their food chiefly confifts of turnips, cabbages, peafe, falt-cucumbers, onions, coarfe fifh, with oil and black bread. Their common beverage is quas, which is a kind of acidulated fmall beer.

The Ruffian women are exceffively fond of paint, and look upon ruddy cheeks as the very effence of beauty; fo that in the Ruffian language, red and beautiful are convertible terms. Even the village girls all over the country know how to prepare a particular herb to the purpofes of rouge.

Perfons of diftinction drefs after the German and French fafhion, and are paffionately addicted to ftate and fplendour. The drefs of the common people is coarfe and fimple, but they are neat and cleanly in their apparel. Both fexes wear a crucifix on their breafts, fufpended round the neck by a ftring, which is put on at their baptifm, and never afterwards put off; thofe of the peafants are of lead; but the better fort have them of filver or gold. The peafants let their beards grow to their full length. In Ruffia there are few peculiar difeafes. The common Ruffians ufe but few medicines, their place being fupplied by the fweating-bath; and indeed baths have been common in this country from time immemorial. In the bath-room the heat is ufually from 32° to 40° of Reaumur; and by throwing water every five minutes on the glowing hot ftones in the chamber of the oven the heat rifes to 44°. The vapour-bath is habitually ufed by the Ruffians once or twice a week; for which purpofe almoft every houfe has the neceffary apartment. They often fally forth naked from the bath, run about in the cold, and roll themfelves in the fnow, or in fummer plunge into the water, and then rufh again into the bath.

A particular air of grace and civility is obfervable in the falutations even of the common people to one another; but on entering a room, before they greet the company, the cuftom is to make repeatedly the fign of the crofs, at the fame time bowing as often to the picture of fome faint, which is fo placed in every room as to be feen immediately on coming in. In vifits of ceremony, it is ufual for both men and women to welcome each other with a kifs. Great deference, approaching to fervility, is fhewn to perfons of fuperior rank.

The nation confifts chiefly of the nobility and peafantry, to which we may add the burgeffes and the Kozaks or Coffacks. The nobility formerly confifted folely of knæfes or princes. Boyar is not a title of nobility, but anciently denoted the poffeffor of a poft or office, as a privy counfellor, &c. To the former, Peter the Great added the titles of count and baron. The knæfes are extremely numerous, and, therefore, unlefs very rich, or of illuftrious races, not greatly honoured. This great multitude of knæfes proceeded, among other caufes, from the cuftom of giving that title to the baptized Tartarian murzas, in the idea that murza, among the Tartars, was of nearly the fame import as knæs. Every knæs, as well as every count, even though no more than a common foldier, has, in virtue of his birth, the ftyle of *vafhe fiatelftvo*, which is commonly tranflated *your excellency*. The nobles may be proprietors of land and people, and hold the higheft offices in the civil and military departments. The "Dvorianini" are a kind of city-nobles, and the "Odnodvortzoi" are the loweft clafs of nobleffe. The burgher ftate, yeomanry, or commonalty, is compofed of the "Poffatfki" and "Rafnotfhintzi," who live in towns and villages, governed by their proper magiftrates, whether as merchants or tradefmen. They are excluded from offices and pofts of fervice of honour, and furnifh head-money and recruits, but cannot be vaffals. The peafants are vaffals of the great, attached to the foil, *glebæ adfcripti*, and groan under many oppreffions: far, however, from being dull and ftupid, they are remarkably ready witted, and are in no want of natural parts. Of the peafantry, fuch as belong to the crown and the monafteries pay taxes according to the laws of the land, and are liable to other duties impofed by the fame authority; but they may be transferred as donatives from the crown. They may purfue trade, in connection with their rural concerns, if they think it beneficial or convenient. Noble boors are the vaffals of their lord; from thefe recruits for the army are taken by lot. Coffacks form a particular clafs originating from the peafantry; they live exempt from taxes in villages, forts, and petty towns, on the produce of their fields and paftures, or the labour of their hands; they furnifh no recruits, and are not given away as ferfs, and they enjoy other privileges. But they all ferve as light-horfemen, as early and as long as as they are fit for it, providing themſelves with horſes, clothes, and accoutrements, and only receive pay when they are in actual ſervice. See Cossacks.

The intercourſe between the ſexes is more free than in other countries, which is owing to the contracted ſpace of their habitations and ſleeping rooms, their baths, the ſimplicity of their converſation, and their artleſs ſongs. The behaviour of huſbands towards their wives is, in compariſon with that of more poliſhed nations, rough and auſtere. The marriage contract is made with mercantile punctuality; the betrothing is performed with eccleſiaſtical rites, generally eight days previous to the marriage, and is indiſſoluble. The marriage is ſolemnized in the church before the altar, to which they proceed with the figure of ſome ſaint carried before them; and during the ceremony a crown is put on each of the heads of the married pair. The prieſt, with due forms, changes their rings, admoniſhes them of their reciprocal duties, gives them a cup to drink, in token of the union of their fortunes, and diſmiſſes them with his bleſſing.

The national diverſions of the Ruſſians on holidays, at weddings, and on other occaſions of feſtivity, are very various, and much reſemble thoſe that are cuſtomary with the Perſians, Arabians, and Egyptians. Their muſic is more uſually vocal than inſtrumental. Their ſongs are ſimple recitations, ancient or modern, on the ſubjects of love, nature, and tales of chivalry, giants, and heroes, frequently lewd; and their melodies are uniform and monotonous, but ſometimes ſufficiently pleaſing. The little groups of girls, ſitting together in an evening and ſinging, afford much amuſement. The moſt complete vocal muſic is that which is heard in their churches, on Sundays and holidays; which, as the church allows of no inſtrumental muſic in divine worſhip, is performed by ſingers expreſsly taught and moſtly brought from the Ukraine. The ſubſtance is Slavonian poetry; the notes are expreſſed by points, after the very old faſhion, for four voices. The preſent choral muſic is moſtly by mottete. The moſt common inſtrument of the nation is the Cow-horn, which is a kind of cornet, of from one to four feet in length, made of wood or tree-bark. For a deſcription of the balalaika, ſee Balalaika. The gudak is a miſerable violin with three ſtrings: the dutka conſiſts of two parallel reed-pipes, each with three holes, differing in their notes up to an octave, ſo that the hearer conceives that two are played on it. The rilek is a common village lyre; and the valinka a diminutive pair of bagpipes. The guſſi is a horizontal harp with wires, played on with the fingers, and capable of any kind of muſic: it is a pleaſing inſtrument and much uſed; and ſo is likewiſe the cornet among ſailors and boatmen: the ſailors alſo make a kind of jingling noiſe with two bunches of little bells, keeping time with their muſic. Dancing is a diverſion to which the Ruſſians are very much devoted; and they are no leſs attached to gymnaſtic paſtimes.

The dead are long and ſincerely lamented by their ſurviving relations; but, from a natural repugnance to the idea of death, they uſe little ceremony with the corpſe. They bring it to the grave in an open coffin, covered only with a pall, attended by prieſts, chanting hymns, and bearing croſſes and lighted tapers in their hands. At the place of interment they take leave of the body by a kiſs, then faſten up the coffin, and let it down into the grave. Perſons of the lower claſs bury their dead in their ordinary clothes. At the new year is annually held a feaſt of the dead, on which occaſion every body viſits the grave of his relations, lays ſome victuals upon it, and hears maſs, in payment for which the prieſts get the victuals.

The ancient orthodox Greek *religion* is univerſally acknowledged both in doctrine and diſcipline. (See *Greek* Church.) The churches and ſacerdotal veſtments are very magnificent. The people are ſtrict in the obſervance of the outward forms of religion; attendance on maſs, keeping the faſts (which take up one-third of the year), performance of domeſtic devotions, confeſſion, receiving the ſacrament, &c. Paſſion week is obſerved with great apparent ſolemnity; but Eaſter week is paſſed much as in other countries, in various diverſions, drunkenneſs, and debauchery. The Ruſſians are ſuperſtitious, both in their notions and practices, believing in ghoſts, apparitions, and hobgoblins. Some ſpecimens of their ſuperſtitions we ſhall here ſubjoin. On the Thurſday before Whitſuntide, the girls celebrate the feſtival of the Slavonian goddeſs Lada and her ſon Dida, with ſinging, dancing, and decorating a birch-buſh with garlands of ribbons; which they afterwards throw with much ſolemnity into a river, and infer, from the figures aſſumed by the ribbons in the current, to whom they ſhall be married, and their ſubſequent condition. On the fifth of January they go by night into a croſs-ſtreet, or into a cellar, which is called "To go hearing," and fancy they hear, in every ſound, the prediction of their deſtiny. The day after Chriſtmas is ſolemnized by the midwives, becauſe the Virgin Mary's midwife had a great hand in the redemption of the world: but it is needleſs to enlarge in this way.

The *clergy* in Ruſſia enjoy peculiar privileges: they cannot ſuffer corporal puniſhment without being previouſly deſecrated, and they are exempt from taxes. The empire comprehends, according to the uſual enumeration, 18,350 pariſh churches and cathedrals of the orthodox Greek religion. The number of Ruſſian clergy is computed at 67,900 perſons, without including their families. Some authors aſſert, that the whole empire contains 480 monaſteries and 74 nunneries; the former including 7300 monks and the latter 5300 nuns; but theſe numbers are ſuppoſed to be exaggerated: Mr. Coxe ſtates the nuns at only 1300, and this is ſaid to be a juſt eſtimate. The monaſteries all follow the rule of St. Baſil. By the laws of Ruſſia no eccleſiaſtic can be brought before a temporal judge, unleſs commiſſaries of the clerical order be likewiſe on the bench. For the boors of Ruſſia, ſee Boors.

Throughout the old provinces of Ruſſia not any beggars are to be ſeen. The inferior claſs of nobility, which is the moſt numerous, live at their eaſe in the country. They are the true Ruſſian farmers: their well-being depends on the progreſs of agriculture, and it proſpers in their hands. The peaſantry are very far from being unhappy. They are in general much more at their eaſe than the ſame order of men were in France, under the ancient government, when it was hardly poſſible for a carriage to ſtop, any where between Lyons and Paris for example, without being ſurrounded by a clamorous troop of beggars. Even the number of wealthy peaſants is by no means inconſiderable; and it muſt every day become greater, ſo long as they retain their ancient ſimplicity of manners. Their ſavings neceſſarily accumulate under the form of capitals, and theſe capitals by degrees become productive; for many peaſants have already abandoned agriculture, to engage in other branches of induſtry, as manufactures and trades, and even commerce. It is only in Finland and the Poliſh provinces that the peaſants are poor.

The power of a ſtate does not ſolely depend on the number of its inhabitants, but upon their wealth and activity. Ruſſia, in this reſpect, has no reaſon to complain. She is ſufficiently peopled for the actual ſtate of her national riches. What would not this empire become, if its population was more concentrated!

The Ruſſian *language* is an improved dialect of the Slavonian, which, with its characters, is ſtill uſed in the offices of religion. According to M. Schlœtzer, it is preferable to almoſt all the European languages. It is rich in words, ſoft, expreſſive, and requires great flexibility in the organs of utterance. It is, however, difficult of attainment by foreigners, on account of its innumerable peculiarities and anomalies. The Ruſſian grammarians themſelves are not agreed even concerning the number of letters contained in the alphabet. Some make it to be forty-one, and others thirty-one; whilſt Rodde, with greater propriety in the opinion of Mr. Tooke, fixes the number at thirty-eight. Some of theſe letters are merely notes of accent in pronunciation.

Government of the Ruſſian Empire.—As far as hiſtory reaches, Ruſſia has always been an hereditary empire. The throne was occupied by Rurik and his deſcendants, according to the uſual computation, from about the year 862 to 1598: and when Michael Feodor Romanow aſcended the throne in 1613, a charter was executed confirming it to him and all his poſterity, by which act Ruſſia was in a formal manner declared a real hereditary empire. His acceſſion to the throne was by unanimous election, "in a general aſſembly of the boyars and the other eſtates of the country," and partly by his relationſhip to the tzarian family now extinct in the male lineage, and alſo in virtue of nomination, by which his father had already been heir to the throne. On a vacancy the heir takes poſſeſſion of the throne, without any invitation or acts of homage. The oath of allegiance is uſually adminiſtered to all claſſes of ſubjects, though the ſovereign may diſpenſe with it. The coronation has for many centuries been cuſtomary in Ruſſia, and is ſtill continued, on which occaſion the ſovereign, who puts the crown on himſelf, is anointed with holy oil. Since the introduction of Chriſtianity, the ſovereigns have always profeſſed themſelves of the orthodox Greek church. As to the title of the ſovereign, we may obſerve, that Ivan Vaſſillievitch declared himſelf tzar in the year 1547, but it was expreſsly given to the ſovereigns of Ruſſia long before: this title in the Ruſſian Bible ſignifies a king. In 1721 Peter I. aſſumed the appellation of emperor; and this imperial title has been borne ever ſince by the ſovereigns of Ruſſia. The abridged title, uſual in ukaſes, ſentences, commands, petitions, &c. is "emperor and autocrator, or empreſs and autocratrix, of all Ruſſia, or of all the Ruſſias." It is beſide our purpoſe to diſcuſs the queſtion concerning the ancient origin, or even exiſtence of fundamental laws of the empire: it will be ſufficient to remark, that all the preſent laws of this kind may be reduced to two principal claſſes, as they aſcertain either the authority and prerogatives of the ſovereign, or the claims of the ſubjects. Thoſe that regard the ſovereign comprehend the hereditary ſucceſſion, the uncircumſcribed authority, including all the great and excluſive prerogatives of majeſty, and the principle that the ſovereign is an imperial majeſty and the dominion an empire: thoſe that regard the ſubjects include ſpecific obligations and rights, and they concern either the empire at large, or particular tribes, ranks, and claſſes; ſuch are ſecurity of perſon, of reputation, of property, the non-denial of juſtice, legal protection againſt violence and oppreſſion, unmoleſted enjoyment of all lawfully obtained immunities, privileges, and rights; the right, on the extinction of the reigning family, if no ſucceſſor be appointed, to elect one, &c. Accordingly, the nobility may juſtly demand the quiet enjoyment of all the privileges and immunities granted to them by letters of grace. The burghers may appeal to the privileges granted to them in the regulations for townſhips. The Don Coſſacks, and other nations of that kind, may juſtly expect that no invaſion be made on their diſtricts and poſſeſſions, or any infringement of their rights, &c.

The legiſlative authority is veſted ſolely in the monarch; neither the whole nation as a body, nor ſingle members or claſſes of it, can claim any part of it. The ſovereign is alſo the ſole diſpenſer of all ranks and dignities; to the higher he himſelf appoints the perſons, and ſigns with his own hand the inſtrument or patent. The inferior degrees are beſtowed in his name by the proper commiſſioners or boards, *e. g.* in the civil department by the ſenate, in the military by the college of war, in the navy by the admiralty, in the church by the ſynod, in the medical department by the college of medicine, &c. Formerly there were ſeveral monopolies of the crown; but the late empreſs, to the manifeſt advantage of her ſubjects, aboliſhed the greater part of them, reſerving only two, *viz.* ſalt and brandy. As to landed property in general, it belongs either to the crown, or to private owners, and that again either to individuals, or in common to a whole tribe. Another prerogative that adheres to the throne is that the ſovereign can appoint a regency during the minority of his ſucceſſor, and fix the period of his arriving at majority. The form of government in Ruſſia is unlimited monarchy; however, the free-born Ruſſian ſubjects are always treated as ſuch; and in general, it is permitted the ſubjects to utter their complaints and to make a repreſentation of them. From ſeveral ukaſes it appears, that the next ſucceſſor, his conſort, and all their children, are ſtyled grand dukes and grand ducheſſes, and that they all bear the title of imperial highneſs; that it is conferred upon them always by a ſigned decree of the monarch, and that, reſpecting the grand-daughters, the terms grand ducheſs and grand ducal princeſs are ſometimes ſynonimous. The rights of the grand duke, as heir apparent, do not ſeem to have been accurately defined; he is the firſt ſubject, but he has properly no functions ariſing from his high birth and appointment, theſe depending on the good pleaſure of the ſovereign. The princes and princeſſes of the reigning family have no ſettled eſtabliſhment; their houſehold depending on the pleaſure of the ſovereign. The annual allowance to the grand duke, it is ſaid, is uſually 220,000 rubles, and ſometimes more, to which are added many great preſents.

The arms in the middle ages were borrowed from Moſcow, at that time the imperial reſidence, and conſiſted of St. George on horſeback, killing a dragon with a ſpear. Ivan Vaſſillievitch made choice of a black ſpread eagle, with a crown on each head, a larger crown between them, in a golden field, and holding in one claw a ſceptre, and in the other an imperial mound, with the arms of Moſcow on the breaſt. Sometimes it is ſurrounded with a collar compoſed of the arms of ſome of the countries belonging to the Ruſſian empire, as Aſtrachan, Kazan, Siberia, &c. This is accordingly the imperial ſeal, and when the late empreſs uſed it for letters, it had an imperial mantle, and over it an imperial crown. The court is compoſed of the great officers of ſtate, of ſenators, actual privy-counſellors, princes, counts, barons, &c. On court-days acceſs is open to every ſubject. Six orders of knighthood form a part of the ſplendour of the court, with their peculiar inſignia. The firſt three were conſtituted by Peter I.; the two next by the late empreſs Catharine II., and the ſixth proceeds from Sleſwick-Holſtein. Of the former five the monarch is always grand-maſter; but of the ſixth, the grand duke, as duke of Sleſwick-Holſtein. To the fourth and fifth, penſions are annexed to a ſelect number of the eldeſt knights. Theſe orders take precedence according to the ſeniority of their

their inſtitution. They are as follow, St. Andrew, St. Catharine, St. Alexander Neffsky, St. George, Vladimir, St. Anne of Holſtein. See each reſpectively.

Of the imperial colleges, inſtituted for the government of the Ruſſian empire, our limits will allow our mention only of the two principal and ſupreme, viz. the "Directing Senate," and the "Holy Synod." The former was conſtituted by Peter I., who raiſed it to the rank of the ſupreme or higheſt college of the empire. In 1763 the late empreſs new-modelled it, cauſing it to conſiſt of ſix departments, four at Peterſburg and two at Moſcow. This ſupreme imperial college, ſtyled by the empreſs the ſanctuary of the laws, can iſſue orders to any other imperial college, and receive reports from them (the ſynod excepted); it publiſhes the laws and edicts received from the monarch, and provides for their execution; returns a deciſive anſwer to the queſtions ſent in by the courts or governors in doubtful caſes; appoints to many conſiderable poſts in the viceroyalties; advances, in the name of the ſovereign, meritorious civil officers to higher rank, and is the higheſt tribunal to which appeal can be made, for none can either appeal from its decrees nor complain of them; but any one who is diſſatisfied with its ſentence has no other reſource than to preſent his petition to the cabinet. The ſecond ſupreme college is the "Holy Directing Synod," which is the higheſt ſpiritual court of the Ruſſo-Greek church. In 1789 this college conſiſted of one metropolitan, one archbiſhop, one biſhop, one proto-pope (the imperial confeſſor), one archimandrite, one proto-pope (of the ſeculars), one upper procureur, one chief ſecretary, one executor, three ſecretaries, one protocoliſt, and one ſtaff-ſurgeon; the abſent members were one metropolitan, two archbiſhops, and one biſhop. At the ſynodal comptoir at Moſcow, at that time, were one metropolitan, one arch-prieſt of the ſecular clergy, one procureur, and one ſecretary. In the ſpiritual commiſſion, one metropolitan, one archbiſhop, one privy-counſellor, and one ſecretary, have their ſeats. Under the authority of the ſynod are all prelates, conſiſtories, eccleſiaſtics, churches, religious books, &c. For the other ſubordinate imperial colleges, we refer to Mr. Tooke's account of them; as well as for other particulars relating to the laws, the conſtitution of the Ruſſian government, and the condition of the Ruſſian ſubjects. On this latter topic we ſhall ſelect and ſubjoin a few particulars.

The nobleman, generally ſpeaking, pays no tax for any part of his land which he occupies himſelf, nor even for his moveable property. If he poſſeſs no male vaſſals, his fields, foreſts, mines, mills, fiſheries, &c. which he occupies with free or hired labourers, are as exempt from taxation as his perſon; but, on the other hand, the nobleman who has vaſſals muſt furniſh recruits out of them. The clergy, in regard to their perſons, are likewiſe exempt from taxes. Their ſtipends, which conſiſt in money, and in the country of corn and pieces of land, are raiſed by them free of all deductions. Placemen, and officers of the crown, &c. pay no annual tax on their ſalaries. Literary men, who are not enrolled in any guild, and who, beſides their learned profeſſion, as phyſicians, lawyers, &c. are not engaged in trade, are entirely exempt from taxes; and this is alſo the caſe with artiſts, &c. People who live ſolely on the intereſt of their capital, and do not inſcribe themſelves in any guild, however large their income may be, pay no tax upon it whatever. All inhabitants of towns poſſeſs their immoveable property free of all taxation. As for the great body of the yeomanry or country-folk, their real neceſſaries are ſubject to no taxes, becauſe in all Ruſſia there is no ſuch thing as exciſe; and in general the taxes are not oppreſſive. That both the nobility and burghers live in affluence is manifeſt from the luxury that every where prevails. The Ruſſian boor, even the vaſſal of the nobleman, lives very decently in his houſe, has a ſufficiency of wholeſome food, is neatly dreſſed, puts commonly two or three diſhes on his table, and even accumulates a trifling capital, though, as it is not ſecured to him, and may be taken from him, he frequently buries it in the ground. In ſome villages the boors diſplay even an opulence. Among the very numerous nobility many poſſeſs fortunes of 100,000 or 500,000 rubles, and ſometimes more; and the generality may have a fortune of between 30,000 and 100,000 rubles. In no country are the learned profeſſions ſo well provided for as in ſome provinces of Ruſſia, particularly Livonia and Eſthonia. The preacher, even in the ſmalleſt country-paſtorate, lives on a footing no leſs brilliant than the general ſuperintendant in many of the provinces of Germany. Although his ſtipend is ſmall, yet his preſents for the diſcharge of his official duties from noblemen and burghers are numerous and large. His daily table is ſupplied with ſeveral diſhes; he has men ſervants and maid ſervants; he is commonly the friend and confidant of the noblemen of his pariſh, and his houſe is the place of their uſual reſort. The caſe is ſimilar with regard to law-advocates, phyſicians, ſurgeons, and private tutors. On account of the flouriſhing ſtate of commerce in the maritime towns, there are many merchants who poſſeſs capitals of ſome hundred thouſands of rubles. The condition of the boors is far from being contemptible and wretched. The Coſſacks generally enjoy not only the neceſſaries but the accommodations and comforts of life. In the parts about the Don, eaſe and affluence are every where ſeen; and the Coſſacks of the Ural paſs their time in idleneſs and yet in plenty from the riches obtained by means of the productive fiſheries on that river. Upon the whole, the writer now cited obſerves, that the moderate taxes, the cheap living, the excellent and numerous products, the contentedneſs of the people, and the good regulations adopted through the empire, afford to every one who conducts himſelf well in his ſtate of life, ſufficient means for acquiring a competency. The majority of the Ruſſian ſubjects fare better in their way than the great multitudes in France, Germany, Sweden, and ſeveral other countries.

The ſocial ſtate of the inhabitants of the Ruſſian empire is capable of great melioration, and productive of much actual comfort, from the opportunities that are afforded them for active and induſtrious exertions. The objects of the *chace*, in the moſt northern and eaſtern parts of Ruſſia, and particularly on the iſlands between Kamtſchatka and America, and alſo in the governments of Tobolſk, Perm, Ufa, Viætka, Archangel, Olonetz, Vologda, and ſome others, afford both an amuſing and lucrative employment. The chace, for the ſake of furs, is of primary importance in its relation to foreign commerce. The moſt valuable of all the animals that are ſought for their ſkin is the "ſable," the ſkin ſerving as a ſtandard to the tribute, which is paid to the crown by the Siberian nation of hunters. This animal is found in Aſiatic Ruſſia, from the Aleutan iſlands and from Kamtſchatka to the diſtricts of the Petſchora and of the Kama. The fineſt ſables come from Yakutſk and Nertſchinſk; and among theſe are likewiſe, though rarely, yellow, and very ſeldom, white ſables. The Kamtſchatka ſables are the largeſt of all. As the ſable is become ſcarce, the crown accepts of the ſkins of foxes, martens, ſquirrels, and fiſh-otters, from the inhabitants of Siberia, inſtead of the ſable. Eaſtern Siberia, and particularly Kamtſchatka, abound moſt in beautiful foxes. To the other objects of chace for the furs, we muſt add the bear, the wolf, the lynx,

the

the glutton, the ferret, the pole-cat, &c. which, generally ſpeaking, are ſpread over the whole of North Ruſſia; and vaſt quantities of their ſkins are either conſumed at home or ſent abroad. But we have not room to enumerate all the animals that are profitable objects of chace to the Ruſſians. We ſhall obſerve in general, that peltry of all kinds may be conſidered as a remarkable and lucrative product of the Ruſſian empire. The principal ſpecies are: ſables, beavers, blue and white foxes, wolves, hyænas, lynxes, ermines, peſtzui or muſcovite dogs, ſquirrels, martens, hares, ſheep, wild cats, panthers, tigers, and bears. The Ruſſians have the art of dyeing the furs ſo ingeniouſly, that the Chineſe, and therefore others who are not good judges, are eaſily cheated.

Beavers are chiefly found in Kamtſchatka; they are principally uſed in trimming the caps and peliſſes of women of quality.

Foxes are every where met with in Ruſſia proper, in the conquered provinces, and in Siberia. Thoſe of Siberia are the beſt. Beſides the common croſs-blue fox, they have very dark, called black, and even white foxes, which laſt, however, are extremely rare, and, like the black, fetch a higher price than ſables. The ermine is a ſort of rat, and is employed for trimming peliſſes. All minever is ſquirrel-ſkin. The Siberian is incomparably darker, thicker, and more laſting, and accordingly much dearer than the ordinary Ruſſian. The Ruſſian hare-ſkin is of the hare peculiar to this country, which in winter becomes white. The ruſſaki cannot be uſed as fur, as they never change their colour. Common coarſe ſheep-ſkin affords a warm and durable peliſſe for the lower order of people; the finer is worn even by perſons of diſtinction. The Kalmuck and Bucharian ſheep-furs are rather ſcarce and dear, ſtill more ſo are the Kalmuck furs of unborn lambs. The genuine Bucharian ſheep-ſkins are watered, and the Kalmuckian by nature criſp and curly. But here likewiſe great frauds are practiſed, as the Ruſſians frequently curl the fine ſkins of the common ſort, in order to impoſe upon the unwary.

Bear-ſkins and tiger-ſkins are uſed only for covers to ſledges, and trappings for horſes, or, inſtead of beds, for ſervants to lie on. Boots are lined with the ordinary Ruſſian cat-ſkin; but the blue Siberian cats yield a very beautiful fur.

All theſe ſkins are ſold either by the piece or ſackwiſe. Two hundred ſkins of Ruſſian, and a hundred ſkins of Siberian minever, compoſe a ſack, and two hundred hare-ſkins are alſo reckoned a ſack. The Ruſſians are ſingularly induſtrious and ingenious in aſſorting their furs. Of one ſort of ſkin they make ſeveral deſcriptions of furs; as, for example, a particular fur is prepared of the ſmall dark ſtripe on the backs of ſquirrels, another of the ſides, again another of the bellies; and in like manner with the ſkins of other animals.

Beſides the chace, which has always been the excluſive occupation of particular nations of the Ruſſian empire, there are alſo tribes who maintain themſelves principally or wholly by the *fiſhery*, and with whom even the eſtabliſhment of this trade forms a part of their civil conſtitution. Some follow it for their own ſupport, while others, as the Coſſacks of the Don and the Ural, and the tribes on the ſhores of the Volga, carry on a lucrative traffic with the products of their fiſhery. The Frozen ocean, together with its bays and rivers, affords various ſpecies of ſea-animals, that are ſought after by ſeveral nations. To the inhabitants of the governments of Archangel and Olonetz the iſlands of Spitzbergen and Novaya Zemlia afford the chief ſcene of fiſhery at the proper ſeaſon. The animals that principally engage their attention are whales and morſes. Accordingly, every year a ſhip goes from Archangel to winter at Spitzbergen, and at leaſt one, frequently more, to Novaya Zemlia. The inhabitants of Meſen navigate theſe coaſts only in ſummer. From the morſe fiſhery the chief commercial products are the blubber and the ſkin; the blubber for its oil, and the ſkins, when dried, for horſe traces, and when cut, as ſize for the paper-manufactories. The teeth of the morſe likewiſe are tranſported to Peterſburg, Meſen, and Archangel, and are wrought up into the various works for which ivory can be uſed. The Frozen ocean alſo teems with the narwhal, the pott-fiſh, from whoſe brain ſpermaceti is prepared, the ſea-dog, dolphin, ſea-hog (delphinus phocæna), hay-fiſh (ſqualus carcharias), ſea-cow (trichecus manatus), the ſea-bear (phoca urſina), the ſea-lion (phoca leonina jubata), the ſea-otter (lutra marina), and many others, which are caught either for their ſkin or their blubber. Among the principal objects of the fiſhery on the coaſts of the White ſea, which ſkirt the government of Archangel, are the cod, the navaga (gadus callarias), plaiſe, ſoals, ſtock-fiſh, and herrings. The Dvina and the Petſhora abound in that excellent fiſh called by the Ruſſians ſighi and ſalmons, the latter being reckoned the fatteſt and beſt flavoured of all Northern Ruſſia, and they are therefore frozen or ſalted, in order to be tranſported to a great diſtance round the country. The Oby alſo affords an ample ſupply of ſturgeons, ſterlet, white ſalmon, pikes, muræna, quobbe or quappe (gadus lota), and a multitude of other fiſh. The Oby fiſhery is chiefly carried on by Oſtiaks and Samoyedes. The Irtiſch alſo contains almoſt all the fiſh that are found in the Oby; and here the fiſhery is very conſiderable. The Yeniſſei and Lena, and moſt of the rivers that fall into them, furniſh great variety and abundance of fiſh. The whale fiſhery we ſhall have occaſion to mention under another article. The Eaſtern ocean furniſhes, beſides the whale, the ſea-bear, ſea-lion, ſea-cow, and ſea-otter, which we ſhall elſewhere deſcribe. In a commercial view, there is not any of theſe marine animals ſo important as the ſea-otter, the beautiful fur of which is in high eſtimation. See Fur.

The fiſhery on the Caſpian, as Pallas obſerves, is in ſome reſpects as important to Ruſſia, as the herring, the cod, and the whale fiſhery to other maritime powers of Europe. Of the fiſh of the Volga, the ſeveral kinds of ſturgeon and the white ſalmon are the beſt. The Kamma, which falls into the Volga, alſo abounds with fiſh, which is held to be the beſt flavoured of any in Ruſſia, at leaſt its ſturgeon, ſterlet, and white ſalmon, are preferable to thoſe of the Volga. Beſides theſe three kinds, a principal fiſh of the Kamma is a ſmall ſalmon called in Ruſs kraſnaya reba, red or beautiful fiſh (ſalmo eriox, or ſalmo alpinus). For an account of the means for catching fiſh on the Volga, and on the confines of Aſtrachan, ſee Utsching. The fiſhery on the Ural is not leſs conſiderable than that of the Volga; and being under good regulation, it forms the principal ſupport and occupation of the Uralian Coſſacks. See Ural.

The fiſhery of the Euxine and the ſea of Azof, though neither ſo important nor extenſive as that of the Caſpian, affords numerous ſorts of ſturgeon. The whole northern coaſt of the ſea of Azof, from the Don to Perekop, is laid out in fiſheries, for which theſe diſtricts are extremely favourable. The moſt conſiderable fiſheries on the peninſula of Taurida are at Kertſh and Yenicaly, where the capture uſually begins in May, and continues till ſome time in October. On the coaſts of the Baltic, alſo, a conſiderable fiſhery is carried on. The gulfs of Riga and of Finland contain generally the ſame kinds of fiſh. In the waters of Livonia, ſays a naturaliſt of that country, are forty-nine different ſpecies of fiſh, among which the ſalmon, ſtreamlings, pike, and lampreys,

preys, for exportation if not for home consumption, are the most important. One species of fish peculiar to these waters is the kyllo streamling, caught in great numbers in autumn, near Revel and Roggervyk. They are pickled, and form a good substitute for anchovies and sardelles, and thus prepared, they are sent abroad to various parts. The potted lampreys from Narva are no less exquisite. The greatest store of the gulf of Finland consists of sterlets, salmon, and carp. Sturgeon are found in the gulf of Cronstadt, and likewise at times in the Neva. In winter, the transport of frozen fish from the remoter parts of the empire to St. Petersburg is very considerable. In Russia there are several lakes that afford an abundant supply of fish. The chief of these is the *Baikal*, which see. The Tschan, a Siberian lake, is particularly prolific in fish; and in this respect among the European lakes the Ladoga is the most remarkable. The Peipus and the Ilmen also yield a great variety of fish, and the smaller European lakes are proportionally productive. According to the calculations of Hermann, the whole value of the fishery in one year, may be estimated at 15,000,000 of rubles.

Another branch of productive industry in the Russian empire is the *breeding of cattle*. The nations of herdsmen in this empire are the Kirghises, the Kalmucks, the Baschkirs, the Burats, and several others less numerous: the breeding of cattle is a principal trade with the Cossacks of the Don, the Nogayans, the Barabinzes, and some others; with most of the nations of hunters it is a considerable means of profit, and as a profitable branch of trade it flourishes in many districts of proper Russia. The breeding of cattle affords to the inhabitants many, and in some districts all the means of subsistence, and yields besides to commerce a multitude of articles for exportation. Two of these are hides and tallow: of the latter, in the year 1793, 1,035,000 poods were exported; and the value of that quantity amounted to 4,279,000 rubles, not including the tallow candles, the exportation of which amounted in value to 170,000 rubles. Yufts and leather were in the same year shipped off to the amount of 2,249,000 rubles, and the other exports in the products arising from the breeding of horned cattle, made a sum of more than 163,000 rubles. The whole value of all these articles in one year was upwards of 6,862,000 rubles. The breeding of sheep is also an article of importance in the Russian empire. The Nomades are richer in sheep than in any other article, and even the boors and Cossacks in Southern Russia and Siberia possess flocks of hundreds and thousands. Through the whole country this branch of productive industry might be very much improved. Goats and hogs are also animals that yield to the Russian empire considerable profit, and with due attention might be rendered much more lucrative. Hog's bristles constitute an important article of exportation; in the year 1793, these, to the value of 742,000 rubles, were shipped off. The horse, the ass, the camel, the rein-deer, and the dog, are animals which are capable of being rendered profitable to this country in a much greater degree than they now are; though at present they are not unworthy of attention.

Another branch of productive industry in the Russian empire is *agriculture*. In Russia, agriculture is less the business of the peasantry than in other countries. Throughout the empire every village has its proper territory, and every estate its allotted inclosures and commons. In Siberia every man takes as much ground from the open steppes as he can manage; and when such a portion of ground is exhausted, he proceeds to another, &c. so that these little slips of land lie scattered at twenty, fifty, and even eighty versts distance from the village. In Russia and Siberia they cultivate winter rye and summer rye, winter wheat only in Russia as far as the Kama, summer wheat both in Russia and Siberia; barley, spelt-barley, or bear-barley plentifully in Russia; oats in Russia and Siberia; few pease, and still fewer vetches and beans; a great deal of buck-wheat; in Siberia, Tartarian buck-wheat, millet, and the grain called panicum germanicum, only in Russia. The villagers have hay-fields on the banks of lakes and rivers, in brakes and fens of the forests. The old withered grass, weeds, twigs, and light stuff they set on fire, and this occasions an appearance which at night is tremendous. Besides corn, they grow flax in large quantities, chiefly on the Volga, but most of all in the government of Yaroslaf, and also in the governments of Moscow and Kazan. Hemp is indigenous in all the south and middle of Russia and Siberia, and is propagated in great abundance, both for the material of linen, sail-cloth, &c. and for the oil expressed from its seed, of which a very great quantity is consumed for food during the fasts, and which, as well as the hemp, is exported annually to a great amount. Woad likewise grows wild in Southern Russia and Siberia; it is gathered in the Ukraine, and employed in staining and dyeing. It is also cultivated in the government of Penza, and about the Don. Tobacco is planted almost solely, but in great abundance, in the Ukraine. Hops are propagated by the villagers only, in small quantities, in the governments of Kazan, Nishnei-Novgorod, &c.; and in Siberia, in the province of Irkutsk, the wild sort is plentiful. Orchards are of little account, except in the chief towns. No fruit-trees thrive in Siberia. Water-melons are much cultivated in the south-eastern parts of Russia, from the Don to the Ural, especially on the Volga. In the breeding of cattle, the countryman is directed by climate and pasturage. In the south of Siberia a person often possesses 300 horses, as many sheep, about half the number of horned cattle, always a few swine, and much poultry, sometimes geese and ducks. The Russian horses are of a middling size, with large heads, long flabby ears, not very handsome, but spirited, strong, and hardy. The horned cattle are small and brisk: the cows give little milk, which is poor and thin. In Little Russia the oxen are used for draught. About Archangel there is a fine breed of large cows, originally brought from Holland, and they do not degenerate. The true Russian sheep are distinguished from the common sort by a short tail, about the length of seven inches. Hogs, dogs, and cats are of the ordinary kinds. The poultry are housed all the winter in the cottage, under the hearth and the sleeping benches, for the sake of having Easter eggs. The culture of bees is the principal concern of the Baschkirs in the Ural, and is also an object of attention in Southern Russia. In the northern districts of Russia and Siberia the chace is pursued as a trade, particularly for those animals whose skins are used as furs, especially sables and grey squirrels, for the wear of the Russian gentry in town and country. The carrier's trade is a source of great profit. The towns at the distance of from 500 to 1000 versts, serve as stations for changing the drivers and carriages, *e. g.* from Kiachta, Irkutsk, Krasnoiarsk, Tomsk, Tara, Ekaterinenburg, &c. The country market-towns and hamlets are commonly open, and mostly built in irregular streets, with little kitchen-gardens and large yards to the houses; they are situated on the banks of rivers, for the convenience of obtaining water. They contain many churches; and the monasteries in or near them, from their strong walls, massy gates, and numerous church towers, have the appearance of castles. The fortresses dispersed about the country have seldom earth-ramparts, but are mostly built like their houses, with a low palisade round them. The cannons stand on the gates and on the angles of the ramparts,

or

or batteries on wooden carriages. These are designed to keep the tributary tribes in awe, and the neighbouring Nomades from the borders. Ostrogs, or houses surrounded with a palisade of upright pointed bauks, are situated either in towns, where they serve as prisons for criminals, or solitarily, in various parts of the country, for the same purposes as the fortresses. The parishes, or church villages, are sometimes very extensive; containing 500 or even 1000 and more farms, and from three to seven churches, many of them brick buildings, markets, and trafficking places. Large villages are frequently called slobodes, but many slobodes are less than church villages; the houses are ranged in straight streets, and the streets mostly laid with timbers.

Of the nations, says Mr. Tooke, who have followed agriculture from time immemorial, though in various ways, and with different success, the principal are the Russians, the Poles, the Lithuanians, the Lettes, the Finns, and Esthonians. The state of agriculture in all countries must depend on the nature of the soil and climate, as well as on the industry of the inhabitants. With this view of Russia, the most northern and eastern districts of the empire, of the former, particularly in Siberia, are totally unfit for every kind of economical culture. The 60th degree of latitude may be regarded as the boundary beyond which no agriculture is practicable. The repeated attempts that have been made about Okhotsk (between 59° and 60° N. lat. and 160° E. long.), and Udskoy-ostrog (55° 20′ N. lat. and 150° 40′ E. long.), in the government of Irkutsk, shew, that the culture of corn will never be introduced to effect; and even in Kamtschatka, where the southernmost cape runs out to 51° N. lat. similar trials have been made with very poor and precarious effects. Admitting, therefore, the 60th degree of latitude to be the general boundary of the soil susceptible of culture to the north, we may infer, that the Russian empire contains about 162,000 square geographical miles of land totally unserviceable to the purposes of agriculture. Accordingly the circles in the governments of Olonetz and Archangel have no agriculture, and even in some districts of Vyborg, St. Petersburg, Novgorod, Vologda, Perm, and Viætka, it is attended with almost insuperable, or at least deterring difficulties. In some also of the southern districts of Caucasus, Saratof, Ufa, Kolyvan, Ekaterinoslaf, and Taurida, the soil is so poor, that the natural impediments can perhaps never be entirely surmounted. To the fertile regions belong most of the governments of the middle, and several of the northern tracts; but the best and most productive soils are chiefly found in Little Russia, Kazan, Simbirsk, Kharkof, Kursk, Orel, Nishnei-Novgorod, in the southern part of Taurida and Caucasus, in the newly-acquired portion of the Polish Ukraine, and particularly also in some of the Siberian provinces. The great fertility of the districts bordering on the Volga, the Kama, the Dnieper, the Terek, and the parts about the Euxine, has been long experienced. Moreover, in the territory of Krasnoiarsk, a circle-town of the government of Kolyvan, between the 55th and 56th degrees of N. lat., the fertility of the soil is such, that no instance has occurred of a general failure, and that it is a very ordinary harvest, when the summer rye yields 10-fold, the winter corn 8-fold, and the barley 12-fold. It is usual for the wheat only in bad years to yield the sixth grain, and the oats give an increase rarely short of 20-fold. In consequence of this exuberance, provisions are here in great plenty, and probably in no province of the empire at so low a price. When Pallas was at Krasnoiarsk, a pood of rye-meal sold for 2 or 3, and a pood of wheaten flour for $4\frac{1}{2}$ or 5 kopeeks; a whole ox was bought for $1\frac{1}{2}$ ruble, a cow for a ruble, and a good serviceable horse for 2 or 3 rubles at most; sheep and hogs fetched from 30 to 50 kopeeks a-piece. And though in 25 years that have elapsed since that period an alteration has taken place, yet this country is still one of the cheapest, as well as one of the richest and most plentiful of all.

The implements of husbandry, without which no great progress in the culture of the soil can be expected, are the most simple and artless that can be well imagined.

In such a state, and with such instruments, we need not wonder that agriculture is negligently and badly conducted, and yet we may well be surprised, that the country so managed should yield so considerable a produce; the bounty of nature supplying the work of skill in most of the provinces of middle and southern Russia. Moreover, in the provinces lying in the Baltic, in the White-Russian governments, in the Polish Ukraine, and even in proper Russia, on the estates of noblemen who carry on the farming business with some degree of care, much greater pains are bestowed, and in general more ingenious implements are used. It would lead us too far to give an account of the practice of husbandry either in the northern or southern provinces of Russia; yet, in spite of all the defects of Russian agriculture, its products are so numerous and important, that they not only supply the home consumption, but constitute by far the most considerable article of exportation. The corn most generally cultivated in Russia, and in those tracts of land that do not lie farther north than the 60th degree of latitude, is rye: wheat is more cultivated in the middle and southern governments; in the government of Ekaterinoslaf is cultivated the "Arnautan" wheat, which yields a yellowish flour, and which produces in good years 15 corns above the sowing. Turkish wheat, or maize, is raised on the confines of the Terek and in Taurida. Barley is also a considerable produce of governments in which wheat succeeds, and oats also are cultivated for the consumption of the people in meal for porridge.

Of the four kinds of corn now enumerated, Russia annually exports a considerable quantity, especially from the Livonian ports. The Livonian corn is said to keep longer than that of other countries, not to need such frequent turning, and likewise to yield more flour. In 1793 these exports amounted, in corn and meal, to the value in wheat, of 1,490,000; in rye, of 1,379,000; in barley, of 236,000; and in oats, of 17,000 rubles. The other corns cultivated for home consumption, but not for exportation, are millet, spelt or bear-barley, buck-wheat, manna, or festuca fluitans, growing almost every where in Russia, on meadow-grounds that are overflowed, particularly in the governments of Riga, Pscove, Polotsk, Novgorod, Tver, Smolensk, &c. and rice. Potatoes are cultivated only in a few governments, and chiefly among foreign colonists. Grasses, and fodder of all kinds, every where abound in the Russian empire; and vegetables, for the use of manufactures and commerce, are very abundant, such as hemp, of the produce of which the export, in 1793, amounted to upwards of 8,808,000 rubles; without including the hemp-oil. Flax of the best kind, and most in quantity, is cultivated in the governments of Vologda, Pscove, Novgorod, Riga, Mohilef, Tver, Polotsk, Viætka, the confines of the middle Volga, and in the parts about the Oka and Kama. Both the common and the Siberian flax are often found wild, the former in the steppes, about the northern Ural, the latter on the shores of the Volga, near Tzaritzin, and in other places. Among the plants growing wild, and yielding fibres like flax or hemp, is also the common and the Siberian stinging-nettle (urtica dioica and cannabina), which are found plentiful on the Uralian mountains.

mountains. The Baſchkirs, the Koibals, the Sagayan Tartars, &c. prepare yarn and weave linen of them. Of flax, in feeds and other products, excluſively of the oil, the exportation in 1793 amounted to 7,220,000 rubles. Cotton has hitherto been little cultivated; ſome attempts have been made about Aſtrachan and Kitzliar, on the Terek; but there are other climates and ſoils that would ſuit it. Some wild-growing ſilk-plants, yielding a material ſimilar to cotton, known among botaniſts by the name of "cynanchum acutum," and "apocynum maritimum," grow wild in the worſt ſoils, and might be cultivated and manufactured to advantage. There are alſo other plants of a ſimilar kind that might become objects of profitable attention. Ruſſia alſo furniſhes a variety of plants that would afford, if duly regarded, abundance of dyeing materials; ſuch as madder, which grows wild on the banks of the Oka, near Riazan and Arſamas, on the borders of the Volga, in the confines of Syſran and Saratof, and in great quantities, and of ſuperior quality, about the Samara, in Taurida, on the Terek, and in ſeveral diſtricts of the government of Caucaſus; woad (iſatis tinctoria), and a variety of it (iſatis luſitanica), which are ſeen wild in ſeveral of the ſouthern governments; ſaffron, which grows wild about the Terek, in the governments of Voronetch and Ekaterinoſlaf, in Taurida, and eſpecially in the Caucaſian mountains, around Moſdok; and ſafflower (carthamus tinctorius), which thrives perfectly well in the gardens at Toropetz, Moſcow, Tzaritzin, Poltava, and other places. Among the vegetables for fabrication and trade, we might enumerate hops and tobacco; the former grows wild in moſt diſtricts of Ruſſia and Siberia, and the latter is cultivated in the Malo-Ruſſian governments, and alſo about the Volga and the Samara, and particularly by the Coſſacks on the Orenburg and Siberian lines.

In 1793 the exportation from Ruſſia of hemp-oil and flax-oil exceeded in value 697,000 rubles.

Of medicinal plants of all kinds, Ruſſia poſſeſſes a great ſtore; ſuch are the rhubarb (rheum compactum), and the rhapontic, or Siberian rhubarb (rheum undulatum). Saſſafras (ſaxifraga craſſifolia) grows abundantly in the ſouthern and lofty ſnow-mountains of Kolyvan; and the polypodium fragrans, a beautiful and odoriferous fern, is gathered by the Buræts on the ſummits of rocks, and is taken as a wholeſome tea againſt ſcorbutic and colicky complaints. The culinary vegetables that are cultivated in Ruſſia are ſo numerous and various, that it is needleſs to mention them. Beſides thoſe ſhrubs and berries known to us, ſuch as raſpberries, currants, ſtrawberries, which grow in ſurpriſing quantities, gooſeberries, &c. Ruſſia produces in great abundance ſeveral which are here very rarely or never ſeen. Of theſe, for inſtance, are the berries called *pianitza*. In appearance they are much like the bilberry, but have a very different, exceedingly agreeable taſte, and intoxicate if taken in quantities. Hence it is they have their appellation, from *pian*, drunk. Muſhrooms are found in great plenty, and are very generally eaten, excepting the champignon, which, for what reaſon it is not eaſy to diſcover, is carefully avoided by the common people. Of the Ruſſian muſhrooms, the riſchicki or ritzgen are moſt famous. This ſort of muſhroom is likewiſe found in Courland and Pruſſia. Their name, riſchicki, is derived from their reddiſh-yellow hue; and they are eaten either raw, boiled or broiled, or pickled. We ſhall further ſelect ſome other vegetables that have engaged more than ordinary attention: ſuch are aſparagus, which in the government of Moſcow, and ſome others, is made an article of trade; ſuch are berries of various kinds, ſome of which are peculiar to the north of Ruſſia, as well as to the whole of Siberia; the hazle-buſh, found over all Ruſſia as far as the Kamma, and ſo plentiful in the regions between Simbirſk and Kazan, as to give riſe to a branch of conſiderable trade, as a great part of Ruſſia and all Siberia are hence ſupplied with a ſweet-meat in very general uſe, eaten in the faſts with nut-oil; ſugar-melons and water-melons, which thrive in the open air to the 52d degree of latitude; the common orchard fruits, which ſucceed every where in the middle and ſouthern parts of Ruſſia. Of all the ſpecies of fruit produced in the Ruſſian empire, apples and pears are the moſt abundant. All the villages on the Oka and Volga have their orchards, or more properly apple-gardens, ſo that many boors live here without huſbandry, merely by horticulture, in good circumſtances. Cherries are very frequently produced in orchards, but in Southern Ruſſia there are even whole foreſts of cherry-trees. Apricots and peaches ſucceed in moſt parts of Taurida and Caucaſus, and in the ſouthern circles of Kief, Ekaterinoſlaf, Voſneſenſk, and ſome other governments, without much attention. The quince-tree grows wild and plentifully in the foreſts about the Terek: cheſnut-trees are only found ſingly in Taurida, Kief, and Voronetch: walnut-trees are ſeen in moſt diſtricts of Southern Ruſſia, and in great abundance; but the almond-tree grows only in the provinces that lie moſt to the ſouth: figs and pomegranate-trees are ſeen ſingly near Kitzliar and in Taurida; but lemons and orange-trees are every where raiſed only in hot-houſes, though Pallas aſſures us, that they would very well bear the winter in Taurida with more attention. The culture of the vine is at preſent carried on in the governments of Caucaſus, Taurida, Ekaterinoſlaf, and Voſneſenſk, and the country of the Don Coſſacks. The whole region of the Ruſſian empire, from the ſouthernmoſt borders to the 48th degree of latitude, conſtitutes a ſuperficies of more than 12,000 ſquare geographical miles; but of this large tract, ſcarcely one-fourth part is proper for the culture of the vine.

The foreſts of Ruſſia amount to a ſuperfluous abundance in the governments of Archangel, Olonetz, Tobolſk, and Irkutſk: the governments of Perm, Kazan, Smolenſk, Mohilef, Minſk, Tchernigof, Voronetch, Ufa, Tula, Simbirſk, Orel, Kaluga, &c. are richly furniſhed with them, not only ſupplying moſt of the forges and metal founderies, but alſo ſending excellent ſhip-timber to the yards. Moſt of the other provinces have a ſufficiency for their own conſumption; but ſome few of the ſouthern governments, as Kief, Kharkof, Kurſk, Ekaterinoſlaf, and Taurida, are but ſcantily provided. Of trees, thoſe that have narrow-pointed leaves are chiefly indigenous in Northern Ruſſia, forming foreſts of prodigious extent, among which the fir, the pine, and the black pine, are the moſt common and moſt widely diffuſed. The Siberian cedar (pinus cembra) is found particularly in the Uralian mountains; the larch-tree grows in the north of European Ruſſia, and in moſt of the Siberian mountains. Among the umbrageous trees the birch is the moſt common, and its bark and wood are applied to various purpoſes. Next to the birch is the linden, from which Ruſſia derives great advantage. The oak is indigenous only in the European part: it is moſt frequently found in the governments of Kazan and Voronetch, where it is chiefly employed in ſhip-building; but alſo in Little and White Ruſſia it forms conſiderable foreſts. The aſh and the willow grow almoſt every where: but beech, elms, the maple, and the poplar, are chiefly the growth of the ſouthern regions. The foreſts ſupply an extraordinary number of products for home conſumption, and alſo very conſiderable articles of export. In 1793 the value of the latter in ſpecie amounted to upwards of $2\frac{1}{2}$ millions of rubles, when Ruſſia ſhipped off to the value of 1,744,000 rubles in maſts, balks, and deals; 394,000 in pot-aſhes and or batteries on wooden carriages. These are designed to keep the tributary tribes in awe, and the neighbouring Nomades from the borders. Ostrogs, or houses surrounded with a palisade of upright pointed bauks, are situated either in towns, where they serve as prisons for criminals, or solitarily, in various parts of the country, for the same purposes as the fortresses. The parishes, or church villages, are sometimes very extensive; containing 500 or even 1000 and more farms, and from three to seven churches, many of them brick buildings, markets, and trafficking places. Large villages are frequently called slobodes, but many slobodes are less than church villages; the houses are ranged in straight streets, and the streets mostly laid with timbers.

Of the nations, says Mr. Tooke, who have followed agriculture from time immemorial, though in various ways, and with different success, the principal are the Russians, the Poles, the Lithuanians, the Lettes, the Finns, and Esthonians. The state of agriculture in all countries must depend on the nature of the soil and climate, as well as on the industry of the inhabitants. With this view of Russia, the most northern and eastern districts of the empire, of the former, particularly in Siberia, are totally unfit for every kind of economical culture. The 60th degree of latitude may be regarded as the boundary beyond which no agriculture is practicable. The repeated attempts that have been made about Okhotsk (between 59° and 60° N. lat. and 160° E. long.), and Udskoy-ostrog (55° 20′ N. lat. and 150° 40′ E. long.), in the government of Irkutsk, shew, that the culture of corn will never be introduced to effect; and even in Kamtschatka, where the southernmost cape runs out to 51° N. lat. similar trials have been made with very poor and precarious effects. Admitting, therefore, the 60th degree of latitude to be the general boundary of the soil susceptible of culture to the north, we may infer, that the Russian empire contains about 162,000 square geographical miles of land totally unserviceable to the purposes of agriculture. Accordingly the circles in the governments of Olonetz and Archangel have no agriculture, and even in some districts of Vyborg, St. Petersburg, Novgorod, Vologda, Perm, and Viætka, it is attended with almost insuperable, or at least deterring difficulties. Turkish wheat, or maize, is raised on the confines of the Terek and in Taurida. Barley is also a considerable produce of governments in which wheat succeeds, and oats also are cultivated for the consumption of the people in meal for porridge.

Of the four kinds of corn now enumerated, Russia annually exports a considerable quantity, especially from the Livonian ports. The Livonian corn is said to keep longer than that of other countries, not to need such frequent turning, and likewise to yield more flour. In 1793 these exports amounted, in corn and meal, to the value in wheat, of 1,490,000; in rye, of 1,379,000; in barley, of 236,000; and in oats, of 17,000 rubles. The other corns cultivated for home consumption, but not for exportation, are millet, spelt or bear-barley, buck-wheat, manna, or festuca fluitans, growing almost every where in Russia, on meadow-grounds that are overflowed, particularly in the governments of Riga, Pscove, Polotsk, Novgorod, Tver, Smolensk, &c. and rice. Potatoes are cultivated only in a few governments, and chiefly among foreign colonists. Grasses, and fodder of all kinds, every where abound in the Russian empire; and vegetables, for the use of manufactures and commerce, are very abundant, such as hemp, of the produce of which the export, in 1793, amounted to upwards of 8,808,000 rubles; without including the hemp-oil. Flax of the best kind, and most in quantity, is cultivated in the governments of Vologda, Pscove, Novgorod, Riga, Mohilef, Tver, Polotsk, Viætka, the confines of the middle Volga, and in the parts about the Oka and Kama. Both the common and the Siberian flax are often found wild, the former in the steppes, about the northern Ural, the latter on the shores of the Volga, near Tzaritzin, and in other places. Among the plants growing wild, and yielding fibres like flax or hemp, is also the common and the Siberian stinging-nettle (urtica dioica and cannabina), which are found plentiful on the Uralian mountains.

mountains. The Bafchkirs, the Koibals, the Sagayan Tartars, &c. prepare yarn and weave linen of them. Of flax, in feeds and other products, exclufively of the oil, the exportation in 1793 amounted to 7,220,000 rubles. Cotton has hitherto been little cultivated; fome attempts have been made about Aftrachan and Kitzliar, on the Terek; but there are other climates and foils that would fuit it. Some wild-growing filk-plants, yielding a material fimilar to cotton, known among botanifts by the name of "cynanchum acutum," and "apocynum maritimum," grow wild in the worft foils, and might be cultivated and manufactured to advantage. There are alfo other plants of a fimilar kind that might become objects of profitable attention. Ruffia alfo furnifhes a variety of plants that would afford, if duly regarded, abundance of dyeing materials; fuch as madder, which grows wild on the banks of the Oka, near Riazan and Arfamas, on the borders of the Volga, in the confines of Syfran and Saratof, and in great quantities, and of fuperior quality, about the Samara, in Taurida, on the Terek, and in feveral diftricts of the government of Caucafus; woad (ifatis tinctoria), and a variety of it (ifatis lufitanica), which are feen wild in feveral of the fouthern governments; faffron, which grows wild about the Terek, in the governments of Voronetch and Ekaterinoflaf, in Taurida, and efpecially in the Caucafian mountains, around Mofdok; and fafflower (carthamus tinctorius), which thrives perfectly well in the gardens at Toropetz, Mofcow, Tzaritzin, Poltava, and other places. Among the vegetables for fabrication and trade, we might enumerate hops and tobacco; the former grows wild in moft diftricts of Ruffia and Siberia, and the latter is cultivated in the Malo-Ruffian governments, and alfo about the Volga and the Samara, and particularly by the Coffacks on the Orenburg and Siberian lines.

In 1793 the exportation from Ruffia of hemp-oil and flax-oil exceeded in value 697,000 rubles.

Of medicinal plants of all kinds, Ruffia poffeffes a great ftore; fuch are the rhubarb (rheum compactum), and the rhapontic, or Siberian rhubarb (rheum undulatum). Saffafras (faxifraga craffifolia) grows abundantly in the fouthern and lofty fnow-mountains of Kolyvan; and the polypodium fragrans, a beautiful and odoriferous fern, is gathered by the Buræts on the fummits of rocks, and is taken as a wholefome tea againft fcorbutic and colicky complaints. The culinary vegetables that are cultivated in Ruffia are fo numerous and various, that it is needlefs to mention them. Befides thofe fhrubs and berries known to us, fuch as rafpberries, currants, ftrawberries, which grow in furprifing quantities, goofeberries, &c. Ruffia produces in great abundance feveral which are here very rarely or never feen. Of thefe, for inftance, are the berries called *pianitza*. In appearance they are much like the bilberry, but have a very different, exceedingly agreeable tafte, and intoxicate if taken in quantities. Hence it is they have their appellation, from *pian*, drunk. Mufhrooms are found in great plenty, and are very generally eaten, excepting the champignon, which, for what reafon it is not eafy to difcover, is carefully avoided by the common people. Of the Ruffian mufhrooms, the rifchicki or ritzgen are moft famous. This fort of mufhroom is likewife found in Courland and Pruffia. Their name, rifchicki, is derived from their reddifh-yellow hue; and they are eaten either raw, boiled or broiled, or pickled. We fhall further felect fome other vegetables that have engaged more than ordinary attention: fuch are afparagus, which in the government of Mofcow, and fome others, is made an article of trade; fuch are berries of various kinds, fome of which are peculiar to the north of Ruffia, as well as to the whole of Siberia; the hazle-bufh, found over all Ruffia as far as the Kamma, and fo plentiful in the regions between Simbirfk and Kazan, as to give rife to a branch of confiderable trade, as a great part of Ruffia and all Siberia are hence fupplied with a fweet-meat in very general ufe, eaten in the fafts with nut-oil; fugar-melons and water-melons, which thrive in the open air to the 52d degree of latitude; the common orchard fruits, which fucceed every where in the middle and fouthern parts of Ruffia. Of all the fpecies of fruit produced in the Ruffian empire, apples and pears are the moft abundant. All the villages on the Oka and Volga have their orchards, or more properly apple-gardens, fo that many boors live here without hufbandry, merely by horticulture, in good circumftances. Cherries are very frequently produced in orchards, but in Southern Ruffia there are even whole forefts of cherry-trees. Apricots and peaches fucceed in moft parts of Taurida and Caucafus, and in the fouthern circles of Kief, Ekaterinoflaf, Vofnefenfk, and fome other governments, without much attention. The quince-tree grows wild and plentifully in the forefts about the Terek: chefnut-trees are only found fingly in Taurida, Kief, and Voronetch: walnut-trees are feen in moft diftricts of Southern Ruffia, and in great abundance; but the almond-tree grows only in the provinces that lie moft to the fouth: figs and pomegranate-trees are feen fingly near Kitzliar and in Taurida; but lemons and orange-trees are every where raifed only in hot-houfes, though Pallas affures us, that they would very well bear the winter in Taurida with more attention. The culture of the vine is at prefent carried on in the governments of Caucafus, Taurida, Ekaterinoflaf, and Vofnefenfk, and the country of the Don Coffacks. The whole region of the Ruffian empire, from the fouthernmoft borders to the 48th degree of latitude, conftitutes a fuperficies of more than 12,000 fquare geographical miles; but of this large tract, fcarcely one-fourth part is proper for the culture of the vine.

The forefts of Ruffia amount to a fuperfluous abundance in the governments of Archangel, Olonetz, Tobolfk, and Irkutfk: the governments of Perm, Kazan, Smolenfk, Mohilef, Minfk, Tchernigof, Voronetch, Ufa, Tula, Simbirfk, Orel, Kaluga, &c. are richly furnifhed with them, not only fupplying moft of the forges and metal founderies, but alfo fending excellent fhip-timber to the yards. Moft of the other provinces have a fufficiency for their own confumption; but fome few of the fouthern governments, as Kief, Kharkof, Kurfk, Ekaterinoflaf, and Taurida, are but fcantily provided. Of trees, thofe that have narrow-pointed leaves are chiefly indigenous in Northern Ruffia, forming forefts of prodigious extent, among which the fir, the pine, and the black pine, are the moft common and moft widely diffufed. The Siberian cedar (pinus cembra) is found particularly in the Uralian mountains; the larch-tree grows in the north of European Ruffia, and in moft of the Siberian mountains. Among the umbrageous trees the birch is the moft common, and its bark and wood are applied to various purpofes. Next to the birch is the linden, from which Ruffia derives great advantage. The oak is indigenous only in the European part: it is moft frequently found in the governments of Kazan and Voronetch, where it is chiefly employed in fhip-building; but alfo in Little and White Ruffia it forms confiderable forefts. The afh and the willow grow almoft every where: but beech, elms, the maple, and the poplar, are chiefly the growth of the fouthern regions. The forefts fupply an extraordinary number of products for home confumption, and alfo very confiderable articles of export. In 1793 the value of the latter in fpecie amounted to upwards of $2\frac{1}{2}$ millions of rubles, when Ruffia fhipped off to the value of 1,744,000 rubles in mafts, balks, and deals; 394,000 in pot-afhes and barilla;

barilla; 249,000 rubles in mats, and 150,000 rubles in pitch, tar, and resin.

The Russian woods consist of limes, firs, pines, birch and larch-trees (larix), to which may be added some cedars. The beech and the oak are rarely seen, excepting in Kazan, where the oaks appear pretty plentifully. For ship-building the larch-tree is generally used, though some vessels are constructed of oak, which is brought at an almost incredible expence from the territory of Kazan to the yard of St. Petersburg. The larch, which in other countries is classed among the evergreens, is deciduous in Siberia. Besides the astonishing quantity of wood that is consumed as fuel, Russia has ample supplies of timber for construction. For, throughout the whole empire, excepting St. Petersburg, and a very few other places, the houses and churches are almost all of timber. And even at St. Petersburg great numbers of them are still seen, though, in pursuance of an express imperial edict, no new ones are to be built. These timber houses are extremely well adapted to the Russian climate, as being much warmer than those constructed of brick and stone. Both in towns and villages the same mode of building is uniformly practised. One balk is laid upon another to the height intended. The roof is formed either of boards or oak shingles; and the interstices between the balks are crammed with moss. The Russian carpenters, in the whole construction of a house, employ no other tool than an axe, and a sharp circular iron, with which they shave off the bark from the timber. With the axe alone they carve the ornamental comb or crest (*greben*), which is frequently wrought with exquisite ingenuity, and carried along the ridge of the roof. It appears strange to the foreigner that they never work without gloves, yet always, even in winter, go bareheaded. The generality of houses are only of one story; if they have another, as is occasionally seen in towns, the staircase is usually run up on the outside. In the houses of the boors, as well as those of the citizens, unless they are in good circumstances, are square holes instead of windows, provided with a wooden shutter. Sometimes these apertures are furnished with a hog's bladder, through which the light enters. Only boors of property have windows of isinglass. The boors' houses regularly consist of one room; which is at the same time kitchen, cellar, hog-stye, and the habitation of the whole family; together with the tutelary saints, who have their tabernacle in one corner of the upper part of the apartment, commonly however so encrusted with smoke as hardly to be cognizable. The boor, with all his inmates, customarily during the winter lodges on the shelves fastened to the walls about the stove which heats his room, and which serves also as an oven for dressing his victuals. Here they constantly sleep, winter and summer, without beds or other accommodations. In all the boor-houses the door of the room is uncommonly low. On account of the abundance of timber, and the cheapness of provisions, and consequently the moderate price of labour, building in Russia is not expensive. For five hundred rubles the burgher builds himself a house of five rooms, with an ice-cellar, stable, a bathing-room, and the necessary offices. The burgher-houses have withinside a somewhat better appearance than the houses of the boors; the walls within, and frequently without, being chipped smooth and whitened over with a sort of wash used for smearing their stoves, and which dries much faster than mortar. Houses in Russia are reckoned among the moveables, and in every town there is a house-market, where a man bargains for a house, packs it upon sledges, and sets it up wherever he chuses. Such a house will last thirty years, and often longer. Convenient, however, as these timber edifices are in several respects, they are hazardous in another point of view; since they may be considered as the occasion of such frequent conflagrations as happen in no other country; for, notwithstanding that in towns the houses stand pretty distant from each other, yet there never passes a year in which a very considerable number is not a prey to the flames. This is the less surprising on being informed that the common people generally stick a fir lath (luchine) into the wall, lighted at the projecting extremity, as a substitute for a candle, and that the precautions against fires, in the Russian provinces, are none of the best. Mr. Tooke says, that he has himself seen, more than once, in a provincial town, on a calm day at high noon, above 130, and at one time, upwards of 200 houses on fire. The number would certainly have been much smaller, if the houses had not been of wood, and proper precautions had been taken.

Besides the important advantages that Russia obtains from its wood, in regard of fuel and building, this product is profitable in several other ways, particularly in the preparation of potash. The rind of the numerous lindens that grow in the districts of Kazan and Astrachan is usefully employed in the manufacture of basket-work of all kinds; of which, as well as of masts and deals, Russia annually exports to a great amount.

As the mines constitute an object of great importance in the Russian empire, we shall here subjoin, from the work cited at the close of this article, an abridged account of them. The largest works of this kind are at present carried on in the Uralian, the Altayan, and Nertschinskian mineral mountains; the iron and copper mines of Olonetz, and those in several other parts of the empire, being of comparatively less importance. In the Uralian mountains are gold, iron, and copper mines, which latter are some of the most important in the empire. The Altayan mountains contain the richest gold and silver shafts, also veins of lead, copper, and iron, impregnated with gold and silver. But in the Nertschinskian mountains are very rich mines of lead, containing gold and silver. The discovery of these shafts, as well as the origin of the proper mine-working in Russia, is of no older date than the beginning of the last century. The art of mining, which had its rise in the reign of Peter the Great, was protected and encouraged in the year 1716 by a manifesto; and in 1719 he instituted the college of mines. In the reign of the empress Anna, and under the empress Elizabeth, the Russian mines acquired increasing importance and value; but their most brilliant era was the reign of Catharine II. The gold mines belonging to the Russian empire are properly two; *viz.* that of Beresof near Ekaterinenburg, on the Ural, which is by far the most material, and the Voytzer gold mines in the mountains of Olonetz. The most important silver mines are those of Kolyvan, in the mineral mountains of Altay. The silver, or rather the auriferous and argentiferous lead mines of Nertschinsk, have been wrought ever since the discovery of them in 1704.

From statements, which we cannot here detail, it appears that in the interval between 1704 and 1788, there were gained at all the gold and silver mines about 1000 pood of gold, and about 36,000 pood of silver, amounting together in value to upwards of 45,000,000 of rubles, on which the expences were not more than 15,000,000 of rubles.

The most important copper mines are principally in the Uralian, Altayan, and Olonetzian mountains. The entire annual amount of the copper obtained from them is about 200,000 pood; the value of which in money, reckoning the pood only at 10 rubles, makes a sum of 2,000,000 of rubles.

The iron mines form, next to the salt-works, the greatest portion

portion of all Ruſſia's mineral wealth: the moſt numerous and rich of theſe are found in the Uralian mountains; and beſides theſe there are two ſmelting-houſes in the Altayan and Sayane mountains, and ſeveral in the governments of Olonetz, Vologda, Niſhnei-Novgorod, Koſtroma, Kurſk, Tula, Tambof, &c. We may allow for the whole empire about 100 forges, and 800 hammers. In the whole empire about 5,000,000 pood of iron are annually produced, which in ſpecie amounts at leaſt to 4,500,000 of rubles.

By the preſent conſtitution, the mines belong either to the crown, to public inſtitutions, or to private individuals. The firſt poſſeſſes all the before-mentioned gold and ſilver mines: the ſhare it has in the copper and iron mines is not accurately aſcertained, but, according to authentic ſtatements, concluded to be about $\frac{1}{6}$th of the former, and $\frac{1}{8}$th part of the latter. The crown mines, which were formerly under the ſuperintendance of the mine college, have, ſince the abolition of that college in 1784, belonged either to the cabinet or to the ſenate. The gold and ſilver mines of Kolyvan and Nertſchinſk are under the direction of the former, and the reſt of the crown mines are dependant on the ſenate. The only public inſtitution hitherto in poſſeſſion of mines is the "Imperial Aſſignation Bank," which purchaſed the copper and iron works in the government of Perm. The private mines have received ſo many grants by law, that it is not eaſy to aſſign to individuals their reſpective rights and immunities. The private owners of mines are moſtly nobles, but ſome are burghers and merchants. The works at the mines of the crown, as well as thoſe belonging to private perſons, are partly carried on by maſter-workmen, partly by inrolled boors, partly by vaſſals, and partly alſo by free workmen. From theſe mines Ruſſia obtains annually of gold about 40, and of ſilver about 1300 pood, amounting, according to the prices in 1789, to the value of 1,729,000 rubles. Theſe metals are brought to St. Peterſburg, and there moſtly coined, having been previouſly ſeparated at the imperial office for that purpoſe, and brought to the perfect ſtandard. Of copper are annually gained about 200,000 pood, eſtimated in value at about 2,000,000 of rubles. The copper which the crown receives from its mines, as well as from the taxes of private proprietors, is wholly coined. The export of this metal is inconſiderable; as in 1793 it amounted, from all the ſea-ports of the empire, only to 187 pood, equal in value to 2910 rubles. Of iron, about 5,000,000 of pood are obtained, the value of which, on account of the fluctuating price, cannot be accurately aſcertained. Ruſſia exports every year ſo great a quantity of this metal, that, next to hemp, it forms the moſt important article of exportation. In 1793 the export in bar and ſort-iron, as well as in caſt-iron goods, amounted to 3,033,249 pood, or in value of money by the cuſtom-houſe books, to 5,204,125 rubles. Lead is found in all the mines, particularly in thoſe of the Nertſchinſk and the Altay; but Ruſſia deriving little advantage from it, imported in 1793 at the port of St. Peterſburg 36,000 pood, valued at 125,000 rubles. Tin has not as yet been diſcovered, nor have the ſemi-metals in general been produced. Ruſſia has ample ſtores of noble, precious, and durable kinds of ſtone, which we ſhall not now record. Turf and coals are found in ſome parts, the argillaceous earths in great quantities, ſulphur ſufficient to prevent the neceſſity of importation, of ſalts ineſtimable ſtores, and of curious petrifactions and mineral waters, Ruſſia has a ſufficient quantity.

The ſalt-works of Ruſſia are numerous, rich, and productive. The ſalt is obtained partly from ſalt-mines, partly from ſalt-lakes, in which it cryſtallizes ſpontaneouſly, and partly from ſalt-ſprings, by boiling the brine, and evaporation. But notwithſtanding its inexhauſtible ſources of ſalt, Ruſſia has not ſufficient for the ſupply of all the provinces without importation. According to the facts above tranſiently ſtated, it may be admitted that there is produced annually in the Ruſſian empire, of gold about 40 pood, of ſilver 1300, of lead 30,000, of copper 200,000, of iron 5,000,000, and of ſalt 12,000,000; the value of all which in money may be eſtimated, by the moſt moderate computation, at 13,000,000 rubles; and if we allow for the advance in the price of mineral products ſince 1788, and conſider their preſent value, the ſaid ſum may be fixed, without exaggeration, at 15,000,000 rubles. According to the liſts of exports in 1793, the total capital with which the productive induſtry of the Ruſſian empire enriched it in that year amounted to 30,823,000 rubles; and this, it is ſaid, is rated too low.

Manufactures and Trade of the Ruſſian Empire.—Manufactories of wool, cotton, ſilk, flax, metals, &c. paper-mills, wax-bleacheries, ſalt-petre and glaſs-houſes, tapeſtry and porcelain fabrics, with many ſimilar eſtabliſhments, belonging partly to the crown and partly to individuals, and eſpecially the working of mines, employ an immenſe number of people, as well artiſts as tradeſmen, both in town and country. Oils of various kinds, iſinglaſs, cavear, ſoap, tallow-candles, beer and other liquors, brandy and ſpirits, vinegar, aqua-fortis and aqua-regia, potaſh, ſalt-petre, alum, vitriol, bitter ſalt, ſugar, colours for dye-houſes, dyeing, tobacco, paper, paper-hanging, play-cards, printing, ſail-cloth and cordage, linen, cotton, ſilk, gold and ſilver lace, cloth and ſtuff, carpet, hat, Ruſſia leather, or red and black yufts, which for colour, ſmell, and ſoftneſs, cannot be equalled in any other part of the world, (ſee YUFTS,) ſhagreen, wax, cabinet and coach-making, glaſs, plate-glaſs, ſtone-cutting, earthenware and porcelain, feathers, pitch-drawing, charcoal, ſulphur, powder, iron in various ways, and for various purpoſes, copper and braſs, cannon, gold and ſilver, clocks, mammots' bones, the beſt of which are found about the rivers Katanga and Indighirka, &c. &c. are the ſubjects of manufacture, and of the operation of artiſts in the Ruſſian empire. Siberia produces alſo a foſſil which has the properties of aſbeſtus. It is ſoaked, like hemp, in water, the threads are then drawn out, of which a linen is made which reſiſts the action of fire.

The commerce of Ruſſia is naturally divided into foreign and domeſtic: and theſe again into the maritime commerce on the Baltic and the White ſea, on the Euxine and the Caſpian; and the commerce by land with Poland, &c. with Perſia, with the Kirghiſes, and with China. The inland commerce is ſmall, and is moſtly conducted by ſhop-keepers and monopolizers; and the chief tranſport of goods by land is by caravans. The petty merchants carry on their trade by travelling from place to place about the country, and this kind of traffic ſupports and even enriches many families. Formerly all traffic was confined to the annual fairs; but for a long time every city and town, and many villages, have a regular market, beſides the annual fairs. Until about the cloſe of the 15th century, the foreign commerce was trifling, and almoſt wholly confined to Novgorod. But ſince the time of Peter the Great, commerce has revived. With the merchants of Ruſſia it is a general practice to be paid half the price before-hand of the inland commodities which they buy up and deliver to foreigners, according to contract, for exportation; but to take foreign goods upon a year's credit. The moſt conſiderable maritime commerce is at St. Peterſburg and Riga, by way of the Baltic at Archangel, on the Northern ocean, &c., at Taganrok on the Euxine, at Aſtrachan on the Caſpian, and at Kamtſchatka on the Eaſtern ocean. The principal ſeats of the foreign commerce by land are the Ukraine, whence the

Ruſſian merchants viſit the markets of Poland, and the fairs of Germany; Orenburg, where a conſiderable trade is carried on with ſeveral Aſiatic nations; and Kiachta in Daouria, where a great mercantile intercourſe is held with China.

Hermann ſtates the Ruſſian commerce, in all the ports, which may generally be termed the Baltic trade, as amounting, in 1790, to a ſum of 35,750,000 rubles, of which the exports make 21,200,000, and the imports 14,550,000 rubles. From all the ports belonging to Ruſſia in the Euxine or Black ſea, the exportation is reckoned at about one million, and the importation at one million and a quarter. The principal articles that find a vent here are, cannon, furs, ſalted beef, butter, cordage, ſail-cloth, caviar, corn, and a variety of Ruſſian manufactures, eſpecially iron, linen, cotton ſtuffs, &c. The imports are, wine, fruit, coffee, ſilks, rice, and all kinds of Turkiſh commodities. The exports over the Caſpian are ſtated to be about 1,200,000, and the imports 1,000,000 rubles. The articles of exportation are nearly the ſame with thoſe that find purchaſers on the Euxine, and in return ſcarcely any thing is taken but ſilk. See CASPIAN.

The commerce by land with the Poles, Pruſſians, &c. is conſiderable. From theſe countries Ruſſia takes commodities for about 2,000,000 of rubles, and carries to them for ſcarcely 500,000. The principal objects of importation are ſcythes, cloths, linens, hemp, flax, &c. the two laſt of which products are ſent off again from Riga. The commerce by land with Perſia paſſes over Kitzliar and Moſdok, and Ruſſia receives principally, by the ſame courſe, ſilk. The exports amount to about 100,000, and the imports to 200,000 rubles. The commerce with the Kirghiſes is moſtly carried on in the way of barter, and chiefly in the Siberian fortreſſes of Orenburg, Troitzk, Peterpavlovſk, Yamiſheva, Semipalat, and Uſtkamenogorſk. Goods to about 1,500,000 of rubles are exported, and imported to the ſame amount. The Kirghiſes bring principally horſes, horn-cattle, ſheep, and very coſtly ſheep-ſkins, receiving in return from Ruſſia woollen cloths, iron, and a great quantity of houſehold goods and other European commodities. The Chineſe commerce is merely a barter, but very conſiderable. Ruſſia, it is ſaid, has of late years received thence articles for 2,000,000 of rubles, and returned them for nearly as much. The chief articles that come to Ruſſia from China are, tea, ſilk, and kitaika (nankeen), and of thoſe that are carried thither, the valuable Siberian furs. The total aggregate of the commerce of Ruſſia by land is ſtated at near 9,800,000 rubles, which gives a balance of about 1,600,000 rubles againſt the empire.

In 1790 the trade of Peterſburg and Riga amounted to as much as the trade of the whole empire in the year 1762, which was then more than twice as much. According to Hermann, the aggregate of the commerce of the empire then amounted to about 50,000,000 of rubles, by which Ruſſia gained near 5,000,000 annually. The returns thus made by the Ruſſian ſubjects, reckoning exports and imports together, amounted to 15,000,000, among which thoſe commodities are to be underſtood, which are imported and exported in ſhips either built or bought in Ruſſia. The ſubjects have accordingly a ſhare of nearly one-third. The total of the imports and exports of Kiachta may be fairly ſtated at 4,000,000 of rubles.

In an empire that has 30,000,000 of inhabitants, the *internal* trade muſt be much more important and valuable than the external commerce. The Siberian commerce, that is, the commerce of the governments of Irkutſk, Kolyvan, Toboſk, Perm, and Ufa, is of great conſequence. All the products of theſe parts, not conſumed in the country, or not diſpoſed of to China, or to the Kirghiſes, go by the interior diſtricts and ports of Ruſſia. The major part at leaſt of the heavy commodities is brought almoſt entirely from the eaſtern regions of Siberia to St. Peterſburg. Moſt of the return or barter of European commodities againſt Siberian furs, and againſt Chineſe commodities, is carried on in the town of Irbit, in the government of Perm, where a famous fair is held in the months of January and February. The products carried every year from Siberia to Ruſſia are eſtimated at 12,000,000 of rubles, which are thus drawn annually by Ruſſia from Siberia; ſo that Siberia has not unjuſtly been called the Ruſſian Peru. The interior commerce of the Ruſſian provinces with one another, and their traffic in the ports and frontier places of the empire, are of ſtill greater importance. This kind of lucrative intercourſe is facilitated by the many large rivers with which the whole empire abounds. Several conſiderable fairs that are held in various towns and cities of the empire, contribute in a very great degree to aid the proſecution of traffic. The moſt conſiderable of theſe fairs is that at Makarief, a monaſtery and city in the government of Niſhnei-Novgorod, at which the Siberian and Ruſſian merchants aſſemble from all parts of the country. Among the trading cities of greateſt note, the principal are St. Peterſburg, Riga, and Moſcow. The latter is the central point at which all the affairs of the interior commerce of the empire flow together and unite, and it contains a numerous and opulent body of mercantile men. Mr. Tooke eſtimates the aggregate national wealth of Ruſſia in the following manner: 30,000,000 of inhabitants of both ſexes, making about 6,000,000 of families, each family conſiſting of five perſons, conſume monthly at leaſt 48,000,000, in the whole therefore 576,000,000 of poods of all kinds of meal, grits, &c. each pood, on an average, at 25 kopeeks, makes a ſum of

	Rubles.
	144,000,000
Conſumption of brandy, 5,000,000 of eymers, each at 3 rubles - - - - -	15,000,000
Salt, 12,000,000 of poods, at 35 kopeeks -	4,200,000
Gold, ſilver, lead, copper, iron, &c. - -	8,750,000
Fine and coarſe furs - - - - -	5,000,000
Hemp, flax, tobacco, linens, hemp-oil, linſeed-oil, &c. - - - - - -	30,000,000
Fire-wood, timber, charcoal, ſhip-timber, tar, pitch, &c. - - - - - -	20,000,000
Cattle, leather, wool, milk, pulſe, garden vegetables, &c. - - - - -	58,050,000
Product of the fiſheries - - - -	15,000,000
Total -	300,000,000

Of this capital, there comes to the annual ſhare of each individual 10 rubles.

By commerce, the annual exports of this capital are,

	Rubles.
In metal wares about - - - - -	3,000,000
In hemp, flax, and articles prepared from them - - - - - - -	10,000,000
In leather, tallow, furs, and all other products from the animal kingdom - - -	8,000,000
In corn, wood, and other petty articles -	4,500,000
Total -	25,500,000
To this add the tranſport at - - -	2,000,000
which together make out - - -	27,500,000

The

The quantity of money circulating in the empire in 1788, is ftated as follows:

	Rubles.
In gold and filver coin - - - - -	76,000,000
Copper coin - - - - - - -	54,000,000
Paper money - - - - - -	100,000,000
Total -	230,000,000

Add together this fum, and the progreffive value of the product, and there appears an annual political revenue of 530,000,000, or, to confine ourfelves to the loweft, of at leaft 500,000,000 of rubles. The quantity of fpecie, from the above-mentioned period, is faid to be every year increafed:

	Rubles.
By money ftruck of Siberian gold and filver, about - - - - - - -	1,700,000
By foreign coinage of various forts - -	1,300,000
By copper money - - - - - -	2,000,000
Total -	5,000,000

Forces of the Ruffian Empire.—The Ruffian army confifts partly of regular infantry and cavalry, and partly of irregular troops. To the latter clafs belong the Kozaks or Coffacks, who anfwer all the purpofes of regular huffars, and have acquired great military reputation. The moft ferviceable of this clafs of warriors are divided into thofe of Ekaterinoflaf and thofe of the Euxine. It is impoffible, from any documents before us, to afcertain the precife number of the Ruffian military; but from a ftatement given by Mr. Tooke from the college of war in the year 1791, they amounted to about 600,000 men, of whom might be reckoned at leaft 500,000 effective foldiers in actual fervice. Some authors have degraded the value of the Ruffian foldiers, but from fome late memorable exploits their character muft have rifen in general eftimation. A circumftance that diftinguifhes them is the fmall pay, on which they are able to fubfift. Frederic II. pronounced them to be excellent foldiers. Accordingly it is faid, that the Ruffian foldiers will not fall back one ftep, while his commander bravely keeps his ground; he contents himfelf with an extremely little pay, and with very flender diet, and is always cheerful; hungry and thirfty he traverfes the heavy fands of the defarts under the load of his accoutrements, without murmur or complaint; executes every command; reckons nothing impoffible or too difficult; does every thing that he is ordered to do without fhunning any danger; and is inventive of a thoufand means for accomplifhing his defign. What may not be performed with fuch an army when led on by experienced and valiant generals, in whom they have confidence. Let the foldier but fee that he is fpared as much as poffible, he attaches himfelf with all his foul to his commander, and performs almoft miracles. Well might the emprefs denominate the Ruffians an obedient, brave, intrepid, enterprifing, and powerful people.

In general, it may be affirmed, that no army in Europe cofts fo little as the Ruffian, and that no foldiers in Europe can fubfift on fo little pay as the Ruffian. For, what other European foldiers will fubfift on an annual pay not amounting to more than feven or eight rubles, or, when in garrifon, only half that fum, and the allowance of grits and flour weighed out to him with the utmoft nicety?

Concerning the pay of the officers, &c. it muft be obferved, that the officers of the garrifon regiments in the towns of the Baltic, have double the pay of other garrifon regiments; that the officers of all marching regiments have three times the pay of the officers of the regiments in the provinces; and that the private men in the guards have double the pay of thofe in the marching regiments. A general field-marfhal is allowed, *per annum*, 7000 rubles, 200 rations, valued at 1140 rubles, and 16 denfhiks or fervants.

	Rubles.	Rations.		Rubles.	Denfh.
A general in chief	3600	80	=	456	12
A lieutenant-general	2160	50	=	285	10
A major-general	1800	40	=	228	8
A brigadier -	840	20	=	171	7

In the marching regiments a colonel is allowed yearly 600 rubles, for rations 96 rubles 90 kopeeks, and 6 denfhiks or fervants.

	Rubles.		Rub.	Kop.	Denfh.
A lieutenant-colonel	360	For rations	62	70	4
A major - -	300	——	62	70	3
A captain - -	180	——	28	50	2
A lieutenant -	120	——	22	80	1
A fecond lieutenant	84	——	17	10	1
An enfign - -	84	——	17	10	1
A quarter-mafter of a regiment	84	——	22	80	1
An adjutant -	120	——	22	80	1

A private man is allowed yearly 10 rubles 98 kopeeks, befides three barrels of meal, a certain quantity of grift or coarfe oatmeal, 24 pounds of falt, and flefh to the value of 72 kopeeks, all which articles are computed at 5 rubles 74 kopeeks. But 6 rubles 35 kopeeks are deducted from the pay of every private man for clothing, medicines, flefh, cartridges, and repairing of fire-locks. His whole clothing from head to foot cofts near 12 rubles.

The navy of Ruffia confifts of two fleets, diftinct from each other. The creator of the Ruffian fleet was the emperor Peter I. Before his reign armed veffels, much lefs fhips of war, were not known in Ruffia; but in confequence of travelling into foreign countries, for the fake of informing himfelf concerning the beft method of building fhips, and with a view of introducing it into his empire, he raifed a maritime force, and caufed a fet of regulations to be printed for the eftablifhment of a navy. The admiralty is at Peterfburg, with a high admiral at the head of it. According to the regulation of Peter I., the high admiral has the rank and pay of a general field-marfhal in the army; an admiral thofe of a general-in-chief; a vice-admiral thofe of a lieutenant-general; and a contre-admiral thofe of a major-general. The captains in the navy were divided by Peter I. into three claffes. At prefent, the captain-commander has the rank of a brigadier in the army; the captain of the firft clafs the rank of a colonel, and the captain of the fecond clafs that of a lieutenant-colonel; the captain-lieutenant that of a premier-major; the lieutenant that of a captain in the army, and the midfhipman that of a lieutenant. The pay of the high admiral *per annum* is 7000 rubles; that of an admiral, 3600; of a vice-admiral, 2160; of a contre-admiral, 1800; of a captain-commander, 840; of a lieutenant 200, and of a midfhipman 120 rubles. Officers are allowed denfhiks or fervants, *viz.* a lieutenant two, and the reft in proportion. When they are at fea, the officers are allowed table-money, *viz.* in the Baltic, each officer monthly has feven rubles, and the captain fomewhat more. On long voyages this allowance is increafed. The failors are divided into two claffes: to the firft belong the experienced, at 18 rubles *per annum* each; but thofe of the fecond clafs have only 12. Moreover, they are fed while at

fea;

sea; but when on shore, each receives his ordinary provision, as in the land service. To a ship of 100 guns the crew is usually reckoned at 1000 men.

Russia had formerly no more than two dock-yards, those of Petersburg and Archangel, to which have been added those of Kherson, Cronstadt, and Taurida. At Petersburg and Cronstadt the men of war are constructed of oak, transported thither at a great expence from Kazan. At Archangel the ships are built of the wood of the larch-tree.

Revenues of the Russian Empire.—Mr. Coxe estimates the national revenue of Russia at 41,830,910 rubles, which is below the just amount. Mr. Tooke professes to give a more accurate statement: and he begins with enumerating the sources from which the national revenue is derived. The *first* of these sources is the "head-money," paid only by male heads, including babes and old men, and supposing 12,000,000 of taxable persons, and averaging them at 72 kopeeks each, the amount will be very considerable. The *second* source is the "tax upon the capital of merchants," or, as it is sometimes called, the *per centage*. Every one pays yearly one *per cent.*, in return for which he and his children are exempt from the poll-tax. The *third* source of revenue is the "domain lands," the income of which is very various. 4. The "sea-duties," which are liable to great fluctuations. 5. The "land-tolls." 6. The duties on "law-proceedings," commonly called "poschlin," to which may be referred the passport money. 7. "Stamped-paper," which brings in a considerable sum *per annum*. 8. The duty on the "sale of immoveable property," including not only houses and lands but also vassals; fixed by the late empress in 1787 at five *per cent.* 9. The "kabaks," or tipling-houses, or the sale of corn spirits. 10. The "salt-trade." 11. The "mines." 12. The "mint." 13. "Natural products." 14. The share of "excise and recognition duties" in towns. 15. The "posts." 16. All kinds of "rent" for places, shops, mills, parcels of ground, bee-hives in forests, bathing-houses, fisheries, public inns, &c. 17. "Recruit money" from merchants, from which foreign merchants are exempt. 18. Various "pecuniary penalties." The amount of the receipts from the several towns is upwards of 46,000,000 of rubles, which it has been thought may be rated at 48,000,000.

Coins, Measures, and Weights of the Russian Empire.—We are informed by Mr. Tooke (ubi infra), that previous to the 10th century neither foreign nor domestic coin was known in Russia; but that instead of it, small pieces of marten and squirrel skins, stamped, were the only currency. From that period frequent mention is made in the chronicles of Grecian and other sorts of money. It is said by some persons, that the first coins were introduced by the Tartars into Russia, and that the Russian word for money, "denghi," is derived from the Tartarian term "tanga," which signifies a token; but, when coins were impressed with the arms of Moscow, *viz.* a St. George and his spear, the name "kopeeka" arose from kopæ, or kopeitzo, a spear. Towards the middle of the 16th century, though coins had been struck in several places before, the tzar Ivan Vassillievitch instituted the first regular coinage, set up a mint at Moscow, and caused three rubles to be struck out of one "grivenka," denoting probably a certain weight of silver. However, at this time, and long afterwards, the ruble was only an imaginary coin. The first actual rubles were struck during the reign of tzar Alexey Mikhailovitch, in the year 1654, though history makes mention of the ruble about the year 1317. The first ruble of 1654 is still extant, and it is easily discernible to have been previously a Spanish cross-dollar; Russian rubles having been recoined from dollars. A foreign dollar then passed for 50 kopeeks. But afterwards, in consequence of the war with Poland, the coin suffered a diminution; and for some time, kopeeks and altines were struck of copper. The intrinsic value, however, of the ruble remained unaltered at 100 kopeeks. Various alterations were made in the coinage by Peter I. By an edict of 1724, he ordered that no more silver kopeeks should be coined, and in lieu of them he caused to be struck one and two-kopeek pieces of copper, having on one side the St. George, and on the other within the initial of the emperor's name П, the value of the coin. All mints were abolished except those at Moscow; and in process of time a mint was set up at St. Petersburg, which is at present the only one where gold and silver coins are struck. Although the mint of Moscow still exists, it is confined to the coinage of copper money. At this time Russia has one mint for silver and six for copper coin.

After the battle of Pultava, Peter caused to be coined pieces called sun-rubles, now very scarce, having on the reverse a sun in the centre, and in the area the initial in Russ П. Besides the ruble, there were coined at the same time half and quarter-rubles (poltiniki and polpoltiniki, or poltins and polpoltins), bearing his likeness and the imperial eagle. The grieven, or tenth part of a ruble, had 10 dots, with the inscription "Grievenik" on one side, and the eagle on the other. The altins, or three kopeeks (copecks), had on one side the eagle, and on the other the date of the year and the word "Altinik." These were all the silver coins under Peter I. The empress Elizabeth for a short time caused five-kopeek pieces to be coined, which have long since ceased. The gold coins in Russia have been always struck in larger sorts than those of silver. Nevertheless most of the gold coins, of ancient times, still subsisting, consist of very small sorts. There are some that are called "golden kopeeks." A Russian ducat was formerly equal to two rubles silver, whence probably arose the denomination of golden ruble, as well as the quarter-ruble, now shewn as curiosities. Under Peter I. the gold coins were either two-ruble pieces, with the apostle Andrew on the reverse, which are very rare; or ducats with a Latin inscription. On one side is the bust of Peter with a crown of laurels, on the other the Russian imperial eagle, with the St. George on its breast. Both sides have round them "Petrus Alexii I. D. G. Russ. Imp. M. Dux Moscoviæ 1716." The empress Elizabeth first caused imperials, half-imperials, golden rubles, and half-rubles, to be struck. At the accession of Peter I. the copper coins were half-kopeeks (denuschka or denga), kopeeks, and five-kopeek pieces. On the first, stands on one side "Denga," and on the other 1706. The kopeeks have on one side the St. George, and on the other "Kopeika." The five-kopeek pieces have undergone several alterations. The copper five-kopeek pieces that had been struck by Elizabeth were fixed by Peter III. at 10, but Catharine II. reduced them again to five kopeeks. For the accommodation of the provinces of Esthonia and Livonia, the empress Elizabeth, in 1757, caused to be struck the livoneses of whole, half, and quarter pieces; the whole piece being in value 96 kopeeks; but the coinage of these soon ceased.

In Russia, accounts are kept in rubles of 100 kopeeks or copecks. The ruble is divided into 10 grievens, $33\frac{1}{3}$ altins, or 50 groschen; and the kopeek or copeck is divided into 2 denuschkas, or 4 poluschkas. The coins now in circulation are, of gold, the imperial, and half-imperial of 10 and 5 rubles; double and single ducats, which were formerly worth $4\frac{1}{2}$ rubles and $2\frac{1}{4}$ rubles; but their value was raised, in 1764, that of the double ducat to 5 rubles 60 copecks, and the single to 2 rubles 80 copecks. The silver coins are, rubles of 100 copecks; poltins, or half-rubles, of

50

50 copecks; polpoltins, or quarter-rubles, of 25 copecks; double and single grieven, of 20 and 10 copecks; and pieces of 5 altins or 15 copecks; payte-copecks of 5 copecks each, and altins of three copecks, the two latter of which are now nearly out of circulation. The copper coins are pieces of 10 copecks, called grieven or grievnik, of 5 copecks or pataki, which are the most common, of two copecks or grosch, of 1 kopeek; also denuschkas or half-copecks, and poluschkas or quarter-copecks. The following table shews their mutual relation as to value:

Ruble.	Grievnik.	Altine.	Copecks.	Denuschkas.	Poluschkas.
1	10	$33\frac{1}{3}$	100	200	400
	1	$3\frac{1}{3}$	10	20	40
		1	3	6	12
			1	2	4
				1	2

Dutch ducats are worth $2\frac{3}{4}$ rubles, more or less; Dutch and Danish rixdollars pass for 1 ruble 40 copecks; or 14 rixdollars, weighing a Russian pound, (1 lb. 1 oz. 3 dwt. 2 gr. troy,) are worth 19 rubles 6 copecks.

The fineness both of gold and silver is expressed in solotniks, the pound or other weight being divided into 96 such parts. The solotnik is also the $\frac{1}{96}$th part of a Russian pound weight. By the ukase, or edict, of 1763, the imperial was to weigh $3\frac{5}{11}$ solotniks, the half-imperial $1\frac{8}{11}$ solotniks; and the gold to be 88 solotniks, or 22 carats fine. Also, 118 ducats were to weigh a Russian pound, 93 solotniks fine, or $23\frac{1}{4}$ carats. By the same edict, silver of 72 solotniks, or 9 oz. fine, was coined into rubles and half-rubles, at the rate of 17 rubles $6\frac{2}{3}$ copecks *per* lb.; into quarter-rubles and 20-copeck pieces, at the rate of 17 rubles $15\frac{40}{96}$ copecks *per* lb.; and into grievens and 15-copeck pieces, at the rate of 17 rubles $25\frac{40}{96}$ copecks *per* lb. Copper was coined at the rate of 16 rubles *per* pood of 40 Russian pounds. New regulations were established by an edict of the emperor Alexander, in 1801; according to which, $22\frac{1}{4}$ rubles are to contain a Russian pound of fine silver; and they are to be $83\frac{1}{3}$ solotniks (11 oz. 8 dwt.) fine; and thus each ruble should weigh $320\frac{1}{4}$ English grains, and contain $277\frac{1}{2}$ grains of fine silver. It was also declared, that no gold coin should hereafter be struck in Russia, except the imperial and half-imperial, the standard of which was raised to $94\frac{1}{2}$ solotniks, or $23\frac{5}{8}$ carats; and the weight of the imperial reduced to $2\frac{17}{36}$ solotniks, or $188\frac{1}{4}$ English grains; by which the value is nearly the same as before.

According to these mint regulations,

	£	s.	d.	
The imperial is worth	1	12	$9\frac{1}{2}$	valued in English gold.
The ducat - - - -	0	9	1	
The ruble of 1763 -	0	3	3	valued in English silver.
The ruble of 1801 -	0	3	$2\frac{1}{2}$	

The following is the report of an assay lately made on a number of rubles at the London mint, by order of the Bank of England. Rubles of 1763, weight from 14 dwt. 21 gr. to 15 dwt. 20 gr.; average 15 dwt. $8\frac{1}{2}$ gr.; fineness 44 dwt. worse than English, that is, 8 oz. 18 dwt. Rubles of 1801, weight from 13 dwt. 2 gr. to 13 dwt. 12 gr.; average 13 dwt. 7 gr.; fineness 14 dwt. worse than English, that is, 10 oz. 8 dwt. Hence we have the value of the old ruble, 3*s.* 2*d.* sterling; and of the new, 3*s.* $2\frac{1}{2}$*d.*

Besides the hard coin, "paper money" constitutes the chief circulating medium or money of Russia, under the denomination of "bank-assignations." Until the year 1787, these notes of 100, 50, and 25 rubles in circulation were estimated at the amount of 50 millions of rubles. They were so readily taken through the whole empire, instead of copper money, that, in many places, 1, 2, and as far as 5 *per cent.* agio must be given to get paper money for copper. In 1787 the old notes were liquidated, and a fresh issue was made to the amount of 100 millions. They are at a *per cent.* of 100, 50, 25, 10, and 5 rubles. By the ukase of August 3, 1788, it was ordered, that there should be never more than 100 millions in circulation. It was customary to convert them into copper money on demand at the assignation-banks; but they fluctuate considerably in value, and with respect to gold and silver they are mostly at a discount; and even on copper there is sometimes an agio against them, as they are not always paid off in this metal, when the sum is considerable. The ruble of exchange is subject to a similar depreciation. In 1770 this ruble and the paper ruble were at par with the silver ruble; in 1790 they were 20 *per cent.* worse; in 1799 the paper ruble was 60 *per cent.* below par, and the ruble of exchange 50 *per cent.*; in 1803 the paper ruble was 20 *per cent.*, and the ruble of exchange 10 *per cent.* below par; and in 1808 they were 100 *per cent.* worse, that is, 1 silver ruble was worth 2 rubles of exchange, or 2 of bank paper.

Bills of exchange are paid in copper, or bank notes; but this chiefly regards inland bills, as foreign merchants scarcely ever draw on Russia. The commercial debts here are usually settled by drawing and remitting bills on foreign countries.

Petersburg, Archangel, Moscow, &c. draw on the following places, and give Amsterdam 1 ruble for 37 stivers current, more or less, at 65 days' date; Hamburgh, 1 ruble for 34 schillings or sols banco, more or less, at 65 days' date; London, 1 ruble for 38*d.* sterling, more or less, at 3 months' date.

The ruble here mentioned is not the silver ruble, but the ruble of exchange, which, as we have just stated, is subject to great fluctuations.

Bills drawn in Russia, payable after date, are allowed 10 days' grace; but if payable at sight, 3 days only; but bills payable at so many days after sight are not allowed any days of grace.

During the reign of the empress Catharine, three different banks were established at Petersburg, *viz.* the Loan-bank, the Assignation-bank, and the Loan-bank for the nobility and towns; and during the reign of the emperor Paul, the Aid-bank and Discount-office were established.

The "Loan-bank, or Lombard," lends money on gold, silver, jewels, &c. A year's interest is taken in advance, which, according to the legal rate, is 5 *per cent.* No interest is paid for money drawn out, on giving two days' notice; but if a declaration be made, that the money will be left there a year, and that a notice of three months shall be given of the intention to draw it out, the legal interest is allowed, payable in the same kind of money in which the deposit was made. The property of this bank belongs to the Foundling-hospital at Petersburg.

The "Assignation-bank" was opened in Petersburg and Moscow in the year 1770, and branches of it have been extended to Yaroslaf, Smolensk, Veliki-Ustiug, Astrachan, Nishnei-Novgorod, Vischnevolotschok, Novgorod, Pscove, Tver, Neschna, Kief, Kursk, Kharkof, Tambof, Orel, Tula, Kazan, Kherson, Archangel, Riga, and Revel. This bank issues notes for 5, 10, 25, 50, and 100 rubles. In 1786 it was converted into an imperial establishment, when all the old notes were called in, and exchanged for new ones. It is engaged that these notes are to be reimbursed on demand in copper money, and that the total amount should not exceed 100 millions of rubles; but the

number

number now in circulation is supposed to be greatly beyond this limitation.

The "Loan-bank for the nobility and towns" was established in 1786, for the purpose of advancing money to the nobility on landed property or on male peasants, and to the cities or towns on the security of stone and brick houses. The annual interest charged is 5 *per cent.*; besides which, 3 *per cent.* must be paid annually, towards diminishing the capital, or redeeming part of the mortgage, till the whole be repaid. The loans are made in assignation-notes. This bank is also empowered to insure houses, buildings, and other property, on which it has advanced money, at the annual premium of $1\frac{1}{2}$ *per cent.* It is also allowed to coin money of gold, silver, and copper, according to the mint regulations; and it has the liberty of discounting bills at $\frac{1}{2}$ *per cent. per* month.

The "Aid-bank" was established in 1797, for affording relief to noblemen, whose estates are mortgaged, or burdened with debts; and also for advancing money to those who wish to improve their estates, to establish works or manufactures, &c. The property is valued according to the number of male peasants on the estates, who, in different provinces, are valued at 40, 50, 65, and 75 rubles *per* man. The money is advanced in tickets secured on the estates, which are transferrable, and are to be taken as legal money in all the departments of government. These tickets may remain in circulation for 25 years, reckoning from the time of opening the bank. The annual interest is 6 *per cent.* for the first five years, and 5 *per cent.* for the following years; and a part of the debt is to be discharged annually, till the whole be repaid, which must be done within 25 years from the opening of the bank. If the interest is not regularly paid, a fine is imposed, which increases at the rate of 1 *per cent. per* month, till the third month; and if the interest is not then paid, together with part of the capital, the management of the estate is taken from the owner, and given to noblemen who live nearest to it, and they are to receive the produce, and remit it to the bank, till the debt is entirely paid. The payment must be made in copper money, or notes of the Assignation-bank.

The "Discount-office" was established in 1797, for advancing money on bills and on goods of Russian produce, and also for insuring the goods on which such advances have been made. The holder of the bills or owner of the goods must be a Russian subject; but money is advanced to foreigners, and all sorts of people, on gold and silver.

The Russian weights are as follow: the berquet or berkowitz = 10 poods; the pood = 40 lb.; the lb. = 32 loths or lotes; and the loth = 3 solotniks. The Russian lb. = 28 loths, Cologne weight, or 6314 troy grains; so that 500 lb. Russian = 451 lb. avoirdupois. Among merchants, the ordinary computation is, that 36 lb. avoirdupois = the Russian pood, and that 63 poods = 1 ton avoirdupois. Hemp, flax, and cotton, are sold by the berquet; copper, iron, cordage, horse-hair and tails, linseed and hempseed oil, isinglass, morocco leather, potash, wax, bristles, and tobacco, are sold by the pood.

The measures of Russia are, for corn, the chetwert or cool = 2 osmins = 4 pajacks = 8 chetwericks = 64 garnitzy. A cool of flour = 9 poods, and a sack = 5 poods. The chetwerick is $13\frac{1}{2}$ English inches in diameter, and $11\frac{1}{2}$ in depth; so that it measures 1555.92 cubic inches, and contains $5\frac{3}{4}$ Winchester gallons nearly. In business the computation is, that 100 chetwerts = 72 quarters, and 1 chetwert = $5\frac{3}{4}$ bushels, Winchester measure. For wine, the cask, sarokowoi, or pipe, contains 40 vedros; the vedro = 8 osmuchki or krushkas, and the krushka = 11 tscharkays or cups. In Petersburg the vedro contains 621 French, or 752 English cubic inches: hence 1 vedro = $3\frac{1}{4}$ English wine gallons; and 3 krushkas = 1 English ale gallon. The long measures are an arsheen or arshine, which is divided into 16 werschocks or vershoks = 28 English inches; so that 9 arsheens = 7 English yards, and 4 werschocks = 7 English inches; a saze, sashe, sajène, or fathom = 3 arsheens, or 7 English feet; a werst, verst, or Russian mile = 500 sajènes = 1500 arsheens = 3500 English feet: 20 wersts = 3 German miles, and 264 wersts = 175 English miles; so that a werst is nearly two-thirds of an English mile; and a degree of the meridian is reckoned to be about 104 wersts. The Russian foot is 155 French lines = $13\frac{3}{4}$ English inches; and the Moscow foot = $148\frac{1}{4}$ French lines = $13\frac{1}{6}$ English inches; but the English foot, as well as the Rhineland foot, is generally used in Petersburg. The superficial measure, called dessetina or desættine, contains 2400 Russian square fathoms, or 21,600 square arsheens = $13,066\frac{2}{3}$ English square yards, or 2 acres 2 roods 32 perches: hence 10 dessetinas correspond to 27 English acres nearly.

In Russia the Julian calendar, or old style, is still retained, which (since the year 1800) is 12 days later than the new style; so that a Russian bill, dated the first day of any month, must be reckoned from the 13th day of the same month in England, and in every other place where the Gregorian calendar, or new style, is used.

Having availed ourselves of the materials which are furnished by Mr. Coxe, in his "Travels" and "Russian Discoveries," and by Mr. Tooke in his comprehensive and very interesting "View of the Russian Empire," in the compilation of this article, we shall close it with observing, that the immense territory of the Russian empire naturally forms itself into two great divisions, by the vast Ural chain of mountains, that intersect it from north to south; but these divisions are very unequal and dissimilar, both as to dimension and quality. That on the westward is *Proper* or *European* Russia; and that lying to the east side, *Asiatic* Russia, or *Siberia*.

European Russia extends, by the final partition of Poland, from the river Dneister to the Uralian mountains, the grand chain which, as we have just said, divides Europe from Asia; in length about 1600 miles, and in breadth above 1000 English miles. The extent is computed at about 1,200,000 square miles. For a further account of *Asiatic* Russia, see SIBERIA.

RUSSIA *Company*. See COMPANY.

RUSSIAN MUSIC, *in the Church*. See GREEK *Church*.

RUSSIAN *Secular Music*. The only instruments known in Russia till the time of Peter the Great, were such as the peasants still use in the provinces, which are described in the Gotha Almanac, and in Guthrie's Dissertations, with drawings. Peter had at first only such military instruments as he had seen in Germany. But the first good music that was heard in Russia, was brought thither by duke Charles Frederic of Holstein-Gottorp, at Petersburg. This prince, destined to marry the princess Anne Petrowna, daughter of Peter, had a complete band, or chapel, as the Germans call it, in his suite, composed of twelve good German musicians: the concerts by this band were new and acceptable to all the great Russian nobility, who had never heard any other music than that of the natives, which was coarse and barbarous. The emperor himself used to frequent these concerts, and established two regular performances in his palace each week, employing the German musicians to teach the boys about the court, and in the army.

All

All the fucceffors of Peter have followed his example as a model in this inftance, as in all others.

The emprefs Anne, the niece and fucceffor of the great Peter in 1730, who died in 1740, early in her reign firft regaled Peterfburg with an Italian opera compofed by Araja, a native of Italy, of fome eminence, whom fhe appointed her maeftro di cappella; and who likewife compofed intermezzi to Italian words, and in the mufical ftyle of his country. Concerts twice a-week, which had been eftablifhed at court, have been continued ever fince. All the grandees of Ruffia imitated this example, had private concerts in their manfions, and many of them became dilettante performers themfelves in a high form of excellence.

The emprefs Elizabeth, daughter of Peter, began her reign in 1741, by a revolution which fet afide the czar Ivan as incapable of reigning. She had been affianced, in 1747, to the duke of Holftein-Gottorp; but that prince dying before the marriage took place, fhe paffed the reft of her days in a fingle ftate. This princefs, on whom nature had beftowed a nice difcriminating ear, with a paffion for mufic and all the fine arts, by her patronage caufed them to flourifh in her dominions, in a way fuperior to moft of the other ftates of Europe. She built an opera-houfe at Mofcow, capable of containing 5000 people. At her coronation, "La Clemenza di Tito," written by Metaftafio, and fet by Haffe, was performed by the beft Italian fingers of the time; and a prologue to this drama, entitled "La Ruffia afflitta e confolata," was fet by Araja, maeftro di cappella to the court of Peterfburg. Soon after this, Peterfburg firft heard an opera in the Slavonian language, fet likewife by Araja.

Such was the progrefs which mufic had made in Ruffia, when Peter Federowitz, confort to the emprefs Catharine, was called to the throne as prefumptive heir. The paffion which this prince had for mufic contributed confiderably to its further advancement into favour in his dominions. He performed himfelf on the violin fufficiently to bear a part in a fymphony. If he now and then played a wrong note, or miffed a difficult paffage, the Italian muficians were too polite to notice it; on the contrary, they perfuaded his imperial majefty that he had a particular talent for mufic, and that his performance on the violin was perfect. Mufic became his favourite, and almoft fole amufement, even to a degree of enthufiafm. He became alfo a great connoiffeur in violins; and, in a fhort time, purchafed a great collection of thofe made by the moft celebrated artifts, particularly thofe of Cremona, by Amati, Straduarius, Guarnerio, &c. and by Steiner and Albani, Germans. He was never more happy than when at the head of his band in his concerts. He intended affembling at his court all the great muficians in Europe, and he would doubtlefs have fucceeded, if his reign had been more durable; but aiming at more important revolutions in his ftate (which, happily for his country, were ftopt), a termination was put at once to his mufical and political projects.

Catharine II. mounted the throne, attended not only by all the fciences and fine arts, but by the genius of legiflators and victory. The ftate, the church, public order, induftry, commerce, maritime force, and the ftate of her army, had her firft attention.

After having provided for the faftey and power of her empire, fhe attended to its embellifhment by means of the fine arts; and erected a temple to painting, fculpture, architecture, and formed an imperial academy of fciences and beaux arts at Peterfburg.

After this latter eftablifhment, which has fince become fo illuftrious, fhe turned her thoughts to mufic, and called to her court from Venice the celebrated Baldaffar Galuppi, detto Il Buranello, the moft fertile and fpirited compofer of his time. His "Didone abbandonata," in which the Gabrielle performed the part of Dido, had fuch prodigious fuccefs, that, after the firft reprefentation, the emprefs, with her own hands, prefented the compofer with a magnificent box filled with pieces of gold: telling him that "the unfortunate Dido, when fhe expired, bequeathed it as a legacy to the illuftrious Buranello."

Thofe who recollect the turn which this princefs gave to her munificence in the purchafe of Diderot's library, will be lefs furprifed at her liberality to Buranello. Diderot, in his latter years, being conftrained to offer his library to fale, unfuccefsfully, to the principal fovereigns in Europe, in order to enable him to educate his only daughter, when his wifh was communicated to the emprefs Catharine, fhe faid, "fhe would willingly purchafe his library of him at his own price, upon condition that he would be fo obliging as to take care of it as long as he lived; and in order to improve it, and to keep pace with the times, fhe hoped that he would take the trouble to lay out for her 2000 rubles a-year in the purchafe of new books."

Buranello was fucceeded at Peterfburg by Traetta, an excellent compofer; and the compofitions of thefe great mafters, fung by the fineft voices of Italy, and accompanied by the beft inftrumental performers with which the orcheftra could be fupplied, together with the tafte and magnificence of the decorations, and the fplendour of the dances, rendered the opera at Peterfburg the moft brilliant and renowned fpectacle in Europe.

When the emprefs and her fon, the grand duke, had fo happily recovered of the fmall-pox, by the inoculation of baron Dimfdale, the agreeable French comic opera of "Annette and Lubin" was performed by the principal nobility of the court; however, too good a tafte in finging and in dramatic mufic was formed at Peterfburg now, for the vocal performers of France to captivate much, even with the compofitions of Duni, Monfigni, Philidor, and Gretry, which were tried for one feafon.

It is to facred mufic that the lyric theatre at Peterfburg is obliged for the great effects of its choruffes. In the opera of "Ifigenia in Tauride," fet by Galuppi, he was allowed to make ufe of the choral fingers of the imperial chapel. Of which permiffion that great mafter availing himfelf, compofed choruffes for ten choirs, in four parts each, which had a moft furprifing effect. See CHACE.

After the period defcribed by the Gotha Almanac for 1772, the opera of Peterfburg had Paefiello and Sarti to compofe. Paefiello, after three years refidence in Ruffia, where his compofitions and perfonal merits were perfectly underftood, and treated with great admiration and regard, was fucceeded by Sarti, who went to Peterfburg in 1784, for three years, but remained in Ruffia till 1790; during which time he eftablifhed a concert fpirituel, or oratorio, for which he compofed mufic *à cappella*, in which he introduced inftruments which are not allowed in the Greek church. He likewife compofed a Te Deum for the victory obtained over the Turks by the Ruffians at Ockzakow, and eftablifhed a confervatorio for the education of young muficians in the Neapolitan manner, of which he was appointed director. With his opera of "Armida" the emprefs was fo pleafed, that fhe gave him a golden vafe, and a ring of great value. See SARTI.

Mufic is ftill patronized in Ruffia; concerts and operas are fupported in the ufual magnificent manner (1805); and the Italian tafte, befides its prevalence at the opera and court concerts

concerts to Italian words, is propagated in the church and provinces by national compofers, who had been fent to Italy by the emprefs Catharine to ftudy compofition, and who, when they returned, fet hymns, motets, and fongs in the Slavonian language, which is faid to be nearly as foft and capable of receiving melody as the Italian. Palcha, Lolli, Giornovichi, Bortnianiki, Dietz, &c. contributed to refine inftrumental mufic in Ruffia.

RUSSING, in *Geography*, a town of Auftria; 6 miles E. of St. Polten.

RUSSWEIL, a town of Switzerland, in the canton of Lucerne; 6 miles W. of Lucerne.

RUST, FREDERIC WILLIAM, in *Biography*, born in 1739, mufic-director at Deffau. His firft inftrument was the violin, then the harpfichord; but he feems to have played and written for all kinds of inftruments, though chiefly for the harpfichord. He publifhed at Leipfic fix fonatas for that inftrument, and twenty-four variations to a German fong, at Deffau, 1782; with many detached fongs and odes for periodical works.

RUST, in *Geography*, a town of Hungary, the inhabitants of which carry on a confiderable trade in wine, made nearly as ftrong as Tokay; 4 miles E.N.E. of Edenburg.—Alfo, a fmall ifland in the North fea, about 60 miles from the coaft of Norway. N. lat. 67° 5'.

RUST, in *Rural Economy*, a diftemper incident to corn, and generally called mildew. (See MILDEW. See alfo BLIGHT, and SMUT.) The ancients generally thought that it came from heaven, being ignorant of its true caufe. Virgil gives this up as an incurable diftemper, and tells the farmer, that if his corn is blighted he muft live upon acorns, not fuppofing that any remedy could be devifed for fuch a diftemper. Thefe people in general, having no true knowledge of the theory of hufbandry, had recourfe to magic, and ufed what they thought fpells and enchantments on all occafions. Cato, Varro, and even Columella, are full of thefe ridiculous devices. A better knowledge in the real nature of hufbandry has taught us to underftand this matter in a very different manner, and to apply more efficacious remedies to it.

Wheat is blighted at feafons, firft in the bloffom, and then its generation is prevented, many of the hufks being empty in the ear, and the rudiments of the grains not impregnated; fecondly, wheat is blighted when the grains are brought to maturity; and in this cafe they become light, and are of little value for making of bread, having fcarcely any flour in them.

Under this term of ruft may, perhaps, moft properly be arranged, and included, that fort of deftructive affection of grain, which is caufed by the fungufes and parafitical plants, which fix themfelves on, and attach themfelves to, the ftems or other parts of it, fo as to diminifh, intercept, or deftroy its nutritive properties and qualities. The injury done in this way is often more dreadful than that from any of the other caufes, as whole fields have been known to be utterly deftroyed, fo as not to contain a fingle grain of wheat in the ear, and, at the fame time, the ftraw rendered totally unfit for fodder, as being little better than a *caput mortuum*, poffeffing neither ftrength nor fubftance in it. The evidence of different places fully confirm the exiftence of fungi, as injurious in this manner; as from fome it is ftated, that, as the wet weather continued, the ruft or fungus made a rapid progrefs from the ear downwards, until, in many inftances, it covered the ftem from the ear, as far as it was unfheathed. From others it is faid, that the ruft or fungus prevented thofe grains which the maggot had not deftroyed from being perfected, in a greater or lefs degree. From ftill others it is afferted, that thefe parafitical plants multiplied fo much upon the ftraw, and on the hufk and chaff of the ears, that, in many cafes, whole fields put on an univerfal blackened, rufty appearance. From different other perfons, various other circumftances of this nature are alfo related to be met with.

The beft means of preventing and removing affections of this nature in this fort of grain crop, are fuppofed to be thofe of cultivating only the forts of wheat which are the hardieft in point of quality, and the leaft liable to difeafe; the fowing of the wheat earlier than ufual in the feafon; the introduction of earlier varieties of it; the giving of a fufficient quantity of feed; the draining of the land where it is inclined to be wet; the rolling and treading of the land by live-ftock immediately after fowing; the ufe of fowing different forts of faline fubftances as a manure; the proper regulation and improvement of the courfe of crops; the change of feed, by bringing it frefh from other countries; the extirpation of the difeafed ftems, ftalks, or blades early in the feafon; and the inftantly cutting down of the crop when it is decidedly affected. See ROTATION *of Crops*, SALINE *Manure*, TREADING, and WHEAT.

It is fuppofed, that, by means of one or other of thefe methods, when properly improved and applied by ingenious naturalifts and farmers, there can be no doubt but that this, as well as the other difeafes in wheat crops, may, in a great meafure, be either wholly remedied, or their effects be fo far reduced as to be of little national confequence. Sir John Sinclair's Inquiry into the Blight, Ruft, and Mildew in Wheat.

The ruft or mildew alfo attacks, and is highly injurious to many forts of garden vegetables as well as fruit-trees, fuch as thofe of late peas, &c. and peach-trees, &c.

On the fuppofition of the difeafe, in thefe cafes, arifing from the feeds of fungi, and to be promoted immediately afterwards, and in continuance, by the want of a fufficient fupply of moifture from the foil or ground, with an excefs of humidity in the air, particularly when the plants are expofed to a temperature below that to which they have been accuftomed; the prefident of the Horticultural Society of London was led to purfue the following mode of cultivation with the late autumnal crops of the pea, by which the table may be as abundantly fupplied during the month of September and that which fucceeds it, as in thofe of June and July; and the plants be nearly as free from the difeafe. The ground is firft dug up in the ufual manner, and the fpaces which are to be occupied by the future rows of peas then well foaked with water. After which, the mould upon each fide is collected together, fo as to form ridges feven or eight inches above the previous level of the furface of the ground, which are alfo well watered. The feed-peas are then fown, in fingle rows, along the tops of the ridges. The plants quickly fhew themfelves above the furface of the land, and grow with much vigour, on account of the great depth of ftirred mould, and the abundant moifture. There is water given in rather a profufe manner, once in the courfe of every week or nine days, even when the weather proves fhowery, but if the ground fhould be thoroughly drenched with the water of the autumnal rains, there will be no further trouble neceffary. The plants, under this mode of management, continue perfectly green and luxuriant, until their bloffoms and young feed-veffels become deftroyed by the frofts; and their produce will retain its proper flavour, which is conftantly deftroyed by this difeafe.

The pea, which has conftantly been cultivated in this intention and manner, is a very large kind, the feeds of which are

are greatly ſhrivelled, and grow very high: it is now become common in the ſeed ſhops of the metropolis under the title of knight's pea. This variety is preferred on account of its more ſaccharine quality, and the retention of its flavour more perfectly in the autumnal ſeaſon; however, it is not improbable but that any other late tall-growing variety may ſucceed equally well. It is the practice to ſow a ſmall quantity every ten days until about midſummer, which afford good ſupplies for the table until the end of October, though the ſevere froſts, which ſometimes happen in the early part of that month, prove deſtructive of the more late crops.

The ſame, or ſimilar means, it is ſuppoſed, may be equally effectual in preventing this diſeaſe in the peach-tree. As it is found, that when the roots of it, which ſtrike to the greateſt depth in the ſoil, and which are conſequently the beſt ſuited to ſupply the tree with moiſture during the ſummer, are deſtroyed by a hurtful under ſoil, or by an exceſs of moiſture in the winter ſeaſon, the diſeaſe, on many varieties of the peach-tree, becomes extremely formidable. But that where, on the contrary, a deep, fertile, dry loam permits the roots to extend to their proper depth; and where the ſituation is not ſo low as to be much infeſted with fogs, little of this diſeaſe is met with: alſo in a forcing-houſe it has been found equally eaſy, by appropriate management, to introduce or prevent the appearance of it. When the mould has been kept very dry, and the air in the houſe damp and unchanged, the plants have ſoon become diſeaſed; but when the mould has been regularly, and rather abundantly watered, not a ſingle veſtige of the diſeaſe has ſhewn itſelf.

Rust, in *Gardening*, a diſeaſe of the blight or mildew kind, which affects many ſorts of crops, as well as ſome fruit-trees. All the later pea, bean, kidney-bean, and ſeveral other ſimilar ſorts of crops, are liable to be attacked, and greatly injured, or wholly deſtroyed in this way. Some kinds of the peach and other ſorts of the finer fruit-trees are alſo much expoſed to its ravages and deſtructive effects. See the preceding article.

Rust *of a metal*, the flowers or calx thereof, procured by corroding and diſſolving its ſuperficial parts by ſome menſtruous fluid: or the earth of the metal decompoſed by the action of a proper menſtruum.

Water is the great inſtrument or agent in producing ruſt; the air apparently ruſts bodies, but it is only in virtue of the water it contains.

Hence, in a dry air, metals remain a long time without contracting ruſt; and hence oils, and other fatty bodies, ſecure metals from ruſt, or from being oxydated; water being no menſtruum to oil, &c. and therefore not able to make its way through it. See Iron.

All metals are liable to ruſt; even gold itſelf, though generally held incapable of it, grows ruſty, if expoſed to the fumes of ſea-ſalt.

The reaſon why gold is ſo rarely found to ruſt is, that ſea-ſalt, which is the only ſalt that will prey upon it, is of a very fixed nature; and therefore little of its effluvia, or exhalations, are found floating in the air.

Ruſt is uſually ſuppoſed to be a corruption of the metal, but without much foundation: it is the very metal itſelf, only under another form; and accordingly we find, that ruſt of copper may again be turned into copper.

The ruſt of copper, called *ærugo*, makes what we call *verdigris*. Ceruſs is made of lead converted into ruſt by vinegar. Iron, in time, turns wholly into ruſt, unleſs preſerved from the air by paint or varniſh.

Citizen Conté has adopted a method, which he finds effectual, for preventing the oxydation of iron and ſteel; or, in popular terms, to prevent iron and ſteel from ruſting. It conſiſts in mixing with fat oil varniſh, at leaſt half, or at moſt four-fifths of its quantity of highly rectified ſpirits of turpentine. This varniſh muſt be lightly and evenly applied with a ſponge; after which the article is left to dry in ſome ſituation not expoſed to duſt. He affirms that articles thus varniſhed retain their metallic luſtre, and do not contract any ſpots of ruſt. This varniſh may alſo be applied to copper, of which it preſerves the poliſh, and heightens the colour. It may be employed with particular advantage to preſerve philoſophical inſtruments from any change, in experiments where, by being placed in contact with water, they are ſubject to loſe that poliſh and preciſion of form, which conſtituted part of their value. Nicholſon's Journal, vol. vi. p. 142.

Plumbago protects iron from ruſt, and on that account is rubbed on various ornamental caſt-iron works, ſuch as the fronts of grates, &c.

RUSTAN, in *Geography*, a town of Perſia, in the province of Schirvan; 14 miles N. of Derbend.

RUSTANGUNGE, a town of Hindooſtan, in Bahar; 13 miles S.W. of Patna.

RUSTBURN, in *Farming*, a term provincially uſed to ſignify the troubleſome weed reſt-harrow.

RUSTENBURG, in *Geography*, a town of Weſtphalia, in the territory of Eichsfeld, with a caſtle; nine miles W. of Heiligenſtadt.

RUSTGADEN, a town of Sweden, in Dalecarlia; 23 miles S.S.W. of Fahlun.

RUSTI, or Rust, in *Biography*, born in 1744, was maeſtro di cappella, at Barcelona, in 1767. He ſtudied in the conſervatorio of La Pietà at Naples, and afterwards under Rinaldo di Capua. His firſt opera, "La Contadina in Corte," was compoſed for Venice in 1764. He went from Venice to Barcelona, where he compoſed "l'Idolo Cineſe," in 1774, "Amor Bizzazzo" in 1775, and "Aleſſandro nell' Indie," the ſame year. "Il Baron di terra aſciutta," 1776; "Il Socrate Immaginario," 1776; "Il Giove Immaginario;" "Il due protetti," 1777. His operas were much eſteemed in Italy.

RUSTIC Gods, *Dii Ruſtici*, in *Antiquity*, were the gods of the country, or thoſe who preſided over agriculture, &c. Varro invokes the twelve *dii conſentes*, as the principal among the ruſtic gods; *viz.* Jupiter, Tellus, the Sun, Moon, Ceres, Bacchus, Rubigus, Flora, Minerva, Venus, Lympha, and Good Luck. Beſides theſe twelve arch-ruſtic gods, there was an infinity of leſſer ones; as Pales, Vertumnus, Tutelina, Fulgor, Sterculius, Mellona, Jugatinus, Collinus, Vallonia, Terminus, Sylvanus, and Priapus. Struvius adds the Satyrs, Fauns, Sileni, Nymphs, and even Tritons; and gives the empire over all the ruſtic gods to the god Pan.

Rustic, in *Architecture*, expreſſes a manner of building in imitation of ſimple or coarſe nature, rather than according to the rules of art.

Rustic *Faſti*. See Fasti.

Rustic *Fountain*. See Fountain.

Rustic *Freeze*. See Freeze.

Rustic *Quoins*, by Vitruvius called *lapides minantes*. See *Ruſtic* Quoin.

Rustic *Services*. See Service.

Rustic *Work* is where the ſtones in the face, &c. of a building, inſtead of being ſmooth, are hatched or picked with the point of an inſtrument.

Rustics, *Regular*, are thoſe in which the ſtones are chamfered off at the edges, and form angular or ſquare receſſes ceffes of about an inch deep at their jointings, or beds, and ends.

Rustic *Order*, is an order decorated with ruftic quoins, ruftic work, &c.

Felibien fays, it is properly where the feveral parts of the five orders are not exactly obferved; but this confounds ruftic with Gothic.

RUSTICI, Francesco, in *Biography*, a native of Sienna, born about 1595, was a difciple of Francefco Vanni. His tafte led him afterwards to adopt the ftyle and fubjects of Caravaggio. A dying Magdalen in the gallery at Florence, and a Sebaftian in the Borghefe palace at Rome, are in that manner, though with more felection of form. He ftudied at Rome the works of a Caracci and Guido, not, however, to the lofs of his own peculiar ftyle. His moft renowned work is the Annunciation, at Sienna. He died in the prime of life, in 1625.

RUSTICIANA, in *Ancient Geography*, a town of Hifpania, in Lufitania, on the left bank of the Tagus, to the E. of Norba-Cæfarea, and W. of Augufto-Briga.

RUSTICOLA, in *Ornithology*, a fpecies of *Scolopax;* which fee.—Alfo, a fpecies of tringa. See Tringa *Calidris.*

RUSTICULA, a name by which Aldrovand, and fome other authors, have called the godwit, more commonly known by the name *ægocephalus*. See Scolopax *Ægocephala.*

Rusticula *Brafilienfis*, the name given by Mr. Ray, and fome others, to the guarauna, a water-bird of the Brafils, of the fize of our fnipe. See Scolopax *Guarauna.*

RUSTONIUM, in *Ancient Geography*, a town of Africa, on the coaft of Mauritania Cæfarienfis, between the river Savus and the town of Ruficibar, according to Ptolemy. It is called Rufconia Colonia by Pliny; Rungoniæ Coloniæ by Antonine; and according to Livy, the Africans called it Rufcinona.

RUSTRE, in *Heraldry*, a bearing of a diamond fhape, pierced through in the middle with a round hole.

RUSUBESER, Tacksibt, in *Ancient Geography*, a town of Africa, upon the coaft of Mauritania Cæfarienfis, according to Ptolemy, fituated to the E. of Rufucurium, between Iomnyum and Rufazus.

RUT, in *Hunting*, &c. a term ufed for the venery or copulation of deer.

For the terms which obtain in refpect of this and other beafts of game, with the noife they make during the acts, fee Hunting.

The rutting-time with the hart begins about the middle of September; and holds two months: the older they are the better, and the more beloved they are by the hinds, and the earlier do they go to rut. At this time they will turn head, and furioufly make at any living creature. It is eafy killing them at this time; their whole bufinefs being to fcent and purfue the track of the females; fcarcely feeding at all. The young herd are forced to fly with great precipitancy, when the hart comes in fight of his mate. If there be any other of bulk, they will difpute it very hotly with their horns. As the feafon expires, they withdraw, and dig themfelves holes in which to lie to affuage the ftrong fervour of their luft: when become a little fweet, they return to their pafture, and live in herds.

The rutting or tourning time of the roe-buck begins in October, and lafts only twelve or fifteen days. When this is paft, he cafts his horns.

After the hind is filled, fhe keeps no more company with the male till fhe be delivered. But the doe always accompanies her paramour till her time approaches, when fhe retires, for the fafety of her young, which he would otherwife kill.

Rut, in *Rural Economy*, a track or narrow opening formed in a road by the wheel of a cart or other carriage, which has but little breadth. Ruts of this fort are often dangerous and troublefome, when they become of any confiderable depth; therefore they frequently ftand in need of being filled in and rendered even with the other furface. In order to do this with the beft effect, the infides of them require to be well loofened with the point of a pick, that a firm bed may be given to the frefh ftones which are put in, and at the fame time, the protuberances about them, if there fhould happen to be any, may be chipped off and removed. And ftill further to prevent the frefh ftones from being difplaced, it is neceffary that they fhould be covered in with part of the loofened or other materials, and the whole firmly rammed down, or otherwife driven in, fo as to give the part, thus put in order, not only the evennefs of furface, but, as much as poffible, the firmnefs of the reft of the road. This fort of accuracy may be readily attained by a little practice and experience.

All the minor ruts, depreffions, and dimples or hollows in roads which are of any confequence, fhould always be made up and fecured in the fame manner, as no water fhould ever be fuffered to ftand on any part of the furface of them.

An implement of the three-pointed pick kind is often found extremely ufeful and convenient in trimming and filling in ruts in this way, as well as for rendering the furface even and regular. See Pick.

Rut *of the Sea*, is where it dafhes againft any thing.

RUTA, in *Botany*, an ancient Latin name, *ῥυτη* of the Greeks, which lexicographers derive from *ῥυω*, *to flow*, in allufion to fome reputed expelling qualities of the plant. The word is rather perhaps, as De Theis obferves, not capable of explanation, being nearly the fame in all the moft ancient European languages; *ruz* in Runic; *rude*, *ruta*, or *rutu*, in Anglo-Saxon; *rutiza* in Sclavonian. Hence it is *rue* in Englifh and French; *ruta* in Italian; *ruda* in Spanifh and Portuguefe; *raute* in German; *rhy'w* in Welfh. Πηγανον, a Greek fynonym of *ῥυτη*, is derived from πηγνυω, *to congeal* or *reprefs;* and fuppofed to refer to a quality in the plant, oppofite, in fome refpects, to the above-mentioned. This latter name is ufed by Linnæus for a genus nearly akin to *Ruta;* fee Peganum. If etymology were a fure guide to the virtues of plants, rue might be taken by monks, who wifh to keep their vows, and by nuns, who have broken theirs. But we believe its efficacy, in either cafe, as uncertain, as the object is unworthy of confideration.—Linn. Gen. 210. Schreb. 286. Willd. Sp. Pl. v. 2. 542. Mart. Mill. Dict. v. 4. Ait. Hort. Ord. *Multifiliquæ*, Linn. *Rutaceæ*, Juff.

Gen. Ch. *Cal.* Perianth inferior, in five deep fegments, fhort and permanent. *Cor.* Petals five, fpreading, nearly ovate, concave, with narrow claws. *Stam.* Filaments ten, awl-fhaped, fpreading varioufly, the length of the corolla, broadifh at the bafe; anthers incumbent, fimple, very fhort. *Pift.* Germen gibbous, cut croffwife, furrounded with ten melliferous pores at the bafe, and raifed on a *receptacle* pierced with as many fimilar pores; ftyle central, erect, awl-fhaped; ftigma fimple. *Peric.* Capfule gibbous, five-lobed half way down, of five cells, burfting elaftically at the fummit of each lobe. *Seeds* numerous, rough, angular, fomewhat kidney-fhaped.

Obf.

Obſ. R. *graveolens*, and ſome others, in all except the primary flowers, exclude one-fifth of every part of the fructification. In *R. chalepenſis* the petals are fringed at the baſe.

Eſſ. Ch. Calyx in five deep ſegments. Petals concave, Receptacle ſurrounded with ten honey-bearing pores. Capſule lobed. Seeds numerous. Anthers ſimple.

1. R. *graveolens*. Common Rue. Linn. Sp. Pl. 548. Willd. n. 1. Ait. n. 1. Bulliard Herb. t. 85. (Ruta; Matth. Valgr. v. 2. 95. R. hortenſis, et montana; Ger. Em. 1255.)—Leaves repeatedly compound; leaflets oblong; the terminal one obovate. Petals entire.—Native of the ſouth of Europe. Frequent in the iſlands of the Archipelago. A hardy ſhrub, cultivated, time out of mind, in our gardens, where it flowers from June to September, and propagates itſelf ſpontaneouſly by ſeed. The *ſtem* is buſhy, riſing to the height of ſeveral feet, round, ſmooth, branched. *Leaves* alternate, ſtalked, twice or thrice compound, ſmooth, of a deep blueiſh glaucous hue; their leaflets oblong or obovate, entire, tapering at the baſe. *Stipulas* none. *Flowers* of a rather dull yellow, copious, in terminal corymboſe *panicles*; the terminal ones only having the full number of each of the parts of fructification, while the reſt are octandrous and four-cleft. *Petals* jagged at the extremity; angular, but not fringed, at the baſe. The *ſtamens* of this, and perhaps all the other ſpecies, are remarkable for their progreſſive approach to the *ſtigma*, over which they in turn drop their pollen and retire. Every part of the plant when rubbed, or touched, has a peculiar acrid pungent ſmell, too ſtrong to be agreeable. The bruiſed leaves excoriate the lips and noſtrils, if incautiouſly applied, as they often are, to counteract bad ſmells; rue being ſuppoſed powerfully to prevent contagion. Its internal uſe is unſafe; yet we have known it eaten with bread and butter in no ſmall quantity; not altogether with impunity. Botaniſts diſtinguiſh two varieties; the wild, which has more oblong leaflets, or ſegments, and the garden rue, which has rounder ones. Gerarde has tranſpoſed the cuts of theſe, borrowed from Dodonæus.

2. R. *montana*. Mountain Rue. Ait. n. 2. Willd. n. 2. (R. legitima; Jacq. Ic. Rar. t. 76. R. ſylveſtris; Camer. Epit. 495. R. ſylveſtris minima; Ger. Em. 1255.)—Leaves repeatedly compound; leaflets all linear. Branches of the panicle racemoſe. Petals entire.—Native of dry hilly ſituations in the ſouth of Europe. Dr. Sibthorp found this ſpecies in various parts of Greece, and the neighbouring countries, and juſtly conſidered it as the πηγανον ορεινον, or Mountain Rue of Dioſcorides, for which moſt of the commentators of that old writer have miſtaken the wild, or narrower-leaved, *R. graveolens*. This is a hardy perennial herb, rather than a ſhrub, flowering in autumn in our gardens, where, however, though cultivated by Gerarde, it is now rarely to be ſeen. The plant is known by its more humble ſtature, and eſpecially by the very narrow *leaflets*. The radical *leaves* are crowded into a denſe tuft. Moſt of the *flowers* are four-cleft, as in the former. The branches of the *panicle* are racemoſe, and elongated. *Capſule* not half ſo big as in the Common Rue.

3. R. *chalepenſis*. African Rue. Linn. Mant. 69. Willd. n. 3. Ait. n. 3. Sm. Fl. Græc. Sibth. t. 368. (R. tenuifolia, florum petalis villis ſcatentibus; Moriſ. ſect. 5. t. 35.)—Leaves repeatedly compound; leaflets oblong or obovate. Petals with fringe-like teeth.—Native of Africa, as well as of Zante, and the iſles of the Archipelago. A common greenhouſe ſhrub, flowering at various ſeaſons, and chiefly diſtinguiſhed from the Common Rue by its larger *flowers*, whoſe *petals* are copiouſly fringed with taper teeth. Many of the *flowers* are four-cleft, and the *foliage* varies in breadth, as in that ſpecies.

4. R. *pinnata*. Wing-leaved Rue. Linn. Suppl. 232. Willd. n. 4. Ait. n. 4.—Leaves ſimply pinnate; leaflets lanceolate, tapering at the baſe, bluntly ſerrated. Petals ſomewhat notched.—Native of rocks in the Canary iſlands, from whence it was brought by Mr. Maſſon to Kew, in 1780. This is a greenhouſe ſhrub, flowering in ſpring and ſummer. It is very diſtinct from all the foregoing, reſembling the firſt in ſize and *infloreſcence*, but the *flowers* are ſmaller, with crenate, or ſlightly toothed, petals. The *leaves* are very different, compoſed of two or three pair of oppoſite *leaflets*, above an inch long, various in breadth, more or leſs obtuſe, with unequal blunt ſerratures; the odd one rather the largeſt, on a long ſtalk.

5. R. *patavina*. Three-leaved Rue. Linn. Sp. Pl. 549. Willd. n. 5. Sm. Fl. Græc. Sibth. t. 369, unpubliſhed. (Pſeudo-ruta patavina trifolia, floribus luteis umbellatis; Mich. Gen. 22. t. 19.)—Leaves ternate, ſeſſile. Stamens hairy. Germen creſted.—Originally diſcovered by Micheli on a hill near Arqua, not far from Padua. Dr. Sibthorp met with it on mount Parnaſſus. Linnæus had no ſpecimen, nor is the plant known in our gardens, ſo that it ſeems not to have fallen in the way of many botaniſts. The *root* is woody and perennial. *Stems* ſeveral, a foot high, erect, round, downy, leafy, branched at the baſe only. *Leaves* numerous, downy, of a light, rather glaucous green, alternate, ſeſſile, each compoſed of three, nearly equal, narrow, obtuſe, entire, ſlightly revolute *leaflets*, about an inch long. *Flowers* five-cleft, in a terminal, denſe, cymoſe *panicle*. *Calyx* hairy, ſpreading. *Petals* ovate, obtuſe, entire, of a pale dull yellow, with a green central rib. *Stamens* ten, not ſo long as the petals; their filaments hairy half way up. *Germen* five-lobed, covered with glandular tubercles, and crowned with numerous oblong, notched, creſt-like, leafy ſcales.

6. R. *linifolia*. Broad Flax-leaved Rue. Linn. Sp. Pl. 549. Willd. n. 6. Ait. n. 5. Andr. Repoſ. t. 565. Sm. Fl. Græc. Sibth. t. 370, unpubliſhed. (R. ſylveſtris linifolia hiſpanica; Bocc. Muſ. v. 1. 82. t. 73. f. 3. Barrel. Ic. t. 1186. R. montana, foliis integris ſubrotundis; Buxb. Cent. 2. 30. t. 28. f. 2.)—Leaves ſimple, obovate. Stamens hairy. Germen without a creſt.—Native of Spain, Cyprus, and various parts of Greece. The plant of Buxbaum, gathered by him in fields, after harveſt, near Rodoſtro, in Thrace, as far as can be diſcerned from his imperfect figure, does not deſerve to be conſidered as even a variety. This agrees with the laſt in general habit, but is more robuſt, the *flowers* more numerous, and of a deeper yellow. *Leaves* much broader, leſs glaucous, and all ſimple and ſolitary. *Stamens* much dilated, and very hairy, in their lower part. *Germen* roundiſh, five-lobed, ten-furrowed, rough with ſmall granulations, but entirely deſtitute of the leafy creſt, which, though ſo remarkable in *R. patavina*, is not expreſſed by the generally exact Micheli. The name of *linifolia*, uſually alluding to the Common Flax, is not well adapted to the plant we have been deſcribing, except we underſtand it as referring to ſome of the broad-leaved yellow ſpecies of *Linum*, between which and this *Ruta* there exiſt indeed many points of reſemblance.

7. R. *fruticuloſa*. Narrow Flax-leaved Rue. Labillard. Syr. faſc. 1. 13. t. 4. Willd. n. 7. (R. orientalis, linariæ folio, flore parvo; Tourn. Cor. 19. Buxb. Cent. 2. 30. t. 28. f. 1.)—Leaves ſimple, ovato-lanceolate. Cluſters corymboſe, of few flowers. Stamens hairy at the baſe. Germen hairy, without a creſt.—Gathered in Syria, near Damaſcus, by our worthy friend M. Labillardiere, to whom

ceffes of about an inch deep at their jointings, or beds, and ends.

RUSTIC *Order*, is an order decorated with ruftic quoins, ruftic work, &c.

Felibien fays, it is properly where the feveral parts of the five orders are not exactly obferved; but this confounds ruftic with Gothic.

RUSTICI, FRANCESCO, in *Biography*, a native of Sienna, born about 1595, was a difciple of Francefco Vanni. His tafte led him afterwards to adopt the ftyle and fubjects of Caravaggio. A dying Magdalen in the gallery at Florence, and a Sebaftian in the Borghefe palace at Rome, are in that manner, though with more felection of form. He ftudied at Rome the works of a Caracci and Guido, not, however, to the lofs of his own peculiar ftyle. His moft renowned work is the Annunciation, at Sienna. He died in the prime of life, in 1625.

RUSTICIANA, in *Ancient Geography*, a town of Hifpania, in Lufitania, on the left bank of the Tagus, to the E. of Norba-Cæfarea, and W. of Augufto-Briga.

RUSTICOLA, in *Ornithology*, a fpecies of *Scolopax;* which fee.—Alfo, a fpecies of tringa. See TRINGA *Calidris*.

RUSTICULA, a name by which Aldrovand, and fome other authors, have called the godwit, more commonly known by the name *ægocephalus*. See SCOLOPAX *Ægocephala*.

RUSTICULA *Brafilienfis*, the name given by Mr. Ray, and fome others, to the guarauna, a water-bird of the Brafils, of the fize of our fnipe. See SCOLOPAX *Guarauna*.

RUSTONIUM, in *Ancient Geography*, a town of Africa, on the coaft of Mauritania Cæfarienfis, between the river Savus and the town of Rufícibar, according to Ptolemy. It is called Rufconia Colonia by Pliny; Rungoniæ Coloniæ by Antonine; and according to Livy, the Africans called it Rufcinona.

RUSTRE, in *Heraldry*, a bearing of a diamond fhape, pierced through in the middle with a round hole.

RUSUBESER, TACKSIBT, in *Ancient Geography*, a town of Africa, upon the coaft of Mauritania Cæfarienfis, according to Ptolemy, fituated to the E. of Rufucurium, between Iomnyum and Rufazus.

RUT, in *Hunting*, &c. a term ufed for the venery or copulation of deer.

For the terms which obtain in refpect of this and other beafts of game, with the noife they make during the acts, fee HUNTING.

The rutting-time with the hart begins about the middle of September; and holds two months: the older they are the better, and the more beloved they are by the hinds, and the earlier do they go to rut. At this time they will turn head, and furioufly make at any living creature. It is eafy killing them at this time; their whole bufinefs being to fcent and purfue the track of the females; fcarcely feeding at all. The young herd are forced to fly with great precipitancy, when the hart comes in fight of his mate. If there be any other of bulk, they will difpute it very hotly with their horns. As the feafon expires, they withdraw, and dig themfelves holes in which to lie to affuage the ftrong fervour of their luft: when become a little fweet, they return to their pafture, and live in herds.

The rutting or tourning time of the roe-buck begins in October, and lafts only twelve or fifteen days. When this is paft, he cafts his horns.

After the hind is filled, fhe keeps no more company with the male till fhe be delivered. But the doe always accompanies her paramour till her time approaches, when fhe retires, for the fafety of her young, which he would otherwife kill.

RUT, in *Rural Economy*, a track or narrow opening formed in a road by the wheel of a cart or other carriage, which has but little breadth. Ruts of this fort are often dangerous and troublefome, when they become of any confiderable depth; therefore they frequently ftand in need of being filled in and rendered even with the other furface. In order to do this with the beft effect, the infides of them require to be well loofened with the point of a pick, that a firm bed may be given to the frefh ftones which are put in, and at the fame time, the protuberances about them, if there fhould happen to be any, may be chipped off and removed. And ftill further to prevent the frefh ftones from being difplaced, it is neceffary that they fhould be covered in with part of the loofened or other materials, and the whole firmly rammed down, or otherwife driven in, fo as to give the part, thus put in order, not only the evennefs of furface, but, as much as poffible, the firmnefs of the reft of the road. This fort of accuracy may be readily attained by a little practice and experience.

All the minor ruts, depreffions, and dimples or hollows in roads which are of any confequence, fhould always be made up and fecured in the fame manner, as no water fhould ever be fuffered to ftand on any part of the furface of them.

An implement of the three-pointed pick kind is often found extremely ufeful and convenient in trimming and filling in ruts in this way, as well as for rendering the furface even and regular. See PICK.

RUT *of the Sea*, is where it dafhes againft any thing.

RUTA, in *Botany*, an ancient Latin name, ῥυτη of the Greeks, which lexicographers derive from ῥυω, *to flow*, in allufion to fome reputed expelling qualities of the plant. The word is rather perhaps, as De Theis obferves, not capable of explanation, being nearly the fame in all the moft ancient European languages; *ruz* in Runic; *rude*, *ruta*, or *rutu*, in Anglo-Saxon; *rutiza* in Sclavonian. Hence it is *rue* in Englifh and French; *ruta* in Italian; *ruda* in Spanifh and Portuguefe; *raute* in German; *rhy'w* in Welfh. Πηγανον, a Greek fynonym of ῥυτη, is derived from πηγνυω, *to congeal* or *reprefs;* and fuppofed to refer to a quality in the plant, oppofite, in fome refpects, to the above-mentioned. This latter name is ufed by Linnæus for a genus nearly akin to *Ruta;* fee PEGANUM. If etymology were a fure guide to the virtues of plants, rue might be taken by monks, who wifh to keep their vows, and by nuns, who have broken theirs. But we believe its efficacy, in either cafe, as uncertain, as the object is unworthy of confideration.—Linn. Gen. 210. Schreb. 286. Willd. Sp. Pl. v. 2. 542. Mart. Mill. Dict. v. 4. Ait. Hort. Kew. v. 3. 34. Sm. Prodr. Fl. Græc. Sibth. v. 1. 271. Juff. 297. Tourn. t. 133. Lamarck Illuftr. t. 345. Gærtn. t. 111.—Clafs and order, *Decandria Monogynia*. Nat. Ord. *Multifiliquæ*, Linn. *Rutaceæ*, Juff.

Gen. Ch. *Cal.* Perianth inferior, in five deep fegments, fhort and permanent. *Cor.* Petals five, fpreading, nearly ovate, concave, with narrow claws. *Stam.* Filaments ten, awl-fhaped, fpreading varioufly, the length of the corolla, broadifh at the bafe; anthers incumbent, fimple, very fhort. *Pift.* Germen gibbous, cut croffwife, furrounded with ten melliferous pores at the bafe, and raifed on a *receptacle* pierced with as many fimilar pores; ftyle central, erect, awl-fhaped; ftigma fimple. *Peric.* Capfule gibbous, five-lobed half way down, of five cells, burfting elaftically at the fummit of each lobe. *Seeds* numerous, rough, angular, fomewhat kidney-fhaped.

Obf.

Obſ. R. *graveolens*, and ſome others, in all except the primary flowers, exclude one-fifth of every part of the fructification. In *R. chalepenſis* the petals are fringed at the baſe.

Eſſ. Ch. Calyx in five deep ſegments. Petals concave, Receptacle ſurrounded with ten honey-bearing pores. Capſule lobed. Seeds numerous. Anthers ſimple.

1. R. *graveolens*. Common Rue. Linn. Sp. Pl. 548. Willd. n. 1. Ait. n. 1. Bulliard Herb. t. 85. (Ruta; Matth. Valgr. v. 2. 95. R. hortenſis, et montana; Ger. Em. 1255.)—Leaves repeatedly compound; leaflets oblong; the terminal one obovate. Petals entire.—Native of the ſouth of Europe. Frequent in the iſlands of the Archipelago. A hardy ſhrub, cultivated, time out of mind, in our gardens, where it flowers from June to September, and propagates itſelf ſpontaneouſly by ſeed. The *ſtem* is buſhy, riſing to the height of ſeveral feet, round, ſmooth, branched. *Leaves* alternate, ſtalked, twice or thrice compound, ſmooth, of a deep blueiſh glaucous hue; their leaflets oblong or obovate, entire, tapering at the baſe. *Stipulas* none. *Flowers* of a rather dull yellow, copious, in terminal corymboſe *panicles;* the terminal ones only having the full number of each of the parts of fructification, while the reſt are octandrous and four-cleft. *Petals* jagged at the extremity; angular, but not fringed, at the baſe. The *ſtamens* of this, and perhaps all the other ſpecies, are remarkable for their progreſſive approach to the *ſtigma*, over which they in turn drop their pollen and retire. Every part of the plant when rubbed, or touched, has a peculiar acrid pungent ſmell, too ſtrong to be agreeable. The bruiſed leaves excoriate the lips and noſtrils, if incautiouſly applied, as they often are, to counteract bad ſmells; rue being ſuppoſed powerfully to prevent contagion. Its internal uſe is unſafe; yet we have known it eaten with bread and butter in no ſmall quantity; not altogether with impunity. Botaniſts diſtinguiſh two varieties; the wild, which has more oblong leaflets, or ſegments, and the garden rue, which has rounder ones. Gerarde has tranſpoſed the cuts of theſe, borrowed from Dodonæus.

2. R. *montana*. Mountain Rue. Ait. n. 2. Willd. n. 2. (R. legitima; Jacq. Ic. Rar. t. 76. R. ſylveſtris; Camer. Epit. 495. R. ſylveſtris minima; Ger. Em. 1255.)—Leaves repeatedly compound; leaflets all linear. Branches of the panicle racemoſe. Petals entire.—Native of dry hilly ſituations in the ſouth of Europe. Dr. Sibthorp found this ſpecies in various parts of Greece, and the neighbouring countries, and juſtly conſidered it as the πηγανον ορεινον, or Mountain Rue of Dioſcorides, for which moſt of the commentators of that old writer have miſtaken the wild, or narrower-leaved, *R. graveolens*. This is a hardy perennial herb, rather than a ſhrub, flowering in autumn in our gardens, where, however, though cultivated by Gérarde, it is now rarely to be ſeen. The plant is known by its more humble ſtature, and eſpecially by the very narrow *leaflets*. The radical *leaves* are crowded into a denſe tuft. Moſt of the *flowers* are four-cleft, as in the former. The branches of the *panicle* are racemoſe, and elongated. *Capſule* not half ſo big as in the Common Rue.

3. R. *chalepenſis*. African Rue. Linn. Mant. 69. Willd. n. 3. Ait. n. 3. Sm. Fl. Græc. Sibth. t. 368. (R. tenuifolia, florum petalis villis ſcatentibus; Moriſ. ſect. 5. t. 35.)—Leaves repeatedly compound; leaflets oblong or obovate. Petals with fringe-like teeth.—Native of Africa, as well as of Zante, and the iſles of the Archipelago. A common greenhouſe ſhrub, flowering at various ſeaſons, and chiefly diſtinguiſhed from the Common Rue by its larger *flowers*, whoſe *petals* are copiouſly fringed with taper teeth. Many of the *flowers* are four-cleft, and the *foliage* varies in breadth, as in that ſpecies.

4. R. *pinnata*. Wing-leaved Rue. Linn. Suppl. 232. Willd. n. 4. Ait. n. 4.—Leaves ſimply pinnate; leaflets lanceolate, tapering at the baſe, bluntly ſerrated. Petals ſomewhat notched.—Native of rocks in the Canary iſlands, from whence it was brought by Mr. Maſſon to Kew, in 1780. This is a greenhouſe ſhrub, flowering in ſpring and ſummer. It is very diſtinct from all the foregoing, reſembling the firſt in ſize and *infloreſcence*, but the *flowers* are ſmaller, with crenate, or ſlightly toothed, petals. The *leaves* are very different, compoſed of two or three pair of oppoſite *leaflets*, above an inch long, various in breadth, more or leſs obtuſe, with unequal blunt ſerratures; the odd one rather the largeſt, on a long ſtalk.

5. R. *patavina*. Three-leaved Rue. Linn. Sp. Pl. 549. Willd. n. 5. Sm. Fl. Græc. Sibth. t. 369, unpubliſhed. (Pſeudo-ruta patavina trifolia, floribus luteis umbellatis; Mich. Gen. 22. t. 19.)—Leaves ternate, ſeſſile. Stamens hairy. Germen creſted.—Originally diſcovered by Micheli on a hill near Arqua, not far from Padua. Dr. Sibthorp met with it on mount Parnaſſus. Linnæus had no ſpecimen, nor is the plant known in our gardens, ſo that it ſeems not to have fallen in the way of many botaniſts. The *root* is woody and perennial. *Stems* ſeveral, a foot high, erect, round, downy, leafy, branched at the baſe only. *Leaves* numerous, downy, of a light, rather glaucous green, alternate, ſeſſile, each compoſed of three, nearly equal, narrow, obtuſe, entire, ſlightly revolute *leaflets*, about an inch long. *Flowers* five-cleft, in a terminal, denſe, cymoſe *panicle*. *Calyx* hairy, ſpreading. *Petals* ovate, obtuſe, entire, of a pale dull yellow, with a green central rib. *Stamens* ten, not ſo long as the petals; their filaments hairy half way up. *Germen* five-lobed, covered with glandular tubercles, and crowned with numerous oblong, notched, creſt-like, leafy ſcales.

6. R. *linifolia*. Broad Flax-leaved Rue. Linn. Sp. Pl. 549. Willd. n. 6. Ait. n. 5. Andr. Repoſ. t. 565. Sm. Fl. Græc. Sibth. t. 370, unpubliſhed. (R. ſylveſtris linifolia hiſpanica; Bocc. Muſ. v. 1. 82. t. 73. f. 3. Barrel. Ic. t. 1186. R. montana, foliis integris ſubrotundis; Buxb. Cent. 2. 30. t. 28. f. 2.)—Leaves ſimple, obovate. Stamens hairy. Germen without a creſt.—Native of Spain, Cyprus, and various parts of Greece. The plant of Buxbaum, gathered by him in fields, after harveſt, near Rodoſtro, in Thrace, as far as can be diſcerned from his imperfect figure, does not deſerve to be conſidered as even a variety. This agrees with the laſt in general habit, but is more robuſt, the *flowers* more numerous, and of a deeper yellow. *Leaves* much broader, leſs glaucous, and all ſimple and ſolitary. *Stamens* much dilated, and very hairy, in their lower part. *Germen* roundiſh, five-lobed, ten-furrowed, rough with ſmall granulations, but entirely deſtitute of the leafy creſt, which, though ſo remarkable in *R. patavina*, is not expreſſed by the generally exact Micheli. The name of *linifolia*, uſually alluding to the Common Flax, is not well adapted to the plant we have been deſcribing, except we underſtand it as referring to ſome of the broad-leaved yellow ſpecies of *Linum*, between which and this *Ruta* there exiſt indeed many points of reſemblance.

7. R. *fruticuloſa*. Narrow Flax-leaved Rue. Labillard. Syr. faſc. 1. 13. t. 4. Willd. n. 7. (R. orientalis, linariæ folio, flore parvo; Tourn. Cor. 19. Buxb. Cent. 2. 30. t. 28. f. 1.)—Leaves ſimple, ovato-lanceolate. Cluſters corymboſe, of few flowers. Stamens hairy at the baſe. Germen hairy, without a creſt.—Gathered in Syria, near Damaſcus, by our worthy friend M. Labillardiere, to

whom

whom we are obliged for a ſpecimen. This ſpecies is not known in gardens. The *ſtem* is ſhrubby, a ſpan high, much branched, particularly from the baſe, round, downy, leafy. *Leaves* ſcattered, ſeſſile, downy, about half an inch, or rather more, in length. *Flowers* ſmall, five-cleft, yellowiſh, four or five together, forming ſhort ſimple *cluſters* at the ſummit of each *branch*. *Calyx* fringed with hairs, like the lower part of the *ſtamens*. *Germen* deeply five-lobed, clothed with fine hairs. The *petals* have ſhort claws, more evident, as Willdenow obſerves, than in the preceding.

Ruta, in *Gardening*, contains plants of the under-ſhrubby evergreen kinds, of which the ſpecies cultivated are: the common rue (R. graveolens); the mountain rue (R. montana); the African rue (R. chalepenſis); and the three-leaved rue (R. patavina).

In the firſt ſort the varieties are; the common broad-leaved rue, the narrow-leaved rue, and the variegated-leaved rue.

And in the third kind there are varieties with broad leaves and with narrow leaves.

Method of Culture.—All the ſpecies and varieties of theſe plants may be readily increaſed by feeds, ſlips, and cuttings. The feed ſhould be ſown in the open ground in March or April, on a bed of light earth, raking it in: the plants ſoon come up, which, when two or three inches high, ſhould be planted out in nurſery-rows, and watered till freſh rooted. And from the ſcattered or ſelf-ſown ſeeds of the common ſort, many young plants often riſe in autumn and ſpring, which form good plants; but by ſlips or cuttings is the moſt expeditious method of raiſing all the ſorts, as every ſlip or cutting of the young wood will readily grow. It is the only method by which the different varieties can be continued diſtinct. The ſlips or cuttings ſhould be made from the young ſhoots ſix or eight inches long, and planted in a ſhady border, in rows half a foot aſunder, giving a good watering, and repeating it occaſionally; by which they will ſoon emit roots below and ſhoots at top, ſo as to form little buſhy plants by the autumn following. And they all afford variety in the borders and other parts of gardens and pleaſure-grounds, and the firſt ſort and varieties are alſo uſeful medicinal plants. The third ſort ſhould have a dry ſoil and ſheltered ſituation, otherwiſe it does not ſucceed well.

Some of theſe plants may be uſed for variety in the borders and other parts of pleaſure-grounds, gardens, &c.

Ruta, in the *Materia Medica*. See Rue.

Ruta Baga, in *Agriculture*, a plant of the turnip kind, which has lately been introduced into field culture with great benefit to the farmer, as affording a ſupply of green food for the ſupport and fattening of ſheep or other live-ſtock, between the common turnip and graſs ſeaſons. This root has been conſidered by ſome as a mere variety of the yellow turnip, but it is found to differ very materially from it both in texture and other properties. With reſpect to the top, or ſtem, it has ſomething of the appearance of the rape, or cabbage kind; and the bottom, or that part of the root-bulb which is above the ſurface of the ground, is covered by a thick, green, tough cuticle or ſkin, which in ſome is ſmooth, but in others quite rough, and the internal fleſhy part is of a denſe, cloſe, firm conſiſtence, having a yellowiſh tinge, nearly ſimilar to that of the horn carrot. It has indeed been ſuſpected by ſome that there are two varieties of this valuable plant, the one having a *white*, and the other a *yellow* root, the latter being conſidered as much the beſt; but this ſeems to have ariſen from their having been grown from feed collected in the neighbourhood of plants of the turnip or cole kinds, as is fully ſhewn in the Surveys of the North Riding of Yorkſhire and Nottinghamſhire.

But the great inducements for the farmer to enter freely into the culture of this root are, according to Mr. Young, 1. If he has the right ſort of feed, the root yellow in fleſh, and rough in coat, it laſts through all froſts, and may be depended on for ſheep quite through the month of April, though drawn two months before, and ſpread on a graſs field. 2. It is an excellent and nouriſhing food for ſheep, and alſo for any ſort of cattle. 3. It is equal to potatoes, in keeping ſtock ſwine: a point of very great conſequence. 4. It is, next to carrots, the very beſt food that can be given to horſes. 5. It is ſown at a ſeaſon which leaves ample time, in caſe of a failure, to put in common turnips, or cabbages.

And in regard to the ſoils moſt proper for this root, thoſe of the good, rich, loamy kinds are perhaps the beſt; but it may be grown to advantage on many of thoſe that are too moiſt and heavy for the common turnip; where the land has been brought into a tolerably perfect ſtate of pulverization and mellowneſs, and been well enriched with manure before the feed was put into the ground, or the plants ſet out upon it; as it has been perhaps from the want of this full preparation of the land, and the putting in the feed of a bad kind, and at too late a period, that cultivators of this uſeful root have been ſo frequently diſappointed in obtaining good crops.

Seed.—In procuring the feed, it ſhould always be collected from ſuch plants as have been tranſplanted, and which are the moſt perfect of their kind, as where this is not the caſe, the cultivator can never be certain of having his plants of the proper ſort. The writer of the Eaſt Lothian Report on Agriculture has indeed obſerved, that as no dependence can be placed on the feed purchaſed in the ſhops, every farmer ought to raiſe feed for himſelf: this may be done with very little trouble, and at no expence; it is only neceſſary that the feed-plants be carefully placed by themſelves, and not allowed to be near other plants bearing flowers or feed, while they are in the ſame ſtate. The danger ſeems to reſult from plants of kinds nearly related to each other mixing the farina of their flowers, when growing to feed. The ruta baga ſeems much liable to ſome adulteration of this kind, and unleſs farmers guard againſt it, by taking the trouble to preſerve their own feed, they need hardly expect it genuine.

With reſpect to the quantity or proportion of feed that is made uſe of where the broad-caſt method is employed, it is generally about two pounds to the acre; but where the drill plan is purſued, a ſomewhat ſmaller proportion may be ſufficient: however, as it is moſtly found difficult to produce a ſufficient plant of this crop, it may be adviſeable never to be too ſparing in the article of feed. In all caſes new feed is to be conſtantly preferred, and when the ſeaſon is hot and dry, it may be of utility to have it prepared by ſteeping a ſhort time before ſowing it.

In what regards the time of ſowing, as this plant is much ſlower in its vegetation than that of the common turnip, it ought to be ſown or put into the ground at an earlier period, by which circumſtance, it will not only be more forwarded for the hoe, and more fully fixed and eſtabliſhed in the ſoil, but better protected from the attacks of the fly, and the heats of the enſuing ſummer months. It has been the too common practice of farmers to ſow this crop at the ſame time with that of the common turnip, by which the crops have often failed. But if put in a month or ſix weeks ſooner, it will be found more advantageous, as from about the latter end of April to the middle of May, or perhaps a little later in the northern diſtricts, as is ſhewn by the agricultural ſurveys of theſe counties. In different places different

ferent methods are practised in raising these kinds of crops; sometimes, instead of sowing the seed over the land in either the broast-cast or drill manner, it is sown upon nursery beds of good rich earth, and after the plants are sufficiently advanced, as where they are about the size of small cabbage-plants, they are transplanted into the field, and set out on raised drills, at the distance of eight or nine inches or more from each other, and a foot or more in the rows. The business of transplanting should, if possible, be performed when the weather is in a moist state. And this may perhaps be the best mode of executing the work where such crops are cultivated only to a small extent; but where they are grown upon a more extensive scale, the former are probably to be preferred, as being more expeditious and convenient, as well as more certain of affording a sufficient plant for a full crop. From the danger of these crops being destroyed by the ravages of the fly, it has been suggested by Mr. Young, that the best culture of this plant is to sow it where it is to remain, broad-cast, from the 10th of May to the end of the month; and of all others, the best preparation to secure a crop is that of paring and burning, for the fly being the grand enemy, from its coming so very slowly to the hoe, this operation not only proves by far the best preservative against that enemy, but also pushes the plants on in an accelerated vegetation, and thereby doubly secures the crop. If the seed cannot be thus put in on land so prepared, the next best management is, to sow it after common turnips fed on the land by sheep. If neither method suits, it must be put in on well pulverized soil, very amply manured.

On a well cultivated farm near Hampstead, in the county of Middlesex, the method of culture and expences attending it were these.

Expences of Cultivation of an Acre of Land.

	£	s.	d.
Three ploughings, at 10s. - - -	1	10	0
Three harrowings, at 5s. - - - -	0	15	0
Cleaning by hand-picking - -	0	10	0
Making up drills - - - - -	0	5	0
Dung and labour of putting it in, half only allowed to this crop - - -	2	10	0
Covering it up in drills - - -	0	5	0
Seed 2lb. - - . -	0	7	6
Drilling in ditto - - - -	0	1	0
Horse-hoeing twice - - -	0	1	8
Hand-hoeing twice - - -	0	12	0
Moulding up rows - - -	0	1	0
	6	18	2

And in this mode the crop was very good, being capable of being sold in 1806 at 12*l.* *per* acre; the turnips averaging about five pounds weight each, and a large portion rising as high as twelve. The crop was put in upon land that had previously borne winter tares. And under this management the cultivator has no doubt of raising still larger crops.

After-culture.—It is evident, that in the after-culture of this plant, from its advancing more slowly to the hoe, that it must require greater attention to keep it clean and free from weeds than that of the common turnip. The business of hoeing, both in the horse and hand methods, must therefore be more diligently practised, repeating the operations as often as may be sufficient for the purpose, keeping the mould constantly well broken down, and applied to the roots of the plants.

And the plants of the Swedish turnip are liable to be affected by the same causes as those of the common turnip, the fly especially, being equally, if not more prejudicial to these crops than those of the common turnip kind. And besides, they are apt to be greatly injured or destroyed by rabbits, hares, and different sorts of birds, both in their tops and roots.

It may be noticed, that there is much difference in the statements in regard to the amount of the produce in this sort of crop; but when it is put in at a sufficient early period, and the ground prepared and managed in the manner that has been stated above, it will probably in general equal, if not surpass, that of the common turnip. And when it is considered that the flesh of the roots is much more solid and compact, and abounds more with nutritious matter, the *real* quantity of food which they afford must probably be much greater. In the trials of the above cultivator, they are found to go one-third further in the fattening of cattle or other animals, than the common turnip. And the Rev. Mr. Close, in the ninth volume of the Bath papers, has recorded an experiment in the transplanted method upon ridges of the same dimensions as those used for the common turnip, and the produce was found, after they had sustained the frosts, in the month of March, without either tops or tails, and when perfectly free from dirt, to be thirty-two tons on the acre. Mr. Daiken has stated in the Nottinghamshire Report, their advantage in the feeding of horses for a few acres to have been as high as thirty pounds the acre. And in the experiments of others, as detailed in the Agricultural Report of the North Riding of Yorkshire, they have likewise been found in common heavier than those of common turnips, though in appearance, from the closeness of their texture, they did not seem to equal them. This is, however, only conjecture, and is quite at variance with what has been the result in other cases, where actual weighing and measuring have been had recourse to. In common soils, and the ordinary modes of cultivation and application of these crops, the quantity of produce on the acre must probably be rated considerably lower, as well as their value as food for live-stock.

On actually weighing a square perch of each of these different sorts of turnip crops in the month of November, in 1808, which were grown together in the same field, on the very same kind of land, at Quarmer Park, near Lancaster, under the excellent management of Charles Gibson, esq. the respective weights were found to stand thus:

	Cwt.	qrs.	lbs.
Common turnip - - - - - -	4	2	10
Ruta baga, or Swedish turnip - - -	4	2	7
Difference	0	0	3

Which is a very trifling superiority in favour of the former; and on account of the earliness of the season for the growth of the latter, they would in all probability soon exceed it, as they are well known to increase in size and weight to a considerable later period.

It may be stated, that this sort of crop has been found of vast use in the support of sheep and other sorts of live-stock, in the more late winter and early vernal months, where the common turnip is liable to become rotten; or run up to seed: as being much more easily preserved in a sound condition, from its greater power of resisting the effects of the season, even when taken up, as well as while in the ground. In some situations, in very severe seasons, it is however sometimes a little injured, when left in the ground through the winter. Mr. Close has however found, that by having the tops and tails removed when they first begin to shoot, and being

being ftacked, they may be kept till the latter end of May, and later probably if neceffary; but which can rarely be the cafe. In this manner an ufeful fupply of cattle food is provided for that difficult and haraffing period, when turnips or other fimilar forts of food get fcarce, exhaufted, or unfit for being employed, and when the grafs is not in a ftate to be made ufe of by the ftock. On thefe accounts it is of courfe of admirable advantage for the farmer to be well provided with crops of this kind, to the full extent of his live-ftock, in bringing them through the difficult months of March, April, and the early part of May. Its application has been to almoft all forts of domeftic animals: with neat cattle, both in fattening, and as an ordinary article of food, it has long been in ufe, it is faid, with much greater effect than the common turnip. It is given after being cut or chopped into fmall pieces: when given to milch cows, it is found to increafe the milk confiderably, and render it more rich, as well as to give it a finer colour; but we are afraid it in fome meafure affects the flavour, though fome have denied its having this effect.

And fheep fucceed well upon it, gaining much more while upon it than on the common turnip, but it has been objected to in this application, from its hardnefs being fuppofed to injure their teeth, when the root is well grown: this is, we believe, from experience to be only imaginary.

Alfo, in the North Riding of Yorkfhire, in the ftore-feeding of hogs, it has been found equal to potatoes. And as a food for labouring horfes, it is faid to be highly beneficial, as rendering a fmaller proportion of oats requifite, not being of fo loofening a quality as moft other roots. In this application, the roots, after being wafhed and having their tails cut off, are put as below, and cut or chopped into large pieces by fome fort of fharp tool acting in a high fort of tub or box for the purpofe. In fome of the northern diftricts it is given both in its raw ftate, or boiled and mixed with barley duft or broken corn. But as the roots are liable to be greatly injured by expofure after being cut, for this ufe as well as that of fattening cattle, not more than are neceffary for the daily confumption fhould be prepared at a time.

It may be neceffary as well as advantageous after this account of the culture and ufes of thefe turnips, to ftate the facts refpecting them, as they are found in thofe diftricts where they are become an article of almoft general growth. In Hertfordfhire, according to the Agricultural Survey of that diftrict, they have fo rapidly made their way, as to be found in the ufual management of great numbers of the common farmers: no trivial proof, the writer fays, of their obfervation, knowledge, and good fenfe. He adds that Mr. Byde has this year (1804) 25 acres of them; a very regular plant, promifing a great produce. He finds that fheep will not touch the common turnip, if they can get at thefe; but they are apt to break their teeth, from the greater hardnefs and folidity of the root. He alfo finds that they do not taint the milk of cows, like the common turnip; and are an ufeful food for horfes. He fows them from the 13th of May to the 20th of June. When fown very early, as in May, they are fo difficult to keep clean, that he prefers June. Mr. Byde reaps better crops of barley after them than after common turnips. And Mr. Greg, at Weftmill, has 25 acres: he has cultivated this crop for fome years, and generally on a large fcale. He manures for them with yard-muck, or pulverized rape-cake, from fix to twenty bufhels an acre, according to the foil, ufually with about twelve, and fows the feed early in May. He ftates them, from his experience, to be much better than the common turnips; as they never rot, let the weather be as fevere as it may, nor are they ftringy, when confumed late in the fpring. He informs him that the barley after them is not fo good as after other turnips eat earlier, but much better than when thofe turnips are confumed as late as the Swedifh; that they do not coft more in cultivation, yet are of double the value. The farmers fow them very generally, fo that few are to be found who fow none. Mr. Wittington, at Broadwater, is a confiderable cultivator of this plant. He prefers them to common turnips, and would fubftitute them for the greateft part of that crop. He fows foon after the firft week in May: for the value in feeding, time of confumption, duration, &c. he knows nothing equally valuable. The Rev. Mr. Keate, at Hatfield, is alfo confiderably in this cultivation, and with much fuccefs: he has had crops of them for five years. His crop this year amounts to five acres, which he viewed with great pleafure—a fine regular plant, very luxuriant; equally fet out, and quite clean. They were well manured with yard-dung, and the land ploughed four times. He fows in the middle of June: they had been hoed at the expence of feven fhillings *per* acre: part of the field had yielded a crop of winter tares. They have ufually come to a large fize on Mr. Keate's farm. He has fed horfes with them, entirely to his fatisfaction; and cuts the roots with a very fimple, effective turnip-flicer: each horfe had a bufhel every day, with chaff, but no oats; they did their work very well, and became fat while they were eating this turnip. Cows alfo do well on it; nor does it give their milk or butter any tafte, but increafes their milk confiderably. They are excellent alfo for fattening fheep. The culture is become very general through this county: fo that there are few farmers in it who are without a field of this excellent plant. He likewife fays that the marchionefs of Salifbury has many acres in great perfection, and finds them of incomparable ufe. But Mr. Stephenfon remarks, that their moft important ufe is fo late in the fpring, that it is difficult to introduce them in a regular courfe, and fow fpring corn in time: he thinks them rather applicable to a few fields out of a regular rotation for fowing fome other crop than barley or oats after them; fuch, for inftance, as winter tares. He may add buck-wheat alfo. Cows do very well on Swedifh turnips without hay, and give much milk; and thefe roots laft longer for fheep in confumption than an equal quantity of common turnips, but the fheep do not thrive equally. Mr. Deerman, of Aftwich, is a great friend to them; but obferves, that they throw the land out of courfe: as they are moft ufeful fo late in the feafon, that fpring corn cannot be fown after them, he thinks the beft way is to fow common turnips for the next crop, by which means alfo the land would be brought into remarkably high order. Mr. Marfh, his neighbour, makes the fame obfervation, but has, however, always fown fpring corn after them.

On this fubject it is further ftated, that Mr. Clarke, of Sandridgbury, has cultivated them eight or nine years with great fuccefs; having generally from 20 to 25 acres annually. He fows the laft week in May, and finds no difficulty with the fucceeding crop, which is always barley, and as good as any, and often the beft on his farm. He has eat them fo late as the 6th of May. Mr. Cotton, at Hempftead, cultivates, and has the higheft opinion of them; and has only one objection to them, their flow growth, which retards their hoeing. His corn grown after them is good. Mr. Pickford, at Market-ftreet, has 30 acres this year, a beautiful regular crop. He has from experience a great opinion of them, when applied to the fatting of oxen and fheep, and to the feeding of hogs; in which laft application he thinks them

them superior to potatoes. He saw above 500 hogs on his farm. On finding these roots so profitable, he grew no more potatoes. But Mr. Chapman, of Hitchin, is of opinion that this root demands a richer and stronger soil than the chalks and loams about Hitchin; for they have been cultivated some years, dunged for, and twice hoed, but the success has not been great. The farmers entertain a high opinion of them. And Mr. Hale, of King's Walden, has cultivated them four years; he sows them the latter end of May broad-cast; hoes them twice always, picks charlock by hand, and uses all for sheep and lambs: they have been very valuable indeed. In the spring of 1800, he could have sold the crop, eight acres, at 10*l.* *per* acre. In the beginning of March, common turnips being over, 200 sheep and 200 lambs, and 140 other sheep, were kept on them near seven weeks. The same field was to have been sown with barley, and ploughed twice, but being late, was sown with Swedish turnips again, and the crop, without manure, except two cart-loads of pigeons' dung, was in every respect as good as the other. This year the land was ploughed once, and sown with white oats, and the crop was equal to full eight quarters *per* acre. Last year he had fifteen acres, and this year eleven, of this root. Mr. Roberts, the steward, who has a farm himself, has nine acres this year, and intends never to be without them; being perfectly convinced that they are a most useful crop. The writer has not seen many finer crops than Mr. Hale's, and all the parts of a full yellow colour. Lord Clarendon has five or six acres every year, and finds them of capital use. His lordship sows in May, on land, upon which, in autumn, the dung was ploughed in, as he thinks it very essential for this crop; he stirs the land in April, and ploughs it in May for sowing: he sows three pounds *per* acre: they are hand-hoed twice: he first uses them in the beginning of March: he did not eat them last year until the 24th of April, and had a large barley crop after them. They run very much to top, more than common turnips, and if his lordship had none, he would buy them for the spring at a much greater price than common. He feeds first with ewes and lambs, and then store sheep follow and eat clean. Good barley always grows after them. He has only gravels to sow them on. Mr. Parker, at Munden, has also cultivated them four years: he has twenty acres this year, and had sixteen last year; and as many the year before. The yellow-fleshed turnip is much the best. He sows in May, hand-hoes twice, and has always very good crops. He feeds them on the land with sheep; and draws them for horses, for which stock they are very useful: he uses them also for beasts of all sorts; they are of prodigious utility in point of duration, and excellent, late in the spring, for straw-fed beasts. He grows as good spring corn after them as after common turnips; but manures for them rather higher than for other sorts. They are best on loamy land; do well on good gravel; but, on very sharp gravel, they should not be sown. His twenty-acred field this year, for such an extent, is the finest crop that the writer ever saw, the earl of Winchelsea's at Burley alone excepted; yet this crop is from the second sowing in June. Mr. Calvert, at Albury, has had them four years; has now seven or eight acres: he sows them at the end of May; and finds that there is not any thing so good for every animal for which he has tried them. He once gave a few to some fattening wethers that were at common turnips, and after eating them, they would not take again to the common turnips without much starving. He has had Swedish turnips and common turnips on each side of them in the same field, and sheep turned into the field would not touch the common turnip, but seized on the Swedish immediately. The yellow-fleshed is much superior to the white; and the rough-coated to the smooth skins. His present plan is, to assign two fields, well situated for the cattle and sheep, and to have one every year under the Swedish, and the other in common turnips, to follow each other, by which means no inconvenience will result from not getting the Swedish off in time for barley. But Mr. Hill, of Whittle, thinks they injure the land by late keeping and running to seed. However, Mr. Foster, of Royston, has a high opinion of them; and observes that they are peculiarly valuable in a chalky district, where turnips *must* be fed very early, or the barley crop lost; Swedish then come in when most wanted.

It is noticed that the writer concludes on these statements, that the plant, where the soil is not sufficiently rich, may probably give way; but as to the more common objection of some, that barley cannot follow, not to speak of the success with which so many others sow that grain, it may be observed, that the right system, where the objection has really some foundation, is hinted at in the preceding notes: common turnips, winter tares, or buck-wheat, may properly succeed; and this double fallow can scarcely fail of answering in the uncommon degree of cleanness, which must be the consequence. Another plan is, to draw such as would remain too late, and strew them on grass for cattle or sheep. The objection is, therefore, in any case easily remedied. And in the Agricultural Survey of Norfolk, it is stated that Mr. Walker, of Harpley, has cultivated them for some years with great success, generally has from twenty to thirty acres annually; feeds them off with sheep and bullocks, and can depend on them when common turnips are all rotten. This crop in 1800, notwithstanding the drought, was very fine. And Mr. Coke, of Holkham, has thirty acres this year, has cultivated them for several years with the greatest success, and esteems them as a very valuable acquisition. Mr. Syble, of South Walsham, had last year a crop of these roots, which came to a good size, but they were so hard that no stock which he tried liked them. But Mr. H. Blythe, of Burnham, had a field of them of great use in the spring; this year he has ten acres.

It may be remarked, upon the whole, that as the objections to this root, on the score of its being difficult to take up, and of its hurtful and inconvenient effects in remaining upon the land to so late a period, seem not well founded, or to be capable of being readily obviated, there can be no doubt but that it must be found of great advantage on most farms where much live-stock is kept, as a food to succeed that of the common turnip late in the spring, when scarcely any other sorts are to be had in plenty for the feeding of live-stock.

In some other districts they are also cultivated to considerable extent, and with much success and advantage, as in those of Oxfordshire, Essex, &c.: their introduction is likewise attempting in many others, where their utility and value are beginning to be known. In the first of the above counties, Mr. Edwards, who cultivates them largely, has a great opinion of them as a resource, when nothing else is to be had, particularly as a spring feed: though they lose their leaves in the winter, what they produce in the spring is very great. As good barley is got after them, in his management, as after common turnips, but they are supposed to draw the ground rather more: it is not known what could be done without them. Mr. James Payne also grows them largely, and has the highest opinion of their utility. They are found by him to be the most profitable of all ways, when applied in the fattening of young pigs called porkers; which should run about as usual during the time of their becoming fat, only having as much of this kind of food as they

they can eat. Nine porkers fed in this way paid each fixpence in the day, for fix weeks together; which is a remarkable fact, and highly valuable for the cultivators of this root to be acquainted with. Others have had equally great fuccefs in the fame way of ufing this root. Mr. Salmon likewife cultivates this root with much fuccefs, putting in the crops of it in the latter end of May, or early in the following month: ufes his own feed, which produces roots which are fingle with yellow-coloured flefh, and quite round in form: three hoeings are given in raifing them. They are applied as food for calves, fheep, cows, and pigs, being extremely ufeful in each of fuch modes: the pigs, however, have only the hulls, after other cattle. They are made ufe of to the end of April, when fpring wheat is fown on the fame land after them, and as good crops are procured as after any other fort of crop. They are fuppofed to produce fo much fertility, by the abundant ftock which they keep, that barley, if fown after them, would be all ftraw.

In fact, the farmers of this diftrict are ftated to feel a thorough conviction of the importance which is attached to them, and to be well informed of the beft modes of applying them in their confumption. Their ufe in feeding fheep is well underftood, and great reliance is placed on them as a late feed in difficult fpring feafons. The improved practice of giving them fliced in troughs to penned fheep, is highly worthy of the farmer's attention; and their application in the fattening of oxen, from ftores laid up and preferved for that purpofe, is of great importance, and highly deferves to be imitated by different other diftricts. And the difcovery which has been made of the young pigs termed porkers being moft profitably fattened upon them, is alone of very great confideration: but it requires to be further and more fully afcertained, by a fet of experiments inftituted exprefsly for the purpofe; as, fhould the fame fact turn out to be well eftablifhed, not only in this cafe, but upon foils fuperior in fertility to the red fand lands in the north of this diftrict, it would be a moft valuable difcovery indeed to the farming interefts of the whole country.

The practical circumftance of fowing winter tares upon a rich and full manuring, eating them off upon the land, and then immediately putting in a crop of this fort, is likewife fuppofed a method of cultivation which can fcarcely be exceeded, on fuch foils as are of a good quality. The fact of the barley crops after this root being found full as good as thofe after common turnips, alfo deferves to be attended to; as the cultivators who maintain it are perfectly aware, that roots, ftanding in the ground late in the fpring, muft neceffarily tend to draw the land more than if they were confumed at an earlier period; but this circumftance is found to be compenfated by the fheep, or other ftock, remaining fo much longer upon the ground.

In cafes where this fort of crop is removed from the field, there is no more objection on that account than in the cafe of common turnips; but it may be done with the very fuperior advantage, that this root can be kept in any method with perfect fafety, which is well known cannot be done with common turnips.

And in the latter of the above counties, the farmers find them equally valuable and ufeful in feeding and fattening different forts of live-ftock. By fome they are thought to be uncommonly ufeful, and to feed ftock in a manner which fhews their quality to be very rich in nourifhment. But when kept late, fpring tares, it is thought, fhould be fown after them, as barley is hazardous; and others find them much better for fattening fheep and bullocks than common turnips. They are the grand ftaple article for the latter purpofe, in fome inftances; one bufhel of them being found worth three of common turnips, in fuch an application. The beafts and hogs, which have once tafted them, refufe other turnips afterwards. Eight or nine quarters of barley are taken from the acre, in fome cafes, after this root; but the manuring for it was large. The leaves of the crops have fometimes been fed off in the autumn, which did not in the leaft hurt them; and though the fheep ate into fome of the roots, the froft had no other effect than to cover the wound with a thin fkin of putrefcence, leaving the reft of the root perfectly found. Half the crop has been drawn for horfes, which are found to be very fond of them; and they were afcertained to be nearly as ufeful as carrots in this application. They are alfo excellent for feeding and rearing young calves. The beft crops here feem to be raifed by full manuring, efpecially with long, frefh, unftirred dung from the farm-yard.

This root is likewife beginning to be efteemed, and a favourite with fome farmers, in the county of Berks, where it is found to have feveral advantages over the common turnip, efpecially thofe of refifting the fevereft frofts, and of being as good and fit for ufe in the beginning of the new year, as the other kind is at the end of the old one, and thus forming a link in the fucceffion of feed for live-ftock, and faving the expence of hay and other articles. From its fweetnefs, fuperior firmnefs, and more nutritious juicy quality, it is found more quick in its fattening properties; but from its more flow growth, it is fuppofed to exhauft the land to a greater degree: yet, where there are rich, deep, loamy foils, it is undoubtedly entitled to a preference, on thefe and many other accounts.

In Devonfhire, in the practice of Mr. Exter, the relative produce between the tranfplanted root of this kind and the Norfolk green turnip, under precifely the fame circumftances as to the nature and condition of the land, is ftated by Mr. Vancouver as 628 to 851; giving a moft decided preference to the former, after amply defraying the additional expence of tranfplanting.

Ruta Muraria, in *Botany*, Wall Rue, a common little European Fern, fo called from its general place of growth, and the refemblance of its deep glaucous green fronds, to the leaves of Rue. See Ruta, and Asplenium, fpecies 21.

RUTACEÆ, fo named from the genus *Ruta*, which is one of the tribe, is a natural order of plants, the 81ft in the fyftem of Juffieu, or the 21ft of his 13th clafs. The characters of this important clafs are given under Gerania. Of the order now before us, Juffieu muft be confidered as the founder. We fhall, therefore, exhibit his own view of it, though that view is very incomplete, and capable of being much improved and elucidated by recent difcoveries.

Calyx of one leaf, often in five deep fegments. *Petals* moftly five, alternate with the fegments of the calyx. *Stamens* definite, diftinct, generally ten, alternately oppofite to the petals and to the calyx. *Germen* fimple; ftyle folitary; ftigma fimple, or rarely divided. *Fruit* either of many cells, or many capfules, the cells or capfules moftly five, each containing one or more *feeds*, inferted into the inner angle. *Corculum* flat, in a flefhy *albumen*. *Stem* either herbaceous or fhrubby, rarely arboreous. *Leaves* in fome alternate, naked; in others accompanied by *ftipulas*, in which cafe they are moft ufually oppofite. *Flowers* either axillary or terminal.

Sect. 1. *Leaves with ftipulas, and moftly oppofite.*

This fection confifts of *Tribulus*, *Fagonia*, *Zygophyllum*, and *Guaiacum*, all Linnæan genera.

Sect. 2. *Leaves alternate, without ftipulas.*

 Ruta,

Ruta, *Peganum*, and *Dictamnus*.

Sect. 3. *Genera akin to the Rutaceæ.*

Melianthus, *Diosma*, *Empleurum* of Solander, and *Aruba* of Aublet.

The author obferves that the plants of the firft fection are moft akin to his *Gerania*, but differ from that order in having a flefhy *albumen* and a ftraight *corculum*. Their habit is more like *Caffia*, and its allies, among the leguminous family, which have likewife abruptly pinnated leaves, attended by ftipulas, as well as ten ftamens with one ftyle; but thefe *Rutaceæ* differ in having oppofite leaves, a fruit of many cells, and efpecially ftamens inferted into the receptacle, beneath the germen. He inquires whether *Quaffia*, *Thryallis*, *Trigonia*, &c. be akin to them? Alfo whether his two fections are with propriety combined together, and whether they ought not rather to conftitute different orders, diftinguifhed by the fruit? However this may be, he adds, the *Rutaceæ* are diftinguifhed, by the definite number of their ftamens, from both *Tiliaceæ* and *Cifti*, while the alternate fituation of thofe organs with refpect to the corolla, diftinguifhes this order from the *Berberides*.

The true idea of the order before us muft be taken from Juffieu's fecond fection, compofed of *Ruta*, *Peganum*, and *Dictamnus*, to which are, moft indubitably, to be added from his third, *Diofma* and *Empleurum*; but fcarcely the *Aruba* of Aublet, and certainly not *Melianthus*. The difcoveries in the fouthern hemifphere have made botanifts acquainted with many new genera of this tribe. (See PHEBALIUM, CORRÆA, CROWEA, ERIOSTEMON, and MELICOPE.) *Tetratheca*, however, is erroneoufly mentioned, under the laft article, as belonging to the fame family. We have always been inclined to refer OXALIS to it, (fee that article,) rather than to the *Gerania*, on account of the elaftic *arillus* of its feeds, fo analogous to what occurs in many *Rutaceæ*; at leaft *Oxalis* is a connecting link between the two orders.

The *Rutaceæ* are nearly all fhrubby; their *leaves* without *ftipulas*, coriaceous, or flightly flefhy, moftly fmooth, full of refinous dots ftrongly fcented, fometimes acid; ufually alternate and fimple; in fome inftances oppofite, whorled, or compound. *Flower-ftalks* moftly axillary, either fimple, aggregate, or forked. *Calyx* in four or five deep fegments. *Petals* four or five. *Stamens* almoft always twice as many as the petals; their filaments often peculiar in ftructure, with fome fort of appendages; the anthers not always terminal, fometimes fupported on a partial ftalk. *Style* fimple, connected with the inner angle of each cell of the germen, either at the fummit or bafe. *Capfule* of four or five cells, each lined with a membranous or horny, more or lefs elaftic, tunic, ferving to fcatter the *feeds*. Moft of the flowers are regular, *Dictamnus* being perhaps the only exception. It is an obfervation of our learned friend Mr. Correa, that every natural order feems to afford one genus, at leaft, with an irregular flower.

Our ZIERIA, Tr. of Linn. Soc. v. 4. 216, belongs to this order, and we truft will appear, in its proper place, hereafter. So likewife does BORONIA, which, having been accidentally omitted by the Rev. Mr. Wood, in vol. v. we fhall here defcribe.

BORONIA was fo named, by the writer of the prefent article, in memory of his faithful fervant and friend Francis Borone, born at Milan, April 6, 1769, who devoted himfelf to botany with an ardour, which his fingular turn for obfervation, and acutenefs of difcrimination, even with regard to the technical characters of plants, promifed to render eminently advantageous to the fcience. This ardour induced him to vifit Sierra Leone, as affiftant to Dr. Adam Afzelius, with whom he returned, rich in difcoveries and information, in the autumn of 1793. The next year he attended the late profeffor Sibthorp to Greece, and unfortunately died, by an accidental fall, at Athens, in October, 1794.—Sm. Tracts, 287. Poiret in Lamarck Dict. v. 8. 503. Ait. Hort. Kew. v. 2. 348.—Clafs and order, *Octandria Monogynia*. Nat. Ord. *Rutaceæ*, Juff.

Gen. Ch. *Cal.* Perianth inferior, in four deep, equal fegments, permanent. *Cor.* Petals four, equal, alternate with the calyx and much longer, feffile, withering. Nectary a glandular ring, furrounding the bafe of the germen. *Stam.* Filaments eight, fhorter than the corolla, inferted into the receptacle, alternately oppofite to the petals and calyx, flat, tapering, fringed, terminating varioufly, four of them a little the fhorteft; anthers of two cells, roundifh, incumbent, inferted on the infide below the fummit of each filament. *Pift.* Germen fuperior, ftanding on the nectary, conical, with four furrows; ftyle vertical, fhort; ftigma roundifh, fmooth, with four notches. *Peric.* Capfule of four diftinct lobes, foon feparating, compreffed, each of one cell, and two equal valves, lined with a bivalve elaftic tunic. *Seeds* one or two, oblong, compreffed, fmooth, polifhed.

Eff. Ch. Calyx in four deep fegments. Petals four. Anthers ftalked, below the fummit of the filaments. Style terminal, very fhort. Stigma capitate. Capfule of four compreffed lobes. Seeds with an elaftic tunic.

Sect. 1. *Leaves compound.*

1. B. *pinnata*. Hawthorn-fcented Boronia. Sm. Tr. 290. t. 4. Ait. n. 1. Andr. Repof. t. 58. Venten. Malmaif. t. 38. Poiret n. 4.—Leaves pinnate, entire, fmooth. Flower-ftalks axillary, forked. Filaments obtufe and glandular at the fummit.—Found in the neighbourhood of Port Jackfon, New South Wales. Firft raifed in England by Meffrs. Lee and Kennedy in 1794. It proves a favourite, but not common, green-houfe fhrub, flowering throughout the fpring, and much admired for the beauty as well as fcent of its flowers, which laft refembles hawthorn, approaching to *Heliotropium peruvianum*. The plant is fmooth, fhrubby, two or three feet high, with many roundifh, reddifh, leafy branches. *Leaves* oppofite, rarely three together, without *ftipulas*, of from three to five pair of feffile, lanceolate, pointed, entire *leaflets*; the terminal one rather fmaller than the reft; the common ftalk jointed, channelled, flightly winged, fmooth. *Panicles* axillary, forked, fmooth, with fquare ftalks, fwelling upward. *Bracteas* fmall, thick, oppofite, acute. *Calyx* reddifh. *Corolla* of a delicate pink. *Filaments* fringed with white woolly hairs to the very top, which terminates in a blunt glandular body, fometimes flightly hairy alfo, rifing above the *anther*, whofe ftalk is curved downwards, over the *ftigma*. *Germen* fmall, with a hairy *ftyle*. *Seeds* folitary, black, in a white, polifhed, rigid, elaftic tunic. The dried *petals* retain fomewhat of an acid tafte.

2. B. *alata*. Wing-ftalked Boronia. Sm. Tranf. of Linn. Soc. v. 8. 283.—Leaves pinnate, crenate; their common ftalk hairy. Flower-ftalks forked. Filaments obtufe. Anthers nearly terminal.—Gathered by Mr. Menzies, at King George's found, on the weft coaft of New Holland. Rather larger, and more handfome, than even the preceding. The *branches* are hairy, as well as the under fide of the common *footftalks*, efpecially at their joints. Thefe ftalks have alfo a more dilated wing, refembling *Fagara* in that refpect. *Leaflets*, moftly five pair, broad, elliptical, revolute, and crenate, with a hairy rib beneath. *Panicles* axillary, but all crowded about the tops of the branches, hairy, with fringed *bracteas*. *Flowers* larger than in *B. pinnata*; their dried petals with an opaque whitenefs

on the upper fide, reddifh-brown beneath. *Filaments* fringed all the way up, each terminating in a round knob, nearly on the top of which ftands the capillary ftalk bearing the *anther.*

3. B. *pilofa.* Hairy Boronia. Labill. Nov. Holl. v. 1. 97. t. 124. Poiret n. 1.—Leaves pinnate; leaflets linear-lanceolate, hairy, entire. Flowers folitary, axillary, and terminal, on ftalks longer than the leaves.—Native of the cape of Van Diemen. *Labillardiere.* A fmaller fhrub than the two preceding, being only from nine to eighteen inches high. *Leaflets* from five to eleven, fmall and narrow, each about half an inch long; their ftalks jointed, not winged. *Flowers* erect, about half the fize of *B. pinnata,* folitary, on fimple ftalks, bearing two pair of awl-fhaped *bracteas. Filaments* fringed, each with a round hairy head, beneath which the capillary footftalk of the *anther* is inferted.

4. B. *tetrandra.* Tetrandrous Boronia. Labill. Nov. Holl. v. 1. 98. t. 125. Poiret n. 2.—Leaves pinnate; leaflets obtufe, fmooth. Flowers folitary, axillary, on fhort recurved ftalks. Four of the ftamens awl-fhaped, without anthers.—Gathered by the fame botanift in Lewin's land, on the fouth coaft of New Holland. This fhrub is a cubit high and hairy, except the *leaflets,* which are of a very narrow obovate figure, obtufe and entire, about the fize and number of the laft. *Flowers* drooping, on fhort axillary ftalks. Four of the *filaments,* oppofite to the petals, are fomewhat club-fhaped, and bear the *anthers* on ftalks below the fummit; the reft, oppofite to the *calyx,* are awl-fhaped, rather longer, deftitute of *anthers* or their ftalks.

Sect. 2. *Leaves fimple.*

5. B. *ferrulata.* Rofe-fcented Boronia. Sm. Tr. 292. t. 5.—Leaves rhomboid, acute; unequally ferrated in the upper part. Flower-ftalks aggregate, terminal. Filaments heart-fhaped and hifpid at the fummit.—Gathered near Port Jackfon, New South Wales, by John White, M.D., to whom we are obliged for fpecimens and coloured drawings. A very elegant, fmooth, much branched *fhrub,* four feet high, not yet introduced into our green-houfes, though few can be more worthy of cultivation. The *leaves* are oppofite, numerous, rather crowded, hardly an inch long, fomewhat oblique, entire, and tapering towards the bafe, fharply ferrated or toothed above; fmooth on both fides, minutely dotted, with fcarcely any traces of ribs or veins; their colour often purplifh; their flavour approaching to that of turpentine. *Flowers* of a beautiful red, many together, in terminal corymbofe clufters; their fize rather exceeding that of the firft fpecies, and their fcent faid to refemble the fragrance of a rofe. The *filaments* are red, fringed with pale hairs chiefly at the bafe, each terminating in a globular, emarginate knob, covered with white prominent hairs, and largeft in the four longer ftamens. The *anthers* ftand, each on a deflexed ftalk, below this knob. *Style* very fhort. *Seeds* two in each elaftic tunic.

6. B. *crenulata.* Small-leaved notched Boronia. Sm. Tranf. of Linn. Soc. v. 8. 284.—Leaves obovate, with a fmall point, finely crenate. Stalks fingle-flowered, axillary, and terminal. Filaments obtufe and glandular at the fummit.—Gathered at King George's found, by Mr. Menzies, with the fecond fpecies. This appears at firft like a flender delicate variety of the *ferrulata,* the *leaves* being about one-third the fize of that fpecies; but they are obovate, minutely crenate, not fharply toothed. The *flowers* effentially differ, being much fmaller, axillary, as well as terminal, and all folitary, on bracteated angular *ftalks,* fhorter than the leaves. *Calyx* fringed. *Filaments* denfely fringed throughout, obtufe, but not inverfely heart-fhaped, at the top, neither are they briftly, though glandular, there; below the fummit they are tumid and inflexed; and the footftalks of the *anthers* are nearly terminal.

7. B. *denticulata.* Narrow-leaved toothed Boronia. Sm. Tranf. of Linn. Soc. v. 8. 284.—Leaves linear, toothed. Flower-ftalks corymbofe. Filaments obtufe and glandular at the fummit.—Found by Mr. Menzies with the laft. A branched, fmooth, erect fhrub, with longer, and much narrower, *leaves* than in any other known fpecies of this genus, their margins regularly, and rather ftrongly, but obtufely, toothed; their bafe tapering down into a fort of *footftalk. Flowers* in axillary or terminal fmooth *corymbs,* with fmall deciduous *bracteas. Calyx* fmooth. *Petals* of a pale rofe-colour, with a dark red rib, their fize not much above half that of the *B. pinnata. Filaments* but flightly fringed, their fummits obtufe and glandular, but not hairy. *Anthers* on lateral horizontal ftalks.

8. B. *parviflora.* Pale-flowered Boronia. Sm. Tr. 295. t. 6.—Leaves obovato-lanceolate, obfcurely crenate. Stalks aggregate, terminal, fingle-flowered. Filaments oblong and glandular at the fummit.—Gathered near Port Jackfon, by Dr. White, who fent us fpecimens and drawings in 1795. A fmooth erect fhrub, a foot or more in height, moft branched and leafy at the top. *Leaves* obovate, or elliptic-lanceolate, oppofite, as in all the preceding fpecies of the prefent fection, hardly an inch long, flightly crenate, chiefly towards the end, fmooth dotted, veinlefs, a little aromatic. *Flower-ftalks* fmooth, fimple, club-fhaped, three together at the fummit of each branch, with two axillary ones occafionally from the adjoining pair of leaves. Sometimes one or two leafy branches are extended beyond the inflorefcence. *Bracteas* two or four, ovate, concave, fmooth, at the common bafe of the ftalks. *Flowers* fmall. *Calyx* purplifh, half as long as the *petals,* which are ovate, pointed, pale blufh-coloured, with a red mid-rib. *Filaments* pink, fringed with white hairs, and terminating in an oblong, obtufe, fmall, flightly glandular, but not hairy, appendage, below which the *anther* projects laterally, on a horizontal ftalk.

9. B. *pilonema.* Single-flowered Boronia. Labill. Nov. Holl. v. 1. 98. t. 126. Poiret n. 3.—Leaves elliptic-oblong, entire. Stalks terminal, folitary, fingle-flowered, without bracteas. Filaments fmooth, their fummit very fhort.—Found by Labillardiere, at cape Van Diemen. The *root* is knotty at the fummit, producing feveral upright, fimple, round, rather fhrubby, *ftems,* about half a foot high. *Leaves* oppofite or three together, dotted, not an inch long, entire, acute, without rib or veins. *Flower-ftalks* erect, fwelling upwards, longer than the leaves, naked. *Flowers* about the fize of the laft. *Calyx* fmooth, nearly as long as the *petals. Filaments* awl-fhaped, fmooth, fimple, their minute points hardly extended beyond the infertion of the little ftalk of the *anther,* which however is marginal, or lateral. The author fufpected this plant to be very nearly related to the laft, from which neverthelefs he rightly diftinguifhes it by the folitary *flowers,* unaccompanied by *bracteas,* and the fmooth *ftamens,* whofe points fcarcely project above the fpot where the *anther* is inferted, fo that the latter ftands above the *filament,* like a little hat, or cap; a circumftance perhaps alluded to in the name. The habit of this fpecies, particularly the *root,* feems moft to refemble the following.

10. B. *polygalifolia.* Milkwort-leaved Boronia. Sm. Tr. 297. t. 7.—Leaves linear-lanceolate, entire. Stalks axillary, folitary, fingle-flowered, much fhorter than the leaves. Filaments hairy, their fummit fhort and blunt.—Native of the neighbourhood of Port Jackfon. The *root* is woody and knotty like the laft, throwing up many *ftems,* which

which are ſimple and leafy, as in that ſpecies, and the ſame height, but appear to be herbaceous rather than ſhrubby. *Leaves* moſtly oppoſite, very rarely alternate, ſometimes three together, almoſt ſeſſile, an inch or more in length, acute at each end, entire, dotted, with one central rib; their under ſide paleſt. *Flower-ſtalks* erect, club-ſhaped, not a quarter the length of the leaves, angular, with a pair of ſmall *bracteas* about the middle. *Calyx* ſmall, green, ſmooth. *Petals* five times as long as the calyx, roſe-coloured, tipped with deeper crimſon. *Filaments* pale, fringed to the top, obtuſe, though ſcarcely extended beyond the point where the ſtalk of the drooping *anther* is laterally inſerted. *Style* about as long as the *germen*, firmly attached to its top, ſo as to ſplit into four parts with the ſeparating cells of the fruit. *Seeds* ſolitary. The various diſtribution of the *leaves* in this ſpecies is peculiar to it. The *ſtems* are very rarely branched.

RUTE, in *Geography*, a town of Spain, in the province of Cordova; 5 miles S. of Lucena.

RUTENI Provinciales, in *Ancient Geography*, a people of Gallia Narbonnenſis, according to Pliny. Cæſar (Bell. Gall. l. vii. c. 7.) mentions them. Theſe people inhabited the territory to the left of the Tarn.

RUTGERS, John, in *Biography*, an able critic and negociator, was born of an ancient family at Dordrecht, in 1589. He received a part of his early education under Gerard Voſſius, and in 1605 was ſent to Leyden, where he reſided with Dominic Baudius. Having completed his courſe, he travelled into France, and took the degree of licentiate in law at Orleans. While at Paris, he printed, at the office of Robert Stephens, an edition of Horace, with notes; which was afterwards reprinted by Burmann, at Leyden, in 1699. When he returned to Holland, he accepted the invitation of the Swediſh ambaſſador to accompany him to Sweden, where Guſtavus Adolphus, in 1614, conferred upon him the title of his counſellor. He was, after this, employed three times as envoy from that prince to Holland upon very important affairs, in which he acquitted himſelf with great credit, and quite to the ſatisfaction of his majeſty, who ennobled him in 1619. He viſited Bohemia, Denmark, and ſeveral German courts, in the ſame quality; and laſtly he reſided at the Hague, as miniſter from Guſtavus to that republic, where he died in 1625, at the age of 36. He had publiſhed in 1618 ſix books, entitled "Variæ Lectiones;" and after his death, Heinſius publiſhed his Latin poems in conjunction with his own.

RUTH, in *Biblical Hiſtory*, a ſacred book of ſcripture, admitted into the canon, and placed in our bibles between the book of Judges and thoſe of Samuel, as being the ſequel of the former and an introduction to the latter. St. Jerome informs us, that the Jews added it to the book of Judges, becauſe the tranſactions which it records happened in the time of the judges of Iſrael (Judges, ii. 1.); and ſeveral of the ancient fathers make but one book of the Judges and Ruth. But the modern Jews place in their bibles, after the Pentateuch, the five megilloth, *viz.* the Song of Songs, Ruth, the Lamentations of Jeremiah, Eccleſiaſtes, and Eſther. Ruth is ſometimes placed the firſt of the five, ſometimes the ſecond, and ſometimes the fifth.

The ſcope of the author of this book is to relate the genealogy of David; and hence it has been conjectured, that the firſt book of Samuel was compoſed by the ſame author; in which book he could not conveniently place the genealogy of David, and he therefore choſe to give it by itſelf. The writer obſerves, at the beginning of his work, that the hiſtory he propoſed to relate happened when the judges governed Iſrael; and, therefore, they ceaſed to govern it when he wrote. He alſo ſpeaks of David at the end of his book; which ſhews, that the earlieſt period that can be aſſigned to it muſt be the time of David. Beſides, there are two modes of expreſſion in it, which occur only in the books of Samuel and of the Kings. The firſt is, "The Lord do ſo to me, and more alſo," Ruth, i. 17. Compare 1 Sam. iii. 17. xiv. 44. xx. 23. 2 Sam. iii. 9. 35. xiv. 13. 1 Kings, ii. 23. xix. 2. xx. 10. 2 Kings, vi. 31. The ſecond phraſe is, "I have diſcovered to your ear," for "I have told you," Ruth, iv. 4. Compare 1 Sam. xx. 2. 2 Sam. vii. 27. The canonicalneſs of this book was never diſputed. Ruth the Moabiteſs occurs in the genealogy of our Saviour, Matt. i. 5.

Ruth had married the ſon of Elimelech and Naomi, who had ſettled for ſome time in Moab; but being deſirous of returning to Bethlehem, her own country, after having loſt her huſband and two ſons, was accompanied by her daughter-in-law Ruth. This event happened, according to Uſher, about 120 years after the time of Joſhua. When Naomi came to Bethlehem, Ruth went to the fields in order to glean for their ſupport; and by chance entering the field of a rich citizen of Bethlehem, named Boaz, who was related to Elimelech, her father-in-law, received from him civilities, which indicated his affection for her. In proceſs of time, Ruth became the wife of Boaz, by whom ſhe had a ſon called Obed, who was father to Jeſſe, and grandfather to king David. Such is an outline of the hiſtory contained in the book of Ruth.

RUTHE, in *Commerce*, a long meaſure at Amſterdam, which is equal to 13 feet, or 143 inches, the Amſterdam foot being = $11\frac{1}{7}$ inches; the Rhineland foot of 12 inches being = $12\frac{1}{3}$ Engliſh inches. At Berlin the ruthe is = 12 Rhineland feet = $148\frac{2}{7}$ Engliſh inches. At Hamburgh the ruthe or perch is of two ſorts: one is 7 ells, or 14 feet; the other 8 ells, or 16 feet, Hamburgh meaſure. The Rhineland ruthe (12 Rhineland feet) is $13\frac{1}{7}$ Hamburgh feet, or $12\frac{1}{10}$ Engliſh feet. A Hamburgh mile contains 2000 Rhineland ruthes, or 8244 Engliſh yards: hence $14\frac{4}{5}$ ſuch miles anſwer nearly to a degree of the meridian, and 16 Hamburgh miles to 75 Engliſh miles. A ſcheffel of corn-land contains 200 ſquare ruthes, each 256 Hamburgh ſquare feet, which gives 166 Engliſh ſquare perches, or 1 acre 6 perches. A morgen or acre of land contains 600 ſquare ruthes, each ruthe being 196 Hamburgh ſquare feet, which equal 2 acres $6\frac{1}{7}$ perches, Engliſh meaſure. See Measure. Kelly's Un. Camb.

RUTHERFORD, in *Geography*, a county of Morgan diſtrict, in North Carolina, bounded N. by Burke, and S. by the ſtate of South Carolina. It contains 13,202 inhabitants.

Rutherford, the capital of the above county, which has a court-houſe, gaol, and a few houſes.

RUTHERFORTH, Thomas, in *Biography*, was born at Papſworth-Everhard, in Cambridgeſhire, in 1712. Having paſſed through the elementary parts of his education, he was entered at St. John's college, in the univerſity of Cambridge, where he took his degrees in the arts, and obtained a fellowſhip in the college. He was afterwards appointed regius profeſſor of divinity in the univerſity, and created D.D. Being attached to, and well verſed in, mathematics and natural philoſophy, he was elected a fellow of the Royal Society, and was afterwards appointed a chaplain to his royal highneſs the prince of Wales. In the church he was rector of Barley in Hertfordſhire, and of Shenfield in Eſſex, and an archdeacon. He died in October, 1771, having nearly completed his 59th year. He was author of

a thin

on the upper fide, reddifh-brown beneath. *Filaments* fringed all the way up, each terminating in a round knob, nearly on the top of which ftands the capillary ftalk bearing the *anther*.

3. B. *pilofa*. Hairy Boronia. Labill. Nov. Holl. v. 1. 97. t. 124. Poiret n. 1. — Leaves pinnate; leaflets linear-lanceolate, hairy, entire. Flowers folitary, axillary, and terminal, on ftalks longer than the leaves.—Native of the cape of Van Diemen. *Labillardiere*. A fmaller fhrub than the two preceding, being only from nine to eighteen inches high. *Leaflets* from five to eleven, fmall and narrow, each about half an inch long; their ftalks jointed, not winged. *Flowers* erect, about half the fize of *B. pinnata*, folitary, on fimple ftalks, bearing two pair of awl-fhaped *bracteas*. *Filaments* fringed, each with a round hairy head, beneath which the capillary footftalk of the *anther* is inferted.

4. B. *tetrandra*. Tetrandrous Boronia. Labill. Nov. Holl. v. 1. 98. t. 125. Poiret n. 2. — Leaves pinnate; leaflets obtufe, fmooth. Flowers folitary, axillary, on fhort recurved ftalks. Four of the ftamens awl-fhaped, without anthers.—Gathered by the fame botanift in Lewin's land, on the fouth coaft of New Holland. This fhrub is a cubit high and hairy, except the *leaflets*, which are of a very narrow obovate figure, obtufe and entire, about the fize and number of the laft. *Flowers* drooping, on fhort axillary ftalks. Four of the *filaments*, oppofite to the petals, are fomewhat club-fhaped, and bear the *anthers* on ftalks below the fummit; the reft, oppofite to the *calyx*, are awl-fhaped, rather longer, deftitute of *anthers* or their ftalks.

Sect. 2. *Leaves fimple.*

5. B. *ferrulata*. Rofe-fcented Boronia. Sm. Tr. 292. t. 5.—Leaves rhomboid, acute; unequally ferrated in the upper part. Flower-ftalks aggregate, terminal. Filaments heart-fhaped and hifpid at the fummit.—Gathered near Port Jackfon, New South Wales, by John White, M.D., to whom we are obliged for fpecimens and coloured drawings. A very elegant, fmooth, much branched *fhrub*, four feet high, not yet introduced into our green-houfes, though few can be more worthy of cultivation. The *leaves* are oppofite, numerous, rather crowded, hardly an inch long, fomewhat oblique, entire, and tapering towards the bafe, fharply ferrated or toothed above; fmooth on both fides, minutely dotted, with fcarcely any traces of ribs or veins; their colour often purplifh; their flavour approaching to that of turpentine. *Flowers* of a beautiful red, many together, in terminal corymbofe clufters; their fize rather exceeding that of the firft fpecies, and their fcent faid to refemble the fragrance of a rofe. The *filaments* are red, fringed with pale hairs chiefly at the bafe, each terminating in a globular, emarginate knob, covered with white prominent hairs, and largeft in the four longer ftamens. The *anthers* ftand, each on a deflexed ftalk, below this knob. *Style* very fhort. *Seeds* two in each elaftic tunic.

6. B. *crenulata*. Small-leaved notched Boronia. Sm. Tranf. of Linn. Soc. v. 8. 284.—Leaves obovate, with a fmall point, finely crenate. Stalks fingle-flowered, axillary, and terminal. Filaments obtufe and glandular at the fummit.—Gathered at King George's found, by Mr. Menzies, with the fecond fpecies. This appears at firft like a flender delicate variety of the *ferrulata*, the *leaves* being about one-third the fize of that fpecies; but they are obovate, minutely crenate, not fharply toothed. The *flowers* effentially differ, being much fmaller, axillary, as well as terminal, and all folitary, on bracteated angular *ftalks*, fhorter than the leaves. *Calyx* fringed. *Filaments* denfely fringed throughout, obtufe, but not inverfely heart-fhaped, at the top, neither are they briftly, though glandular, there; below the fummit they are tumid and inflexed; and the footftalks of the *anthers* are nearly terminal.

7. B. *denticulata*. Narrow-leaved toothed Boronia. Sm. Tranf. of Linn. Soc. v. 8. 284.—Leaves linear, toothed. Flower-ftalks corymbofe. Filaments obtufe and glandular at the fummit.—Found by Mr. Menzies with the laft. A branched, fmooth, erect fhrub, with longer, and much narrower, *leaves* than in any other known fpecies of this genus, their margins regularly, and rather ftrongly, but obtufely, toothed; their bafe tapering down into a fort of *footftalk*. *Flowers* in axillary or terminal fmooth *corymbs*, with fmall deciduous *bracteas*. *Calyx* fmooth. *Petals* of a pale rofe-colour, with a dark red rib, their fize not much above half that of the *B. pinnata*. *Filaments* but flightly fringed, their fummits obtufe and glandular, but not hairy. *Anthers* on lateral horizontal ftalks.

8. B. *parviflora*. Pale-flowered Boronia. Sm. Tr. 295. t. 6.—Leaves obovato-lanceolate, obfcurely crenate. Stalks aggregate, terminal, fingle-flowered. Filaments oblong and glandular at the fummit.—Gathered near Port Jackfon, by Dr. White, who fent us fpecimens and drawings in 1795. A fmooth erect fhrub, a foot or more in height, moft branched and leafy at the top. *Leaves* obovate, or elliptic-lanceolate, oppofite, as in all the preceding fpecies of the prefent fection, hardly an inch long, flightly crenate, chiefly towards the end, fmooth dotted, veinlefs, a little aromatic. *Flower-ftalks* fmooth, fimple, club-fhaped, three together at the fummit of each branch, with two axillary ones occafionally from the adjoining pair of leaves. Sometimes one or two leafy branches are extended beyond the inflorefcence. *Bracteas* two or four, ovate, concave, fmooth, at the common bafe of the ftalks. *Flowers* fmall. *Calyx* purplifh, half as long as the *petals*, which are ovate, pointed, pale blufh-coloured, with a red mid-rib. *Filaments* pink, fringed with white hairs, and terminating in an oblong, obtufe, fmall, flightly glandular, but not hairy, appendage, below which the *anther* projects laterally, on a horizontal ftalk.

9. B. *pilonema*. Single-flowered Boronia. Labill. Nov. Holl. v. 1. 98. t. 126. Poiret n. 3. — Leaves elliptic-oblong, entire. Stalks terminal, folitary, fingle-flowered, without bracteas. Filaments fmooth, their fummit very fhort. — Found by Labillardiere, at cape Van Diemen. The *root* is knotty at the fummit, producing feveral upright, fimple, round, rather fhrubby, *ftems*, about half a foot high. *Leaves* oppofite or three together, dotted, not an inch long, entire, acute, without rib or veins. *Flower-ftalks* erect, fwelling upwards, longer than the leaves, naked. *Flowers* about the fize of the laft. *Calyx* fmooth, nearly as long as the *petals*. *Filaments* awl-fhaped, fmooth, fimple, their minute points hardly extended beyond the infertion of the little ftalk of the *anther*, which however is marginal, or lateral. The author fufpected this plant to be very nearly related to the laft, from which neverthelefs he rightly diftinguifhes it by the folitary *flowers*, unaccompanied by *bracteas*, and the fmooth *ftamens*, whofe points fcarcely project above the fpot where the *anther* is inferted, fo that the latter ftands above the *filament*, like a little hat, or cap; a circumftance perhaps alluded to in the name. The habit of this fpecies, particularly the *root*, feems moft to refemble the following.

10. B. *polygalifolia*. Milkwort-leaved Boronia. Sm. Tr. 297. t. 7.—Leaves linear-lanceolate, entire. Stalks axillary, folitary, fingle-flowered, much fhorter than the leaves. Filaments hairy, their fummit fhort and blunt.—Native of the neighbourhood of Port Jackfon. The *root* is woody and knotty like the laft, throwing up many *ftems*, which

which are simple and leafy, as in that species, and the same height, but appear to be herbaceous rather than shrubby. *Leaves* mostly opposite, very rarely alternate, sometimes three together, almost sessile, an inch or more in length, acute at each end, entire, dotted, with one central rib; their under side palest. *Flower-stalks* erect, club-shaped, not a quarter the length of the leaves, angular, with a pair of small *bracteas* about the middle. *Calyx* small, green, smooth. *Petals* five times as long as the calyx, rose-coloured, tipped with deeper crimson. *Filaments* pale, fringed to the top, obtuse, though scarcely extended beyond the point where the stalk of the drooping *anther* is laterally inserted. *Style* about as long as the *germen*, firmly attached to its top, so as to split into four parts with the separating cells of the fruit. *Seeds* solitary. The various distribution of the *leaves* in this species is peculiar to it. The *stems* are very rarely branched.

RUTE, in *Geography*, a town of Spain, in the province of Cordova; 5 miles S. of Lucena.

RUTENI Provinciales, in *Ancient Geography*, a people of Gallia Narbonnensis, according to Pliny. Cæsar (Bell. Gall. l. vii. c. 7.) mentions them. These people inhabited the territory to the left of the Tarn.

RUTGERS, John, in *Biography*, an able critic and negociator, was born of an ancient family at Dordrecht, in 1589. He received a part of his early education under Gerard Vossius, and in 1605 was sent to Leyden, where he resided with Dominic Baudius. Having completed his course, he travelled into France, and took the degree of licentiate in law at Orleans. While at Paris, he printed, at the office of Robert Stephens, an edition of Horace, with notes; which was afterwards reprinted by Burmann, at Leyden, in 1699. When he returned to Holland, he accepted the invitation of the Swedish ambassador to accompany him to Sweden, where Gustavus Adolphus, in 1614, conferred upon him the title of his counsellor. He was, after this, employed three times as envoy from that prince to Holland upon very important affairs, in which he acquitted himself with great credit, and quite to the satisfaction of his majesty, who ennobled him in 1619. He visited Bohemia, Denmark, and several German courts, in the same quality; and lastly he resided at the Hague, as minister from Gustavus to that republic, where he died in 1625, at the age of 36. He had published in 1618 six books, entitled "Variæ Lectiones;" and after his death, Heinsius published his Latin poems in conjunction with his own.

RUTH, in *Biblical History*, a sacred book of scripture, admitted into the canon, and placed in our bibles between the book of Judges and those of Samuel, as being the sequel of the former and an introduction to the latter. St. Jerome informs us, that the Jews added it to the book of Judges, because the transactions which it records happened in the time of the judges of Israel (Judges, ii. 1.); and several of the ancient fathers make but one book of the Judges and Ruth. But the modern Jews place in their bibles, after the Pentateuch, the five megilloth, *viz.* the Song of Songs, Ruth, the Lamentations of Jeremiah, Ecclesiastes, and Esther. Ruth is sometimes placed the first of the five, sometimes the second, and sometimes the fifth.

The scope of the author of this book is to relate the genealogy of David; and hence it has been conjectured, that the first book of Samuel was composed by the same author; in which book he could not conveniently place the genealogy of David, and he therefore chose to give it by itself. The writer observes, at the beginning of his work, that the history he proposed to relate happened when the judges governed Israel; and, therefore, they ceased to govern it when he wrote. He also speaks of David at the end of his book; which shews, that the earliest period that can be assigned to it must be the time of David. Besides, there are two modes of expression in it, which occur only in the books of Samuel and of the Kings. The first is, "The Lord do so to me, and more also," Ruth, i. 17. Compare 1 Sam. iii. 17. xiv. 44. xx. 23. 2 Sam. iii. 9. 35. xiv. 13. 1 Kings, ii. 23. xix. 2. xx. 10. 2 Kings, vi. 31. The second phrase is, "I have discovered to your ear," for "I have told you," Ruth, iv. 4. Compare 1 Sam. xx. 2. 2 Sam. vii. 27. The canonicalness of this book was never disputed. Ruth the Moabitess occurs in the genealogy of our Saviour, Matt. i. 5.

Ruth had married the son of Elimelech and Naomi, who had settled for some time in Moab; but being desirous of returning to Bethlehem, her own country, after having lost her husband and two sons, was accompanied by her daughter-in-law Ruth. This event happened, according to Usher, about 120 years after the time of Joshua. When Naomi came to Bethlehem, Ruth went to the fields in order to glean for their support; and by chance entering the field of a rich citizen of Bethlehem, named Boaz, who was related to Elimelech, her father-in-law, received from him civilities, which indicated his affection for her. In process of time, Ruth became the wife of Boaz, by whom she had a son called Obed, who was father to Jesse, and grandfather to king David. Such is an outline of the history contained in the book of Ruth.

RUTHE, in *Commerce*, a long measure at Amsterdam, which is equal to 13 feet, or 143 inches, the Amsterdam foot being = $11\frac{1}{7}$ inches; the Rhineland foot of 12 inches being = $12\frac{1}{3}$ English inches. At Berlin the ruthe is = 12 Rhineland feet = $148\frac{2}{7}$ English inches. At Hamburgh the ruthe or perch is of two sorts: one is 7 ells, or 14 feet; the other 8 ells, or 16 feet, Hamburgh measure. The Rhineland ruthe (12 Rhineland feet) is $13\frac{1}{7}$ Hamburgh feet, or $12\frac{1}{10}$ English feet. A Hamburgh mile contains 2000 Rhineland ruthes, or 8244 English yards: hence $14\frac{4}{5}$ such miles answer nearly to a degree of the meridian, and 16 Hamburgh miles to 75 English miles. A scheffel of corn-land contains 200 square ruthes, each 256 Hamburgh square feet, which gives 166 English square perches, or 1 acre 6 perches. A morgen or acre of land contains 600 square ruthes, each ruthe being 196 Hamburgh square feet, which equal 2 acres $6\frac{1}{2}$ perches, English measure. See Measure. Kelly's Un. Camb.

RUTHERFORD, in *Geography*, a county of Morgan district, in North Carolina, bounded N. by Burke, and S. by the state of South Carolina. It contains 13,202 inhabitants.

Rutherford, the capital of the above county, which has a court-house, gaol, and a few houses.

RUTHERFORTH, Thomas, in *Biography*, was born at Papsworth-Everhard, in Cambridgeshire, in 1712. Having passed through the elementary parts of his education, he was entered at St. John's college, in the university of Cambridge, where he took his degrees in the arts, and obtained a fellowship in the college. He was afterwards appointed regius professor of divinity in the university, and created D.D. Being attached to, and well versed in, mathematics and natural philosophy, he was elected a fellow of the Royal Society, and was afterwards appointed a chaplain to his royal highness the prince of Wales. In the church he was rector of Barley in Hertfordshire, and of Shenfield in Essex, and an archdeacon. He died in October, 1771, having nearly completed his 59th year. He was author of a thin a thin quarto in Latin, entitled "Ordo Inſtitutionum Phyſicarum in privatis Lectionibus," of which the ſecond edition was publiſhed at Cambridge in 1756; alſo of "A Syſtem of Natural Philoſophy," in 2 vols. 4to., which for many years was held in high eſtimation; "Inſtitutes of Natural and Political Law," being the ſubſtance of a courſe of lectures on Grotius, read in St. John's college in Cambridge, in 2 vols. 8vo. 1756; "A Letter to Dr. Middleton, in defence of Biſhop Sherlock's Diſcourſe on Prophecy," and divers other theological works. Dr. Rutherforth communicated to a philoſophical ſociety at Spalding, a curious correction of Plutarch's deſcription of the inſtrument uſed to renew the veſtal fire, as relating to the triangle with which the inſtrument was formed.

RUTHERGLEN, or Ruglen, in *Geography*, a royal borough and market-town in the lower ward of the county of Lanark, Scotland, is ſituated on the ſouth bank of the river Clyde, at the diſtance of $2\frac{1}{2}$ miles S.E. from Glaſgow, and 9 miles W. from Hamilton. It is a town of high antiquity, and was conſtituted a royal borough by king David I., whoſe charter was ſubſequently confirmed by his ſucceſſors, king Robert Bruce, James V., and James VI. At that period the river Clyde was much deeper in the lower part of its courſe than at preſent, and Rutherglen was not only a conſiderable ſea-port, but was in fact the firſt mercantile town in the valley of Clyde. When the city of Glaſgow, now the emporium of Scottiſh commerce and manufactures, conſiſted but of a few private houſes attached to the cathedral, this town was comparatively a buſy ſpot, whoſe inhabitants devoted themſelves to civil and commercial employments. Glaſgow, indeed, appears even to have been within the bounds, over which the corporation of Rutherglen claimed juriſdiction; for a charter is yet extant, bearing date in 1226, whereby a grant is made to the biſhop of Glaſgow, and his ſucceſſors, that no toll nor cuſtom ſhall be levied in that city by the inhabitants of Rutherglen. All the mercantile importance of this place, however, is now loſt, and it is alſo reduced in extent and population. It ſtill retains, neverthelefs, all the privileges of a royal burgh, and is governed by a provoſt, two baillies, a dean of guild, and fifteen counſellors, who are elected annually at Michaelmas. The principal branch of trade carried on here is the weaving of muſlins for the Glaſgow manufacturers. The market-day is Wedneſday, weekly; and there are, beſides, ſix annual fairs, famous for the ſale of horſes. Since the union, this burgh has joined with Glaſgow, Renfrew, and Dumbarton, in ſending a repreſentative to the Britiſh ſenate.

The town of Rutherglen conſiſts chiefly of one principal ſtreet, and a lane, called the Back-Row, both lying parallel in a direction nearly eaſt and weſt. The main ſtreet, which is very ſtraight and well paved, extends about half a mile in length, and is about 100 feet in breadth. From both ſides of it, ſeveral lanes go off; and at the diſtance of about 150 yards to the ſouthward is another lane, known by the name of Din's-Dykes, which is characterized with an indelible mark of opprobrium from the following circumſtance. The unfortunate Mary, queen of Scots, having viewed the battle of Langſide from an eminence near this town, no ſooner ſaw her army defeated than ſhe fled to the ſouth. Din's-Dykes unfortunately lay in her way. Two ruſtics, who were at that inſtant cutting graſs cloſe by, ſeeing her majeſty flying in haſte, rudely attempted to ſtop her, and threatened to cut her to pieces with their ſcythes if ſhe preſumed to proceed a ſtep further. Neither beauty, nor even royalty itſelf, can at all times ſecure the unfortunate, when they are aſſailed by the unfeeling or revengeful. Relief, however, was luckily at hand, and her majeſty was reſcued from her barbarian oppoſers.

The church of this town, which is the only public edifice worthy of notice, is very ancient, and is in a ſtyle of architecture ſuperior to moſt churches in Scotland. But what renders it particularly intereſting is the circumſtance of its having been the ſcene of two tranſactions, in which the fate of ſir William Wallace, and of the kingdom of Scotland, were deeply concerned. It was within the walls of this church that peace was concluded between England and Scotland in the year 1297, and it was here alſo that ſir John Monteith contracted with the Engliſh to betray the greateſt of Scottiſh heroes.

Rutherglen, in ancient times, was a place of ſtrength, and had a caſtle attached to it, which was conſidered to be one of the moſt important Scottiſh fortreſſes. In the diſpute between Bruce and Baliol for the poſſeſſion of the throne, it fell, with many others, into the hands of the Engliſh. It was beſieged by Robert Bruce in 1309; but he appears to have been compelled to abandon the enterpriſe by the approach of an Engliſh army. In 1313, however, it was taken by Edward Bruce, the king's brother; and ſeems ever after to have belonged to the Scotch. This caſtle was kept in good repair till a ſhort time after the battle of Langſide, when it was burnt by the orders of the regent, Murray, out of revenge againſt the Hamilton family, in whoſe cuſtody it then was. One of the principal towers was, however, afterwards repaired, and having been enlarged by ſome modern improvements, became the ſeat of the Hamiltons of Elliſton, lairds of Shawfield. At length, on the decline of that family, it was for about a century wholly neglected, and, by frequent dilapidations, was ſoon levelled with the ground. Its ſcite is now converted into a kitchen-garden; but many of its ſculptured ſtones may be ſeen built into the walls adjoining the town.

In Rutherglen the cuſtom of riding the marches of the borough is ſtill obſerved. On the day appropriated to this purpoſe, the magiſtrates and council aſſemble at the croſs, whence they proceed, in martial order, with drums beating, &c. round the boundaries of the royalty, to ſee if any encroachment has been made. Theſe boundaries are diſtinguiſhed by march-ſtones ſet up at ſmall diſtances from each other, which are ſhaped at the top in the form of a man's head; but the lower part is ſquare. This peculiar form was originally deſigned to repreſent the god Terminus, of whom they are ſo many rude images. Every new burgeſs is bound to provide a march-ſtone at his own expence, and to cut upon it the initials of his name, and the year in which it is ſet up. It has been a cuſtom, time out of memory, for the riders of the marches to deck their hats and drums with broom, and to combat with one another at the newly-erected ſtone, out of reſpect perhaps to the deity whoſe image they had ſet up, or that they might the more firmly impreſs on their minds the preciſe boundary of that place. This ceremony has of late been deferred till the company return to the croſs, when the broom engagement commences with great fury, and laſts as long as the weapons will endure. Rutherglen is likewiſe famous for the ſingular cuſtom of baking, what are called, four cakes, previous to St. Luke's fair. The operators are women only, and they ſeldom begin till after ſunſet, and a night or two before the fair. A large ſpace of the houſe is marked out by a line drawn upon it. The area is conſidered as ſacred, and if paſſed by any of the bye-ſtanders, he or ſhe incurs the penalty of a fine, which is expended in drink for the uſe of the company. This hallowed ſpot is occupied by ſix or eight women, all of whom, except the toaſter, ſeat

ſeat themſelves on the ground in a circular form, having their feet turned towards the fire. Each of them is provided with a baking-board about two feet ſquare, which they hold on their knees. The perſon who toaſts the cake, which is done on an iron-plate, ſuſpended over the fire, is called the queen or bride, and the others her maidens. She neareſt the fire on the eaſt is named the todler, and her companion on the left-hand the hodler. The remainder have arbitrary names given them by the bride. The buſineſs is commenced by the todler, who takes a ball of the dough, forms it into a ſmall cake, and then caſts it on the bake-board of the hodler, who beats it out a little thinner, and then throws it on the board of her next neighbour, and thus it goes round from eaſt to weſt till it comes to the toaſter, by which time it is as thin and ſmooth as a ſheet of paper. The firſt cake caſt on the girdle is uſually named as a gift to ſome well-known cuckold, from a ſuperſtitious notion that thereby the reſt will eſcape that miſchance. As the whole operation is performed by the hand, conſiderable noiſe is made; but as the bakers generally beat time to ſome air ſung by one or more of the company, it is far from being diſagreeable. Great dexterity is requiſite in the performance of this cuſtom, particularly in throwing the cakes from one board to another, without ruffling or breaking them; and as the toaſting requires great ſkill, the moſt experienced perſon is always choſen for that part of the work. One cake is ſent round in quick ſucceſſion after another, ſo that none of the individuals engaged are ſuffered to be idle. The whole is a ſcene of activity, mirth, and diverſion. There being no account, even by tradition, of the origin of this cuſtom, it is preſumed to be very ancient, and probably took its riſe in the days of paganiſm, as it is fraught with ſeveral of the ſacred rites peculiar to heathen worſhip; ſuch as the leavened dough, the mixing with ſugar and ſpices, the conſecrated ground, &c.; but the particular deity for whoſe honour theſe cakes were firſt made, is a point of difficult ſolution. According to the population cenſus of 1811, the borough and pariſh of Rutherglen contain 756 houſes, and 3529 inhabitants. The Hiſtory of Glaſgow and its Suburbs, by James Denholm, 1 vol. 12mo. Glaſgow, 1798. Beauties of Scotland, vol. iii. 8vo. Lond. 1806.

RUTHIN. See Rhuthyn.

RUTHSBOROUGH, a village in queen Anne's county, Maryland, on Tuckahoe creek; 6 miles S.E. of Centerville.

RUTHWELL, a market-town and pariſh in the county of Dumfries, Scotland, is ſituated on the northern bank of the Solway frith. The town, which ſtands on the high road from Port-Patrick to Carliſle, was formerly a long ſtraggling place, but has of late years been much improved, and almoſt entirely rebuilt, chiefly at the expence of the earl of Mansfield, who is proprietor of the greater part of the pariſh. It is a burgh of barony, and has the privileges of a weekly market, and ſeveral annual fairs. The pariſh extends about ſix miles along the ſhore of the Solway frith, and is nearly three miles in breadth. In virtue of an ancient charter from one of the kings of Scotland, all the inhabitants were entitled to manufacture ſalt duty free; conſequently a large quantity of that article was formerly made here; and the trade is ſtill followed by many perſons, though the exemption from duty has been diſcontinued ſince the union. About forty years ago a ſingular road was diſcovered leading through a deep moraſs. It was formed of ſtrong oak planks, eight feet in length, faſtened down by ſtakes driven through the boards into the earth. At the time it was thrown open, it lay ſix feet beneath the ſurface of the earth.

The church of Ruthwell, one of the oldeſt eccleſiaſtical buildings in Scotland, was formerly remarkable for an ancient obeliſk which ſtood within its walls, and fragments of which are ſtill viſible in the church-yard. This monument was demoliſhed by order of the General Aſſembly in 1644, under pretence of its being an object of ſuperſtition among the vulgar. When entire, according to Pennant, it meaſured about twenty feet high, excluſive of pedeſtal and capital, and was of a ſquare form, but the ſides were of unequal breadth. Two of theſe were ornamented with foliage and figures of animals, and had Runic inſcriptions round the margin. On one of the broader ſides was a very rude figure of our Saviour, and beneath were two other figures, one bearded, and the other not, deſigned to repreſent ſome of the apoſtles. The oppoſite ſide alſo diſplayed a figure of the Saviour, with Mary Magdalen waſhing his feet. Theſe ſculptures, ſays the author above-mentioned, were probably "the work of different times and nations; the firſt, that of Chriſtian Saxons, the other of the Danes, who either found thoſe ſides plain, or, defacing the ancient carving, replaced it with ſome of their own." In the cemetery is a monument to the memory of Mr. Gawin Young, the Scottiſh vicar of Bray, who was ordained miniſter of this pariſh in 1617, and maintained his poſt for fifty-four years, notwithſtanding the many changes from Preſbyterianiſm to Epiſcopacy, and from Epiſcopacy to Preſbyterianiſm, which occurred during that revolutionary period. The inſcription has, among others, theſe words:

"Far from our own; amidſt our own we ly;
Of our dear bairns thirty and one us by."

Within this pariſh ſtands Comlorgan caſtle, an ancient manſion, belonging to the earl of Mansfield. It is ſurrounded by extenſive parks and plantations, and commands a fine view of the Solway frith, and of the adjacent country. There are likewiſe ſome remains of an ancient caſtle at Cockpool.

According to the population cenſus of 1811, Ruthwell pariſh contained 231 houſes, and 1184 inhabitants. Pennant's Tour in Scotland, vol. i. 4to. Lond. 1776. Carliſle's Topographical Dictionary of Scotland, 4to. 1813.

RUTICILLA, in *Ornithology*, a ſpecies of *Muſcicapa*; which ſee.

Ruticilla, the *Red-Start*; which ſee. See alſo Motacilla *Phœnicurus*.

RUTIDEA, in *Botany*, a genus ſo named by Decandolle, from ῥυτὶς, ῥυτίδος, *a wrinkle*, alluding to the ruggedneſs of its ſeeds. Annales du Muſée d'Hiſt. Nat. v. 9. 219. *De Theis.*

RUTIGLIANO, in *Geography*, a town of Naples, in the province of Bari; 8 miles S.W. of Monopoli.

RUTILE, in *Mineralogy*, *Titane Ruthile* of Brongniart, an oxyd of titanium: it is of a dark blue-red colour, inclining to brown, with a degree of metallic ſplendour: the longitudinal fracture is foliated; the croſs fracture conchoidal and unequal. It is opaque or ſlightly tranſlucent, and ſometimes ſufficiently hard to ſcratch quartz. The ſpecific gravity is from 4.18 to 4.24. Rutile is infuſible by the blowpipe, but with the addition of borax it melts into a yellow glaſs. It is found cryſtallized: the primitive form of the cryſtals is a right-angled priſm. Sometimes two cryſtals are united by their extremities, forming a kind of twin-cryſtal. It alſo occurs in extremely minute capillary cryſtals,

cryſtals, which are either divergent or reticulated, but ſometimes ſingle, and are imbedded in quartz and rock-cryſtal. From the analyſis of Klaproth, it appears to be a pure oxyd of titanium. This mineral is found near Limoges in France, in Hungary, at St. Gothard in Switzerland, on the Carpathian mountains, near Burgos in Spain, in Siberia, on the ſummit of Sierra de Avilla, in New Granada in South America, and in South Carolina in North America.

RUTILITE, called by Klaproth *Sphen*. Its colour is a brown, inclining to red, yellow, grey, or black. It is found both cryſtallized and amorphous. The cryſtals are ſmall, oblique, four-ſided priſms, which are acutely bevelled at both extremities, but are ſometimes terminated by tetrahedral pyramids. The longitudinal fracture is radiated or foliated, the croſs fracture flatly conchoidal, paſſing into even. The luſtre is gliſtening, or faintly glimmering; it is more or leſs tranſlucent on the edges. Rutilite ſcratches glaſs, is very brittle, and nearly infuſible by the blowpipe, without the addition of borax or an alkali. The ſpecific gravity is from 3.1 to 3.5. According to Klaproth it conſiſts of

Oxyd of titanium - -	35
Silex - - - - -	35
Lime - - - - -	33

It is found at Paſſau, in the diſtrict of the Inn, in a rock compoſed of felſpar, hornblende, and quartz. It alſo occurs in ſeveral Norwegian mines.

RUTILIUS, Numatianus, in *Biography*, a Latin poet, probably a native of Toulouſe, and advanced to high employments at the Roman court, was a military tribune, and about the year 414 A. D. was prefect of Rome. The empire at this time, as we have ſeen in the article Rome, was over-run by the Viſigoths, under the furious Alaric and his ſucceſſors; and Rutilius, for the purpoſe of ſuccouring his diſtreſſed native country, took a journey from Rome to Gaul, of which he wrote a deſcription in elegiac verſe. It conſiſted of two books, of which the latter is loſt. The work gives a favourable impreſſion of the writer, who was a Pagan, though it has been greatly cenſured by Catholic authors, on account of the following remarks which it contains on the monks of the iſland of Capraria. "The whole iſland," ſays Rutilius, "is filled, or rather defiled, by men who fly from the light. They call themſelves monks, or ſolitaries, becauſe they chooſe to live without any witneſſes of their actions. They fear the gifts of fortune, from the apprehenſion of loſing them; and leſt they ſhould be miſerable, they embrace a life of voluntary wretchedneſs. How abſurd is their choice; how perverſe their underſtanding, to dread the evils, without being able to ſupport the bleſſings, of the human condition. Either this melancholy madneſs is the effect of diſeaſe, or elſe the conſciouſneſs of guilt urges theſe unhappy men to exerciſe on their bodies the tortures which are inflicted on fugitive ſlaves by the hand of juſtice." For theſe and ſome other remarks on the Jewiſh ſabbath as a commemoration "Laſſati Dei," Rutilius and his adherents are ſtyled, by his commentator, Barthius, *rabioſi canes diaboli;* but Tillemont remarks, that the unbelieving poet praiſes where he means to cenſure. The verſe of Rutilius is ſaid to be more elegant than the common ſtandard of the age; and though the ſubject does not admit of poetry, he diſplays much taſte and ingenuity. The "Itinerarium" was diſcovered in 1494 at a monaſtery, and has been ſeveral times printed. The beſt editions are thoſe of 1582, and 1687. It is inſerted in Burmann's "Poetæ Minores," and in Mattaire's "Corpus Poetarum."

RUTILUS, Roach, in *Ichthyology*, a ſpecies of *Cyprinus;* which ſee.

Rutilus *Latior*, a name given by many authors to the fiſh called in Engliſh *rud*, or *finſcale*, and *rubellus*. See Cyprinus *Erythrophthalmus*.

RUTINIUM, in *Ancient Geography*, a town of the iſland of Albion, upon the route from the Portus Rutupæ, between Mediolanum and Urioconium in the Itinerary of Antonine. Camden, Gale, and Baxter agree in opinion, that Rutinium was ſituated at Rowton caſtle; but Mr. Horſley is poſitive, that it was really at Wem, on the banks of the river Roden.

RUTKIN, in *Geography*, a town of Bohemia, in the circle of Konigingratz; 8 miles E. of Gitſchin.

RUTLAM, a town of Hindooſtan, in the Malwa country; 48 miles W. of Ougein. N. lat. 23° 23′. E. long. 74° 58′.

RUTLAND, *Firſt Duke of*, in *Biography*. The words of the opera of Tamerlane, written by Nicola Haym, and ſet by Handel in 1724 for the Royal Academy of Muſic, were dedicated to the duke of Rutland, not only as one of the directors of the Royal Academy of Muſic, and a liberal patron of ſcience, but as a nobleman who, by ſtudy and application, had rendered himſelf a moſt intelligent judge both of the theory and practice of the art of muſic. And it is well known that the firſt duke of Rutland was an excellent performer on the violin; that his grace brought Carbonelli hither from Italy, when he returned from his tour through that country; and that the ſolos which this muſician dedicated to him, were compoſed expreſsly for his uſe.

Rutland, in *Geography*, one of the Andaman iſlands, in the Eaſt Indian ſea. N. lat. 11° 24′. E. long. 92° 27′.

Rutland, a county of Vermont, bounded N. by Addiſon county, E. by Windſor, S. by Bennington, and W. by New York. This county is watered by Otter creek and other ſtreams. It abounds with lakes or ponds ſtored with fiſh; the principal are lakes Bombazan and St. Auſtin, the former in Hubbarton and Caſtleton, and the latter in Wells. It contains 25 townſhips, and 29,486 inhabitants. In this county are 14 forges, 3 furnaces, and a ſlitting-mill.—Alſo, a poſt-town of Vermont, the capital of the above county, ſituated on Otter creek; 55 miles from its mouth in lake Champlain, 45 miles W. by N. from Windſor. It contains a congregational church, a court-houſe, and 2379 inhabitants. The mean heat of this place is 43°.6, the leaſt 21°, and the greateſt 92°. Durable crucibles are wrought of the pipe-clay found here. N. lat. 43° 34′ 30″. W. long. 72° 50′ 10″.—Alſo, a townſhip of Worceſter county, Maſſachuſetts; 14 miles N.W. of Worceſter; incorporated in 1722, and containing 1231 inhabitants. It is ſituated on the height of land between Connecticut river and Merrimack. The proſpects from the centre of the town are extenſive and delightful. It is a curious circumſtance, that the water which drops from the eaſtern roof of a barn in this town runs to the Merrimack, and that which falls from the weſtern ſide runs to the Connecticut. In this town are two conſiderable ponds, which furniſh ſtreams in different directions, ſome of which are large enough for mills.

Rutland, a poſt-town of Ireland, in the county of Donegal, built in one of the cluſter of iſlands called North iſles of Arran, in the diſtrict of the Roſſes. The late colonel Burton Conyngham procured a grant from parliament to eſtabliſh a ſettlement here, as a ſituation peculiarly adapted to the herring fiſhery. This town, ſo called from the duke of Rutland, who was viceroy at the time, has very fine ſtores and accommodations for drying and ſalting the fiſh, but,

but, like moſt undertakings which owe their origin to parliamentary grants, it has proved unſucceſsful, and remains a monument of the folly of expecting to force trade by ſuch means. The ſum expended was 20,000*l.* by parliament, and as much more raiſed by mortgage on the eſtate of colonel Conyngham; a man who, however he might be miſtaken in his calculations of advantage, was too honourable and patriotic to be ſuſpected of an intention to miſlead. Rutland is 153 miles N.W. from Dublin. N. lat. 54° 56′. W. long. 8° 18′. Journals of the Houſe of Commons.

RUTLANDSHIRE, one of the central counties of England, is bounded on the north, north-weſt, weſt, and ſouth-weſt, by Leiceſterſhire; on the ſouth and ſouth-eaſt by Northamptonſhire; and on the eaſt and north-eaſt by the county of Lincoln. It is the ſmalleſt ſhire in the kingdom, extending only about 18 miles in length and 15 in breadth; its circumference being 60 miles, which gives an area of 200 ſquare miles, or 128,000 acres. According to the parliamentary returns of 1811, it contains 3417 houſes and 16,380 inhabitants.

The *hiſtory* of this county, in remote times, is ſo intimately connected with that of the ſurrounding counties, that they can ſcarcely be ſeparated. Previous to the arrival of the Romans it formed part of the territories of the Coritani; and after the latter were forced to ſubmit to the imperial authority, it was included in the province of Flavia-Cæſarienſis. During the Saxon heptarchy it formed part of the kingdom of Mercia, under eighteen ſucceſſive monarchs; and when the Saxon kingdoms became united into one, it ſeems to have belonged to the crown; as we find that Edward the Confeſſor bequeathed it to his queen Edith, and after her demiſe to Weſtminſter Abbey. His will, which is ſtill extant, ſays, "I will, that after the deceaſe of queen Eadgith my conſort, Rotelond, with all its appurtenances, be given to my monaſtery of St. Peter, and be ſurrendered, without delay, to the abbot and monks there ſerving God, for ever." So anxious, indeed, was the king to ſecure this obituary grant to the abbey, that he endeavoured to render more certain the obſervance of his will by a kind of anterior deed of gift, bearing date in the 25th year of his reign. This grant, however, was but of ſhort duration, for when William the Conqueror aſcended the throne, he reſumed poſſeſſion of Rutlandſhire as crown land, and merely allowing the monaſtery to receive the tithes, divided it among ſome of his neareſt relatives, and his moſt powerful adherents. Theſe firſt Norman grantees were Robert Malet, great chamberlain of England; Gilbert de Gaunt; earl Hugh; Aubrey, the clerk, and ſeveral others. Some manors were likewiſe granted to the conqueror's niece Judith, afterwards counteſs of Huntingdon; and to Maud, counteſs of Albemarle, his half ſiſter. Conſiderable poſſeſſions, however, were reſerved to the crown; and in the reign of Edward II. it poſſeſſed the hundreds of Martinſley, Alſto, and Eaſt hundred, all of which that monarch granted to the lady Margaret, wife of Piers de Gaveſton, duke of Cornwall, to be held by her during the royal pleaſure. The hundred of Wrangdyke was then the property of Guy de Beauchamp, earl of Warwick, but his ſon Thomas being a minor at his father's death, Edward gave that eſtate to Hugh Spencer the elder, on the pretence of its being in ſatisfaction of a debt due to him of 6770*l.* During thoſe tranſactions, the preſent hundred of Oakham-Soke is never mentioned: it is therefore conjectured to have formed part of Martinſley hundred.

The aſpect of the country in Rutlandſhire is, generally ſpeaking, very beautiful, being much diverſified by gently riſing hills, running eaſt and weſt, with vallies about half a mile in breadth intervening, ſo that every three or four miles preſents a new view to the eye of the traveller. The principal vale is that of Catmoſe, in the centre of the county, which Camden deſcribes as "a pleaſant and fertile valley, perhaps from Coet Maes, which ſignifies in Britiſh, a woody plain." On the north ſide of this vale the ground riſes, and level with its ſummit a flat tract extends for ſeveral miles to the northward, forming a kind of table land, looking down upon the fertile and well-wooded plains of Leiceſter, Nottingham, and Lincoln-ſhires. The ſouthern diſtrict conſiſts, in a great meaſure, of one widely expanded vale, moſtly open land, which ſtretches into Northamptonſhire; and on the weſtern borders, the remains of the old foreſt of Liefield are well wooded, and ſink in the diſtance into the Leiceſterſhire plains.

The climate of this county is generally reckoned good and healthy, but has no peculiarity demanding notice. The ſoil is various, but is, upon the whole, fertile. The moſt prevalent kind is a ſtrong reddiſh loam, intermixed with keal, lying upon an under-ſtratum of blue clay; but almoſt every farm has a mixture of poor clay, hazel earth, white ſtony land, black clay and gravelly clay. This great variation of ſoils within a ſmall ſpace cauſes each ſort to be much more valuable than it would be, were one kind prevalent throughout an entire lordſhip.

The modes of agriculture adopted here differ, as may be ſuppoſed, in ſome degree on the different ſoils, and alſo on the incloſed and unincloſed lands. Upon the unincloſed arable lands, except upon ſome of the light ſoils, the old courſe of two crops and a fallow is yet practiſed. On the light ſoil, a turnip crop is ſubſtituted for the fallow, and barley is ſown inſtead of wheat for the enſuing crop. The ſecond crops on both ſoils are peas, or peas and beans. A few farmers in the eaſtern diſtrict ſow barley and broad clover after fallow, mowing the clover for a ſecond year's crop, and feeding it off with ſheep when it is conſidered as proper for a courſe of wheat. The farmers have an idea that winter ploughing is hurtful to the land, and conſequently they lay their manure on the fallows, where it remains till the ſpring.

The incloſed lands conſiſt moſtly of the light ſoils, on limeſtone baſes; and of the heavy red loam. Theſe are principally under the Norfolk huſbandry of four years' rotation, and without feeding off, except in the turnip crops; but another mode is likewiſe practiſed, of taking two crops of ſpring corn after breaking up the clover, then turnips, next barley with rye-graſs and clover, after which there are three or four years' ſheep-feeding, when it is broken up again for ſpring corn. The firſt of theſe methods is beneficial for raiſing a large crop of wheat, and the ſecond is equally advantageous for ſheep ſtock, and hence each has its warm advocates among the farmers.

Tenures in this county are various; freehold, leaſehold, and copyhold, but freehold is moſt general. A few farmers hold their lands by leaſes of ſeven or twenty-one years' duration; but by far the greater proportion of land is held at will from year to year. Rents, in 1806, averaged about 1*l.* 1*s.* *per* acre, but they are now much increaſed. Above three-fourths of the pariſhes are exonerated from tythes, either by modus, or being made free. Farms differ much in ſize, running from 15 to 640 acres, but the large farms are few in number.

Reſpecting the mineralogy of Rutlandſhire there is nothing worthy of notice, except that there is at Ketton "a kind of ſtone very proper and famous for buildings;" and in ſeveral places lime-ſtone, conſiſting of a hard and ſoft ſpecies,

ſpecies, and containing a great number of marine ſubſtances. The exiſtence of chalybeate ſprings in different parts of the county, however, ſeems to prove the preſence of iron-ſtone, but that mineral has not yet been diſcovered, at leaſt in any quantity.

The only rivers of note, connected with the county, are the Guaſh and the Welland. The former, which is popularly called the Waſh, interſects the county nearly in the centre, croſſing it from eaſt to weſt. It takes its riſe in Leiceſterſhire, and is conſidered to be an excellent fiſhing river. The Welland alſo has its ſource in Leiceſterſhire, and forms the boundary for many miles between this county and Northamptonſhire. The other Rutlandſhire ſtreams are the Chater, which croſſes the county to the ſouthward of the Guaſh, and the Little Eye, or Lytelee, which bounds it on the ſouth-weſt. Rutlandſhire does not boaſt of a ſingle lake; but it has the more important advantage of a canal, denominated the Oakham canal. This branch of a more extended line begins in the vicinity of Melton Mowbray, in Leiceſterſhire, enters Rutlandſhire near Teigh, and paſſes by Market Overton, Barrow, Cotſmore, and Burley, until it approaches Oakham on the north ſide in the level of the vale of Catmoſe.

The roads in this county are tolerably good, but are not generally formed on a good plan, being raiſed too high before the materials are laid upon them, and the ſtones being much too large. No manufactures of any import are carried on here, owing to the deficiency of water and the ſcarcity of fuel. Rutlandſhire may, therefore, be conſidered as entirely an agricultural county; and it is worthy of remark, that notwithſtanding the improvements in huſbandry, population has not increaſed during the laſt thirty years; while in manufacturing counties it has almoſt doubled itſelf within the ſame period.

Politically ſpeaking, Rutlandſhire is divided into five hundreds, *viz.* Wrangdyke, Alſto, Oakham, Eaſt, and Martinſley, which contain fifty-three pariſhes and two market towns, Oakham and Uppingham. There are no boroughs in the county, ſo that it is repreſented in parliament only by two knights of the ſhire. In judicial affairs it is in the Midland circuit, and in eccleſiaſtical juriſdiction is ſubject to the biſhop of Peterborough. Rutland was an earldom at a very early period, and the honour was uſually a branch of the royal family. It is now a dukedom in the family of Manners. This county is altogether devoid of objects of antiquarian curioſity. Beauties of England and Wales, vol. xvii. by Mr. Laird, 8vo. 1814. General View of the Agriculture of the County of Rutland, by Richard Parkinſon, London, 8vo. 1808. A portion of a hiſtory of this county has been recently publiſhed by Thomas Blore, folio. This ſpecimen is ſo well executed, that every lover of topographical hiſtory, as well as the inhabitants of the county in general, muſt regret that the whole work is not completed in the ſame ſtyle and manner.

RUTLEDGE, the ſhire-town of Grainger county, in the ſtate of Teneſſee, ſituated in Richland valley: it contains a few dwelling-houſes, and is merely a handſome flouriſhing village.

RUTLINGEN. See Reutlingen.

RUTNAGHERI, a hill-fort of Hindooſtan, in Myſore, taken in the year 1799 by the Britiſh; three miles W.S.W. of Oudeadurgam.

RUTSHA, a town of Imiretta; 38 miles N.E. of Cotatis.

RUTTAGURRA, a town of Hindooſtan, in Malwa; 30 miles E.N.E. of Bilſah.

RUTTANGUR, a town of Hindooſtan, in Baglana; 25 miles N.W. of Junere.

RUTTEE, a weight uſed in the Eaſt Indies, one hundred of which make eighty-eight caracts. See Caract.

RUTTENSTEIN, in *Geography*, a town of Auſtria; 9 miles N.N.W. of Grein.

RUTTUNGUNGE, a town of Bengal, 47 miles S.S.E. of Nattore. N. lat. 23° 53′. E. long. 89° 43′.—Alſo, a town of Bengal; 10 miles S. of Boglipour.

RUTTUNPOUR, a circar of Hindooſtan, bounded on the N. by Surgooja and Juſhpour, on the E. by Gangpour, on the S. by a country unknown to Europeans, and on the E. by Goondwanah. Its chief towns are Ruttunpour, Raypour, and Dumdah. It is traverſed towards the ſouth by the river Mahanada.—Alſo, the capital of the fore-mentioned circar, in the country of Oriſſa; 326 miles W. of Calcutta, lying in the road from Bahar to Nagpour. N. lat. 22° 16′. E. long. 82° 36′.—Alſo, a town of Hindooſtan, in Bahar; 12 miles N.W. of Durbungah.

RUTUBA, in *Ancient Geography*, a river of Italy, in Liguria, according to Pliny, lib. iii. c. 5.

RUTULI, a people of Italy, in Latium, who inhabited the country near the ſea-coaſt. Their origin is uncertain; but it ſeems, according to Virgil, that at the arrival of Æneas, Turnus was their king. This prince, in his attempt to oppoſe the eſtabliſhment of the Trojans, was killed in the combat. The Rutuli, in proceſs of time, were often confounded with the Latins. Their capital was called Ardea.

RUTULUS, in *Roman Antiquity*, the barrier of the cavea, or place where the wild beaſts uſed in amphitheatrical ſports were ſhut up. It was made of iron bars, which turned upon hinges, and all at once flew open with great ſwiftneſs.

RUTUNIUM, in *Ancient Britiſh Geography*. See Rutinium.

RUTUPIÆ Portus, in *Ancient Geography*. See Richborough.

RUTY-PUNDOC, in *Natural Hiſtory*, a name given by the people of the Eaſt Indies to a peculiar ſpecies of yellow orpiment, which they find on the tops of the mountains there; and, after ſeveral calcinations, give internally in coughs and colds. The ancient Greeks uſed this orpiment in the ſame manner. We have of late run into an opinion of its being a fatal poiſon; but Dr. Boerhaave, in his Chemiſtry, affirms, on his own trials, that it is innocent and harmleſs. Theſe people, who have not the uſe of chemiſtry, give us a hint of the virtues of great numbers of our own foſſils, which are common alſo to their country. The ſelenitæ, fibroſe tails, ſpars, and many other foſſils, which we wholly neglect, are in common uſe with them, and great cures are often performed by them.

RUTZDORF, in *Geography*, a town of Brandenburg, in the New Mark; eight miles N. of Cuſtrin.

RUTZEN, a town of Sileſia, in the principality of Wolau; 18 miles N. of Wolau. N. lat. 51° 37′. E. long. 16° 32′.

RUUN, Runo, or *Runeholm*, an iſland of the Baltic, belonging, in an extenſive ſenſe, to the province of Oeſel, and lying in the middle of the gulf of Riga, at the diſtance of 95 verſts from the town of that name, and rather more than 51 verſts from Oeſel. It is diſtinguiſhable far off at ſea by a foreſt of birch trees, which occupies one of its ſides. It is entirely the property of the crown, and is inhabited by Swediſh boors. Here is a church, to which belongs a preacher, whoſe congregation is ſmall, but income very decent, conſiſting of the tythe of all the products of the iſland, together with a portion of land. In this iſland is a light-a light-houfe, for the fupply of which the boors are obliged to buy the fuel on the continent, the crown allowing them towards it 40 dollars. There is no farm on the ifland except that of the paftorate. Among the inhabitants, it is faid, there are fome remains of the old Livonians, who fpeak the Runic language, alfo the Efthnic, the Lettifh, the Swedifh, and moft commonly the German and Rufs, each with facility, from their frequent intercourfe with others. In the labours of the chace, and the capture of the fea-dog, they are indefatigable, by which they gain an opulent fubfiftence. They live in great harmony, and only intermarry among their own fociety. Tooke's Ruffia, vol. ii.

RUVO, a town of Naples, in the province of Bari, the fee of a bifhop; 5 miles S. of Trani. N. lat. 41° 12'. E. long. 16° 28'.—Alfo, a town of Naples, in Bafilicata; 18 miles S.W. of Venofa.

RUY, a town of France, in the department of the Ifere; 20 miles E. of Vienne.

RUYSCH, Frederic, in *Biography*, a celebrated anatomift and phyfician, was born at the Hague, in the month of March 1638. His father was commiffary of the States-general, and defcended from a family of confiderable wealth and importance at Amfterdam, where they had occupied places of public truft for two centuries, until the Spanifh war, which began in 1576, occafioned a great revolution in their fortunes. The celebrity of the name, however, is built upon the talents and perfonal merits of Frederic. He commenced his academical ftudies at Leyden, after being grounded in grammatical learning in his native city, and applied himfelf with great affiduity to the ftudy of anatomy, botany, and chemiftry, efpecially to the practical inveftigation of thefe fciences, having conceived an early bias to the profeffion of medicine. His zeal and curiofity were fo much excited by the new objects which opened before him, that he allowed nothing to interfere with his labours, and at length the habit of experimental refearch rendered the moft laborious inquiries a mere agreeable recreation. He repaired alfo to Franeker, for the farther purfuit of his ftudies; but received the degree of doctor at Leyden, in 1664. Even during his pupillage at Leyden, he was applied to by Sylvius and Van Horne, to affift them in combatting the vanity of Bilfius, who came thither to exhibit his boafted method of preferving dead bodies.

After his graduation, young Ruyfch returned to the Hague, where he married, and fettled fo heartily to the practice of his profeffion, as even to neglect every purfuit which had not fome relation to it. In the following year, 1665, he publifhed his treatife on the lacteal and lymphatic veffels, which contained the refult of his inquiries while engaged in the difpute with Bilfius. In this work he does not deny that the exiftence of valves in the lymphatic had been noticed before, but he claims the honour of having firft demonftrated them, and taught the method of difcovering them. This ingenious tract immediately procured him reputation; and he was invited, the year after, to the chair of anatomy at Amfterdam; an invitation which he gladly accepted, on account of the great opportunities which it was likely to afford for the profecution of his favourite refearches. Anatomy, in fact, both human and comparative, henceforth conftituted the principal object of his life: he fpared neither time, labour, nor expence, for the attainment of his purpofes; he was almoft continually employed in diffection, and not only examined with the moft minute exactnefs every organ of the human body, but devifed means by which to facilitate the detection and demonftration of the different parts, and to preferve and exhibit them thus demonftrated. If he were not the difcoverer of the ufe of injections, for the difplay of vafcular and other ftructure, he contributed, together with the fuggeftions of De Graaf and Swammerdam, by his own ingenuity and induftry, to introduce that important practice among anatomifts. His collection of injected bodies is defcribed, indeed, as marvellous; the fineft tiffue of capillary veffels being filled with the coloured fluids, fo as to reprefent the frefhnefs of youth, and to imitate fleep rather than death. In this way he had preferved fœtufes in regular gradation, as well as young and adult fubjects, and innumerable animals of all forts and countries. His mufeum, indeed, both in the extent, variety, and arrangement of its contents, became ultimately the moft magnificent that any private individual had ever accumulated, and was the refort of vifitors of every defcription; generals, ambaffadors, princes, and even kings, were happy in the opportunity of examining it. The czar Peter, in his journey through Holland in 1698, frequently dined at the frugal table of Ruyfch, in order to fpend whole days in his cabinet; and in 1717, on his return to Holland, the czar purchafed it of him for 30,000 florins, and fent it to Peterfburg. The indefatigable anatomift immediately commenced the labour of fupplying its place by a new collection.

When we confider the advantages which Ruyfch poffeffed, his ingenuity in devifing the means of minute inveftigation, and the *improbus labor* by which he manufactured two collections of anatomical preparations, and inveftigated fuch a multitude of fubjects, it will be expected that he muft have been the author of fome difcoveries. He claims, indeed, and probably made many; which, however, were not all unknown to other anatomifts: for his fault was a neglect of reading, which rendered him often ignorant of the difcoveries of others; and therefore he fometimes gave, as new, what other writers had defcribed. Among other parts which he inveftigated minutely, were the pulmonary circulation, (in which he claims the difcovery of the bronchial artery,) the ftructure of the ear, of the brain, of the lymphatic and glandular fyftem.

Ruyfch was appointed profeffor of phyfic in 1685, a poft which he filled with honour and reputation until the year 1728, when he unhappily broke his thigh by a fall in his chamber. He was alfo nominated fuperintendant of the midwives at Amfterdam, in the exercife of which office he introduced fome improvements in the practice of thefe good women; efpecially the abolition of the habit of fpeedily extracting the placenta, which he believed to be expelled by an orbicular mufcle at the fundus. He was a member of the Royal Society of London, and of the Academy of Sciences of Paris, having fucceeded fir Ifaac Newton, in the latter body, in 1727. In the fame year he had the misfortune to lofe his fon, Henry Ruyfch, alfo doctor of phyfic, who, like himfelf, was an able practitioner, well fkilled in anatomy and botany, and was fuppofed to have materially affifted him in his publications, inventions, and experiments. This lofs was the more feverely felt, on the occurrence of the accident juft mentioned, as it deprived him of his beft affiftance in completing the fecond collection of rarities, which he was occupied in making. His youngeft daughter, however, who was ftill unmarried, and had been initiated into all the myfteries of his anatomical experiments, was fully qualified for the tafk of affiftance which fhe now undertook, and he proceeded with his new mufeum; retaining his general health until the commencement of the year 1731, when he was carried off by a fever, in the ninety-third year of his age.

Ruyfch was the author of many publications, feveral of which were controverfial; for his want of reading, and confequent differences with fome of the learned of his profeffion, led him into frequent difputes. His firft work, which originated

ginated in his defence of Sylvius and Van Horne againſt Bilſius, was entitled "Dilucidatio valvularum in Vaſis Lymphaticis et Lacteis, cum figuris æneis," Hague, 1665. His ſecond was "Obſervationum Anatomico-Chirurgicorum Centuria. Accedit Catalogus rariorum in Muſæo Ruyſchiano," Amſt. 1691; containing ſome curious facts and engravings. His third publication was an anſwer to Bidloo, who had attacked ſeveral of his doctrines, and was entitled "Reſponſio ad Godef. Bidloo Libellum, cui nomen Vindiciarum, &c." 1694. In addition to this, he publiſhed no leſs than fourteen controverſial works, in anſwer to profeſſor Gaubius, to C. Wedelius, and others, which were entitled "Epiſtolæ Anatomicæ Problematicæ, unâ cum Reſponſionibus," and were printed between the years 1696 and 1700 incluſive, and in many of which conſiderable acrimony appears on both ſides.

In addition to theſe numerous tracts, Ruyſch alſo publiſhed a ſeries of anatomical eſſays, to the number of twelve, under the title of "Theſaurus Anatomicus primus, ſecundus, &c." between the years 1701 and 1728, containing the reſults of his minute inveſtigations into the ſtructure of the different organs and textures of the body, and, in the laſt, obſervations on the anatomy of vegetables. He publiſhed alſo "Theſaurus Animalium," in 1710, with plates; three decades of "Adverſaria Anatomico-Chirurgico-Medico," in 1717—20, and 23. And a tract "De Fabricâ Glandularum ad Boerhaavium," 1722, in anſwer to an attack from that celebrated profeſſor. A collection of all his works was printed at Amſterdam in 1721, 4to. entitled "Opera omnia Anatomico-Medico-Chirurgica;" but this is neceſſarily leſs complete than the edition of 1737, in five volumes, 4to.

Henry Ruyſch, the ſon of the preceding, who died in 1727, publiſhed a "Theatrum univerſale omnium Animalium, &c. 240 Tabulis ornatum," 1718, in two vols. folio. He is ſaid to have been the ſole depoſitary of the ſecret of his father, by which thoſe beautiful preparations were made, which retained the appearance of life; and Ruyſch was reproached for allowing the contrivance to periſh with his family. But the modern improvements in the art of injection do not probably fall ſhort of his expedients, in the demonſtration of the vaſcular ſtructure of the different organs of the body. See Eloy Dict. Hiſt. de la Med.; Eloge de Fenelon; Hutchinſon, Biographia Medica.

RUYSCHIA, in *Botany*, received that appellation from Jacquin, in memory of profeſſor Frederick Ruyſch, the celebrated anatomiſt; another plant, which had borne his name, being referred to *Dracocephalum*. He is noticed by Haller, Bibl. Bot. v. 2. 98, for having directed his anatomical ſkill to the maceration and diſſection of leaves, as well as for his fondneſs for exotic plants. He appears as the editor, commentator, and tranſlator into Latin, of Commelin's valuable *Hortus Amſtelodamenſis*.—Jacq. Amer. 75. Schreb. Gen. 144. 823. Willd. Sp. Pl. v. 1. 1116. Mart. Mill. Dict. v. 4. Swartz Ind. Occ. 501. t. 11. Juſſ. 428. Lamarck Illuſtr. t. 135. (Souroubea; Aubl. Guian. 244. t. 97. Juſſ. 428.)—Claſs and order, *Pentandria Monogynia*. Nat. Ord. uncertain. Juſſ.

Gen. Ch. *Cal.* Perianth inferior, double; the outermoſt longeſt, in three deep unequal ſegments, coloured; the inner of five roundiſh, concave, obtuſe, converging, permanent leaflets. *Cor.* Petals five, ovate, flattiſh, obtuſe, reflexed, thrice as long as the inner calyx. *Stam.* Filaments five, awl-ſhaped, flat, ſpreading, ſhorter than the petals; anthers oblong, incumbent. *Piſt.* Germen ſuperior, roundiſh-ovate; ſtyle none; ſtigma quadrangular, cruciform, flat, *Peric.* Berry of two cells. *Seeds* numerous.

Eſſ. Ch. Calyx double; the outer in three deep unequal ſegments; inner of five leaves. Petals five, reflexed. Style none. Berry of two cells, with many ſeeds.

Obſ. Aublet deſcribes the ſtigma as of five angles or points, and the germen of five cells.

1. R. *cluſiæfolia*. Purple Ruyſchia. Jacq. Amer. 75. t. 51. f. 2. Willd. n. 1. Swartz Ind. Occ. 502.—Leaves obovate, obtuſe, without tranſverſe veins. Two ſegments of the outer calyx ſhorter than the inner one.—Native of the vaſt boggy foreſts in the interior parts of Martinico, where Jacquin found it flowering in April. Nobody elſe ſeems to have gathered this ſpecies. The *ſtem* is rather ſhrubby, two feet high, growing paraſitically upon trees. *Leaves* alternate, on ſhort ſtalks, obovate, obtuſe, entire, coriaceous, ſhining, ſmooth, four inches long, with a ſolitary mid-rib, and no lateral veins. *Cluſters* terminal, quite ſimple, ſolitary, erect, many-flowered; cylindrical, nine inches long; the common ſtalk cylindrical, thick and ſmooth; partial ones ſcattered, ſimple, ſhort, ſpreading. *Flowers* between the ſize of a lauruſtinus and hawthorn bloſſom, inodorous, with purple petals. *Filaments* alſo purple, uſually five, often ſeven, ſometimes ſix. Jacquin did not ſee the ripe *fruit*, but conjectured it to be a berry.

2. R. *Souroubea*. Red and yellow Ruyſchia. Swartz Ind. Occ. 504. Willd. n. 2. (Souroubea guianenſis; Aubl. Guian. 244. t. 97.)—Leaves obovate, emarginate, with a ſmall point, and many tranſverſe veins. All the ſegments of the outer calyx longer than the inner one.—Gathered by Aublet, on the banks of the river *du Gallion*, in Guiana, flowering in October. The *ſtems* are ſhrubby, but brittle, long and trailing, ſupporting themſelves on the neighbouring buſhes, but drooping at the ends; their outer bark aſh-coloured, eaſily peeling off. *Leaves* alternate, on ſhort thick ſtalks, ſmooth, fleſhy, four inches long, marked with numerous, tranſverſe, not very evident, veins. *Cluſters* terminal, ſolitary, long and drooping, of numerous *flowers*, much larger than thoſe of the firſt ſpecies; their partial ſtalks an inch long. The *outer calyx*, as we chooſe to call it, rather than a *bractea*, conſiſts of three diviſions, each near an inch long, of a coral red, one of whoſe ſegments is a tube, cloſed at the end, the other two obovate, or ſpatulate, concave above. *Inner calyx* of five or ſix yellowiſh leaves, firm, folding over each other. *Corolla* of a golden yellow, deſcribed by Aublet as monopetalous; but Swartz, who examined this author's ſpecimens, ſays otherwiſe. *Stamens* yellow. Ripe *fruit* not ſeen by Aublet. No other perſon appears to have gathered this plant. The habit of the genus, and in ſome meaſure the peculiar conformation of the outer *calyx*, reſemble MARCGRAVIA; ſee that genus, and ASCIUM.

RUYSCHIANA. See TUNICA and EYE.

RUYSDAEL, JACOB, in *Biography*, was born at Haerlem in 1636, and at firſt ſtudied ſurgery as his profeſſion, although he had given early proofs of a fine taſte in the art of painting; to which, at length, his attention was entirely directed by Nicholas Berghern, with whom he lived in habits of intimacy. He is ſaid by ſome writers to have improved his taſte in Italy, but ſcarcely a particle of Italian taſte is to be found in his works. Nature was the ſchool in which he ſtudied; her pure etherial tints, her peculiar forms, the freſhneſs of the morning, the brilliancy of mid-day, and the ſpirit-ſtirring tone of twilight, were the foundation of the principles by which he was governed, and in the contemplation of which he laid the baſis of that perfection of locality to which he ſucceſsfully aſpired.

His landſcapes are generally ſcenery in the neighbourhood of his reſidence, or occaſionally taken from the rocky borders of of the Rhine, varied with cascades, which he composed and treated in a manner till then unknown, and till now unrivalled, as mere matters of imitation.

The talents of Ruysdael were not confined to landscape, he painted sea-pieces with equal success; and he has seldom been surpassed in the truth, the brilliancy, and variety, with which he pursued that branch of the art, particularly fresh breezes and gales of wind.

He frequently obtained assistance in his figures from the pencils of Ostade, Vander-Velde, and sometimes from Wouvermary, which adds considerably to the prices obtained for his works, and they are in general of a considerable magnitude. Indeed a fine specimen of this master may be regarded as current coin, such is the general estimation of his talent. He died in 1681, at the age of 45.

His elder brother, Solomon Ruysdael, was also a landscape painter in the same style, but with indifferent success. He gained more credit as a decorative artist.

RUYSDAL, in *Geography*, a town of Holland; five miles E. of Naerden.

RUYSSELADE, a town of France, in the department of the Lys, and chief place of a canton, in the district of Bruges. The place contains 5281, and the canton 10,071 inhabitants, on a territory of 65 kiliometres, in two communes.

RUYTER, Michael-Adrian de, in *Biography*, a celebrated Dutch admiral, born at Flushing in 1607, entered into the naval service of his country very early. From the situation of cabin-boy he rose through all the commands to the rank of captain, in which he distinguished himself both among his own countrymen and foreigners. Much of the early part of his life was spent in the service in the West Indies, to which he is said to have made eight voyages, and two to Brasil. In 1641 he was sent to the assistance of the Portuguese, who had thrown off the yoke of Spain, and on this occasion he was raised to the rank of rear-admiral. His conduct obtained for him the applause of the king of Portugal, and he afterwards rendered some important services on the Barbary coast, entering the road of Sallèe in a single ship, although five Algerine corsairs disputed the passage. When war broke out, in 1652, between the English and Dutch, Van Tromp having been disgraced, De Ruyter was appointed to the command of a separate squadron, for the purpose of convoying home a rich fleet of merchantmen. He fell in with the English admiral Ayscough, with whom he had an engagement off Plymouth, in the month of August, which lasted two days, and terminated so far to the advantage of the Dutch, that he brought his convoy safe into port. In the following October De Ruyter and De Witte had an action with Blake and Ayscough on the Flemish coast, which was severely contested; but De Ruyter, being deserted by some of his captains, found it adviseable to retreat to his own coast, the loss having been nearly equal on both sides. Van Tromp was now restored to the chief command, and De Ruyter had a squadron under him in the battle of December off Folkstone, in which Blake was obliged to take shelter in the Thames. De Ruyter likewise distinguished himself in the terrible battle of three days, fought in February 1653, between Tromp and Blake, near the mouth of the Channel. In the month of June, Tromp and De Ruyter engaged Monk and Dean off Nieuport; and after a battle of two days, in which the two Dutch admirals successively rescued each other from imminent danger, the Dutch confessed their inferiority by retiring behind their own sand-banks. The commanders thence sent a warm remonstrance to the States concerning the necessity of a reinforcement, and at length they were enabled to attack the English under Monk and Lawson, near Scheveling. In the final battle between the two republics, Tromp was killed; and though De Ruyter made every effort to restore the day, returning to the combat after he had been obliged to shift his flag to a frigate, yet he was at length compelled to withdraw his shattered ships to the Meuse. The peace with England, which was concluded the following year, gave a respite to this terrible service, and De Ruyter was sent to cruize in the Mediterranean. He was to reinforce Opdam, who was laying siege to that town, and this service being effected, he returned to his station. The Dutch trade was at this time much molested by French privateers, but the vigorous conduct of De Ruyter put an end to this predatory warfare. A dispute with Portugal brought this Dutch admiral again into action, and he exhibited his vigilance, taking several Portuguese ships at the mouth of the Tagus, and made several prizes from the Brasil fleet, till a want of provisions obliged him to return to Holland. War having recommenced between the Swedes and Danes in 1658, De Ruyter was sent with a fleet to the assistance of the latter. He made a descent on the island of Funen, defeated the Swedes, and forced them to surrender at discretion in Nyborg, whither they had retired. He then wintered at Copenhagen, where the king of Denmark ennobled him for his good services. In 1662 he was sent with a strong squadron to curb the insolence of the Barbary states, who had exercised their piracy upon the Dutch shipping, and succeeded entirely to the satisfaction of his employers. At the commencement of the disputes between Charles II. and the United Provinces, De Ruyter had a command on the coast of Africa, where he recovered the forts which had been taken from the Dutch by the English, and made prizes of some merchant ships. After the defeat of the fleet of Opdam by the duke of York, in 1665, De Ruyter returned, and was raised to the rank of lieutenant-admiral-general of the Dutch navy. In the parties into which Holland was at this time divided, De Ruyter was considered as attached to the republican cause, while the younger Tromp, his rival, was a warm adherent to the house of Orange: they, however, went to sea together. The first service of De Ruyter was to convoy home a fleet of merchantmen; and in June 1666, the great fleets of the two maritime powers met in the Downs; the Dutch commanded by De Ruyter and Tromp, the English by prince Rupert (see his article) and Monk, now the duke of Albemarle. In the three days fight which ensued the Dutch had the advantage, though the valour of the English rendered the contest very severe. Both De Ruyter and Tromp were obliged several times to shift their flags from ship to ship, and the latter, having borne down to the centre of the English, was reduced to the utmost extremity, when he was nobly rescued by his rival and political foe. The action was renewed on the fourth day, and in the end the English, who had been the greatest sufferers, withdrew to their harbours.

In the following August the duke of Albemarle and prince Rupert fell in, near the coast of Essex, with De Ruyter and Tromp, and in the ensuing action, Tromp, eagerly pursuing a defeated division of the English fleet, left De Ruyter alone to contend with the main body of the enemy, who, after a long and most severe contest, was obliged to retreat, exclaiming, how wretched he was that not one bullet of so many thousands would free him from the disgrace. He gained, however, additional glory by the good order in which he drew off his shattered ships, and in no action were his skill and courage more distinguished.

The year 1667 was memorable for the disgrace which the reign of Charles II. incurred by the triumphant entrance of the Dutch into the Thames. Negociations for peace had been carrying

carrying on at Breda, which De Witte had protracted, while he haftened the naval preparations. The Dutch fleet appeared in the Thames under the command of De Ruyter, which threw the Englifh into the utmoft confternation. A chain was thrown acrofs the Medway, and fome new fortifications were added to Sheernefs and Upnore caftle: but thefe preparations were unequal to the urgency of the cafe. Sheernefs was foon taken, though defended with the utmoft valour by fir Edward Sprague. Having the advantage of a fpring tide and an eafterly wind, the Dutch, with fix men of war and five fire-fhips, preffed on and broke through the chain, and burnt feveral Englifh men of war in their courfe: among thefe was the Royal Oak, the commander of which, captain Douglas, perifhed in the flames, though he might readily have efcaped. "Never was it known," faid he, "that a Douglas left his poft without orders." The peace which foon after followed gave fome repofe to De Ruyter, till the alliance between Charles II. and Lewis XIV. for the ruin of the Dutch republic, again called him to the defence of his country. With a fleet of 91 fail, in June 1672, De Ruyter attacked the combined fleets of 130 fail, commanded by the duke of York, lord Sandwich, and count d'Eftrées, in Solebay; and after an engagement, which he reprefented as the moft obftinate that he ever witneffed, night parted the adverfaries, each claiming the victory. Lord Sandwich and count d'Eftrées loft their lives, and the other loffes were nearly equal, but De Ruyter kept the fea, and fafely convoyed home a large fleet of merchantmen. The French kept aloof, and fuffered very little.

De Ruyter was now doomed to fuffer danger from a different caufe. During the popular fury againft the oppofers of the houfe of Orange, which proved fatal to the De Wittes, De Ruyter, as one of the party, notwithftanding the great fervices which he had rendered his country, was attacked in the ftreets of Amfterdam with all forts of weapons, but efcaped without much injury. When William was raifed to the ftadtholderfhip, the fervices of this great admiral were too important to be flighted through party difputes, and in 1673 he was fent to fea with a ftrong fleet in queft of the combined Englifh and French, who were on the Dutch coaft, under the command of prince Rupert. An indecifive engagement enfued on the 7th of June, in which De Ruyter difengaged Tromp from the French fquadron which had furrounded him. The battle was partially renewed on the 14th, and in Auguft, as we have feen in the article RUPERT, a more fevere engagement took place, in which an Englifh and two Dutch admirals were killed, and both parties claimed the victory. De Ruyter, however, received the thanks of the ftadtholder for his good conduct on this occafion. Peace between England and the Dutch foon after followed, and never fince have the two nations contefted the empire of the ocean with fuch mighty force, and fo determined a fpirit. France, at this time, was rifing faft to be a maritime power, and Holland, in alliance with Spain, had to contend with her for the fuperiority. De Ruyter, in 1674, made a fruitlefs expedition to the French Caribbee iflands. In the beginning of 1676 he was fent with a fleet to Sicily, which had been encouraged by the French to revolt from the Spaniards. He fell in with the French fleet under the duke de Vironne, and an action enfued, which lafted the whole day, with no decifive advantage to either fide. De Ruyter repaired to Leghorn to refit, and then, forming a junction with the Spanifh fleet, they proceeded towards Meffina. The French came out to meet them, led on by the celebrated Du Quefne, and a fecond battle took place on the 21ft of April. The Spaniards kept at a cautious diftance, but De Ruyter, like himfelf, rufhed to the centre, broke the French line, and was in the act of chafing, when a cannon-fhot wounded him in the left heel and right leg. A fever fupervened, which within a week put an end to his life in the port of Syracufe, at the age of 69, deeply regretted by his country and admired by all Europe. The king of Spain had, only a few days previoufly to this, conferred upon him the title of duke, with a penfion. His remains were magnificently interred at Amfterdam at the public expence, and a fuperb monument was erected to his memory. Univer. Hift. Hume. Campbell's Lives of the Admirals, edit. 1813.

RUZA, in *Geography*, a town of Ruffia, in the government of Mofcow; 48 miles W.N.W. of Mofcow. N. lat. 55° 46'. E. long. 36° 2'.

RUZASUS, ZAFFOONE, in *Ancient Geography*, a port in the eaftern part of Mauritania Cæfarienfis, fituated E. of Rufcurium.

RY, in *Geography*, a town of France, in the department of the Lower Seine; nine miles E. of Rouen.

RYACOTTA, a town of Hindooftan, in Myfore, ftrong, and well furnifhed with guns, ammunition, and provifion for its defence, but taken by the Britifh in July 1791; 75 miles S. of Seringapatam. N. lat. 12° 26'. E. long. 78° 5'.

RYADER. See RIADER.

RYAL. See RIAL.

RYAL, a name given to the noble, which, on account of the fcarcity of gold in the time of Henry V. of England, was diminifhed in fize, whilft it retained its former value, but was reftored by Henry VI. to its original fize, and caufed to pafs for 10*s*. under this appellation. (See ROSE-*noble*.) This ryal of 10*s*., and alfo the angel of 6*s*. 8*d*., with their divifions of half and quarter, were the fole gold coins, till, in 1485, Henry VII. publifhed the double ryal, or fovereign of 20*s*. accompanied by the double fovereign of 40*s*. James I. of England iffued rofe-ryals of 30*s*., and fpur-ryals of 15*s*.; angels of 10*s*., and angelets of 5*s*.; till his ninth year, when gold was raifed in the proportion of 1*s*. in 10*s*.

RYALCHERY, in *Geography*, a town of Hindooftan, in the Carnatic; 10 miles N.W. of Bomrauzepollam.

RYAN, LOCH, an arm of the fea, which extends itfelf in a S.E. direction into Wigtonfhire, Scotland, forming, with the bay of Glenluce, the peninfula denominated the Rinns of Galloway. It is about ten miles in length from its entrance to Stanraer, which is fituated at its head, and varies in breadth from two to four miles. On its eaftern fide ftands the little village of Cairn, contiguous to which is a very fafe and commodious bay, with good anchoring ground, and depth of water fufficient for fhips of any burthen. King William's fleet anchored here on their paffage to Ireland. Oppofite to this village a fand-bank runs a confiderable way acrofs the loch, but few accidents ever happen upon it, and it even contributes to the fafety of the fouthern part of the bay, by breaking the force of the tides, which flow ftrongly in the direction in which it lies. This bank abounds with oyfters of a moft excellent quality. Befides Cairn bay, there are feveral other excellent anchoring bays in the loch, called Portmore bay, the Wig bay, the bay of Soleburn, and the bay of Dalmennock. In fhort, the anchoring is good and fafe in almoft every part of the loch. For fome further remarks relative to this arm of the fea, fee STANRAER. Sinclair's Statiftical Account of Scotland, vol. i. 8vo. Edin. 1791. Carlifle's Topographical Dictionary of Scotland, 4to. 1813.

RYANIA, in *Botany*, was named by Vahl in juft commemoration of John Ryan, M.D. F.R.S., a very active and

and intelligent correfpondent, to whom he was indebted for many fpecimens of rare plants from the iflands of Santa Cruz, Montferrat, &c.—Vahl. Eclog. fafc. 1. 51. Willd. Sp. Pl. v. 2. 1164. Mart. Mill. Dict. v. 4.—Clafs and order, *Polyandria Monogynia*. Nat. Ord. *Tiliaceæ*, Juff.

Gen. Ch. *Cal.* Perianth inferior, of five lanceolate, tapering, fpreading, finely ribbed, coloured, permanent leaves. *Cor.* Petals none. Nectary between the germen and ftamens, the height of the former, pitcher-fhaped, very villous. *Stam.* Filaments numerous, about 60, in a double row, awl-fhaped, a little fhorter than the calyx, fmooth, except a few hairs at the bafe; anthers erect, awl-fhaped, one-third the length of the filaments, pointed, corrugated, naked, finally waved at the edge. *Pift.* Germen fuperior, ovate, very villous; ftyle fmooth, the length of the ftamens; ftigmas four, convex. *Peric.* Berry dry, corky, nearly globular, of one cell, with five longitudinal tuberculated receptacles, from its inner coat. *Seeds* numerous, ovate, nearly globular, brown, befprinkled with a few minute hairs, and each half enclofed in a membranous tunic, with three double wings.

Eff. Ch. Calyx inferior, of five coloured permanent leaves. Petals none. Nectary pitcher-fhaped, between the ftamens and piftil. Berry corky, of one cell, with many tunicated feeds.

1. R. *fpeciofa*. Vahl. Eclog. t. 9.—Found by Dr. Ryan, in the ifland of Trinidad. A *tree*, with afh-coloured round *branches*, finely downy towards the ends. *Leaves* alternate, ftalked, elliptic-oblong, pointed, entire, fmooth on both fides, except a mealinefs on the mid-rib beneath. *Stipulas* awl-fhaped, hoary, rather longer than the footftalk, deciduous. *Flowers* axillary, moftly folitary, on fhort fimple ftalks. *Leaves* of the *calyx* an inch and half long. *Berry* double the fize of a walnut. *Seeds* rather bigger than thofe of Coriander. Vahl conceived this genus to be allied to *Laetia*, but diftinct in the nectary, permanent calyx, four ftigmas, awl-fhaped (not round) anthers, and other particulars.

RYCKE, Theodore de, in *Biography*, a learned critic, born at Arnheim in 1640; was firft an advocate at the Hague, and then profeffor of hiftory at the univerfity of Leyden. In 1681 he delivered an oration "De Gigantibus," which, with a differtation "De Primis Italiæ Colonis et Æneæ adventu," he added to an edition of Stephanus Byzantinus and Scymmus Chius, Lugd. Bat. 1684. He alfo publifhed a valuable edition of Tacitus, with notes and illuftrations, in 1687, in two vols. 12mo. He died in 1690.

RYCQUIUS, Justus, was born at Ghent in 1587, and educated at Douay. From this place he travelled into Italy, and was for fome time librarian to count Lodovico Sahero. Returning to the Low Countries, he was made canon of Ghent, and refided fome time at Louvain. In 1624 he was appointed by Urban VIII. to the chair of eloquence in the univerfity of Bologna, where he died in 1627. He publifhed a number of Latin poems, and other works, but is chiefly known by his treatife "De Capitolio Romano," 1617, containing a defcription of the works of art, ancient and modern, preferved in that relic of antiquity. This performance obtained for him the title of a Roman citizen. It was reprinted at Leyden by Gronovius in 1696, with notes and plates. Gen. Biog.

RYD, in *Geography*, a town of Sweden, in the province of Upland; 20 miles S. of Upfal.—Alfo, a town of Sweden, in the province of Smaland; 22 miles E.S.E. of Jonkioping.

RYDAHOLM, a town of Sweden, in the province of Smaland; 22 miles W.N.W. of Wexio.

RYDAL Head, a mountain of England, in Weftmoreland; two miles N. of Amblefide.

Rydal Water, a lake of England, in Weftmoreland, which communicates with the Windermere lake.

RYDALL, a river of Wales, which runs into the fea at Aberyftwith.

RYDDA, in *Ancient Geography*, a city which the Jews conquered from the Arabians, under Alexander Jannæus. Jofeph. Antiq. lib. xiv. cap. 2.

RYDER, *Sir* Dudley, in *Biography*, was born in the year 1691, and having received a good elementary education, he was brought up to the profeffion of the law. It may be obferved, that the family from which the fubject of this article was defcended, had been very long eftablifhed in Yorkfhire, and took their name from Ryther, in the hundred of Barkfton, in that county, hence the name has been written differently at different periods, as Rythre, Ryther, or Ryder. It appears from Dugdale's Baronage, that William de Ryther was fummoned to parliament among the barons of the realm, from the 21ft of Edward I. till the 1ft of Edward II., and that he was fucceeded by John de Rythre, governor of Shipton caftle. Sir Dudley Ryder was appointed folicitor-general to his majefty George II. in 1733; in 1736 he was advanced to the office of attorney-general, and in 1754 he was appointed to the high office of lord chief juftice of the court of king's bench. In the year 1756 his majefty, as a reward for his long and very faithful fervices, determined to advance him to the dignity of the peerage, by the title of lord Ryder, baron of Harrowby in Leicefterfhire, and a warrant was accordingly figned by the king for that purpofe, on the 24th of May; but fir Dudley died on the following day, before the patent could be completed. He left a fon, Nathaniel, the firft lord who was fo created in 1776. He died in 1803, and was fucceeded by his eldeft fon, Dudley, the prefent lord.

Ryder, or *Ruyder*, in *Commerce*, a gold coin in Holland. The new ftand-pennings, or ryders, are fixed by the regulation of 1749 at 14 florins, and the half ditto at 7 florins. The affay and value, &c. are as follow:

	Affay.	Weight.	Contents in pure Gold.	Value in Sterling.
	car. gr.	oz. dwt. gr.	grains.	*L.* *s.* *d.*
Double ryder	ftandard.	0 12 21	284.2	2 10 $3\frac{1}{2}$
Ryder -	ditto.	0 6 9	140.2	1 4 10
Half ryder -	ditto.	0 3 $4\frac{1}{2}$	70.1	0 12 5
Ducat -	B. 1 $2\frac{1}{4}$	0 2 $5\frac{3}{4}$	52.8	0 9 4

Impreffions.—The ryder has on the front, an armed horfeman, with a drawn fword; the legend expreffes the province in which it has been coined, thus: MO. AUR. PRO. CONF. BELG. ZELAND, that is, *Moneta aureæ provinciæ confæderationis Belgicæ Zelandiæ* (gold coin of Zeland, a province of the Belgic confederacy), with the arms of the province at bottom: reverfe, the arms of the United Provinces, with 14 Gl. (14 guilders or florins); legend, CONCORDIA RES PARVÆ CRESCUNT (fmall things increafe by concord). The half ryder bears the fame impreffions, except that it is marked 7 Gl.

The ducat has a foot foldier with a drawn fword, and a bundle of arrows in his left hand; legend, CONCOR. RES PAR. CRES., that is, *Concordia res parvæ crefcunt*, as above, and the letters, HOL. or ZEL. &c. to diftinguifh the province: reverfe,

reverfe, a fquare, with ornaments and the following words in five lines, MO. ORD. PROVIN. FŒDER. BELG. AD LEG IMP.; that is, *Moneta ordinarea provinciarum fœderatarum Belgicarum ad legem Imperii,* (the common coin of the confederated Belgic provinces, according to the law of the empire).

RYDER, or *Rider, to a bill.* See PARLIAMENT.

RYDRAIRE, in *Geography*, a town of Hindooftan, in Baramaul; 28 miles N. of Namacul.

RYDROOG, a town and fortrefs of Hindooftan, in Myfore; 128 miles N. of Seringapatam. N. lat. 14° 40′. E. long. 76° 52′.

RYE, in *Botany*. See SECALE.

RYE, in *Agriculture*, a fpecies of corn much cultivated in fome of the northern diftricts. It is a fort of crop that approaches the neareft to that of wheat of any that is at prefent in cultivation. There are two varieties of this grain, the *winter* and *fpring* rye, or what is often diftinguifhed into the *black* and *white*, or Dantzic fort, but the former is the largeft and the moft plump and hardy, confequently the moft frequently grown by the farmer, however the fpring kind may often be employed with fuccefs and advantage. This kind of grain is fo capable of fuftaining the effects of the weather, that when fown in the autumn it is feldom injured by the moft fevere winters; it is likewife more early in the fpring than wheat, and though not equally valuable, is more certain of producing a good crop in general than that grain is.

Soil.—This is a fort of crop which is capable of being grown on moft kinds of land, but the light dry fandy foils that cannot be converted to the purpofe of wheat or barley, are probably the only ones on which it can be cultivated to advantage, from being the moft adapted to it, and from few of them being fo light or poor as not to afford good crops. It can, of courfe, only be introduced with fuccefs on fuch lands as are incapable of producing other forts of corn to advantage. And from fowls being lefs fond of it than moft other forts of grain, it may be the moft proper to be cultivated on thofe portions of ground that are fituated clofe around the farm-houfes and yards.

It is a crop which is moftly grown after early fed turnips, clover, peas, and other fimilar products, as well as after naked fallows. In particular cafes, when grown on the cold and heavy kinds of foil, the grain is found to be much later in becoming ripe than on fuch as are dry and light in their quality.

This is alfo a kind of crop which, as in that of wheat, requires the land to be brought into a tolerable ftate of mellownefs, and to be perfectly cleared from weeds. In many diftricts where intended to ftand for a crop, it is the cuftom to put it in upon fome fort of fallow, but where it is only to be fed off by fheep, feldom more than one ploughing is given, the land being broken up and fallowed for turnips, immediately after the green rye has been fufficiently eaten down by fheep or other animals. And it is the practice in fome places to apply manure immediately for this crop; but where the foil is in a fuitable ftate of tillage, and has not previoufly been too much exhaufted by the growth of grain crops, it may be more proper, efpecially where it is not to be fed off, to defer the application of the manure, in order that it may be employed for the turnip or other green crop that is to fucceed, the ufe of manure being apt to bring up weeds, and render it difficult to be kept clean.

Seed and Sowing.—In refpect to the time of fowing this fort of grain, it is, in general, pretty much the fame as that for wheat where a crop is intended, but when cultivated for green food for animals, it may be advantageous to fow it more early, as in Auguft and September, but it may be fown in October, and during the winter months, until the beginning of March, in particular cafes, as where the early fowings have failed, or there is an intention of having a fucceffion of this feed for fheep. In which cafes, according to Mr. Bannifter, it is ufually fown on one ploughing on a wheat or other ftubble where the field is to come in courfe for turnips in the following year. And the above writer fays that the general allowance of feed, where the crop is defigned to remain for grain, is, in moft fituations, from about two bufhels to two and a half; but when the intention is to feed it off, three, or even more, may be a better proportion, as the plants, in fuch cafes, fhould ftand confiderably thicker upon the ground, in order that the largeft poffible quantity of green food may be provided for the animals. And as the vegetation of this fort of crop is rather flow, it may be proper to put it into the ground when it is in a tolerably dry condition, otherwife much of it may perifh, efpecially in wet feafons, and where the land is rather heavy.

It is likewife ftated in the Report of Yorkfhire, that it was formerly a prevailing cuftom to blend feveral other forts of feeds with that of rye, and the practice ftill continues in fome diftricts, in refpect to wheat and winter tares, but it is by no means either advifeable or ufeful, in Mr. Donaldfon's opinion, fince, in the firft cafe, the rye is in a ftate fit for reaping long before the wheat, confequently much lofs muft be fuftained by the farmer, and in the latter it is moftly in a ftate to be cut as green food, fome weeks before the tares, and becomes ripe at much too early a period for them.

And in cafes where wheat is blended with rye, it is often termed meflin, the proportion of the latter to that of the former being regulated by the nature of the foil, and the opinion of the grower, the general principle being that of giving the largeft proportion of rye to the lighteft kinds of ground.

After-culture.—In cafes where this crop is grown for the purpofe of the grain, it will be neceffary to keep it as clean as poffible in the early ftages of its growth by horfe and hand weedings, and hoeings according as it is fown, when they may appear requifite; but where the intention is merely that of affording a fupply of green food, for the ufe of fheep or other animals in the more early fpring months, no further culture will be wanted after the crop has been put into the ground. This fort of crop is known to be ready to cut by the ftraw of the ftems becoming of a yellowifh colour, the ears hanging down in a bending manner, and the grain feeling hard and in a plump and full condition.

On the poor fandy foils of Suffolk good crops of this fort are feldom produced, and on thofe of a better quality the produce is rarely more than from two to three quarters on the acre. But in the north riding of Yorkfhire it is ftated, by the author of the Agricultural Report of that diftrict, to amount to from three to fix quarters to the acre of land.

In cafes where this fort of grain is free from weeds, and cut when the weather is fine, it may be fecured in the ftack as faft as the reaping proceeds, without its being endangered by it. And the ftraw of this fort of grain is found to be fuperior to that of wheat, for the purpofe of thatch, as well as for the ufe of the collar-makers, who require much of it.

The practice of farmers is fometimes, where rye is intended to ftand for a crop, to feed it with fheep in the early fpring, as in the beginning of March; but this fhould never be done

 except

except where the crop is very luxuriant, and at fo early a period as that there may be no danger of deftroying the new formed ear of the grain. This kind of crop is alfo cultivated in particular cafes, as where the ground is fufficiently light and dry to be turned down as a manure: where this is the cafe, the crop fhould always be turned in while in its moft green and fucculent ftate, and when the weather is moderately dry, in order that it may be more quickly reduced by putrefaction into a manure. And, in the more fouthern diftricts, it is not unfrequently grown for the purpofes of the tanners, who have recourfe to it in the preparation of leather.

Application.—The moft ufual application of this crop is as a green food for fheep in the early fpring, before the turnip crops are ready. When grown in this view it is neceffary, the author of Practical Agriculture fays, to have attention to different circumftances, in order to derive the utmoft advantage from the crops. As this grain begins to fhoot out, or fpindle, as it is termed by farmers, much earlier than wheat, care fhould be taken that the feeding of it down is begun at a fufficiently early period before the ear is formed in the *hofe*, as the latter end of February or beginning of March, otherwife the ftem or blade becomes firm and fticky, and the fucceffion of green feed after the firft eating extremely fmall. Indeed this may be done earlier than the firft of thefe periods, in cafes where the feafon is mild and open, and perfevered in till the end of April. In all cafes it is, however, adviſeable to let the crop be fo advanced in its growth as to cover the ground tolerably before the fheep are turned in. As this fort of green food is faid to have much effect in promoting the flow of milk in fuch ewes as have lambs, probably from its fucculency, and its ftimulant properties being applied immediately after the feverity of the winter feafon, when the bodies of animals are known to be more capable of being excited by the action of ftimuli, and when there is fcarcely any other fort of green feed that can leffen its operation by being taken along with it, the culture of it muft be the moft advantageous, it is fuppofed, where fheep hufbandry is extenfively combined with that of tillage, efpecially that department of it which relates to the feeding of lambs. As by this means, from the quantity of fucculent nutritious food that is provided, the lambs are prevented from being ftinted in their growth while young, which is a matter of the utmoft importance in their future feeding. And that in thus feeding the crop off by fheep it will conftantly be neceffary to keep the fields properly divided by means of hurdles, as in this way the lofs of food will be much lefs, and fome parts will become frefh while the others are eating down, which are advantages not to be difregarded in cafes of this kind.

But Mr. Bannifter thinks, that, notwithftanding what has been urged in favour of a rye pafture, it is fcarcely worth the while of any farmer to attempt the cultivation of this grain, who does not keep large numbers of ewes and lambs; for as the feed ufually fetches a high price, every advantage attending the crop will be more than balanced by the fuperior charges in the cultivation, except in the inftance above-mentioned, where no expence fhould be fpared to maintain the lambs in a thriving way, and to prevent their growing hard and fticky, as the butchers term it; for if lambs once fink in flefh, it is beyond the art of man to reftore them to their former thriving ftate again.

Rye is, in many parts of the country, ufed for bread, either alone, or mixed with wheat.

Rye is alfo a grain which is much ufed in the diftilleries, where it can be procured in large quantity, and alfo by the ginger-bread bakers. In the Rural Economy of Yorkfhire it is obferved, that before the ufe of lime was prevalent, much rye was grown on the lighter lands upon the margin of the vale, and in the moor-lands fcarcely any other crops than rye and oats were attempted. Now rye is principally confined to the moorland dales; and even there the alteration of foils by lime has been fuch, that wheat is become the more prevalent crop. Neverthelefs, on light fandy moorland foils, rye is generally more profitable than wheat; and the bread which is made from a mixture of the two grains is here efteemed more wholefome to perfons in general, than that which is made from wheat alone.

It is cultivated in many diftricts as a good fpring green feed for fheep, particularly ewes and lambs. This is greatly the cafe on the South Downs, in the county of Surrey. It is there fown in the late fummer months, or the very beginning of thofe of the autumn, the more early the better. When other food is fcarce in the fpring and in the lambing feafon, the ewes and lambs are turned upon it, proper portions being hurdled off for the purpofe.

Some fuppofe it prepares well for turnips, and that on many accounts it may be raifed with much ufe and advantage on open expofed fandy foils, where wheat crops will not fucceed, for being fed off, and infure far better crops of the above roots, than are commonly met with in fuch foils and fituations. There would, in thefe cafes, it is faid, be the benefit of an increafed quantity of food, and of courfe an increafe in the number of live-ftock, which would produce a greater abundance of manure, and, confequently, of grain crops ultimately. The trouble and expence of adopting fuch a method of practice would be but trifling, infomuch as the ground would be broken up only in the autumn inftead of the fpring; in return for which fheep-feed would be procured, and, at the fame time, the land be well dreffed for the further crop, which fhould conftantly have a full fupply of manure when the feed is put into the land.

This crop, on the whole, deferves more attention than it has commonly met with, as it forms one of the links in the chain of green food, by which live-ftock, on arable farms, can be fed and fupported the whole year round.

In many parts of France there have been certain years in which this grain, from no apparent caufe, has proved noxious, and fometimes even poifonous. M. Perrault travelling through Sologne, was informed that the rye of that province was fometimes fo corrupted, that thofe who eat of the bread that had much of the corrupted grain in it, were feized with gangrenes in different parts of the body, which were not preceded by any fever, inflammation, or any confiderable pain; and that the gangrened parts ufually fell off after a time of themfelves, without the affiftance of chirurgical inftruments. The grains of rye thus degenerated, are black on the outfide, and tolerably white within; and when they are dry, they are harder and clofer than the natural good grain; they have no ill tafte, but fometimes they have a vifcous metallic-like honey hanging to one end of them. They grow longer than the other grains in the fame ear, and are found from one or two to feven or eight in the fame ear. Some have fuppofed that thefe were not the proper feeds of the plant, but fome other extraneous bodies that got in among them; but it is evident, from a clofe infpection, that they are really the genuine feeds, only altered by fome accident; the coats, and the furrow, and even the germen for the young plant, being entirely the fame as in the natural feeds.

The places where the rye is found to degenerate in this manner, are all a dry and fandy foil. In thefe places there is fcarcely any foil in which more or lefs of thefe large feeds are not found among the others, but where there are but few of them, the ill effects are not perceived. The feafons when the degeneracy is greateft, and the effects the worft of of all, are, when there have been excessive rains in the spring, and there come on excessive heats in the succeeding summer.

The bread which is made of the rye that holds ever so much of this bad corn, is not distinguishable from other rye-bread by the taste, and seldom produces its ill effect, till some considerable time after it is taken. Beside the gangrenes already mentioned, it not unfrequently brings on other bad consequences, such as drying up the milk of women who give suck, and occasioning sometimes malignant fevers, accompanied with drowsiness, ravings, and other dangerous symptoms. The part usually seized by the gangrene is the legs, and this often in a very frightful manner. The arms are the next part most subject; but all the other parts of the body are subject to it.

The first symptom of this approaching gangrene is a stupefaction and deadness in the part; after this there comes on some pain, though not violent, and the skin becomes livid; sometimes the skin shews no mark of it, but the pain and swelling increase; and it is necessary to make an incision into the flesh, to find the gangrened part. In the more desperate cases, the only remedy is, the taking off the part; and if this is neglected, the flesh is all wasted, and the skin becomes black, and clings round the bones, and the gangrene appears again in the shoulders.

The poorer people are only subject to this disease; and, as they principally eat the rye-bread, and as those years when there is most of this bad grain among the ears of rye, produce most of these disorders, it has been judged certain that the rye is the occasion of it. It may deserve enquiry, however, whether that grain may not be innocent of the mischief, and its degeneracy and the distemperature attributed to it may not both be the effect of the same bad constitution of the air. If it proves, on enquiry, that only those who eat of the rye are subject to the disease, it will seem a proof of its being really owing to it; and in this case the mischief may be prevented by the sifting the grain before it is ground, the degenerated grains being so long that they will all remain in the sieve that lets the others through. The experiment has been made on the spot, by giving the flour of the corrupted grains alone to animals, and it is said they have been killed by it. Philos. Trans. N° 130.

Rye-*Grass*, the common name of a particular sort of grass. See Ray-*Grass*.

It has been observed, from the trials made at Wooburn, under the care of Mr. G. Sinclair, that sheep eat this grass, when it is in the early stage of its growth, in preference to most others; but after the seed approaches towards perfection, they leave it for almost any other kind. A field in the park at the above place was laid down in two equal parts, one part with rye-grass and white clover, and the other part with cock's-foot and red clover: from the spring till midsummer the sheep kept almost constantly on the rye-grass; but after that time they left it, and adhered with equal constancy to the cock's-foot during the remainder of the season.

Rye, or *West Rye*, in *Geography*, a borough, market-town, and cinque-port, under the title of "ancient port and town," in the hundred of Gostrow, rape of Hastings, and county of Sussex, England, is situated on the coast of the British Channel, at the distance of 76 miles E. by W. from Chichester, and 62 miles S.E. by E. from London. It is of very high antiquity, but its early history is little known. It seems clear, however, that it was one of the original cinque-ports, and is mentioned as a member of them generally, in a charter granted by king Henry III. In the reign of Edward III. the whole town was environed with a strong wall, and guarded by towers, under the superintendance of William d'Ypres, earl of Kent. At that period Rye was so considerable a port, that it furnished no fewer than nine armed vessels to the royal fleet, when the king undertook the invasion of France; but it suffered materially in the next reign, having been plundered and burnt by the French, who took advantage of the then distracted state of the country, to attack such of the coast-towns as were least capable of resistance. It soon, however, recovered from this disaster, and became a port of considerable consequence; but the rise of others on the same coast has rendered it for the last century comparatively unimportant. The harbour, which lies to the south-east of the town, is at present in a neglected state, notwithstanding it admits vessels of a large size to come quite up to the town-quay, about a mile and a half from its entrance. At spring tides the sea rises so high, and spreads itself so much, that two-thirds of the town are surrounded by water. The mackarel and herrings caught here in their seasons are reckoned the finest of the kind brought to the London market.

Rye is a borough of itself by prescription, as well as by charters granted in confirmation of its privileges. The corporation consists of a mayor, bailiff, jurats, and freemen. The mayor and bailiff are chosen from among the jurats on the Monday after St. Bartholomew's day, by the votes of a majority of freemen. When a vacancy occurs among the jurats, the mayor nominates a freeman to supply it, but he must be approved of by the jurats before his appointment becomes valid. Rye sends two members to parliament, who are ostensibly elected by the mayor, jurats, and freemen inhabiting the borough, and paying scot and lot; but, in fact, they are returned through the influence of the treasury, which is paramount in all the cinque-ports. The principal articles of trade here are, hops, wool, timber, kettles, cannon, chimney-backs, and other iron goods, from the works at Bakeley and at Breed. There are two weekly markets, on Wednesday and Saturday; and two annual fairs, on Whit-monday and the 10th of August.

The town of Rye occupies a considerable eminence, and is, generally speaking, regular and well built. In the centre of the principal street stands the market-house, the higher story of which is appropriated as a town-hall, for the use of the corporation. The church is constructed of stone, and is one of the largest parochial edifices of the kind in England, but does not otherwise claim particular attention. Here is besides a chapel, which was lately appropriated to the French refugees, who settled in the town and its vicinity during the late war; also meeting-houses for Methodists, Quakers, and other Dissenters. Here are likewise two free-schools, one of which was erected and endowed by a Mr. Peacock in the year 1644; and the other by a Mr. Saunders, at a later period. The only monastic establishment in Rye was a priory of Augustine friars, which existed previous to the time of Edward III. and continued to flourish till the general dissolution of religious houses by king Henry VIII. The church formerly belonging to this monastery is still standing, having been converted into a store-house for mercantile goods. Some remains of the ancient walls of the town may yet be traced, but the ditches are entirely filled up.

According to the parliamentary returns of 1811, this town and out-liberty contain 476 houses, and 2681 inhabitants. Camden's Britannia, by Gough, Sussex, folio, 1789. Beauties of England and Wales. vol. xiv. 8vo.

Rye, a town of Denmark, in North Jutland, formerly important, but now much reduced. The church at Rye, in in popish times, was reckoned to be a very sacred place; 16 miles W. of Aarhuys.

Rye, a township of New Hampshire, in America, on the sea-coast of Rockingham county, opposite the isle of Shoals, and 8 miles S. of Portsmouth: incorporated in 1719, and containing 1020 inhabitants.—Also, a township of New York, in West Chester county, in Long Island sound; 36 miles N.E. of New York city.—Also, a township in Cumberland county, Pennsylvania, containing 1356 inhabitants. —Also, a township in Cumberland.

RYECHUNGA, a town of Bengal; 13 miles N.W. of Beyhar.

RYEGATE. See Reygate.

Ryegate, the south-easternmost township of Caledonia county, in the state of Vermont, separated from Bath in New Hampshire by Connecticut river; containing 812 inhabitants.

RYELAND Sheep, a breed of fine-woolled sheep, originally met with in the greatest perfection in a district of Herefordshire, termed the Ryelands. See Sheep.

RYER, Andrew du sieur de Malezais, in *Biography*, was born at Marcigni, in Burgundy. Little is known of his history, but he became gentleman in ordinary of the king's bed-chamber, and knight of the Holy Sepulchre. He resided a considerable time at Constantinople in the king's service, and was consul for the French nation in Egypt, from which opportunities he derived a knowledge of the Arabic, Turkish, and other Oriental languages. He died in France, about the middle of the 17th century. His chief works as a literary man are, "A Turkish Grammar;" "A French Translation of the Koran," and another of the "Gulistan" of Saadi. His version of the Koran is in no great estimation, as he is said to have mixed the reveries of Mohammedan commentators with the original text.

Ryer, Peter du, a dramatic and miscellaneous writer, was born of a good family at Paris, in 1605. He procured a place of secretary to the king in 1626, which his poverty obliged him to sell, and he afterwards served in the same capacity Cæsar, duke of Vendome. In order to support his family he employed his pen in prose and verse. He composed nineteen pieces for the theatre, which were successful at the time of their appearance. Two or three of his tragedies obtained the applause of maturer criticism. His "Alcyonèe" so much delighted queen Christina, that she had it read to her three times in one day. His "Scævole" still keeps its place on the stage. Du Ryer was admitted into the French Academy in 1646. A short time before his death he obtained the office of historiographer royal, with a pension. He died in 1658.

RYES, in *Geography*, a town of France, in the department of the Calvados, and chief place of a canton, in the district of Bayeux. The place contains 650, and the canton 10,510 inhabitants, on a territory of 147½ kiliometres, in 29 communes.

RYEWATER, a river of the county of Kildare, Ireland, which passing by Carton, falls into the Liffey, near Leixlip.

RYKOWICZA, a town of Lithuania, in the palatinate of Brzesc; 25 miles S.E. of Brzesc.

RYKSDALER, in *Commerce*. See Rixdollar.

RYKSORT, a Danish silver coin, reckoned at twenty-four shillings. See Rixdollar.

RYMABAD, in *Geography*, a town of Hindoostan, in Mysore; 15 miles E.S.E. of Chinna Ballabarum.

RYMAROW. See Romerstadt.

RYME. See Rhyme.

RYMENAUT, in *Geography*, a town of France, in the department of the Two Nethes, situated on the Dyle; five miles E. of Malines.

RYMER, Thomas, in *Biography*, a critic and antiquary, was born in the north of England, and educated at the grammar-school of Northallerton. He was admitted a scholar at Cambridge, then became a member of Gray's Inn, and at length was appointed historiographer to king William, in place of Mr. Shadwell. He wrote "A View of the Tragedies of the last Age," and afterwards published a tragedy named "Edgar." For the office of a critic he was certainly not well qualified, for he wanted candour; nor is his judgment much to be relied on, as he could condemn Shakspeare with such rigid severity. His tragedy will shew, that his talents for poetry were by no means equal to those whose poems he has publicly censured. But though he has no title to the appellation of poet or critic, as an antiquarian and historian his memory will long be preserved. His "Fœdera," which is a collection of all the public transactions, treatises, &c. of the kings of England with foreign princes, is esteemed one of our most authentic and valuable records, and is oftener referred to by the best English historians than perhaps any other book in the language. It was published at London in the beginning of the last century, in 17 vols. folio. Three volumes more were added by Sanderson after Rymer's death. The whole were reprinted at the Hague, in 10 vols. 1739. They were abridged by Rapin in French, and inserted in Le Clerc's Bibliotheque, a translation of which was made by Mr. Stephen Whatley, and printed in one vol. folio. &c. 4 vols. 8vo. 1731, under the title of *Acta Regia*. Mr. Rymer died the 14th of December 1713, and was buried in the parish church of St. Clement's Danes. Some specimens of his poetry are preserved in the first volume of Mr. Nichols's Select Collection of Miscellaneous Poems, 1780.

RYNABAD, in *Geography*, a town of Bengal; 35 miles S.E. of Moorley.

RYNCHOPS, *the Skimmer*, in *Ornithology*, a genus of birds of the order Anseres, of which the generic character is, that the bill is straight, the upper mandible is much shorter than the under, the latter truncated at the apex; the tail is forked and shorter than the wings, nostrils linear, and the back toe small.

Species.

Nigra; Black Skimmer, or Cut-water. The specific character is blackish, beneath white; bill red at the base; the lower mandible grooved; the front and chin are white; wings with a transverse white band; the two middle tail-feathers are black, the next edged with white; the legs are red, and it is about twenty inches long. It is found in divers parts of Asia and America. This bird is ever on the wing, sweeping the surface of the water, dipping its bill, or at least its under mandible, to scoop out the smaller fishes, on which it feeds. In stormy weather it frequents the shores, and is contented with oysters, and other shell-fish. There is a variety of a tawny colour, with a black bill.

RYNNTO, in *Geography*, a small island in the gulf of Bothnia, near the coast of Finland. N. lat. 60° 37′. E. long. 21° 46′.

RYNOORT, a town of Holland, on the Rhine; seven miles E. of Leyden.

RYOTS, the modern name by which the renters of land are distinguished in Hindoostan. In every part of India, where the native Hindoo princes retain dominion, these Ryots hold their possession by a lease, which may be considered as perpetual, and at a rate fixed by ancient surveys

 and

and valuations. This arrangement has been fo long eftablifhed, and accords fo well with the ideas of the natives, concerning the diftinctions of cafts, and the functions allotted to each, that it has been inviolably maintained, in all the provinces fubject either to Mahometans or Europeans; and to both it ferves as the bafis on which their whole fyftem of finance is founded. In a more remote period, before the original inftitutions of India were fubverted by foreign invaders, the induftry of the hufbandman, on which every member of the community depended for fubfiftence, was as fecure, as the tenure, by which he held his lands, was equitable. Even war did not interrupt his labours or endanger his property. It was not uncommon, we are informed, that while two hoftile armies were fighting a battle in one field, the peafants were ploughing or reaping in the next field in perfect tranquillity. (Strabo, lib. xv.) Under a form of government, which paid fuch attention to all the different orders of which the fociety is compofed, particularly the cultivators of the earth, it is not wonderful that the ancients fhould defcribe the Indians as a moft happy race of men; and that the moft intelligent modern obfervers fhould celebrate the equity, the humanity, and mildnefs of Indian policy. A Hindoo rajah refembles more a father prefiding in a numerous family of his own children, than a fovereign ruling over inferiors fubject to his dominion. He endeavours to fecure their happinefs with vigilant folicitude; they are attached to him with the moft tender affection and inviolable fidelity. We can hardly conceive men to be placed in any ftate more favourable to their acquiring all the advantages derived from focial union. It is only when the mind is perfectly at eafe, and neither feels nor dreads oppreffion, that it employs its active powers in forming numerous arrangements of police, for fecuring its enjoyments and increafing them. Many arrangements of this nature the Greeks, though accuftomed to their own inftitutions, the moft perfect at that time in Europe, obferved and admired among the Indians, and mention them as inftances of high civilization and improvement. There were eftablifhed among the Indians three diftinct claffes of officers, one of which had it in charge to infpect agriculture, and every kind of country work. They meafured the portions of land allotted to each renter. They had the cuftody of the *tanks*, or public refervoirs of water, without a regular diftribution of which, the fields in a torrid climate cannot be rendered fertile. They marked out the courfe of the highways, along which, at certain diftances, they erected ftones, to meafure the road and direct travellers. To officers of a fecond clafs was committed the infpection of the police in cities; their functions of courfe were many and various; fome of which only we fhall fpecify. They appropriated houfes for the reception of ftrangers; they protected them from injury, provided for their fubfiftence, and, when feized with any difeafe, they appointed phyficians to attend them; and, on the event of their death, they not only buried them with decency, but took charge of their effects, and reftored them to their relations. They kept exact regifters of births and of deaths. They vifited the public markets, and examined weights and meafures. The third clafs of officers fuperintended the military department; but, as the objects to which their attention was directed are foreign from the fubject of this article, it is unneceffary to enter into any detail with refpect to them.

There is ftill the fame attention to the conftruction and prefervation of tanks, and the diftribution of their waters. The direction of roads, and placing ftones along them, is ftill an object of police. *Choultries*, or houfes built for the accommodation of travellers, are frequent in every part of the country, and are ufeful, as well as noble monuments of Indian munificence and humanity.

The precife mode, however, in which the Ryots of Hindooftan held their poffeffions, is a circumftance in its ancient political conftitution, with refpect to which gentlemen of fuperior difcernment, who have refided long in the country, and filled fome of the higheft ftations in government, have formed very different opinions. Some have imagined, that grants of land were made by the fovereign to villages or fmall communities, the inhabitants of which, under the direction of their own chiefs or heads-men, laboured it in common, and divided the produce of it among them in certain proportions. (Defcript. de l'Inde, par M. Bernouilli, tom. ii. 223, &c.) Others maintain, that the property of land has been transferred from the crown to hereditary officers of great eminence and power, denominated *Zemindars*, who collect the rents from the Ryots, and parcel out the lands among them. Others contend, that the office of the Zemindars is temporary and minifterial, that they are merely collectors of revenue, removeable at pleafure, and the tenure by which the Ryots hold their poffeffions is derived immediately from the fovereign. This laft opinion is fupported, with great ability, by Mr. Grant, in an Inquiry into the Nature of Zemindary Tenures in the landed Property of Bengal, &c. This queftion ftill continues to be agitated in Bengal, and fuch plaufible arguments have been produced in fupport of the different opinions, that although it be a point extremely interefting, as the future fyftem of Britifh finance in India appears likely to hinge, in an effential degree, upon it, perfons well acquainted with the ftate of India, have not been able to form a final and fatisfactory opinion upon this fubject. (Captain Kirkpatrick's Introd. to the Inftitutes of Ghazan Khan. New Afiatic Mifcell. N° II. p. 130.) Though the fentiments of the Committee of Revenue, compofed of perfons eminent for their abilities, lean to a conclufion againft the hereditary right of the Zemindars in the foil, yet the Supreme Council, in the year 1786, declined, for good reafons, to give any decifive judgment on a fubject of fuch magnitude.

Mr. Roufe, in his ingenious and inftructive Differtation concerning the landed property of Bengal, adopts an opinion contrary to that of Mr. Grant, and maintains, with laudable candour and liberality of fentiment, that the Zemindars of Bengal poffefs their landed property by hereditary right. Dr. Robertfon, in his "Hiftorical Difquifition concerning India," fuggefts, that the poffeffion of land was granted at firft during pleafure, afterwards for life, and at length became perpetual and hereditary property. But even under this laft form, when land is acquired either by purchafe or inheritance, the manner in which the right of property is confirmed and rendered complete, in Europe by a charter, in India by a "Sunnud" from the fovereign, feems to point out what was its original ftate. According to each of the theories above-mentioned, the tenure and condition of the Ryots nearly refemble the defcription which our author has given of them. Their ftate, we learn from the accounts of intelligent obfervers, is as happy and independent as falls to the lot of any race of men employed in the cultivation of the earth. The ancient Greek and Roman writers, whofe acquaintance with the interior parts of India was very imperfect, reprefent the fourth part of the annual produce of land as the general average of rent paid to the fovereign. Upon the authority of a popular author, who flourifhed in India prior to the Chriftian era, we may conclude, that a fixth part of the people's income was, in his time, the ufual portion of the fovereign. (Sacontala, act v. p. 53.) It is now known,

known, that what the sovereign receives from land varies greatly in different parts of the country, and is regulated by the fertility or barrenness of the soil, the nature of the climate, the abundance or scarcity of water, and many other obvious circumstances. By the account given of it, Dr. Robertson imagines that, in some districts, it has been raised beyond its due proportion. One circumstance with respect to the administration of revenue in Bengal merits notice, as it redounds to the honour of the emperor Akber, the wisdom of whose government has often been conspicuous. A general and regular assessment of revenue in Bengal was formed in his reign. All the lands were then valued, and the rent of each inhabitant and of each village ascertained. A regular gradation of accounts was established. The rents of the different inhabitants who lived in one neighbourhood being collected together, formed the account of a village; the rents of several villages being next collected into one view, formed the accounts of a larger portion of land. The aggregate of these accounts exhibited the rent of a district, and the sum total of the rents of all the districts in Bengal, formed the account of the revenue of the whole province. From the reign of Akber to the government of Jaffeer Ali Cawn, A.D. 1757, the annual amount of revenue, and the modes of levying it, continued with little variation. But in order to raise the sum which he had stipulated to pay the English on his elevation, he departed from the wise arrangements of Akber; many new modes of assessment were introduced, and exactions multiplied. Robertson's India.

RYOZ, in *Geography*, a town of France, in the department of the Upper Saône; 11 miles N. of Besançon.

RYPOUR, a town of Hindoostan, in the circar of Gohud; 10 miles S.S.E. of Gwalior.—Also, a town of Hindoostan, in Bahar; 24 miles S.S.E. of Bahar.

RYPTICS, in *Medicine*. See RHYPTICS.

RYR, in *Geography*, a town of Sweden, in West Gothland; seven miles N.E. of Uddevalla.

RYS, a lake of Denmark, in Norland.

RYSAGON, in the *Materia Medica*, a name by which some authors have called the *cassumunar root*.

RYSBY, in *Geography*, a town of Sweden, in the province of Samland; 10 miles N. of Calmar.

RYSEMSEH, a town of Norway; 48 miles E.N.E. of Romsdal.

RYSEN, or RYSSEN, a town of Holland, in the department of Overyssel, on the river Regge; 20 miles N.E. of Zutphen.

RYSSADIUM, in *Ancient Geography*, a town and port of Africa, in Mauritania Tingitana, on the coast of the Iberian ocean, between Sestiaria Extrema and the promontory Mesagonites, according to Ptolemy. It is named by Antonine Rusarder Colonia, and Rusardir by Pliny, who places it near the promontory "Solis."

RYSSADIUM, a promontory of Africa, in the Interior Libya, near the promontory Arsinarium, according to Ptolemy.

RYSSADIUS MONS, a mountain of Africa, in the Interior Libya, in which Ptolemy places the source of the river "Stachier."

RYSWICK, in *Geography*, a large village in Holland, situated between the Hague and Delft, where the prince of Orange had a palace; and remarkable for a treaty concluded here in 1697 between England, Germany, Holland, France, and Spain; 30 miles S.W. of Amsterdam, and two S.E. from the Hague.

RYVES, THOMAS, in *Biography*, born in the latter end of the 16th century, and educated at Winchester school, from whence he was sent to Oxford. He became celebrated as a civilian in Doctors' Commons, and in the court of Admiralty. At the accession of Charles I. he was made king's advocate, and was knighted. He died in 1651. He wrote several works, among which were "The Vicar's Plea;" "Historia Navalis Antiqua;" "Historia Navalis Media."

RYVES, BRUNO, an English divine, and near relation of the preceding. At the restoration of Charles II. he had the deanery of Windsor conferred on him. He was also secretary to Garter king at arms. He was author of "Mercurius Rusticus," or "The Country's Complaint," and divers other works, which were popular in their day.

RYVORDEN, in *Geography*, a small island in the North sea, near the coast of Norway. N. lat. 59° 27′.

RZECZYCA, a town of Lithuania, in the palatinate of Minsk, on the Dnieper; 140 miles S.E. of Minsk. N. lat. 52° 10′. E. long. 31° 24′.

RZEMIEN, a town of Poland, in the palatinate of Sandomirz; 36 miles S.S.W. of Sandomirz.
